PREFACE

In sync with the recent changes in the test pattern and format of **JEE Main** (Joint Engineering Entrance), it is my pleasure to introduce **Master Resource Book in Mathematics for JEE Main**, for the Students aspiring a seat in a reputed Engineering College. JEE Main is a gateway examination for candidates expecting to seek admission in Bachelor in Engineering (BE), Bachelor of Technology (B.Tech) and Bachelor of Architecture (B.Arch) at Indian Institutes of Information Technology (IIITs), National Institutes of Technology (NITs), Delhi Technological University and other Centrally Funded Technical Institutes (CFTIs).

JEE Main is also an examination which is like screening examination for **JEE Advanced**
(The gateway examination to India's most reputed Technical Institutes, Indian Institutes of Technology IITs). Only the top 2.2 lacs students passed in JEE Main will be able to attempt JEE Advanced. Gradually, the number of students aspiring for the seat in the Engineering College has increased rapidly in the last 5 Years or so. This year nearly 10 lacs students appeared for

JEE Main and only a few were able to reserve a seat in the college of their choice, so there is a cut throat competition among the aspirants. Thus, it calls for a systematic mastery of all the subjects of the test with paramount importance to problem-solving. Most of the books now in the market have become repetitive with scant respect to the needs of true and effective learning. This book has been designed to fulfill the perceived needs of the students as such.

- This book comprehensively covers all the topics of **JEE Main Mathematics syllabus**. The chapters have been sequenced according to the **syllabus of class 11th & 12th.** Each chapter has essential theoretical discussion of the related concepts with sufficient number of solved examples, practice problems and other solved problems. In each chapter previous years' questions of AIEEE and JEE Main have been included to help students know the difficulty levels and nature of questions asked in competitive exams at this level.
- All types of questions have been included in this book: **Single Correct Answer Types, Multiple Correct Answer Types, Reasoning Types, Matches, Passage-based Questions** etc.
- This is the only book which has its subject matter divided as per class 11th & 12th syllabus. It covers almost all questions of **NCERT Textbook & NCERT Exemplar problems**.

It is hoped this new effort will immensely benefit the students in their goal to secure a seat in the prestigious engineering college, and would be convenient to teachers in planning their teaching programmes. Suggestions for further improvement are welcome from the students and teachers.

Prafful K Agarwal

CONTENTS

PART I

Chapters from Class 11th Syllabus

1.	Set	3-19
2.	Fundamentals of Relations and Functions	20-35
3.	Sequence and Series	36-79
4.	Complex Numbers	80-124
5.	Quadratic Equations and Equalities	125-166
6.	Permutations and Combinations	167-197
7.	Mathematical Induction	198-210
8.	Binomial Theorem and its Applications	211-242
9.	Trigonometric Function and Equations	243-294
10.	Properties of Triangles, Heights and Distances	295-325
11.	Cartesian Coordinate System	326-357
12.	Straight Line	358-388
13.	Circles	389-433
14.	Parabola	434-461
15.	Ellipse	462-496
16.	Hyperbola	497-522
17.	Introduction to Three Dimensional Geometry	523-535
18.	Limit and Derivatives	536-550
19.	Mathematical Reasoning	551-569
20.	Statistics	570-599
21.	Fundamentals of Probability	600-625

PART II

Chapters from Class 12th Syllabus

22.	Matrix	629-671
23.	Determinant	672-715
24.	Relation and Function	716-759
25.	Inverse Trigonometric Functions	760-786
26.	Limits, Continuity and Differentiability	787-847
27.	Differentiation	848-888
28.	Application of Derivatives	889-935
29.	Maxima and Minima	936-971
30.	Indefinite Integration	972-1026
31.	Definite Integration	1027-1068
32.	Area Bounded by Curves	1069-1099
33.	Differential Equations	1100-1148
34.	Vector Algebra	1149-1194
35.	Three Dimensional Geometry	1195-1242
36.	Advance Probability	1243-1279

JEE Main Solved Papers

Solved Papers 2013 (Online & Offline)	1-35
Solved Papers 2014	36-43
Solved Papers 2015	44-53
Solved Papers 2016	54-61
Solved Papers 2017	1-8
Solved Papers 2018	1-8

Online JEE Main 2019 Solved Papers
(April & January Attempt) **1-26**

SYLLABUS

UNIT 1 Sets, Relations and Functions

Sets and their representation; Union, intersection and complement of sets and their algebraic properties; Power set; Relation, Types of relations, equivalence relations, functions;. one-one, into and onto functions, composition of functions.

UNIT 2 Complex Numbers and Quadratic Equations

Complex numbers as ordered pairs of reals, Representation of complex numbers in the form $a+ib$ and their representation in a plane, Argand diagram, algebra of complex numbers, modulus and argument (or amplitude) of a complex number, square root of a complex number, triangle inequality, Quadratic equations in real and complex number system and their solutions. Relation between roots and co-efficients, nature of roots, formation of quadratic equations with given roots.

UNIT 3 Matrices and Determinants

Matrices, algebra of matrices, types of matrices, determinants and matrices of order two and three. Properties of determinants, evaluation of deter-minants, area of triangles using determinants. Adjoint and evaluation of inverse of a square matrix using determinants and elementary transformations, Test of consistency and solution of simultaneous linear equations in two or three variables using determinants and matrices.

UNIT 4 Permutations and Combinations

Fundamental principle of counting, permutation as an arrangement and combination as selection, Meaning of $P(n,r)$ and $C(n,r)$, simple applications.

UNIT 5 Mathematical Induction

Principle of Mathematical Induction and its simple applications.

UNIT 6 Binomial Theorem and its Simple Applications

Binomial theorem for a positive integral index, general term and middle term, properties of Binomial coefficients and simple applications.

UNIT 7 Sequences and Series

Arithmetic and Geometric progressions, insertion of arithmetic, geometric means between two given numbers. Relation between A.M. and G.M. Sum upto n terms of special series: $\sum n$, $\sum n^2$, $\sum n^3$. Arithmetico - Geometric progression.

UNIT 8 Limit, Continuity and Differentiability

Real valued functions, algebra of functions, polynomials, rational, trigonometric, logarithmic and exponential functions, inverse functions. Graphs of simple functions. Limits, continuity and differentiability.

Differentiation of the sum, difference, product and quotient of two functions. Differentiation of trigonometric, inverse trigonometric, logarithmic exponential, composite and implicit functions derivatives of order upto two. Rolle's and Lagrange's Mean Value Theorems. Applications of derivatives: Rate of change of quantities, monotonic - increasing and decreasing functions, Maxima and minima of functions of one variable, tangents and normals.

UNIT 9 Integral Calculus

Integral as an anti - derivative. Fundamental integrals involving algebraic, trigonometric, exponential and

logarithmic functions. Integration by substitution, by parts and by partial fractions. Integration using trigonometric identities.

Evaluation of simple integrals of the type

$$\int \frac{dx}{x^2 \pm a^2}, \quad \int \frac{dx}{\sqrt{x^2 \pm a^2}}, \quad \int \frac{dx}{a^2 - x^2}, \quad \int \frac{dx}{\sqrt{a^2 - x^2}},$$

$$\int \frac{dx}{ax^2 + bx + c}, \quad \int \frac{dx}{\sqrt{ax^2 + bx + c}}, \quad \int \frac{(px + q)\, dx}{ax^2 + bx + c},$$

$$\int \frac{(px + q)\, dx}{\sqrt{ax^2 + bx + c}}, \quad \int \sqrt{a^2 \pm x^2}\, dx \quad \text{and} \quad \int \sqrt{x^2 - a^2}\, dx$$

Integral as limit of a sum. Fundamental Theorem of Calculus. Properties of definite integrals. Evaluation of definite integrals, determining areas of the regions bounded by simple curves in standard form.

UNIT 10 Differential Equations

Ordinary differential equations, their order and degree. Formation of differential equations. Solution of differential equations by the method of separation of variables, solution of homogeneous and linear differential equations of the type $\frac{dy}{dx} + p(x)\, y = q(x)$

UNIT 11 Coordinate Geometry

Cartesian system of rectangular coordinates in a plane, distance formula, section formula, locus and its equation, translation of axes, slope of a line, parallel and perpendicular lines, intercepts of a line on the coordinate axes.

- **Straight lines**

  Various forms of equations of a line, intersection of lines, angles between two lines, conditions for concurrence of three lines, distance of a point from a line, equations of internal and external bisectors of angles between two lines, coordinates of centroid, orthocentre and circumcentre of a triangle, equation of family of lines passing through the point of intersection of two lines.

- **Circles, conic sections**

  Standard form of equation of a circle, general form of the equation of a circle, its radius and centre, equation of a circle when the end points of a diameter are given, points of intersection of a line and a circle with the centre at the origin and condition for a line to be tangent to a circle, equation of the tangent. Sections of cones, equations of conic sections (parabola, ellipse and hyperbola) in standard forms, condition for y = mx + c to be a tangent and point (s) of tangency.

UNIT 12 Three Dimensional Geometry

Coordinates of a point in space, distance between two points, section formula, direction ratios and direction cosines, angle between two intersecting lines. Skew lines, the shortest distance between them and its equation. Equations of a line and a plane in different forms, intersection of a line and a plane, coplanar lines.

UNIT 13 Vector Algebra

Vectors and scalars, addition of vectors, components of a vector in two dimensions and three dimensional space, scalar and vector products, scalar and vector triple product.

UNIT 14 Statistics and Probability

Measures of Dispersion: Calculation of mean, median, mode of grouped and ungrouped data. Calculation of standard deviation, variance and mean deviation for grouped and ungrouped data.

Probability: Probability of an event, addition and multiplication theorems of probability, Baye's theorem, probability distribution of a random variate, Bernoulli trials and Binomial distribution.

UNIT 15 Trigonometry

Trigonometrical identities and equations. Trigonometrical functions. Inverse trigonometrical functions and their properties. Heights and Distances.

UNIT 16 Mathematical Reasoning

Statements, logical operations and implies, implied by, if and only if. Understanding of tautology, contradiction, converse and contra positive.

PART - I

Chapters from Class 11th Syllabus

1 Sets

JEE Main MILESTONE

- Sets
- Representation of Sets
- Power Set
- Venn Diagram
- Operations on Sets
- Laws of Algebra of Sets
- Cardinal Number of a Finite and Infinite Set

1.1 Sets

In Mathematical language all living and non-living things in universe are known as objects. The collection of well defined distinct objects is known as a set.

Well defined means in a given set, it must be possible to decide whether or not the object belongs to the set and by distinct means object should not be repeated. The object in the set is called its **member** or **element**. A set is represented by { }.

Generally, sets are denoted by capital letters $A, B, C, \ldots$ and its elements are denoted by small letters $a, b, c, \ldots\ldots$.

Let A is a non-empty set. If x is an element of A, then we write '$x \in A$' and read as 'x is an element of A' or 'x belongs to A'. If x is not an element of A, then we write '$x \notin A$' and read as x is not an element of A' or 'x does not belong to A'.

e.g., A = Set of all vowels in English alphabets.

In this set a, e, i, o and u are members.

The theory of sets was developed by German Mathematician Georg Cantor (1845-1918). *The concept of sets is widely used in the foundation of relations, functions, logic, probability theory, etc. According to Cantor 'A set is any collection into a whole of definite and distinct objects of our intuition or thought'.*

***Sample* Problem 1** *Which of the following is a correct set?*

(a) *The collection of all the months of a year beginning with the letter J.*
(b) *The collection of ten most talented writers of India.*
(c) *A team of eleven best cricket batsmen of the world.*
(d) *A collection of most dangerous animals of the world.*

Interpret (a)

(a) We are sure that members of this collection are January, June and July.
So, this collection is well defined and hence, it is a set.

(b) A writer may be most talented for one person and may not be for other. Therefore, it cannot be said accountely that which writers will be there in the relation.
So, this collection is not well defined. Hence, it is not a set.

(c) A batsman may be best for one person and may not be so for other. Therefore, it cannot be said accountely that which batsman will be there in our relation.
So, this collection is not well defined. Hence, it is not a set.

(d) The term most dangerous is not a clear term. An animal may be most dangerous to one person and may not be for the other.
So, it is not well defined, hence it is not a set.

1.2 Representation of Sets

We can use the following two methods to represent a set.

(i) **Listing Method** In this method, elements are listed and put within a braces { } and separated by commas.

This method is also known as **Tabular method** or **Roster method**.

e.g., A = Set of all prime numbers less than 11
$= \{2, 3, 5, 7\}$

(ii) **Set Builder Method** In this method, instead of listing all elements of a set, we list the property or properties satisfied by the elements of set and write it as

$$A = \{x : P(x)\} \text{ or } \{x \mid P(x)\}$$

It is read as "A is the set of all elements x such that x has the property $P(x)$." The symbol ':' or '|' stands for such that.

This method is also known as **Rule method** or **Property method.**

e.g., $A = \{1, 2, 3, 4, 5, 6, 7, 8\}$
$= \{x : x \in N \text{ and } x \le 8\}$

Note

- The order of elements in a set has no importance *e.g.*, {1, 2, 3} and {3, 1, 2} are same sets.
- The repetition of elements in a set does not effect the set, *e.g.*, {1, 2, 3} and {1, 1, 2, 3} both are same sets.

Notation of Some Standard Sets

(i) Set of all natural numbers, $N = \{1, 2, 3, \ldots\}$

(ii) Set of all whole numbers, $W = \{0, 1, 2, 3, \ldots\}$

(iii) (a) Set of all integers, I or $Z = \{\ldots, -2, -1, 0, 1, 2, \ldots\}$

(b) Set of all positive or negative integers,

$$I^+ = \{1, 2, 3, \ldots \infty\}$$

or $$I^- = \{-1, -2, -3, \ldots \infty\}$$

(c) Set of all even (E) or odd (O) integers,

$$E = \{\ldots, -4, -2, 0, +2, +4, \ldots\}$$

or $$O = \{\ldots, -3, -1, 0, 1, 3, \ldots\}$$

(iv) (a) Set of all rational numbers,

$Q = \{p/q$, where p and q are integers and $q \ne 0\}$

(b) Set of all irrational numbers,

$IR = \{$which cannot be p and $I \in I, q \ne 0\}$

(c) Set of all real numbers,

$$R = \{x : -\infty < x < \infty\}$$

(v) Set of all complex numbers,

$$C = \{a + ib; a, b \in R \text{ and } i = \sqrt{-1}\}$$

***Sample* Problem 2** *The builder form of following set is* $A = \{3, 6, 9, 12\}$, $B = \{1, 4, 9, \ldots, 100\}$ **[NCERT]**

(*a*) $A = \{x : x = 3n, n \in N \text{ and } 1 \le n \le 5\}$,
$B = \{x : x = n^2, n \in N \text{ and } 1 \le n \le 10\}$

(*b*) $A = \{x : x = 3n, n \in N \text{ and } 1 \le n \le 4\}$,
$B = \{x : x = n^2, n \in N \text{ and } 1 \le n \le 10\}$

(*c*) $A = \{x : x = 3n, n \in N \text{ and } 1 \le n \le 4\}$,
$B = \{x : x = n^2, n \in N \text{ and } 1 < n < 10\}$

(*d*) *None of the above*

Interpret (*b*) Given, $A = \{3, 6, 9, 12\}$ and

$$= \{x : x = 3n, n \in N \text{ and } 1 \le n \le 4\}$$

and $B = \{1, 4, 9, \ldots, 100\} = \{x : x = n^2, n \in N \text{ and } 1 \le n \le 10\}$

Different Types of Sets

(i) Empty (Void/Null) Set

A set which has no element, is called an empty set.
It is denoted by ϕ or { }.

e.g., A = Set of all odd numbers divisible by 2

and $B = \{x : x \in N \text{ and } 5 < x < 6\}$

Such sets which have atleast one element, are called non-void set.

Note If ϕ represents a null set, then ϕ is never written with in braces *i.e.*, $\{\phi\}$ is not the null set.

(ii) Singleton Set

A set which have only one element, is called a singleton set.

e.g., $A = \{x : x \in N \text{ and } 3 < x < 5\}$

and $B = \{5\}$

(iii) Finite and Infinite Sets

A set in which the process of counting of elements surely comes to an end, is called a finite set. In other words 'A set having finite number of elements is called a finite set'. Otherwise it is called infinite set *i.e.*, if the process of

counting of elements does not come to an end in a set, then set is called an infinite set.

e.g., $A = \{x : x \in N \text{ and } x < 5\}$

and B = Set of all points on a plane

In above two sets A and B, set A is finite while set B is infinite. Since, in a plane any number of points are possible.

(iv) Equivalent Sets

Two finite sets A and B are said to be equivalent, if they have the same number of elements.

e.g., If $A = \{1, 2, 3\}$ and $B = \{3, 7, 9\}$

Number of elements in $A = 3$

and number of elements in $B = 3$

$\therefore$ A and B are equivalent sets.

(v) Equal Sets

If A and B are two non-empty sets and each element of set A is an element of set B and each element of set B is an element of set A, then sets A and B are called equal sets.

Symbolically, if $x \in A \Rightarrow x \in B$

and $x \in B \Rightarrow x \in A$

e.g., $A = \{1, 2, 3\}$ and $B = \{x : x \in N, x \le 3\}$

Here, each element of A is an element of B, also each element of B is an element of A, then both sets are called equal sets.

Note Equal sets are equivalent sets while its converse need not to be true.

(vi) Subset and Superset

Let A and B be two non-empty sets. If each element of set A is an element of set B, then set A is known as subset of set B. If set A is a subset of set B, then set B is called the superset of A.

Also, if A is a subset of B, then it is denoted as $A \subseteq B$ and read as 'A is a subset of B'.

Thus, if $x \in A \Rightarrow x \in B$,

then $A \subseteq B$

If $x \in A \Rightarrow x \notin B$,

then $A \not\subseteq B$

and read as 'A is not a subset of B.'

e.g., If $A = \{1, 2, 3\}$ and $B = \{1, 2, 3, 4, 5\}$

Here, each element of A is an element of B. Thus, $A \subseteq B$ *i.e.*, A is a subset of B and B is a superset of A.

Note
- Null set is a subset of each set.
- Each set is a subset of itself.
- If A has n elements, then number of subsets of set A is 2^n.

(vii) Proper Subset

If each element of A is in set B but set B has atleast one element which is not in A, then set A is known as proper subset of set B. If A is a proper subset of B, then it is written as '$A \subset B$' and read as A is a proper subset of B.

e.g., If $N = \{1, 2, 3, 4, ...\}$

and $I = \{..., -3, -2, -1, 0, 1, 2, 3, ...\}$

then $N \subset I$

Note If A has n elements, then number of proper subsets is $2^n - 1$.

(viii) Comparability of Sets

Two sets A and B are said to be comparable, if either $A \subset B$ or $B \subset A$ or $A = B$, otherwise, A and B are said to be incomparable.

e.g., Suppose $A = \{1, 2, 3\}$, $B = \{1, 2, 4, 6\}$ and $C = \{1, 2, 4\}$

Since, $A \not\subset B$ or $B \not\subset A$ or $A \ne B$

$\therefore$ A and B are incomparable.

But $C \subset B$

$\therefore$ B and C are comparable sets.

(ix) Universal Set

If there are some sets under consideration, then there happens to be a set which is a superset of each one of the given sets. Such a set is known as the universal set and it is denoted by S or U.

This set can be chosen arbitrarily for any discussion of given sets but after choosing it is fixed.

e.g., Suppose $A = \{1, 2, 3\}$, $B = \{3, 4, 5\}$ and $C = \{7, 8, 9\}$

$\therefore$ $U = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$ is universal set for all three sets.

***Sample* Problem 3** *Consider the following sets*

A = The set of lines which are parallel to the X-axis.

B = The set of letters in the English alphabet.

and C = The set of animals living on the earth. **[NCERT]**

Which of these is finite or infinite set?

(a) *Finite set* $\rightarrow A, B$, *Infinite set* $\rightarrow C$

(b) *Finite set* $\rightarrow B, C$, *Infinite set* $\rightarrow A$

(c) *Finite set* $\rightarrow A, C$, *Infinite set* $\rightarrow B$

(d) *None of the above*

Interpret (*b*)

A = Infinite lines can be drawn parallel to X-axis

B = There are finite 26 English alphabets

C = There are finite number of animals living on earth

***Sample* Problem 4** *Two finite sets have m and n elements, respectively. The total number of subsets of the first set is 56 more than the total number of subsets of second set. What are the values of m and n, respectively?*

(a) 7, 6 (b) 6, 3 (c) 5, 1 (d) 8, 7

Interpret (b) Since, total possible subsets of sets A and B are 2^m and 2^n, respectively.

According to given condition,

$$2^m - 2^n = 56$$

$$\Rightarrow \quad 2^n(2^{m-n} - 1) = 2^3 \times (2^3 - 1)$$

On comparing both sides, we get

$$2^n = 2^3 \text{ and } 2^{m-n} = 2^3$$

$$\Rightarrow \quad n = 3 \text{ and } m - n = 3$$

$$\Rightarrow \quad m = 6 \text{ and } n = 3$$

1.3 Power Set

Let A be a non-empty set, then collection of all possible subsets of set A is known as power set. It is denoted by $P(A)$.

e.g., Suppose $A = \{1, 2, 3\}$

$\therefore \quad P(A) = [\phi, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{2, 3\}, \{3, 1\}, \{1, 2, 3\}]$.

(a) $A \notin P(A)$ (b) $\{A\} \in P(A)$

Properties of Power Set

(i) Each element of a power set is a set.

(ii) If $A \subseteq B$, then $P(A) \subseteq P(B)$

(iii) Power set of any set is always non-empty.

(iv) If set A has n elements, then $P(A)$ has 2^n elements.

(v) $P(A) \cap P(B) = P(A \cap B)$

(vi) $P(A) \cup (B) \subseteq P(A \cup B)$

(vii) $P(A \cup B) \neq P(A) \cup P(B)$

***Sample* Problem 5** *If set $A = \{1, 3, 5\}$, then number of elements in $P\{P(A)\}$ is*

(a) 8 (b) 256 (c) 248 (d) 250

Interpret (b) Given, $A = \{1, 3, 5\}$

$$\therefore \quad n\{P(A)\} = 2^3 = 8$$

$$\therefore \quad n[P\{P(A)\}] = 2^8 = 256$$

***Sample* Problem 6** *Consider $A = \{1, 2\}$, $B = \{2, 3\}$. Then which of the following option is correct?*

(a) $P(A \cup B) \neq P(A) \cup P(B)$ (b) $P(A \cup B) = P(A) \cup P(B)$

(c) $P(A \cup B) = P(A) \cap P(B)$ (d) *None of these*

Interpret (a) Here $P(A) = \{\phi, \{1\}, \{2\}, \{1, 2\}\}$,

$$P(B) = \{\phi, \{2\}, \{3\}, \{2, 3\}\}$$

$$AB = \{1, 2, 3\}$$

$$\therefore \quad P(A \cup B) = \{\phi, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{2, 3\}, \{1, 3\}, \{1, 2, 3\}\}$$

$$P(A)\, P(B) = \{\phi, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{2, 3\}\}$$

$$\therefore \quad P(A \cup B) \neq P(A) \cup P(B)$$

1.4 Venn Diagram

A Swiss Mathematician (1707-1783) Euler gave an idea to represent a set by the points in a closed curve. Later on British Mathematician John Venn (1834-1923) brought this idea to practice. So, the diagrams drawn to represent sets are called Venn Euler diagram or simply Venn diagram.

In Venn diagram, the universal set is represented by a rectangular region and a set is represented by circle or a closed geometrical figure inside the universal set. Also, an element of a set A is represented by a point within the circle of set A.

e.g., If $U = \{1, 2, 3, 4, ..., 10\}$ and $A = \{1, 2, 3\}$

Then, its Venn diagram is as shown in the figure.

1.5 Operations on Sets

Now, we introduce some operations on sets to construct new sets from the given ones.

(i) Union of Two Sets

Let A and B be two sets, then union of A and B is a set of all those elements which are in A or in B or in both A and B. It is denoted by $A \cup B$ and read as 'A union B'.

Symbolically, $A \cup B = \{x : x \in A \text{ or } x \in B\}$

Clearly, $x \in A \cup B$

$\Rightarrow \quad x \in A$ or $x \in B$

If $x \notin A \cup B$

$\Rightarrow \quad x \notin A$ and $x \notin B$

The venn diagram of $A \cup B$ is as shown in the figure and the shaded portion represents $A \cup B$.

$A \cup B$ (when $A \subseteq B$) | $A \cup B$ when neither $A \subseteq B$ nor $B \subseteq A$ | $A \cup B$ when A and B are disjoint sets

e.g., If $A = \{1, 2, 3, 4\}$

and $B = \{4, 8, 5, 6\}$

$\therefore \quad A \cup B = \{1, 2, 3, 4, 5, 6, 8\}$.

General Form

The union of a finite number of sets $A_1, A_2, \ldots, A_n$ is represented by

$$A_1 \cup A_2 \cup A_3 \cup \ldots \cup A_n \text{ or } \bigcup_{i=1}^{n} A_i$$

Symbolically, $\bigcup_{i=1}^{n} A_i = \{x : x \in A_i \text{ for atleast one } i\}$

(ii) Intersection of Two Sets

If A and B are two sets, then intersection of A and B is a set of all those elements which are in both A and B. The intersection of A and B is denoted by $A \cap B$ and read as "A intersection B".

Symbolically,

$$A \cap B = \{x : x \in A \text{ and } x \in B\}$$

If $\quad x \in A \cap B \Rightarrow x \in A$ and $x \in B$

and if $\quad x \notin A \cap B \Rightarrow x \notin A$ or $x \notin B$

The Venn diagram of $A \cap B$ is as shown in the figure and the shaded region represents $A \cap B$.

$A \cap B$ when $A \subseteq B$ or $A \cap B = A$ | $A \cap B$ when neither $A \subseteq B$ nor $B \subseteq A$ | $A \cap B = \phi$ (no shaded region)

e.g., If $\quad A = \{1, 2, 3, 4\}$ and $B = \{4, 3, 5, 6\}$

$\therefore \quad A \cap B = \{3, 4\}$

General Form

The intersection of a finite number of sets

$A_1, A_2, A_3, \ldots, A_n$ is represented by

$$A_1 \cap A_2 \cap A_3 \cap \ldots \cap A_n \text{ or } \bigcap_{i=1}^{n} A_i$$

Symbolically, $\bigcap_{i=1}^{n} A_i = \{x : x \in A_i \text{ for all } i\}$

(iii) Disjoint of Two Sets

Two sets A and B are known as disjoint sets, if $A \cap B = \phi$ *i.e.*, if A and B have no common element.

The Venn diagram of disjoint sets as shown in the figure

$$A \cap B$$

e.g., If $\quad A = \{1, 2, 3\}$

and $\quad B = \{4, 5, 6\}$,

then $\quad A \cap B = \{\ \} = \phi$

$\therefore$ A and B are disjoint sets.

(iv) Difference of Two Sets

If A and B are two non-empty sets, then difference of A and B is a set of all those elements which are in A but not in B. It is denoted as $A - B$. If difference of two sets is $B - A$, then it is a set of those elements which are in B but not in A.

Hence, $\quad A - B = \{x : x \in A \text{ and } x \notin B\}$

and $\quad B - A = \{x : x \in B \text{ and } x \notin A\}$

If $\quad x \in A - B \Rightarrow x \in A$ but $x \notin B$

and if $\quad x \in B - A \Rightarrow x \in B$ but $x \notin A$

The Venn diagram of $A - B$ and $B - A$ are as shown in the figure and shaded region represents $A - B$ and $B - A$.

$A - B$ when $A \subseteq B$, *i.e.*, $(A - B = \phi)$ | $A - B$ when $B \subseteq A$

$A - B$ when neither $A \subseteq B$ nor $B \subseteq A$ | $A - B$ when A and B are disjoint sets. Clearly, $A - B = A$

e.g., If $\quad A = \{1, 2, 3, 4\}$ and $B = \{4, 5, 6, 7, 8\}$

$\therefore \quad A - B = \{1, 2, 3\}$ and $B - A = \{5, 6, 7, 8\}$

Note

- $A - B \neq B - A$
- $A - B \subseteq A$ and $B - A \subseteq B$
- $A - \phi = A$ and $A - A = \phi$
- The sets $A - B$ and $B - A$ are disjoint sets.

(v) Symmetric Difference of Two Sets

If A and B are two sets, then set $(A - B) \cup (B - A)$ is known as symmetric difference of sets A and B and is denoted by $A \Delta B$.

$A \Delta B$

The Venn diagram of $A \Delta B$ is as shown in the figure and shaded region represents $A \Delta B$.

e.g., $\quad A = \{1, 2, 3\}$ and $B = \{3, 4, 5, 6\}$,

then $\quad A \Delta B = (A - B) \cup (B - A)$

$= \{1, 2\} \cup \{4, 5, 6\} = \{1, 2, 4, 5, 6\}$

Note

- Symmetric difference can also be written as
$$A \Delta B = (A \cup B) - (A \cap B)$$
- $A \Delta B = B \Delta A$ (commutative)

(vi) Complement of a Set

The complement of a set A is the set of all those elements which are in universal set but not in A. It is denoted by A' or A^c.

If U is a universal set and $A \subset U$,

then $A' = U - A = \{x : x \in U \text{ but } x \notin A\}$

i.e., $x \in A \Rightarrow x \notin A'$

The Venn diagram of complement of a set A is as shown in the figure and shaded portion represents A'.

e.g., If $U = \{1, 2, 3, 4, 5, ...\}$

and $A = \{2, 4, 6, 8, ...\}$

$\therefore$ $A' = U - A = \{1, 3, 5, 7, ...\}$

By Venn diagram, the operation between three sets can be represented given below.

Note

- $\phi = U'$
- $\phi' = U$
- $(A')' = A$
- $A \cup A' = U$
- $A \cap A' = \phi$

***Sample* Problem 7** *If $U = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$, $A = \{2, 4, 6, 8\}$ and $B = \{2, 3, 5, 7\}$, then $(A \cup B)'$, $(A' \cap B')$, $(A \Delta B)$ is equal to*

(a) $\{1, 9\}, \{2, 8\}, \{3, 4, 5, 6, 7, 8\}$
(b) $\{1, 9\}, \{1, 9\}\ \{3, 4, 5, 6, 7, 8\}$
(c) $\{1, 9\}, \{1, 9\}\ \{5, 6, 7, 8\}$
(d) *None of the above*

Interpret (b) Given sets are

$U = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$,

$A = \{2, 4, 6, 8\}$ and $B = \{2, 3, 5, 7\}$

Now, $A' = U - A$

$= \{1, 2, 3, , 4, 5, 6, 7, 8, 9\} - \{2, 4, 6, 8\}$

$= \{1, 3, 5, 7, 9\}$

and $B' = U - B$

$= \{1, 2, 3, 4, 5, 6, 7, 8, 9\} - \{2, 3, 5, 7\}$

$= \{1, 4, 6, 8, 9\}$

(i) $A \cup B = \{2, 4, 6, 8\} \cup \{2, 3, 5, 7\}$

$= \{2, 3, 4, 5, 6, 7, 8\}$

$\therefore (A \cup B)' = U - A \cup B$

$= \{1, 2, 3, 4, 5, 6, 7, 8, 9\} - \{2, 3, 4, 5, 6, 7, 8\}$

$= \{1, 9\}$

(ii) $(A' \cap B') = \{1, 3, 5, 7, 9\} \cap \{1, 4, 6, 8, 9\}$

$= \{1, 9\}$

(iii) Now, $A - B = \{2, 4, 6, 8\} - \{2, 3, 5, 7\}$

$= \{4, 6, 8\}$

and $B - A = \{2, 3, 5, 7\} - \{2, 4, 6, 8\}$

$= \{3, 5, 7\}$

$\therefore$ $A \Delta B = (A - B) \cup (B - A)$

$= \{4, 6, 8\} \cup \{3, 5, 7\} = \{3, 4, 5, 6, 7, 8\}$

***Sample* Problem 8** *The shaded region in the given figure is*

(a) $B \cap (A \cup C)$
(b) $B \cup (A \cap C)$
(c) $B \cap (A - C)$
(d) $B - (A \cup C)$

Interpret (d) It is clear from the figure that set $A \cup C$ is not shading and set B is shading other than $A \cup C$.

i.e., $B - (A \cup C)$

***Sample* Problem 9** *If $U = \{x : x^5 - 6x^4 + 11x^3 - 6x^2 = 0\}$, $A = \{x : x^2 - 5x + 6 = 0\}$ and $B = \{x : x^2 - 3x + 2 = 0\}$ what is $(A \cap B)'$ equal to ?*

(a) $\{1, 3\}$
(b) $\{1, 2, 3\}$
(c) $\{0, 1, 3\}$
(d) $\{0, 1, 2, 3\}$

Interpret (c) $\because$ $U = \{x : x^5 - 6x^4 + 11x^3 - 6x^2 = 0\}$

$= \{0, 1, 2, 3\}$

$A = \{x : x^2 - 5x + 6 = 0\} = \{2, 3\}$

and $B = \{x : x^2 - 3x + 2 = 0\} = \{1, 2\}$

$\therefore$ $A \cap B = \{2\}$

Hence, $(A \cap B)' = U - (A \cap B)$

$= \{0, 1, 2, 3\} - \{2\} = \{0, 1, 3\}$

1.6 Laws of Algebra of Sets

If A, B and C are three non-empty sets, then

(i) Idempotent law

(a) $A \cup A = A$
(b) $A \cap A = A$

(ii) Identity law

(a) $A \cup \phi = A$
(b) $A \cap U = A$

(iii) Commutative law

(a) $A \cup B = B \cup A$ (b) $A \cap B = B \cap A$

(iv) Associative law

(a) $(A \cup B) \cup C = A \cup (B \cup C)$

(b) $A \cap (B \cap C) = (A \cap B) \cap C$

(v) Distributive law

(a) $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$

(b) $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$

(vi) De-morgan's law

(a) $(A \cup B)' = A' \cap B'$

(b) $(A \cap B)' = A' \cup B'$

(c) $A - (B \cup C) = (A - B) \cap (A - C)$

(d) $A - (B \cap C) = (A - B) \cup (A - C)$

Sample **Problem 10** *If A and B are two sets, then $A \cap (A \cup B)'$ is equal to*

(a) A (b) B

(c) ϕ (d) *None of these*

Interpret (c) $A \cap (A \cup B)' = A \cap (A' \cap B')$ ($\because$ by de-Morgan's law)

$= (A \cap A') \cap B'$ ($\because$ by associative law)

$= \phi \cap B'$ ($\because A \cap A' = \phi$)

$= \phi$

Sample **Problem 11** *If A and B are non-empty sets, then $(A \cap B) \cup (A - B)$ is equal to*

(a) B (b) A (c) A' (d) B'

Interpret (b) $(A \cap B) \cup (A - B) = (A \cap B) \cup (A \cap B')$

$[\because (A - B) = (A \cap B')]$

$= A \cap (B \cup B')$ ($\because$ by distributive law)

$= A \cap U$ ($\because B \cup B' = U$)

$= A$

1.7 Cardinal Number of a Finite and Infinite Set

The number of distinct elements in a finite set A is called cardinal number and it is denoted by $n(A)$. And if it is not finite set, then it is called infinite set.

e.g., If $A = \{-3, -1, 8, 10, 13, 17\}$,

then $n(A) = 6$

Properties

If A, B and C are finite sets and U be the finite universal set, then

(i) $n(A \cup B) = n(A) + n(B) - n(A \cap B)$

(ii) If A and B are disjoint sets then, $n(A \cup B) = n(A) + n(B)$

(iii) $n(A \cup B \cup C) = n(A) + n(B) + n(C) - n(A \cap B) - n(B \cap C) - n(A \cap C) + n(A \cap B \cap C)$

(iv) $n(A - B) = n(A) - n(A \cap B)$

(v) $n(A \Delta B) = n(A) + n(B) - 2n(A \cap B)$

(vi) $n(A') = n(U) - n(A)$

(vii) $n(A' \cup B') = n(U) - n(A \cap B)$

(viii) $n(A' \cap B') = n(U) - n(A \cup B)$

(ix) $n(A \cap B') = n(A) - n(A \cap B)$

Method to Find Common Roots

Sometimes the number of common elements cannot found easily y by solving the given sets. That type of problems can be solved by drawing a curves.

The intersection point of a curve is equal to the number of common elements in a set.

e.g., Consider the sets

$$A = \{(x, y) \mid y = \frac{1}{x}, 0 \neq x \in R\}$$

and $B = \{(x, y) \mid y = -x, x \in R\}$,

then determine $n(A \cap B)$.

Here, we see that, $\forall\ x$, we get infinite values of y. Hence, we find infinite sets A and B. And it is difficult to find the common elements between A and B.

Now, firstly we make the graph of given sets.

A = The set of all points on a curve $xy = 1$,

[$\because xy = c$ is a rectangular hyperbola curve]

and B = The set of all points on a curve $y = -x$.

[$\because y = -x$ is a straight which passes through origin]

Since, there is no intersection point on a curve. So, there is no common elements between two sets.

Sample **Problem 12** *In a town of 10000 families it was found that 40% families buy newspaper A, 20% families buy newspaper B and 10% families buy newspaper C, 5% buy A and B, 3% buy B and C and 4% buy A and C. If 2% families buy all of three newspapers, then the number of families which buy A only, is*

(a) 4400 (b) 3300 (c) 2000 (d) 500

Interpret (b) $n(A) = 40\%$ of $10000 = 4000$, $n(B) = 2000$, $n(C) = 1000$, $n(A \cap B) = 500$, $n(B \cap C) = 300$, $n(C \cap A) = 400$, $n(A \cap B \cap C) = 200$

$\therefore\ n(A \cap \overline{B} \cap \overline{C}) = n\{A \cap (B \cup C)'\} = n(A) - n\{A \cap (B \cup C)\}$

$= n(A) - n(A \cap B) - n(A \cap C) + n(A \cap B \cap C)$

$= 4000 - 500 - 400 + 200 = 3300$

WORKED OUT
Examples

Example 1 *If $A = \{3, 5, 7, 9, 11\}$, $B = \{7, 9, 11, 13\}$, $C = \{11, 13, 15\}$ and $D = \{15, 17\}$, then $(A \cup D) \cap (B \cup C)$ is equal to*

(a) $\{5, 7, 9, 11, 15\}$ (b) $\{7, 9, 11, 15\}$
(c) $\{7, 9, 11, 13, 15\}$ (d) *None of these*

Solution (b) Given, $A = \{3, 5, 7, 9, 11\}$, $B = \{7, 9, 11, 13\}$, $C = \{11, 13, 15\}$ and $D = \{15, 17\}$

Now, $A \cup D = \{3, 5, 7, 9, 11\} \cup \{15, 17\}$
$= \{3, 5, 7, 9, 11, 15, 17\}$

and $B \cup C = \{7, 9, 11, 13\} \cup \{11, 13, 15\} = \{7, 9, 11, 13, 15\}$

$\therefore$ $(A \cup D) \cap (B \cup C) = \{3, 5, 7, 9, 11, 15, 17\} \cap \{7, 9, 11, 13, 15\}$
$= \{7, 9, 11, 15\}$

Example 2 *The set $(A \cup B \cup C) \cap (A \cap B' \cap C')' \cap C'$ is equal to*

(a) $B \cap C'$ (b) $A \cap C$
(c) $B' \cap C'$ (d) *None of these*

Solution (a) $(A \cup B \cup C) \cap (A \cap B' \cap C')' \cap C'$

$= (A \cup B \cup C) \cap (A' \cup B \cup C) \cap C'$
$= (\phi \cup B \cup C) \cap C'$
$= (B \cup C) \cap C'$
$= (B \cap C') \cup \phi = B \cap C'$

Example 3 *Let A, B and C are subsets of universal set U. If $A = \{2, 4, 6, 8, 12, 20\}$, $B = \{3, 6, 9, 12, 15\}$, $C = \{5, 10, 15, 20\}$ and U is the set of all whole numbers. Then, the correct Venn diagram is* **[NCERT]**

(a)

(b)

(c)

(d) *None of these*

Solution (b) Given, $A = \{2, 4, 6, 8, 12, 20\}$

$B = \{3, 6, 9, 12, 15\}$

$C = \{5, 10, 15, 20\}$

Now, $A \cap B = \{2, 4, 6, 8, 12, 20\} \cap \{3, 6, 9, 12, 15\} = \{6, 12\}$

$B \cap C = \{3, 6, 9, 12, 15\} \cap \{5, 10, 15, 20\} = \{15\}$

$C \cap A = \{5, 10, 15, 20\} \cap \{2, 4, 6, 8, 12, 20\} = \{20\}$

and $A \cap B \cap C = \phi$

Example 4 *In a survey of 600 students in a school, 150 students were found to be taking tea and 225 taking coffee. 100 were taking both tea and coffee. Find how many students were taking neither tea nor coffee?* **[NCERT]**

(a) 310 (b) 320 (c) 327 (d) 325

Solution (d) Let C and T denote the students taking coffee and tea, respectively.

Here, $n(T) = 150, n(C) = 225, n(C \cap T) = 100$

Using the identity $n(C \cup T) = n(T) + n(C) - n(C \cap T)$, we have

$n(C \cup T) = 150 + 225 - 100 = 375 - 100$

$\Rightarrow$ $n(C \cup T) = 275$

Given, total number of students $= 600 = n(U)$

We are to find the number of students taking neither tea nor coffee *i.e.*, $n(C \cup T)'$.

$\therefore$ $n(C \cup T)' = n(U) - n(C \cup T) = 600 - 275 = 325$

Example 5 *If there are three atheletic teams in a school, 21 are in the basketball team, 26 in hockey team and 29 in the football team. 15 play hockey and basketball, 15 play hockey and football, 12 play football and basketball and 8 play all the games. The total number of members is*

(a) 42 (b) 43
(c) 45 (d) *None of these*

Solution (b) $\because n(B) = 21, n(H) = 26, n(F) = 29, n(H \cap B) = 14,$

$n(H \cap F) = 15, n(F \cap B) = 12, n(B \cap H \cap F) = 8$

$\therefore$ $n(B \cup H \cup F) = n(B) + n(H) + n(F) - n(B \cap H)$
$- n(H \cap F) - n(B \cap F) + n(B \cap H \cap F)$
$= 21 + 26 + 29 - 14 - 15 - 12 + 8 = 43$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Sets and Their Representation

1. The set of intelligent students in a class is
(a) a null set
(b) a singleton set
(c) a finite set
(d) not a well defined collection

2. The following sets

$$A = \{x : x \text{ is an integer}, -\frac{1}{2} < x < \frac{9}{2}\}$$

and $B = \{x : x$ is a month of year not having 31 days$\}$ is equivalent to [NCERT]
(a) $A = \{0, 1, 2, 3\}$, $B = \{$February, April, June, September, November$\}$
(b) $A = \{0, 1, 2, 3, 4\}$, $B = \{$February, April, June, September, November$\}$
(c) $A = \{0, 3, 4\}$, $B = \{$April, June, September, November$\}$
(d) None of the above

3. Let A and B be two non-empty subsets of a set X such that A is not a subset of B, then
(a) A is always a subset of the complement of B
(b) B is always a subset of A
(c) A and B are always disjoint
(d) A and the complement of B are always non-disjoint

4. Which of the following is not null set? [NCERT]
(a) Set of odd natural numbers divisible by 2
(b) Set of even prime numbers
(c) $\{x : x$ is a natural number, $x < 5$ and $x > 7\}$
(d) $\{y : y$ is a point common to any two parallel lines$\}$

5. Which of the following is an equivalent set? [NCERT]
(a) $A = \{a, b, c, d\}$, $B = \{d, c, b, a\}$
(b) $A = \{4, 8, 12, 16\}$, $B = \{8, 4, 16, 18\}$
(c) $A = \{x : x$ is a multiple of $10\}$
$B = \{10, 15, 20, 25, 30, ...\}$
(d) None of the above

6. Two finite sets have m and n elements. The number of subsets of the first set is 112 more than that of the second set. The values of m and n are, respectively [NCERT Exemplar]
(a) 4, 7 (b) 7, 4 (c) 4, 4 (d) 7, 7

7. If $A = \{x : x = 4n + 1, 2 \le n \le 5\}$, then number of subsets of A is
(a) 16 (b) 15
(c) 4 (d) None of these

8. If $A = \{x : x = n^2, n = 1, 2, 3\}$, then number of proper subsets is
(a) 3 (b) 8
(c) 7 (d) None of these

9. If A and B are non-empty sets, then $P(A) \cup P(B)$ is equal to
(a) $P(A \cup B)$ (b) $P(A \cap B)$
(c) $P(A) = P(B)$ (d) None of these

Venn Diagram and Operations on Sets

10. If $A = \{1, 3, 5, 7, 9, 11, 13, 15, 17\}$, $B = \{2, 4, \ldots, 18\}$ and N the set of natural numbers is the universal set, then $A' \cup \{(A \cup B) \cap B'\}$ is [NCERT Exemplar]
(a) ϕ (b) N (c) A (d) B

11. If $A = \{2, 3, 4, 8, 10\}$, $B = \{3, 4, 5, 10, 12\}$, $C = \{4, 5, 6, 12, 14\}$, then $(A \cap B) \cup (A \cap C)$ is equal to
(a) $\{3, 4, 10\}$ (b) $\{2, 8, 10\}$
(c) $\{4, 5, 6\}$ (d) $\{3, 5, 14\}$

12. If A and B are two given sets, then $A \cap (A \cap B)^c$ is equal to
(a) A (b) B (c) ϕ (d) $A \cap B^c$

13. If $A = \{x : x$ is an odd natural number$\}$ and $B = \{x : x$ is a prime number$\}$, then $A \cap B$ is [NCERT]
(a) odd number (b) prime number
(c) odd prime number (d) None of these

14. Let F_1 be the set of parallelograms, F_2 be the set of rectangles, F_3 be the set of rhombuses, F_4 be the set of squares and F_5 be the set of trapeziums in a plane. Then, F_1 may be equal to [NCERT Exemplar]
(a) $F_2 \cap F_3$ (b) $F_3 \cap F_4$
(c) $F_2 \cup F_5$ (d) $F_2 \cup F_3 \cup F_4 \cup F_1$

15. Suppose $A_1, A_2, \ldots, A_{30}$ are thirty sets each having 3 elements and $B_1, B_2, \ldots, B_n$ are n sets each having 3 elements. Let $\bigcup_{i=1}^{30} A_i = \bigcup_{j=1}^{n} B_j = S$ and each elements of S belongs to exactly 10 of A_i's and exactly 9 of B_j's. The value of n is equal to [NCERT Exemplar]
(a) 15 (b) 3
(c) 45 (d) None of these

16. If $A = \{x : x \text{ is a multiple of } 4\}$ and $B = \{x : x \text{ is a multiple of } 6\}$, then $A \cap B$ consists of all multiples of
(a) 16 (b) 12 (c) 8 (d) 4

17. Let S = set of points inside the square, T = the set of points inside the triangle and C = the set of points inside the circle. If the triangle and circle intersect each other and are contained in a square. Then, [NCERT Exemplar]
(a) $S \cap T \cap C = \phi$ (b) $S \cup T \cup C = C$
(c) $S \cup T \cup C = S$ (d) $S \cup T = S \cap C$

18. If $A = \{x : x^2 = 1\}$ and $B = \{x : x^4 = 1\}$, then $A \Delta B$ is equal to
(a) $\{i, -i\}$ (b) $\{-1, 1\}$
(c) $\{-1, 1, i, -1\}$ (d) None of these

19. Consider the following relations
I. $A - B = A - (A \cap B)$
II. $A = (A \cap B) \cup (A - B)$
III. $A - (B \cup C) = (A - B) \cup (A - C)$
Which of these is/are correct?
(a) I and III (b) Only II
(c) II and III (d) I and II

20. The set $(A \cap B')' \cup (B \cap C)$ is equal to [NCERT Exemplar]
(a) $A' \cup B \cup C$ (b) $A' \cup B$
(c) $A' \cup C'$ (d) $A' \cap B$

Cardinal Number of a Finite and Infinite Sets

21. Let X be the universal set for sets A and B. If $n(A) = 200$, $n(B) = 300$ and $n(A \cap B) = 100$, then $n(A' \cap B')$ is equal to 300 provided $n(X)$ is equal to
(a) 600 (b) 700 (c) 800 (d) 900

22. Let $S = \{x : x \text{ is a positive multiple of 3 less than } 100\}$
$P = \{x : x \text{ is a prime number less than } 20\}$. Then, $n(S) + n(P)$ is [NCERT Exemplar]
(a) 34 (b) 41 (c) 33 (d) 30

23. In a committee, 50 people speak French, 20 speak Spanish and 10 speak both Spanish and French. The number of people speak atleast one of these two languages is [NCERT]
(a) 150 (b) 60
(c) 155 (d) None of these

24. In a class of 60 students, 25 students play Cricket and 20 students play Tennis, and 10 students play both the games. Then, the number of students who play neither is [NCERT Exemplar]
(a) 0 (b) 25 (c) 35 (d) 45

25. In a college of 300 students, every student reads 5 newspaper and every newspaper is read by 60 students. The number of newspaper is
(a) atleast 30 (b) atmost 20
(c) exactly 25 (d) None of these

26. In a town of 840 persons, 450 persons read Hindi, 300 read English and 200 read both. Then, the number of persons who read neither is [NCERT Exemplar]
(a) 210 (b) 290 (c) 180 (d) 260

Round II (Mixed Bag)

Only One Correct Option

1. Which of the following is a singleton set?
(a) $\{x : |x| < 1, x \in I\}$
(b) $\{x : |x| = 5, x \in I\}$
(c) $\{x : x^2 = 1, x \in I\}$
(d) $\{x : x^2 + x + 1 = 0, x \in R\}$

2. If $P(A) = P(B)$, then [NCERT]
(a) $A \not\subset B$ (b) $B \not\subset A$
(c) $A = B$ (d) None of these

3. Which sets are subsets of one and another?
$A = \{x : x \in R \text{ and } x \text{ satisfy } x^2 - 8x + 12 = 0\}$
$B = \{2, 4, 6\}$, $C = \{2, 4, 6, 8, \ldots\}$, $D = \{6\}$ [NCERT]
(a) $D \subset A$, $D \subset B$ and $D \subset C$
(b) $A \subset D$, $B \subset D$ and $D \subset C$
(c) $D \subset A$, $B \subset D$ and $D \subset C$
(d) None of the above

4. If $X = \{8^n - 7n - 1 : n \in N\}$ and $Y = \{49n - 49 : n \in N\}$. Then, [NCERT Exemplar]
(a) $X \subset Y$ (b) $Y \subset X$ (c) $X \subseteq Y$ (d) $X \cap Y = \phi$

5. There are 100 families in a society, 40 families buy newspaper A, 30 families buy newspaper B, 30 families buy newspaper C, 10 families buy newspaper A and B, 8 families buy newspaper B and C, 5 families buy newspaper A and C, 3 families buy newspaper A, B and C, then the number of families who do not buy any newspaper, is [NCERT Exemplar]

(a) 20 (b) 80
(c) 0 (d) None of these

6. In a survey of 200 students of a school, it was found that 120 study Mathematics, 90 study Physics and 70 study Chemistry, 40 study Mathematics and Physics, 30 study Physics and Chemistry, 50 study Chemistry and Mathematics and 20 none of these subjects. The number of students who study all the three subjects is [NCERT Exemplar]

(a) 30 (b) 20
(c) 22 (d) 25

7. Let U be the set of all boys and girls in a school. G be the set of all girls in the school, B be the set of all boys in the school and S be the set of all students in the school who take swimming. Some but not all students in the school take swimming. [NCERT Exemplar]

(a)

(b)

(c)

(d) None of these

8. Out of 800 boys in a school, 224 played Cricket, 240 played Hockey and 336 played Basketball. Of the total, 64 played both Basketball and Hockey; 80 played Cricket and Basketball and 40 played Cricket and Hockey; 24 played all the three games. The number of boys who did not play any game is

(a) 128 (b) 216
(c) 240 (d) 160

9. If $aN = \{an : n \in N\}$ and $bN \cap cN = dN$, where $a, b, c \in N$ and b, c are coprime, then

(a) $b = cd$ (b) $c = bd$
(c) $d = bc$ (d) None of these

10. If $A = \left\{(x, y) : y = \frac{4}{x}, 0 \neq x \in R\right\}$

and $B = \{(x, y) : y = x, x > 0, x \in R\}$

(a) $A \cap B = \phi$ (b) $A \cap B$ is singleton set
(c) $A \cap B \neq 0$ (d) $A \cap B$ has two elements

11. If $A = \{(x, y) : y = e^{2x}, x \in R\}$

and $B = \{(x, y) : y = e^{-2x}, x \in R\}$, then

(a) $A \cap B = \phi$
(b) $A \cap B \neq \phi$
(c) $A \cap B$ is a singleton set
(d) None of the above

12. From 50 students taking examinations in Mathematics, Physics and Chemistry, each of the student has passed in atleast one of the subject, 37 passed Mathematics, 24 Physics and 43 Chemistry. Atmost 19 passed Mathematics and Physics, atmost 29 Mathematics and Chemistry and atmost 20 Physics and Chemistry. The largest possible number that could have passed all three examination is [NCERT Exemplar]

(a) 14 (b) 15
(c) 13 (d) 20

More Than One Correct Option

13. If $X \cup \{1, 2\} = \{1, 2, 3, 5, 9\}$, then

(a) the smallest set X is $\{3, 5, 9\}$
(b) the smallest set X is $\{2, 3, 5, 9\}$
(c) the largest set X is $\{1, 2, 3, 5, 9\}$
(d) the largest set X is $\{2, 3, 4, 9\}$

14. In a group of 50 students, the number of students studying French, English, Sanskrit were found to be as follows

French = 17, English = 13, Sanskrit = 15

French and English = 09, English and Sanskrit = 4

French and Sanskrit = 5, English, French and Sanskrit = 3. The number of students who study

(a) French only is 6
(b) Sanskrit only is 8
(c) French and Sanskrit but not English is 2
(d) atleast one of the three languages is 30

Comprehension Based Questions

Passage

Directions (Q. Nos. 15-17) *Out of* 100 *students;* 15 *passed in English,* 12 *passed in Mathematics,* 8 *in Science,* 6 *in English and Mathematics,* 7 *in Mathematics and Science,* 4 *in English and Science;* 4 *in all the three passed.*

15. The number of students passed in English and Mathematics but not in Science is

(a) 3 (b) 2 (c) 4 (d) 5

16. The number of students only passed in Mathematics is

(a) 5 (b) 4
(c) 3 (d) 2

17. The number of students only passed in more than one subject is

(a) 9 (b) 3
(c) 2 (d) 1

Assertion and Reason

Directions (Q. Nos. 18-21) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*) *and* (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true, Statement II is false.
(d) Statement I is false, Statement II is true.

18. **Statement I** If $A \cup B = A \cup C$ and $A \cap B = A \cap C$, then $B = C$

Statement II $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$

19. Suppose, A, B and C are three arbitrary sets and U is a universal set.

Statement I If $B = U - A$, then $n(B) = n(U) - n(A)$.

Statement II If $C = A - B$, then $n(C) = n(A) - n(B)$.

20. Suppose A be a non-empty set, then the collection of all possible subsets of set A is a power set $P(A)$.

Statement I $P(A) \cap P(B) = P(A \cap B)$

Statement II $P(A) \cup P(B) = P(A \cup B)$

21. In a survey of 60 people, it was found that 25 people read newspaper H, 26 read newspaper T, 26 read newspaper I, 9 read both H and I, 11 read both H and T, 8 read both T and I, 3 read all three newspapers.

Statement I The number of people who read exactly one newspaper is 30.

Statement II Exactly one of the newspaper read is

$$n(H) + n(T) + n(I) - 2\{n(H \cap I) + n(H \cap T) + n(T \cap I)\} + 3n(H \cap T \cap I)$$

22. If A, B and C are three sets such that $A \cap B = A \cap C$ and $A \cup B = A \cup C$, then **[AIEEE 2009]**

(a) $A = C$
(b) $B = C$
(c) $A \cap B = \phi$
(d) $A = B$

Answers

Round I

1. (d)	**2.** (b)	**3.** (d)	**4.** (b)	**5.** (a)	**6.** (b)	**7.** (a)	**8.** (c)	**9.** (d)	**10.** (b)

the Guidance

Round I

1. The set of intelligent students in a class is not a well defined collection, because intelligency is not defined for a student in a class.

2. Given, $A = \{x : x \text{ is an integer}, -\frac{1}{2} < x < \frac{9}{2}\} = \{0, 1, 2, 3, 4\}$

and $B = \{x : x \text{ is a month of year not having 31 days}\}$

$= \{\text{February, April, June, September, November}\}$

3. Since, A is not a subset of B.

$\therefore$ Some elements of A will not be elements of B. Hence, A and complement of B are always non-disjoint.

4. (a) There is no odd natural number divisible by 2, so there will be no element in this set, hence it is a null set.

(b) There is only one even prime number which is 2 *i.e.*, there is a element, so it is not a null set.

(c) There is no natural number which is less than 5 and greater than 7 *i.e.*, there is no element, so it is a null set.

(d) Since, parallel lines never intersect each other, so they have no common point *i.e.*, no element, so it is a null set. Hence, option (b) is correct.

5. (a) Here, all the elements of the sets A and B are same which are a, b, c and d. Thus, $A = B$.

(b) Here, 12 is an element of A but not the element of B and 18 is an element of B but not the element of A. Thus, all the elements of the sets A and B are not same. Hence, $A \neq B$.

(c) Here, $A = \{x : x \text{ is a multiple of } 10\}$

$\{10, 20, 30, 40, \ldots\}$ and $B = \{10, 15, 20, 25, 30\ldots\}$

Clearly, $A \neq B$ as all the elements of the sets A and B are not same.

6. We know, if any set has m elements, then the number of subset is 2^m.

$\therefore$ According to the given condition,

$$2^m = 112 + 2^n$$

$$\Rightarrow \quad 2^m - 2^n = 112 = 16 \times 7 = 112$$

$$\Rightarrow \quad 2^m - 2^n = 2^7 - 2^4$$

On comparing both sides, we get

$$2^m = 2^7 \text{ and } 2^n = 2^4$$

$$\Rightarrow \quad m = 7 \text{ and } n = 4$$

7. Given that, $A = \{x : x = 4n + 1, 2 \leq n \leq 5\}$

$= \{9, 13, 17, 21\}$

$\therefore$ Number of elements in A is 4.

So, number of subsets $= 2^4 = 16$

8. Given that, $A = \{x : x = n^2, n = 1, 2, 3\}$

$= \{1, 4, 9\}$

$\therefore$ Number of elements in A is 3.

So, number of proper subsets $= 2^3 - 1 = 7$

9. Let $A = \{1\}$, $B = \{2, 3\}$

$\therefore \quad A \cup B = \{1, 2, 3\}$

and $\quad A \cap B = \{\phi\}$

Now, $\quad P(A) = \{\phi, \{1\}\}, P(B) = \{\phi, \{2\}, \{3\}, \{2, 3\}\}$

$\therefore \quad P(A) \cup P(B) = \{\phi, \{1\}, \{2\}, \{3\}, \{2, 3\}\}$

$P(A \cup B) = \{\phi, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{2, 3\}, \{3, 1\}, \{1, 2, 3\}\}$

and $\quad P(A \cap B) = \{\phi\}$

10. Given, $A = \{1, 3, 5, 7, 9, 11, 13, 15, 17\}$, $B = \{2, 4, \ldots, 18\}$ and $U = N$ = The set of natural number

$= \{1, 2, 3, \ldots, \ldots 18\}$

$\therefore \quad B' = U - B$

$= \{1, 2, 3, \ldots\} - \{2, 4, \ldots, 18\}$

$= \{1, 3, 5, \ldots, 17\}$

Now, $(A \cup B) = \{1, 3, 5, 7, 9, 11, 13, 15, 17\} \cup \{2, 4, \ldots, 18\}$

$= \{1, 2, 3, 4, 5, \ldots, 18\}$

$\therefore (A \cup B) \cap B' = \{1, 2, 3, 4, \ldots, 18\} \cap \{1, 3, 5, \ldots, 17\}$

$= \{1, 3, 5, \ldots, 17\}$

$\therefore A' \cup [(A \cup B) \cap B'] = \{2, 4, 6, \ldots, 18\} \cup \{1, 3, 5, \ldots, 17\}$ $(\because A' = U - A)$

$= \{1, 2, 3, 4, \ldots, 18\} = N$

11. $A \cap B = \{2, 3, 4, 8, 10\} \cap \{3, 4, 5, 10, 12\} = \{3, 4, 10\}$

and $\quad A \cap C = \{2, 3, 4, 8, 10\} \cap \{4, 5, 6, 12, 14\}$

$= \{4\}$

$\therefore \quad (A \cap B) \cup (A \cap C) = \{3, 4, 10\} \cup \{4\}$

$= \{3, 4, 10\}$

Alternate Solution

$(A \cap B) \cup (A \cap C) = A \cap (B \cup C)$

$= A \cap [\{3, 4, 5, 10, 12\} \cup \{4, 5, 6, 12, 14\}]$

$= A \cap \{3, 4, 5, 6, 10, 12, 14\}$

$= \{2, 3, 4, 8, 10\} \cap \{3, 4, 5, 6, 10, 12, 14\}$

$= \{3, 4, 10\}$

12. $A \cap (A \cap B)^c = A \cap (A^c \cup B^c)$ ($\because$ by De-Morgan's law)

$= (A \cap A^c) \cup (A \cap B^c)$

$= \phi \cup (A \cap B^c)$

$= A \cap B^c$

13. Given, $A = \{x : x \text{ is an odd natural number}\}$

$= \{1, 3, 5, 7, 9, 11, \ldots\}$

and $B = \{x : x \text{ is a prime number}\}$

$= \{2, 3, 5, 7, 11, \ldots\}$

$\therefore$ $A \cap B = \{1, 3, 5, 7, 9, 11, \ldots\} \cap \{2, 3, 5, 7, 11, \ldots\}$

$= \{3, 5, 7, 11, \ldots\}$

Hence, $A \cap B$ is an odd prime natural number.

14. Given, F_1 = The set of parallelograms

F_2 = The set of rectangles

F_3 = The set of rhombuses

F_4 = The set of squares

and F_5 = The set of trapeziums

By definition of parallelogram, opposite sides are equal and parallel.

In rectangles, rhombuses and squares all have opposite sides are equal and parallel, therefore

$$F_2 \subset F_1, F_3 \subset F_1, F_4 \subset F_1$$

$$\therefore \quad F_1 = F_1 \cup F_2 \cup F_3 \cup F_4$$

15. If elements are not repeated, then number of elements in $A_1 \cup A_2 \cup A_3 \cup \ldots \cup A_{30}$ is 30×5. But each element is used 10 times, so

$$S = \frac{30 \times 5}{10} = 15 \quad \ldots\text{(i)}$$

Similarly, if elements in $B_1, B_2, \ldots, B_n$ are not repeated, then total number of elements is $3n$ but each element is repeated 9 times, so

$$S = \frac{3n}{9} \Rightarrow 15 = \frac{3n}{9} \quad \text{[from Eq. (i)]}$$

$$\Rightarrow \quad n = 45$$

16. Given that, $A = \{x : x \text{ is a multiple of } 4\}$

$= \{4, 8, 12, 16, 20, \ldots\}$

and $B = \{x : x \text{ is a multiple of } 6\}$

$= \{6, 12, 18, 24, \ldots\}$

$\therefore$ $A \cap B = \{12, 24, \ldots\} = \{x : x \text{ is a multiple of } 12\}$

17. Given, S = Set of points inside the square

T = Set of points inside the triangle

C = Set of points inside the circle.

According to the given condition, the Venn diagram is given below.

It is clear from the Venn diagram that $S \cup T \cup C = S$

18. Given that, $A = \{x : x^2 = 1\} = \{-1, 1\}$

and $B = \{x : x^4 = 1\} = \{-1, 1, i, -1\}$

Now, $A - B = \phi$ and $B - A = \{-i, i\}$

$\therefore$ $A \Delta B = (A - B) \cup (B - A) = \{-i, i\}$

19. Let us consider the sets

$A = \{1, 2, 4\}, B = \{2, 5, 6\}$ and $C = \{1, 5, 7\}$

I. $A - B = \{1, 4\}$ and $A - (A \cap B) = \{1, 2, 4\} - \{2\} = \{1, 4\}$

$\therefore$ $A - B = A - (A \cap B)$

II. $(A \cap B) \cup (A - B) = \{2\} \cup \{1, 4\}$

$= \{1, 2, 4\} = A$

III. $A - (B \cup C) = \{1, 2, 4\} - \{1, 2, 5, 6, 7\}$

$= \{4\}$

and $(A - B) \cup (A - C) = \{1, 4\} \cup \{2, 4\}$

$= \{1, 2, 4\}$

$\therefore$ $A - (B \cup C) \neq (A - B) \cup (A - C)$

20. $(A \cap B')' \cup (B \cap C)$

$= (A' \cup B'') \cup (B \cap C)$ ($\because$ by De-Morgan's law)

$= (A' \cup B) \cup (B \cap C)$ ($\because B'' = B$)

$= A' \cup B$

21. Given, $n(A) = 200, n(B) = 300, n(A \cap B) = 100$

We know that, $n(A \cup B) = n(A) + n(B) - n(A \cap B)$

$\therefore$ $n(A \cup B) = 200 + 300 - 100 = 400$

Also, $n(A' \cap B') = n\{(A \cup B)'\}$

$= n(X) - n(A \cup B)$

$\Rightarrow$ $300 = n(X) - 400$

$\Rightarrow$ $n(X) = 700$

22. Given, $S = \{x : x \text{ is a positive multiple of 3 and less than 100}\}$

$= \{3, 6, 9, 12, \ldots 99\}$

$\Rightarrow$ $n(S) = 33$

and $P = \{x : x \text{ is a prime number less than 20}\}$

$= \{2, 3, 5, 7, 11, 13, 17, 19\}$

$\Rightarrow$ $n(P) = 8$

$\therefore$ $n(S) + n(P) = 33 + 8 = 41$

23. Given, $n(F) = 50, n(S) = 20, n(S \cap F) = 10$

Using the identity, $n(S \cup F) = n(S) + n(F) - n(S \cap F)$

$n(S \cup F) = 20 + 50 - 10$

$= 70 - 10 = 60$

24. Let C and T denote the students play Cricket and Tennis, respectively. And U denotes the total number of students in a class.

$\therefore \quad n(C) = 25, n(T) = 20$ and $n(U) = 60$

$\therefore \quad n(C \cup T) = n(C) + n(T) - n(C \cap T)$

$= 25 + 20 - 10$

$= 45 - 10 = 35$

$\therefore$ The number of students who play neither matches

$= n(C' \cap T') = n(U) - n(C \cup T)$

$= 60 - 35 = 25$

25. Let number of newspaper be x. If every student reads one newspaper, the number of students would be $60x$.

Since, every student reads 5 newspapers.

$\therefore \quad$ Number of students $= \dfrac{x \times 60}{5} = 300$

$\Rightarrow \quad x = 25$

26. Let H and E denote Hindi and English read newspaper.

Given, total number of persons, $n(U) = 840$

Total number of persons read Hindi newspaper,

$n(H) = 450$

Total number of persons read English newspaper,

$n(E) = 300$

and $\quad n(H \cap E) = 200$

$\because \quad n(H \cup E) = n(H) + n(E) - n(H \cap E)$

$= 450 + 300 - 200$

$= 750 - 200 = 550$

$\therefore$ The number of persons who read neither of the newspaper

$= n(\overline{H} \cap \overline{E}) = n(U) - n(H \cup E)$

$= 840 - 550 = 290$

Round II

1. (a) $\{x : |x| < 1, x \in I\}$

$= \{x : -1 < x < 1, x \in I\} = \{0\}$

(b) $\{x : |x| = 5, x \in I\}$

$= \{x : x = \pm 5\} = \{\pm 5\}$

(c) $\{x : x^2 = 1, x \in I\}$

$= \{x : x = \pm 1\} = \{\pm 1\}$

(d) $\{x : x^2 + x + 1 = 0, x \in R\}$

$$= \left\{x : x = \frac{-1 \pm \sqrt{1^2 - 4 \times 1}}{2(1)}, x \in R\right\}$$

$$= \left\{x : x = \frac{-1 \pm \sqrt{3}i}{2}, x \in R\right\} = \{\phi\}$$

($\because x$ is real but here x is a complex number)

2. Let x be an arbitrary element of A. Then, there exists a subset X of set A such that $x \in X$.

Now, $\quad x \in X \Rightarrow X \subset A$

$\Rightarrow \quad X \in P(A) \Rightarrow X \in P(B)$

$\Rightarrow \quad X \subset B \Rightarrow x \in B$

Hence, $\quad x \in A \Rightarrow x \in B$

$\therefore \quad A \subset B \quad$ ...(i)

Again, now let y be an arbitrary element of B.

Then, there exists a subset Y of set B such that $y \in Y$

Now, $\quad y \in Y \Rightarrow Y \subset B$

$\Rightarrow \quad Y \in P(B) \Rightarrow Y \in P(A) \quad [\because P(A) = P(B)]$

$\Rightarrow \quad Y \subset A \Rightarrow y \in A$

Hence, $\quad y \in B \Rightarrow y \in A$

$\therefore \quad B \subset A \quad$ ...(ii)

From Eqs. (i) and (ii), we have $A = B$

3. Given, $A = \{x : x \in R$ and x satisfy $x^2 - 8x + 12 = 0\}$

$\because \quad x^2 - 8x + 12 = 0$

$\Rightarrow \quad (x - 2)(x - 6) = 0$

$x = 2, 6$

$A = \{6, 2\}$

$B = \{2, 4, 6\}$

and $\quad C = \{2, 4, 6, 8\}$

$D = \{6\}$

Clearly, every element of A is in B and C.

$\therefore \quad A \subset B$ and $A \subset C$

Again, every element of B is in C

$\therefore \quad B \subset C$

Also, every element of D is in A, B and C.

$\therefore \quad D \subset A, D \subset B$ and $D \subset C$

4. Given, $X = \{8^9 - 7n - 1 : n \in N\}$ and $Y = \{49n - 49 : n \in N\}$

Now, $\quad 8^9 - 7n - 1 = (7 + 1)^n - 7n - 1$

$= 7^n + {}^nC_1 7^{n-1} + {}^nC_2 7^{n-2} + \ldots + {}^nC_{n-2} 7^2$

$+ {}^nC_{n-1} 7 + {}^nC_n - 7n - 1$

[$\because$ by binomial expansion, $(x + 1)^n = x^n + {}^nC_1 x^{n-1}$

$+ {}^nC_2 x^{n-2} + \ldots + {}^nC_{n-2} x^2 + {}^nC_{n-1} x + {}^nC_n$]

$= {}^nC_n 7^n + {}^nC_1 7^{n-1} + {}^nC_2 7^{n-2} + \ldots + {}^nC_2 7^2 + n7 + 1 - 7n - 1$

($\because {}^nC_n = 1, {}^nC_{n-1} = n, {}^nC_{n-2} = {}^nC_2$)

$= 7^n \, {}^nC_n + {}^nC_1 7^{n-1} + {}^nC_2 7^{n-2} + \ldots + {}^nC_2 7^2$

$= {}^nC_2 7^2 + \ldots + {}^nC_2 7^{n-2} + {}^nC_1 7^{n-1} + {}^nC_n 7^n$

$= 7^2[{}^nC_2 + \ldots + {}^nC_n 7^{n-2}]$

$= 49[{}^nC_2 + \ldots + {}^nC_n 7^{n-2}]$

$\therefore \quad 8^n - 7n - 1$ is a multiple of 49 for $n \geq 2$

For $n = 1, 8^n - 7n - 1 = 8 - 7 - 1 = 0$

For $n = 2, 8^n - 7n - 1 = 64 - 14 - 1 = 49$

$\therefore 8^n - 7n - 1$ is a multiple of 49 for all $n \in N$.

X contains elements which are multiples of 49 and clearly Y contains all multiples of 49.

$\therefore \quad X \subseteq Y$

5. Given, $n(U) = 100, n(A) = 40, n(B) = 30, n(C) = 30$

$n(A \cap B) = 10, n(B \cap C) = 8, n(C \cap A) = 5, n(A \cap B \cap C) = 3$

Now, $n(A^c \cap B^c \cap C^c) = n(A \cup B \cup C)^c$

$= n(U) - [n(A \cup B \cup C)]$

$= 100 - [40 + 30 + 30 - 10 - 8 - 5 + 3] = 100 - 80 = 20$

6. Let M, P and C denote the students studying Mathematics, Physics and Chemistry.

Also, $n(U) = 200$, $n(M) = 120$, $n(P) = 90$, $n(C) = 70$, $n(M \cap P) = 40$, $n(P \cap C) = 30$, $n(M \cap C) = 50$, $n(M \cup P \cup C)' = 20$

$\because \quad n(M \cup P \cup C)' = 20$

$\therefore \quad n(M \cup P \cup C)' = n(U) - n(M \cup P \cup C)$

$\Rightarrow \quad 20 = 200 - n(M \cup P \cup C)$

$\Rightarrow \quad n(M \cup P \cup C) = 200 - 20 = 180$

$\because \quad n(M \cup P \cup C) = n(M) + n(P) + n(C) - n(M \cap P) - n(P \cap C) - n(C \cap M) + n(C \cap M \cap P)$

$\therefore 180 = 120 + 90 + 70 - 40 - 30 - 50 + n(C \cap M \cap P)$

$\Rightarrow \quad 180 = 280 - 120 + n(C \cap M \cap P)$

$\Rightarrow \quad 180 + 120 - 280 = n(P \cap C \cap M)$

$\Rightarrow \quad n(P \cap C \cap M) = 300 - 280 = 20$

7. Given,

U = Set of all boys and girls in the school

G = Set of all girls in the school

B = Set of all boys in the school

S = Set of all students in the school.

According to the question,

Some boys student taking swimming *i.e.*, $B \cap S \neq \phi$

and some girls student taking swimming *i.e.*, $G \cap S \neq \phi$

8. Here, $n(C) = 224, n(H) = 240, n(B) = 336, n(H \cap B) = 64$

$n(B \cap C) = 80, n(H \cap C) = 40, n(C \cap H \cap B) = 24$

$\therefore \quad n(C^c \cap H^c \cap B^c) = n[(C \cup H \cup B)^c]$

$= n(U) - n(C \cup H \cup B)$

$= 800 - [224 + 240 + 336 - 64 - 80 - 40 + 24]$

$= 800 - 640 = 160$

9. Given, $\quad aN = \{an : n \in N\}$

$\therefore \quad bN = \{bn : n \in N\}$ and $cN = \{cn : n \in N\}$

Also, given $bN \cap cN = dN$

$\therefore \quad bc \in bN \cap cN$ or $bc \in dN$

$\therefore \quad bc = d \quad (\because b$ and c are coprime)

[$\because$ coprime numbers are those numbers, whose common factor is 1. e.g., (i) 3 and 5 (ii) 5 and 9 etc.]

10. Given, $A = \{(x, y) : y = \frac{4}{x}, 0 \neq x \in R\} \Rightarrow A$ is the set of all points on the graph of $xy = 4$

and $\quad B = \{(x, y) : y = x, x > 0, x \in R\}$

$\Rightarrow B$ is the set of all points on the graph of $y = x$

Now, we plot the graph of given sets.

Since, the graph of $xy = 4$ and $y = x, x > 0$ intersect at one point.

$\therefore \quad A \cap B \neq \phi$ and $A \cap B$ is a singleton set.

11. Given, $A = \{(x, y) : y = e^{2x}, x \in R\}$

$\Rightarrow A$ is the set of all points on the graph of $y = e^{2x}$

and $\quad B = \{(x, y) : y = e^{-2x}, x \in R\}$

$\Rightarrow B$ is the set of all points on the graph of $y = e^{-2x}$

Now, we plot the graph of given sets

Since, the graph of $y = e^{2x}$ and $y = e^{-2x}$ intersect at one point.

$\therefore \quad A \cap B \neq \phi$ and $A \cap B$ is a singleton set.

12. Let M be the set of students passing in Mathematics.

P be the set of students passing in Physics.

C be the set of students passing in Chemistry.

Now, $n(M \cup P \cup C) = 50, n(M) = 37, n(P) = 24, n(C) = 43$

$n(M \cap P) \leq 19, n(M \cap C) \leq 29, n(P \cap C) \leq 20 \quad$ (given)

$n(M \cup P \cup C) = n(M) + n(P) + n(C) - n(M \cap P) - n(M \cap C) - n(P \cap C) + n(M \cap P \cap C) \leq 50$

$\Rightarrow \quad 37 + 24 + 43 - 19 - 29 - 20 + n(M \cap P \cap C) \leq 50$

$\Rightarrow \quad n(M \cap P \cap C) \leq 50 - 36$

$\Rightarrow \quad n(M \cap P \cap C) \leq 14$

Thus, the largest possible number that could have passed all the three examinations is 14.

13. Given, $X \cup \{1, 2\} = \{1, 2, 3, 5, 9\}$

The smallest of $X = \{1, 2, 3, 5, 9\} - \{1, 2\} = \{3, 5, 9\}$

The largest set of X = The set which contains atleast elements 3, 5, 9

$= \{1, 2, 3, 5, 9\}$

14. Given, $n(F) = 17, n(E) = 13, n(S) = 15, n(F \cap E) = 9, n(E \cap S) = 4,$

$n(F \cap S) = 5, n(E \cap F \cap S) = 3$

(a) Number of students study only French

$= n(F) - n(F \cap E) - n(F \cap S) + n(F \cap E \cap S)$

$= 17 - 9 - 5 + 3 = 6$

(b) Number of students study only Sanskrit

$= n(S) - n(S \cap F) - n(S \cap E) + n(F \cap E \cap S)$

$= 15 - 5 - 4 + 3 = 9$

(c) $n(F \cap S \cap \bar{E}) = n(F \cap S) - n(F \cap E \cap S)$

$= 5 - 3 = 2$

(d) $\therefore n(F \cup E \cup S) = n(F) + n(E) + n(S)$

$- n(F \cap E) - n(E \cap S) - n(S \cap F) + n(F \cap E \cap S)$

$= 17 + 13 + 15 - 9 - 4 - 5 + 3$

$= 30$

Solutions (Q. Nos. 15-17)

Let U, E, M and S be denote the total number of students passed in English, passed in Mathematics and passed in Science, respectively.

Here, $n(U) = 100, n(E) = 15, n(M) = 12, n(S) = 8, n(E \cap M) = 6,$ $n(M \cap S) = 7, n(E \cap S) = 4$ and $n(E \cap M \cap S) = 4$

15. $\therefore$ The number of students passed in English and Mathematics but not in Science

$= n(E \cap M \cap \bar{S})$

$= n(E \cap M) - n(E \cap M \cap S) = 6 - 4 = 2$

16. The number of students only passed in Mathematics

$= n(M \cap \bar{E} \cap \bar{S})$

$= n(M) - n(M \cap E) - n(M \cap S) + n(M \cap E \cap S)$

$= 12 - 6 - 7 + 4 = 16 - 13 = 3$

17. The number of students only passed in more than one subject

$= n(M \cap E) + n(M \cap S) + n(S \cap E) - 2n(M \cap E \cap S)$

$= 6 + 7 + 4 - 2(4) = 17 - 8 = 9$

18. We have, $B = B \cup (A \cap B)$

$= B \cup (A \cap C)$ $\quad (\because$ given $A \cap B = A \cap C)$

$= (B \cup A) \cap (B \cup C)$

$= (A \cup C) \cap (B \cup C)$ $\quad [\because$ given $(A \cup C) \cap (B \cup C)]$

$= (A \cap B) \cup C$

$= (A \cap C) \cup C = C$

Hence, using result given in statement II, we have proved that $B = C$. Hence, statement II is the correct explanation of statement I.

19. If U is universal set, then $B = U - A = A'$, for which $n(B) = n(A') = n(U) - n(A)$.

But for any three arbitrary sets A, B and C, we cannot always have $n(C) = n(A) - n(B)$, if $C = A - B$ as it is not specified here whether A is universal set or not. In case A is not universal set we cannot conclude

$n(C) = n(A) - n(B)$. Hence, statement I is true but statement II is false.

20. Let $X \in P(A \cap B)$

$\Leftrightarrow \quad X \subset A \cap B$

$\Leftrightarrow \quad X \subset A$ and $X \subset B$

$\Leftrightarrow \quad X \in P(A)$ and $X \in P(B)$

$\Leftrightarrow \quad X \in P(A) \cap P(B)$

Hence, $\quad P(A) \cap P(B) = P(A \cap B)$

Now, consider set $A = \{1\}$ and set $B = \{2\}$

$A \cup B = \{1, 2\}$

$P(A) = \{\phi, \{1\}\}, P(B) = \{\phi, \{2\}\}$

and $\quad P(A \cup B) = \{\phi, \{1\}, \{2\}, \{1, 2\}\}$

Thus, $\quad P(A) \cup P(B) \neq P(A \cup B)$

Hence, statement I is true and statement II is false.

21. Given, $n(H) = 25, n(T) = 26, n(I) = 26,$

$n(H \cap I) = 9, n(H \cap T) = 11, n(T \cap I) = 8$

and $\quad n(H \cap T \cap I) = 3$

$\therefore$ Number of people who read exactly one newspaper

$= n(H) + n(T) + n(I)$

$- 2\{n(H \cap I) + n(H \cap T) + n(T \cap I)\} + 3n(H \cap T \cap I)$

$= 25 + 26 + 26 - 2(9 + 11 + 8) + 3 \times 3$

$= 77 - 2 \times 28 + 9 = 86 - 56 = 30$

22. Since, $A \cap B = A \cap C$ and $A \cup B = A \cup C$

$\therefore \quad B = C$

2 Fundamentals of Relations and Functions

JEE Main MILESTONE

- Ordered Pair
- Cartesian Product
- Relations
- Different Types of Relations
- Inverse Relation
- Composition of Relations
- Functions or Mappings
- Classification of Functions
- Algebra of Real Functions
- Inverse Function
- Composition of Functions

2.1 Ordered Pair

Two elements a and b listed in a specific order form an ordered pair, denoted by (a, b). In an ordered pair (a, b); a is regarded as the first element and b is the second element.

It is evident from the definition that

(i) $(a, b) \neq (b, a)$

(ii) $(a, b) = (c, d)$ iff $a = c, b = d$

In Mathematics we come across many relations such as number m is less than number n, line l is parallel to line m. In all these, a relation involves pairs of objects in certain order. Concept of function plays very important role in Mathematics, since it captures the idea of a mathematically precise correspondence between one quantity with the other.

Equality of Ordered Pair

Two ordered pairs (a_1, b_1) and (a_2, b_2) are equal iff

$$a_1 = a_2 \text{ and } b_1 = b_2$$

i.e., $(a_1, b_1) = (a_2, b_2)$

$\Rightarrow$ $a_1 = a_2$ and $b_1 = b_2$

Thus, it is evident from the definition that $(1, 2) \neq (2, 1)$ and $(1, 1) \neq (2, 2)$.

***Sample* Problem 1** *If* $\left(\frac{x}{3}+1, y-\frac{2}{3}\right)=\left(\frac{5}{3}, \frac{1}{3}\right)$, *find the values of x and y.* **[NCERT]**

(*a*) 2, 1 (*b*) 2, 2

(*c*) –2, 1 (*d*) 1, 1

Interpret (*a*) Given, $\left(\frac{x}{3}+1, y-\frac{2}{3}\right)=\left(\frac{5}{3}, \frac{1}{3}\right)$

$\Rightarrow$ $\frac{x}{3}+1=\frac{5}{3}$ and $y-\frac{2}{3}=\frac{1}{3}$

$\Rightarrow$ $\frac{x}{3}=\frac{5}{3}-\frac{1}{1}$ and $y=\frac{1}{3}+\frac{2}{3}$

$\Rightarrow \quad \frac{x}{3} = \frac{5-3}{3}$ and $y = \frac{1+2}{3}$

$\Rightarrow \quad \frac{x}{3} = \frac{2}{3}$ and $y = \frac{3}{3}$

$\Rightarrow \quad x = 2$ and $y = 1$

2.2 Cartesian Product

Let A and B be two non-empty sets. The cartesian product of A and B is denoted by $A \times B$ and is defined as the set of all ordered pairs (a, b), where $a \in A$ and $b \in B$.

Symbolically, $A \times B = \{(a, b) : a \in A \text{ and } b \in B\}$

If there are three sets A, B and C and $a \in A$, $b \in B$ and $c \in C$, then we form an ordered triplet (a, b, c). The set of all ordered triplets (a, b, c) is called the cartesian product of three sets A, B and C, *i.e.*,

$$A \times B \times C = \{(a, b, c) : a \in A, b \in B, c \in C\}$$

An ordered pair and ordered triplet are also called 2-tuple and 3-tuple, respectively.

e.g., Let $A = \{1, 2, 3\}$ and $B = \{x, y\}$

$\therefore \quad A \times B = \{(1, x), (1, y), (2, x), (2, y), (3, x), (3, y)\}$

and $\quad B \times A = \{(x, 1), (x, 2), (x, 3), (y, 1), (y, 2), (y, 3)\}$

Note

- If $A \neq B$, then $A \times B \neq B \times A$
- If A has p elements and B has q elements, then $A \times B$ has pq elements.
- If $A = \phi$ and $B = \phi$, then $A \times B = \phi$.
- Cartesian product of n sets $A_1, A_2, A_3, \ldots, A_n$ is the set of all n-tuples $(a_1, a_2, a_3, \ldots, a_n)$, $a_i \in A_i$, $i = 1, 2, 3, \ldots, n$ and it is denoted by $A_1 \times A_2 \times \ldots \times A_n$ or $\prod_{i=1}^{n} A_i$.

Properties of Cartesian Product

If A, B and C are three sets, then

(i) (a) $A \times (B \cup C) = (A \times B) \cup (A \times C)$

(b) $A \times (B \cap C) = (A \times B) \cap (A \times C)$

(ii) $A \times (B - C) = (A \times B) - (A \times C)$

(iii) $A \times B = B \times A \Leftrightarrow A = B$

(iv) If $A \subseteq B \Rightarrow A \times A \subseteq (A \times B) \cap (B \times A)$

(v) If $A \subseteq B \Rightarrow A \times C \subseteq B \times C$

(vi) If $A \subseteq B$ and $C \subseteq D \Rightarrow A \times C \subseteq B \times D$

(vii) $(A \times B) \cap (C \times D) = (A \cap C) \times (B \cap D)$

(viii) $A \times (B' \cup C')' = (A \times B) \cap (A \times C)$

(ix) $A \times (B' \cap C')' = (A \times B) \cup (A \times C)$

(x) If A and B have n common elements, then $A \times B$ and $B \times A$ will have n^2 common elements.

***Sample* Problem 2** *If the set A has 3 elements and the set $B = \{3, 4, 5\}$, then find the number of elements in $(A \times B)$ is* **[NCERT]**

(a) 8 (b) 9

(c) 7 (d) 10

Interpret (b) Here, $n(A) = 3$, $B = \{3, 4, 5\} \Rightarrow n(B) = 3$

$\therefore \quad n(A \times B) = n(A) \times n(B) = 3 \times 3 = 9$

***Sample* Problem 3** *If A, B and C are any three sets, then $A \times (B \cup C)$ is equal to*

(a) $(A \times B) \cup (A \times C)$ (b) $(A \cup B) \times (A \cup C)$

(c) $(A \times B) \cap (A \times C)$ (d) *None of these*

Interpret (a) $A \times (B \cup C) = (A \times B) \cup (A \times C)$ by distributive law.

2.3 Relations

Let A and B be two non-empty sets. Then, a relation R from A to B is a subset of $A \times B$.

Thus, R is a relation from A to $B \Rightarrow R \subseteq A \times B$. If R is a relation from a non-empty set A to a non-empty set B and if $(a, b) \in R$, then we write aRb which is read as 'a is related to b by the relation R.' If $(a, b) \notin R$, then we write aRb and it is read as 'a is not related to b by the relation R'.

e.g., If R is a relation between two sets $A = \{1, 2, 3\}$ and $B = \{1, 4, 9\}$ defined as "square root of".

Here, $1R1$, $2R4$, $3R9$.

$\therefore \quad R = \{(1, 1), (2, 4), (3, 9)\}$

Domain and Range of Relations

Let R be a relation from A to B. The domain of R is the set of all those elements $a \in A$ such that $(a, b) \in R$ for some $b \in B$.

$\therefore$ Domain of $R = \{a \in A : (a, b) \in R, \forall b \in B\}$

and range of R is the set of all those elements $b \in B$ such that $(a, b) \in R$ for some $a \in A$.

$\therefore$ Range of $R = \{b \in B : (a, b) \in R, \forall a \in A\}$.

Here, B is called the codomain of R.

e.g., Let $A = \{1, 2, 3\}$

and $B = \{3, 5, 6\}$

Let $aRb \Rightarrow a < b$

Then, $R = \{(1, 5), (2, 5), (3, 5), (1, 6), (2, 6), (3, 6)\}$

$\therefore$ Domain of $R = \{1, 2, 3\}$, range of $R = \{5, 6\}$

and codomain of $R = \{3, 5, 6\}$

Note

- Let A and B be two non-empty finite sets having p and q elements respectively.
- Total number of relations form A to $B = 2^{pq}$.

***Sample* Problem 4** *Find the domain and range of the relation R defined by* $R = \{(x, x+5) : x \in \{0, 1, 2, 3, 4, 5\}\}$.

[NCERT]

(a) $\{0, 1, 2, 3, 4, 5\}, \{5, 6, 7, 8, 9, 10\}$
(b) $\{1, 2, 3, 4, 5\}, \{5, 6, 7, 8, 9, 10\}$
(c) $\{0, 1, 2, 3, 4, 5\}, \{6, 7, 8, 9, 10\}$
(d) *None of the above*

Interpret (a) Given, $R = \{(x, x+5) : x \in \{0, 1, 2, 3, 4, 5\}\}$ ...(i)

Putting $x = 0, 1, 2, 3, 4, 5$, we get

$\Rightarrow$ Domain $= \{0, 1, 2, 3, 4, 5\}$

After putting the value of x from Eq. (i), we get

$$y = x + 5 = 5, 6, 7, 8, 9, 10$$

$\Rightarrow$ Range $= \{5, 6, 7, 8, 9, 10\}$

2.4 Different Types of Relations

(i) Void Relation

Let A be a set and $\phi \subset A \times A$, it follows that ϕ is a relation on A which is called the empty or void relation.

(ii) Universal Relation

Let A be a set and $A \times A \subseteq A \times A$, it follows that $A \times A$ is a relation on A which is called the universal relation.

(iii) Identity Relation

The relation I_A on set A is called an identity relation, if every element of A is related to itself only. Symbolically, the relation

$$I_A = \{(a, a) : a \in A\}$$

is called an identity relation on A.

e.g., If $A = \{1, 2, 3\}$, then an identity relation on A is given by $I_A = \{(1, 1), (2, 2), (3, 3)\}$.

2.5 Inverse Relation

If R is a relation on set A, then the relation R^{-1} on A defined by $R^{-1} = \{(b, a) : (a, b) \in R\}$ is called an inverse relation to A.

Clearly, domain (R^{-1}) = range (R)

and range (R^{-1}) = domain (R)

e.g., Let $A = \{1, 2, 3\}$

and let $R = \{(1, 2), (2, 2), (3, 1), (3, 2)\}$

Then, R being a subset of $A \times A$, it is a relation on A.

Clearly, $1R2$; $2R2$; $3R1$ and $3R2$.

Domain $(R) = \{1, 2, 3\}$ and range $(R) = \{2, 1\}$

Also, $R^{-1} = \{(2, 1), (2, 2), (1, 3), (2, 3)\}$

Domain $(R^{-1}) = \{2, 1\}$ and range $(R^{-1}) = \{1, 2, 3\}$

***Sample* Problem 5** *The relation R defined in* $A = \{1, 2, 3\}$ *by aRb, if* $|a^2 - b^2| \le 5$. *Which of the following is false?*

(a) $R = \{(1, 1), (2, 2), (3, 3), (2, 1), (1, 2), (2, 3), (3, 2)\}$
(b) $R^{-1} = R$
(c) *Domain of* $R = \{1, 2, 3\}$
(d) *Range of* $R = \{5\}$

Interpret (b) $\because R = \{(1, 1), (1, 2), (2, 1), (2, 2), (2, 3), (3, 2), (3, 3)\}$

$R^{-1} = \{(y, x) : (x, y) \in R\}$

$= \{(1, 1), (2, 1), (1, 2), (2, 2), (3, 2), (2, 3), (3, 3)\}$

$= R$

Domain of $R = \{x : (x, y) \in R\} = \{1, 2, 3\}$ and range of $R = \{y : (x, y) \in R\} = \{1, 2, 3\}$.

2.6 Composition of Relations

Let $R \subseteq A \times B, S \subseteq B \times C$ be two relations. Then, composition of the relations R and S denoted by $SoR \subseteq A \times C$ and is defined by $(a, c) \in SoR$, iff $\exists b \in B$ s.t.

$$(a, b) \in R, (b, c) \in S$$

e.g., Let $A = \{1, 2, 3\}, B = \{a, b, c, d\}, C = \{\alpha, \beta, \gamma\}$

$R \subseteq (A \times B) = \{(1, a), (1, c), (2, d)\}$

$S \subseteq (B \times C) = \{(a, \alpha), (c, \gamma), (d, \beta)\}$

Then, $SoR \subseteq (A \times C) = \{(1, \alpha), (1, \gamma), (2, \beta)\}$

Note

- One should be careful in computing the relation RoS. Actually, SoR starts with R and RoS starts with S.
- In general, $SoR \neq RoS$
- $(SoR)^{-1} = R^{-1}oS^{-1}$, known as reversal rule.

Check Point 1

1. If the set A has 3 elements and the set B = {1, 3, 4, 5}, then the number of elements in (A × B) is
(a) 11 (b) 12
(c) 13 (d) 15

2. Let A = {1, 2}B = {1, 2, 3, 4}, C = {5, 6} and D = {5, 6, 7, 8}
Following statements are given below :
I A × (B ∩ C) = (A × B) ∩ (A × C)
II A × C is a subset of B × D.
Which of the following statment is correct ?
(a) Only I (b) Only II
(c) Both I and II (d) None of these

3. Let R be the relation on Z defined by R = {(a, b) : a, b ∈ z, a – b is an interger}. Find the domain and Range of R
(a) z, z (b) z^+, z
(c) z, z^- (d) None of these

4. If A and B are two sets, then A × B = B × A. If and only if
(a) A ⊂ B
(b) B ⊂ A
(c) A = B
(d) None of the above

5. Let R be a relation from a set A to a set B, then
(a) R = A ∪ B (b) R = A ∩ B
(c) R ⊆ A × B (d) R ⊆ B × A

6. If the relation R : A → B, where A = {1, 2, 3, 4} and B = {1, 3, 5} is defined by R = {(x, y) : x < y, x ∈ A, y ∈ B}, then R^{-1}OR is
(a) {(1, 3), (1, 5), (2, 3), (2, 5), (3, 5), (4, 5)}
(b) {(3, 1), (5, 1), (5, 2), (5, 3), (5, 4)}
(c) {(3, 3), (3, 5), (5, 3), (5, 5)
(d) None of the above

7. Let a relation R be defined by R = {(4, 5), (1, 4), (4, 6), (7, 6), (3, 7)}, then ROR is equal to
(a) {(1, 5), (1, 6), (3, 6)}
(b) {(1, 4), (1, 5), (3, 6)}
(c) {(1, 5), (1, 6), (3, 7)}
(d) {(1, 4), (1, 5), (3, 7)}

8. The relation R defined on the set A = {1, 2, 3, 4, 5} by R = {(x, y) : | $x^2 - y^2$ | < 16} is given by
(a) {(1, 1), (2, 1), (3, 1), (4, 1), (2, 3)}
(b) {(2, 2), (3, 2), (4, 2), (2, 4)}
(c) {(3, 3), (4, 3), (5, 4), (3, 4)}
(d) None of the above

2.7 Functions or Mappings

Let A and B be two non-empty sets. Then, a function f from set A to B is a rule which associates elements of set A to elements of B such that all elements of set A are associated to elements of set B in unique way.

If f associates $x \in A$ to $y \in B$, then we say that y is the image of the element x and denote it by $f(x)$ and write as $y = f(x)$. The element x is called the pre-image or inverse image in B.

A function is denoted by $f : A \to B$ or $A \xrightarrow{f} B$.

Note

- There may exist some elements in set B which are not the images of any element in set A.
- To each and every independent element in A there corresponds one and only one image in B.
- Every function is a relation but every relation may or may not be a function.
- The number of functions from a finite set A into finite set B $= [n(B)]^{[n(A)]}$

Difference between a Relation and a Function

Geometrically, if we draw a vertical parallel line (VPL) *i.e.*, any line which is parallel to y-axis ($x = a$), then if this line intersects the graph of the expression in more than one point, then the expression is a relation else if it intersects at only one point, the expression is a function, *e.g.*,

(a) Function (b) Relation

Domain, Codomain and Range of a Function

Let $f : A \to B$, then A is known as domain of f while B is known as codomain of f.

Also, set $f(A) = \{f(x) : x \in A\}$ is known as range of f.

Clearly, $f(A) \subseteq B$

e.g., Let $A = \{1, -1, 2, -2\}$, $B = \{1, 4, 9\}$

$$f : A \xrightarrow{x^2} B \text{ i.e., } f(x) = x^2$$

From the figure, it is clear that domain of function $= \{1, -1, 2, -2\}$ and range of function $= \{1, 4\}$.

Also, codomain of function $= \{1, 4, 9\}$.

***Sample* Problem 6** *Find the domain and range of the function* $f(x) = \sqrt{9 - x^2}$. [NCERT]

(a) $[-3, 3]$, $[0, 3]$ (b) $[-3, 3)$, $[0, 3]$
(c) $(-3, 3)$, $(0, 3)$ (d) *None of these*

Interpret (a) $f(x) = \sqrt{9 - x^2}$

For function to be defined,

$$9 - x^2 \geq 0$$

$$\Rightarrow \quad x^2 - 9 \leq 0 \quad \ldots(i)$$

$$\Rightarrow \quad \{x - (-3)\}(x - 3) \leq 0$$

$$\Rightarrow \quad -3 \leq x \leq 3$$

$\{$if $a < b$ and $(x - a)(x - b) \leq 0 \Rightarrow a \leq x \leq b\}$

$\Rightarrow$ Domain $= [-3, 3]$

or Domain $= \{x : x \in R$ and $-3 \leq x \leq 3\}$

Again for range,

Let $f(x) = y$, then

$$\Rightarrow \quad y = \sqrt{9 - x^2}$$

On squaring both sides, we get

$$y^2 = 9 - x^2$$

$$\Rightarrow \quad x^2 = 9 - y^2 \quad \ldots(ii)$$

On putting the value of x^2 in Eq. (i), we get

$$\Rightarrow \quad 9 - y^2 - 9 \leq 0$$

$$\Rightarrow \quad -y^2 \leq 0$$

$$\Rightarrow \quad y^2 \geq 0$$

$$-\infty < y < \infty$$

But y cannot be negative $f(x) = \sqrt{9 - x^2}$ cannot contain negative values.

$$\therefore \quad y \geq 0$$

Also, from Eq. (ii), $x = \sqrt{9 - y^2}$

$$\Rightarrow \quad 9 - y^2 \geq 0 \quad (\because x^2 \geq 0)$$

$$\Rightarrow \quad y^2 - 9 \leq 0$$

$$\Rightarrow \quad -3 \leq y \leq 3$$

$\Rightarrow$ Range $= [0, 3]$ or $\{y : y \in R, 0 \leq y \leq 3\}$

***Sample* Problem 7** *Let* $f = \{(1, 1), (2, 3), (0, -1), (-1, -3)\}$ *be a function from Z to Z defined by* $f(x) = ax + b$ *for some integers a and b. Find, a, b.*

(a) 1, 2 (b) 2, –1
(c) –1, –2 (d) *None of these*

Interpret (b) Given, $f = \{(1, 1), (2, 3), (0, -1), (-1, -3)\}$

and $\quad f(x) = ax + b$

or $\quad y = ax + b \quad \{\because y = f(x)\}$

At $x = 1, y = 1$

$$\Rightarrow \quad 1 = a + b \quad \ldots(i)$$

At $x = 2, y = 3$

$$\Rightarrow \quad 3 = 2a + b \quad \ldots(ii)$$

On subtracting Eq. (i) from Eq. (ii), we get

$$a = 2$$

On putting the value of a in Eq. (i), we get

$$b = 1 - 2 \quad \Rightarrow \quad b = -1$$

2.8 Classification of Functions

Constant Function

A function which does not change as its parameters vary *i.e.*, the function whose rate of change is zero. In short, a constant function is a function that always gives or returns the same value.

OR

Let k be a constant, then function $f(x) = k, \forall x \in R$ is known as constant function.

Domain of $f(x) = R$ and Range of $f(x) = \{k\}$

Polynomial Function

The function $y = f(x) = a_0 x^n + a_1 x^{n-1} + \ldots\ldots + a_n$, where $a_0, a_1, a_2, \ldots\ldots, a_n$ are real coefficients and n is a non-negative integer, is known as a polynomial function. If $a_0 \neq 0$, then degree of polynomial function is n.

Domain of $f(x) = R$

On range varies from function to function.

Rational Function

If $P(x)$ and $Q(x)$ are polynomial functions, $Q(x) \neq 0$, then function $f(x) = \dfrac{P(x)}{Q(x)}$ is known as rational function.

Domain of $f(x) = R - \{x : Q(x) = 0\}$

and range varies from function to function.

Irrational Function

The function containing one or more terms having non-integral rational powers of x are called irrational function.

e.g., $$y = f(x) = \frac{5x^{3/2} - 7x^{1/2}}{x^{1/2} - 1}$$

Domain = varies from function to function.

Identity Function

Function $f(x) = x, \forall x \in R$ is known as identity function. It is straight line passing through origin and having slope unity.

Domain of $f(x) = R$ and Range of $f(x) = R$

Square Root Function

The function that associates every positive real number x to $+\sqrt{x}$ is called the square root function, *i.e.*, $f(x) = +\sqrt{x}$.

Range of $f(x) = [0, \infty)$.

Exponential Function

A function of the form $f(x) = a^x$, a is a positive real number, is an exponential function. The value of the function depends upon the value of a for $0 < a < 1$, function is decreasing and for $a > 1$, function is increasing.

Domain of $f(x) = R$

and Range of $f(x) = [0, \infty)$

Logarithmic Function

Function $f(x) = \log_a x, (x, a > 0)$ and $a \neq 1$, is known as logarithmic function.

Domain of $f(x) = (0, \infty)$

and Range of $f(x) = R$

Modulus Function

Function $y = f(x) = |x|$ is known as modulus function.

$$y = f(x) = |x| = \begin{cases} x, & x \geq 0 \\ -x, & x < 0 \end{cases}$$

Domain of $f(x) = x \in R$

and Range of $f(x) = [0, \infty)$

Properties of Modulus Function

(i) For any real number x, $\sqrt{x^2} = |x|$.

(ii) If a and b are positive real numbers, then

(a) $x^2 \leq a^2 \Leftrightarrow |x| \leq a \Leftrightarrow -a \leq x \leq a$

(b) $x^2 \geq a^2 \Leftrightarrow |x| \geq a \Leftrightarrow x \leq -a$ or $x \geq a$

(c) $a^2 \leq x^2 \leq b^2 \Leftrightarrow a \leq |x| \leq b \Leftrightarrow x \in [-b, -a] \cup [a, b]$

(iii) $|x \pm y| \leq |x| + |y|$

(iv) $|x + y| \geq ||x| - |y||$

Greatest Integer Function

For any real number x, the greatest integer function $[x]$ is equal to greatest integer less than or equal to x.

In general, if n is an integer and x is any number satisfying $n \leq x < n + 1$, then $[x] = n$. It is also known as integral part function.

e.g., If $2 \leq x < 3$, then $[x] = 2$

Domain = R

Range = I

Properties of Greatest Integer Function

If n is an integer and x is any real number between n and $n + 1$, then

(i) $[-n] = -[n]$

(ii) $[x + n] = [x] + n$

(iii) $[-x] = -[x] - 1$, x is not an integer.

(iv) $[x + y] \geq [x] + [y]$

(v) $[x] > n \Rightarrow x \geq n + 1$

(vi) $[x] < n \Rightarrow x < n$

(vii) $[x + y] = [x] + [y + x - [x]]$, for all $x, y \in R$

(viii) $[x] + \left[x + \frac{1}{n}\right] + \left[x + \frac{2}{n}\right] + \ldots + \left[x + \frac{n-1}{n}\right] = [nx], n \in N$

Signum Function

The function defined by

$$f(x) = \frac{|x|}{x} = \begin{cases} -1, & x < 0 \\ 0, & x = 0 \\ 1, & x > 0 \end{cases}$$

is called the signum function.

Domain $= R$

Range $= \{-1, 0, 1\}$

***Sample* Problem 9** *The domain of the function* $f(x) = \frac{1}{\sqrt{[x]^2 - [x] - 6}}$ *is*

(a) $(-\infty, -2) \cup [4, \infty)$ (b) $(-\infty, -2] \cup [4, \infty)$

(c) $(-\infty, -2) \cup (4, \infty)$ (d) *None of these*

Interpret (a) $f(x)$ is defined, if $[x]^2 - [x] - 6 > 0$

$\Rightarrow$ $([x] - 3)([x] + 2) > 0$

$\Rightarrow$ $[x] < -2$ or $[x] > 3$

But $[x] < -2 \Rightarrow [x] = -3, -4, -5, \ldots$

$\therefore$ $x < -2$

Also, $[x] > 3 \Rightarrow [x] = 4, 5, 6, \ldots$

$\therefore$ $x \geq 4$

Domain of $f = (-\infty, -2) \cup [4, \infty)$

2.9 Algebra of Real Functions

Let $f : X \to R$ and $g : X \to R$ be any two real functions, where $X \subset R$.

(i) **Addition of two real functions**

$$(f + g)(x) = f(x) + g(x)$$

(ii) **Subtraction of two real functions**

$$(f - g)(x) = f(x) - g(x)$$

(iii) **Multiplication by a scalar**

$$(\alpha f)(x) = \alpha f(x), \alpha, x \in R$$

(iv) **Multiplication of two real functions**

$$fg(x) = f(x)\, g(x)$$

(v) **Quotient of two real functions**

$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}, g(x) \neq 0$$

2.10 Inverse Function

Let f be defined a function from A to B such that for every element of B their exist a image. Let y be an arbitrary element of B. Then, f being onto, there exists an element $x \in A$ such that $f(x) = y$. Also, f being one-one, this x must be unique. Thus, for each $y \in B$, there exists a unique element $x \in A$ such that $f(x) = y$. So, we may define a function,

$$f^{-1} : B \to A$$

$\therefore$ $$f^{-1}(y) = x \Leftrightarrow f(x) = y$$

The above function f^{-1} is called the inverse of f.

Note

- Inverse of bijective function is also bijective function.
- If the inverse of f exist, then f is called an invertible function. *i.e.*, A function f is invertible if and only if f is one-one onto.

***Sample* Problem 10** *Let* $f : R \to R$ *be a function defined by* $f(x) = 2x - 3$. *Then,* $f^{-1}(x)$ *is equal to*

(a) $x + 3$ (b) $\frac{x+3}{2}$

(c) $\frac{x-3}{2}$ (d) *None of these*

Interpret (b) Let $y = 2x - 3 \Rightarrow 2x = y + 3$

$\Rightarrow$ $x = \frac{y+3}{2}$ $\therefore$ $f^{-1}(x) = \frac{x+3}{2}$

2.11 Composition of Functions

Let A, B and C be three non-empty sets. Let $f : A \to B$ and $g : B \to C$ be two mappings (or functions), then $gof : A \to C$. This function is called the product or composite of f and g given by

$$gof(x) = g[f(x)] \; \forall x \in A$$

gof exists iff the range of f is a subset of domain of g. Similarly, fog exists if range of g is a subset of domain of f.

Properties of Composition of Function

(i) The composition of functions is not commutative.

i.e., $fog \neq gof$

(ii) The composition of functions is associative.

i.e., $fo(goh) = (fog)oh$

(iii) The composition of any function with the identity function is the function itself.

i.e., If $f : A \to B$, then $foI_A = I_Bof = f$.

***Sample* Problem 11** *If $f(x) = (ax^2 + b)^3$, then the function g such that $f\{g(x)\} = g\{f(x)\}$ is given by*

(a) $g(x) = \left(\dfrac{b - x^{1/3}}{a}\right)^{1/2}$ (b) $g(x) = \dfrac{1}{(ax^2 + b)^3}$

(c) $g(x) = (ax^2 + b)^{1/3}$ (d) $g(x) = \left(\dfrac{x^{1/3} - b}{a}\right)^{1/2}$

Interpret (*d*) Let $g(x) = \left(\dfrac{x^{1/3} - b}{a}\right)^{1/2}$

$$\therefore \quad f\{g(x)\} = f\left(\frac{x^{1/3} - b}{a}\right)^{1/2}$$

$$= \left[a\left(\frac{x^{1/3} - b}{a}\right) + b\right]^3$$

$$= (x^{1/3})^3 = x$$

and $g\{f(x)\} = g\{(ax^2 + b)^3\}$

$$= \left(\frac{ax^2 + b - b}{a}\right)^{1/2} = (x^2)^{1/2} = x$$

$$\Rightarrow \quad g\{f(x)\} = f\{g(x)\}$$

Thus, $g(x) = \left(\dfrac{x^{1/3} - b}{a}\right)^{1/2}$

Check Point 2

1. Find the range of the function $f(x) = x^2 + 2$
   (a) $(-2, 2)$ (b) $[2, \infty)$
   (c) $[3, \infty)$ (d) None of these

2. If the function $f(x) = \dfrac{a^x + a^{-x}}{2}$, $(a > 2)$, then $f(x + y) + f(x - y)$ is equal to
   (a) $2f(x)\,f(y)$ (b) $f(x)\,f(y)$
   (c) $\dfrac{f(x)}{f(y)}$ (d) None of these

3. Domain and range of $f(x) = \dfrac{|x - 3|}{x - 3}$ are respectively
   (a) R, $[-1, 1]$ (b) $R - \{3\}$, $\{1, -1\}$
   (c) R^T, R (d) None of these

4. The domain of the function $f(x) = \sqrt{(2 - 2x - x^2)}$ is
   (a) $-\sqrt{3} \le x \le \sqrt{3}$
   (b) $-1 - \sqrt{3} \le x \le -1 + \sqrt{3}$
   (c) $-2 \le x \le 2$
   (d) $-2 - \sqrt{3} \le x \le -2 + \sqrt{3}$

5. Which of the following function is invertible?
   (a) $f(x) = 2^x$ (b) $f(x) = x^3 - x$
   (c) $f(x) = x^2$ (d) None of these

6. If $f(x) = \sin^2 x$ and the composite function $g\{f(x)\} = |\sin x|$, then the function $g(x)$ is equal to
   (a) $\sqrt{x - 1}$ (b) $\sqrt{x}$ (c) $\sqrt{x + 1}$ (d) $-\sqrt{x}$

WORKED OUT Examples

Example 1 *Let* $f = \left\{\left(x, \frac{x^2}{1+x^2}\right) : x \in R\right\}$ *be a function from R to R. Determine the range of f.* **[NCERT]**

(a) [0, 1) (b) [0, 1]
(c) [0, 2) (d) *None of these*

Solution Given, $f = \left\{\left(x, \frac{x^2}{1+x^2}\right) : x \in R\right\}$ and $f : R \to R$

Let $y = \frac{x^2}{1+x^2}$

$\because$ $f(x)$ or y is positive for all values of x.

and $1 + x^2 > x^2$

$\Rightarrow$ $0 \le y < 1$

$\therefore$ Range of $f = \{y : y \in R \text{ and } y \in [0, 1)\}$

Example 2 *The simplified form of* $f(x) = |x-2| + |2-x|$, $-3 \le x \le 3$ *is* **[NCERT Exemplar]**

(a) $\begin{cases} 2x, & 2 \le x \le 3 \\ 4, & -2 \le x < 2 \\ -2x, & -3 \le x < -2 \end{cases}$ (b) $\begin{cases} -2x, & 2 \le x \le 3 \\ 4, & -2 \le x < 2 \\ 2x, & -3 \le x < -2 \end{cases}$

(c) $\begin{cases} 3x, & 2 \le x \le 3 \\ 4, & -2 \le x < 2 \\ -2x, & -3 \le x < -2 \end{cases}$ (d) *None of these*

Solution (a) $\because$ $|x-2| = \begin{cases} x-2, & x \ge 2 \\ -(x-2), & x < 2 \end{cases}$

and $|x+2| = \begin{cases} (x+2), & x \ge -2 \\ -(x+2), & x < -2 \end{cases}$

$$\Rightarrow \quad f(x) = \begin{cases} (x-2) + (2+x), & 2 \le x \le 3 \\ -(x-2) + (x+2), & -2 \le x < 2 \\ -(x-2) - (x+2), & -3 \le x < -2 \end{cases}$$

$$= \begin{cases} x - 2 + 2 + x, & 2 \le x \le 3 \\ -x + 2 + x + 2, & -2 \le x < 2 \\ -x + 2 - x - 2, & -3 \le x < -2 \end{cases}$$

$$= \begin{cases} 2x, & 2 \le x \le 3 \\ 4, & -2 \le x < 2 \\ -2x, & -3 \le x < -2 \end{cases}$$

Example 3 *Find the domain of the function* $f(x) = \frac{1}{\sqrt{x + |x|}}$. **[NCERT Exemplar]**

(a) R (b) R^+
(c) R^- (d) *None of these*

Solution (b) Given, $f(x) = \frac{1}{\sqrt{x+|x|}}$ for the function to be defined, the denominator should not be equal to 0)

$x + |x| > 0$ $(\because x + |x| \not< 0)$

$\Rightarrow$ $|x| > -x$

It is true for all R^+ (R^+ means set of all positive real numbers)

$\therefore$ Domain of the given function $= R^+$

Example 4 *If* $f(x) = \frac{x-1}{x+1}$, *then* $f\left(-\frac{1}{x}\right)$ *is equal to* **[NCERT]**

(a) $-\frac{1}{f(x)}$ (b) $\frac{1}{f(x)}$
(c) $f(x)$ (d) $-f(x)$

Solution (a) Replacing x by $\left(-\frac{1}{x}\right)$ in Eq. (i), we get

$$f\left(-\frac{1}{x}\right) = \frac{-\frac{1}{x} - 1}{-\frac{1}{x} + 1} = \frac{\frac{-1-x}{x}}{\frac{-1+x}{x}} = \frac{-(1+x)}{x-1} = -\frac{x+1}{x-1} = -\frac{1}{\left(\frac{x-1}{x+1}\right)}$$

$$\Rightarrow \quad f\left(\frac{-1}{x}\right) = -\frac{1}{f(x)}$$

Example 5 *Find the range of* $f(x) = 1 + 3\cos 2x$. **[NCERT Exemplar]**

(a) [2, 3] (b) [2, 4]
(c) [–2, 4] (d) *None of these*

Solution (c) $f(x) = 1 + 3\cos 2x$

$\because$ $-1 \le \cos 2x \le 1$

$\Rightarrow$ $-3 \le 3\cos 2x \le 3$

$\Rightarrow$ $1 - 3 \le 1 + 3\cos 2x \le 3 + 1$

$\Rightarrow$ $-2 \le f(x) \le 4$

$\therefore$ Range $= [-2, 4]$

Example 6 *Let A and B be two sets such that $n(A \times B) = 6$. If three elements of $A \times B$ are (3, 2), (7, 5), (8, 5), then*

(a) $A = \{3, 7, 8\}$ (b) $B = \{2, 5, 7\}$
(c) $B = \{3, 5\}$ (d) *None of these*

Solution (a) $\because (3, 2), (7, 5), (8, 5) \in A \times B$

$\therefore\ 3, 7, 8 \in A$ and $2, 5 \in B$

Also, $n(A \times B) = 6 = 3 \times 2$

$\therefore$ $A = \{3, 7, 8\}$ and $B = \{2, 5\}$

Example 7 *Let R be a relation in N defined by*

$$R = \{(1 + x, 1 + x^2) : x \le 5, x \in N\}.$$

Which of the following is false ?

(a) $R = \{(2, 2), (3, 5), (4, 10), (5, 17), (6, 25)\}$
(b) *Domain of* $R = \{2, 3, 4, 5, 6\}$
(c) *Range of* $R = \{2, 5, 10, 17, 26\}$
(d) *Atleast one is false*

Solution (c) $R = \{(2, 2), (3, 5), (4, 10), (5, 17), (6, 26)\}$

Domain of $R = \{x : (x, y) \in R\} = \{2, 3, 4, 5, 6\}$

and range of $R = \{y : (x, y) \in R\} = \{2, 5, 10, 17, 26\}$

Example 8 *If $f(x) = \dfrac{x-1}{x+1}$, then $f(2x)$ is equal to*

(a) $\dfrac{3f(x)+1}{f(x)+3}$ (b) $\dfrac{f(x)+1}{f(x)+3}$

(c) $\dfrac{f(x)+3}{f(x)+1}$ (d) *None of these*

Solution (d)
$$\frac{3f(x)+1}{f(x)+3} = \frac{3\left(\dfrac{x-1}{x+1}\right)+1}{\dfrac{x-1}{x+1}+3}$$
$$= \frac{3x-3+x+1}{x-1+3x+3} = \frac{4x-2}{4x+2}$$
$$= f(2x)$$

Example 9 *Let $f : (4, 6) \to (6, 8)$ be a function defined by $f(x) = x + \left[\dfrac{x}{2}\right]$, where [.] denotes the greatest integer function, then $f^{-1}(x)$ is equal to*

(a) $x - \left[\dfrac{x}{2}\right]$ (b) $-x - 2$

(c) $x - 2$ (d) $\dfrac{1}{x + \left[\dfrac{\pi}{2}\right]}$

Solution (c) Since, $x \in (4, 6)$

$\therefore$ $f(x) = x + \left[\dfrac{x}{2}\right] = x + 2$

Let $f(x) = y$

$\therefore$ $y = x + 2$

$\Rightarrow$ $x = y - 2$

$\therefore$ $f^{-1}(x) = x - 2$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Cartesian Product

1. If two sets A and B are having 99 elements in common, then the number of elements common to each of the sets $A \times B$ and $B \times A$ are
(a) 2^{99} (b) 99^2
(c) 100 (d) 18

2. If $n(A) = 3$, $n(B) = 4$, then $n(A \times A \times B)$ is equal to
(a) 36 (b) 12
(c) 108 (d) None of these

3. If $A = \{1, 2, 3\}$, $B = \{3, 4\}$, $C = \{4, 5, 6\}$, then $(A \times B) \cap (B \times C)$ is equal to
(a) $\{(1, 4)\}$ (b) $\{(3, 4)\}$
(c) $\{(1, 4), (3, 4)\}$ (d) None of these

4. If $A = \{1, 2, 3\}$, $B = \{3, 8\}$, then $(A \cup B) \times (A \cap B)$ is equal to
(a) $\{(8, 3), (8, 2), (8, 1), (8, 8)\}$
(b) $\{(1, 2), (2, 2), (3, 3), (8, 8)\}$
(c) $\{(3, 1), (3, 2), (3, 3), (3, 8)\}$
(d) $\{(1, 3), (2, 3), (3, 3), (8, 3)\}$

5. Consider the following statements
I. If $A \cap B = \phi$, then either $A = \phi$ or $B = \phi$.
II. For $a \neq b$, $\{a, b\} = \{b, a\}$ and $(a, b) \neq (b, a)$.
III. If $A \subseteq B$, then $A \times A \subseteq (A \times B) \cap (B \times A)$.
IV. If $A \subseteq B$ and $C \subseteq D$, then $A \times C \subseteq B \times D$.
Which of these is/are correct?
(a) Only (II) (b) Only (I)
(c) Only (IV) (d) (II), (III) and (IV)

6. If $A = \{x : x^2 - 5x + 6 = 0\}$, $B = \{2, 4\}$, $C = \{4, 5\}$, then $A \times (B \cap C)$ is
(a) $\{(2, 4), (3, 4)\}$
(b) $\{(4, 2), (4, 3)\}$
(c) $\{(2, 4), (3, 4), (4, 4)\}$
(d) $\{(2, 2), (3, 3), (4, 4), (5, 5)\}$

7. Let $A = \{1, 2, 3\}$. The total number of distinct relations that can be defined over A, is
(a) 2^9 (b) 6
(c) 8 (d) None of these

Relations

8. Let $n(A) = m$ and $n(B) = n$. Then, the total number of non-empty relations that can be defined from A to B is [NCERT Exemplar]
(a) m^n (b) $n^m - 1$
(c) $mn - 1$ (d) $2^{mn} - 1$

9. If $R = \{(x, y) : x, y \in I, x^2 + y^2 \leq 4\}$ is a relation in I, then domain of R is
(a) $\{0, 1, 2\}$ (b) $\{-2, -1, 0\}$
(c) $\{-2, -1, 0, 1, 2\}$ (d) None of these

10. Let R be a relation on N defined by $x + 2y = 8$. The domain of R is
(a) $\{2, 4, 8\}$ (b) $\{2, 4, 6, 8\}$
(c) $\{2, 4, 6\}$ (d) $\{1, 2, 3, 4\}$

11. The relation R defined on set $A = \{x : |x| < 3, x \in I\}$ by $R = \{(x, y) : y = |x|\}$ is
(a) $\{(-2, 2), (-1, 1), (0, 0), (1, 1), (2, 2)\}$
(b) $\{(-2, -2), (-2, 2), (-1, 1), (0, 0), (1, -2), (1, 2), (2, -1), (2, -2)\}$
(c) $\{(0, 0), (1, 1), (2, 2)\}$
(d) None of the above

12. The relation R defined on the set of natural numbers as $\{(a, b) : a$ differs from b by 3$\}$, is given by
(a) $\{(1, 4), (2, 5), (3, 6), \ldots\}$
(b) $\{(4, 1), (5, 2), (6, 3), \ldots\}$
(c) $\{(1, 3), (2, 6), (3, 9), \ldots\}$
(d) None of the above

13. Let R be the relation from $A = \{2, 3, 4, 5\}$ to $B = \{3, 6, 7, 10\}$ defined by 'x divides y', then R^{-1} is equal to
(a) $\{(6, 2), (3, 3)\}$
(b) $\{(6, 2), (10, 2), (3, 3), (6, 3), (10, 5)\}$
(c) $\{(6, 2), (10, 2), (3, 3), (6, 3)\}$
(d) None of the above

14. R is a relation from $\{11, 12, 13\}$ to $\{8, 10, 12\}$ defined by $y = x - 3$. The relation R^{-1} is
(a) $\{(11, 8), (13, 10)\}$ (b) $\{(8, 11), (10, 13)\}$
(c) $\{(8, 11), (9, 12), (10, 13)\}$ (d) None of these

15. If R is a relation from a set A to the set B and S is a relation from B to C, then the relation SoR
(a) is from C to A (b) is from A to C
(c) does not exist (d) None of these

16. Let a relation R be defined by $R = \{(4, 5), (1, 4), (4, 6), (7, 6), (3, 7)\}$. The relation $R^{-1}oR$ is given by
(a) $\{(1, 1), (4, 4), (7, 4), (4, 7), (7, 7)\}$
(b) $\{(1, 1), (4, 4), (4, 7), (7, 4), (7, 7), (3, 3)\}$
(c) $\{(1, 5), (1, 6), (3, 6)\}$
(d) None of the above

Functions

17. Let $f(x) = \sqrt{1 + x^2}$, then [NCERT Exemplar]
(a) $f(xy) = f(x) \cdot f(y)$ (b) $f(xy) \geq f(x) \cdot f(y)$
(c) $f(xy) \leq f(x) \cdot f(y)$ (d) None of these

18. Domain of $\sqrt{a^2 - x^2}\,(a > 0)$ is [NCERT Exemplar]
(a) $(-a, a)$ (b) $[-a, a]$
(c) $[0, a]$ (d) $(-a, 0]$

19. If $f(x) = \dfrac{x}{x-1}$, $x \neq 1$, then $\underbrace{(fofo \ldots of)}_{19 \text{ times}}(x)$ is equal to
(a) $\dfrac{x}{x-1}$ (b) $\left(\dfrac{x}{x-1}\right)^{19}$
(c) $\dfrac{19x}{x-1}$ (d) x

20. If $f(x) = ax + b$, where a and b are integers, $f(-1) = -5$ and $f(3) = 3$, then a and b are equal to [NCERT Exemplar]
(a) $a = -3, b = -1$ (b) $a = 2, b = -3$
(c) $a = 0, b = 2$ (d) $a = 2, b = 3$

21. If $f(x) = \dfrac{3x+2}{5x-3}$, then
(a) $f^{-1}(x) = f(x)$ (b) $f^{-1}(x) = -f(x)$
(c) $(fof)(x) = -x$ (d) $f^{-1}(x) = -\dfrac{f(x)}{19}$

22. Given, $f(x) = \log\left(\dfrac{1+x}{1-x}\right)$ and $g(x) = \dfrac{3x + x^3}{1 + 3x^2}$, then $fog(x)$ equals
(a) $-f(x)$ (b) $3f(x)$
(c) $[f(x)]^3$ (d) None of these

23. If $f : R \to R$ is given by

$$f(x) = \begin{cases} -1, & \text{when } x \text{ is rational} \\ 1, & \text{when } x \text{ if irrational} \end{cases}$$

then $(fof)(1 - \sqrt{3})$ is equal to
(a) 1 (b) -1
(c) $\sqrt{3}$ (d) 0

24. The relation f is defined by $f(x) = \begin{cases} x^2, & 0 \leq x \leq 3 \\ 3x, & 3 \leq x \leq 10 \end{cases}$

The relation g is defined by $g(x) = \begin{cases} x^2, & 0 \leq x \leq 2 \\ 3x, & 2 \leq x \leq 10 \end{cases}$.

Which of the following relation is a function? [NCERT Exemplar]
(a) f (b) g
(c) f, g (d) None of these

25. The domain of the function f defined by $f(x) = \sqrt{4 - x} + \dfrac{1}{\sqrt{x^2 - 1}}$ is equal to [NCERT Exemplar]
(a) $(-\infty, -1) \cup (1, 4]$
(b) $(-\infty, -1] \cup (1, 4]$
(c) $(-\infty, -1) \cup [1, 4]$
(d) $(-\infty, -1) \cup [1, 4)$

26. The domain and range of the real function f defined by $f(x) = \dfrac{4-x}{x-4}$ is given by [NCERT Exemplar]
(a) Domain $= \mathrm{R}$, Range $= \{-1, 1\}$
(b) Domain $= \mathrm{R} - \{1\}$, Range $= R$
(c) Domain $= \mathrm{R} - \{4\}$, Range $= \{-1\}$
(d) Domain $= \mathrm{R} - \{-4\}$, Range $= \{-1, 1\}$

27. The domain of the function f given by $f(x) = \dfrac{x^2 + 2x + 1}{x^2 - x - 6}$ [NCERT Exemplar]
(a) $\mathrm{R} - \{3, -2\}$ (b) $\mathrm{R} - \{-3, 2\}$
(c) $\mathrm{R} - [3, -2]$ (d) $\mathrm{R} - (3, -2)$

28. The domain and range of the function f given by $f(x) = 2 - |x - 5|$ is [NCERT Exemplar]
(a) Domain $= \mathrm{R}^+$, Range $= (-\infty, 1]$
(b) Domain $= \mathrm{R}$, Range $= (-\infty, 2]$
(c) Domain $= \mathrm{R}$, Range $= (-\infty, 2)$
(d) Domain $= \mathrm{R}^+$, Range $= (-\infty, 2]$

29. The domain for which the functions defined by $f(x) = 3x^2 - 1$ and $g(x) = 3 + x$ are equal to [NCERT Exemplar]

(a) $\left\{-1, \frac{4}{3}\right\}$ (b) $\left\{-1, -\frac{4}{3}\right\}$

(c) $\left\{1, \frac{4}{3}\right\}$ (d) $\left\{1, -\frac{4}{3}\right\}$

30. Range of $f(x) = \dfrac{1}{1 - 2\cos x}$ is [NCERT Exemplar]

(a) $\left[\frac{1}{3}, 1\right]$ (b) $\left[-1, \frac{1}{3}\right]$

(c) $(-\infty, -1) \cup \left[\frac{1}{3}, \infty\right)$ (d) $\left[-\frac{1}{3}, 1\right]$

31. Let $f : [0, 1] \to [0, 1]$ defined by $f(x) = \dfrac{1-x}{1+x}, 0 \le x \le 1$ and let $g : [0, 1] \to [0, 1]$ be defined by $g(x) = 4x(1 - x)$, $0 \le x \le 1$, then fog and gof is

(a) $\dfrac{(2x-1)^2}{1+4x-4x^2}, \dfrac{8x(1-x)}{(1+x)^2}$ (b) $\dfrac{(2x-1)}{1+4x-4x^2}, \dfrac{8(1-x)x}{(1+x)^2}$

(c) $\dfrac{(2x+1)^2}{1+4x+4x^2}, \dfrac{8}{(1+x)^2}$ (d) $\dfrac{(2x+1)^2}{(1+x)^2}, \dfrac{8(1-x)}{(1+x)^2}$

32. If $f : R \to R$, $g : R \to R$ and $h : R \to R$ are such that $f(x) = x^2$, $g(x) = \tan x$ and $h(x) = \log x$, then the value of $(ho(gof))(x)$, if $x = \sqrt{\frac{\pi}{4}}$ will be

(a) 0 (b) 1

(c) –1 (d) π

33. If $[x]^2 - 5[x] + 6 = 0$, where $[\cdot]$ denote the greatest integer function, then [NCERT Exemplar]

(a) $x \in [3, 4]$ (b) $x \in (2, 3]$

(c) $x \in [2, 3]$ (d) $x \in [2, 4)$

34. Let $f(x) = x^2 - x + 1$, $x \ge \frac{1}{2}$, then the solution of the equation $f(x) = f^{-1}(x)$ is

(a) $x = 1$ (b) $x = 2$

(c) $x = \frac{1}{2}$ (d) None of these

35. Let $f : R \to R$, $g : R \to R$ be two functions such that

$$f(x) = 2x - 3, \quad g(x) = x^3 + 5.$$

The function $(fog)^{-1}(x)$ is equal to

(a) $\left(\frac{x+7}{2}\right)^{1/3}$ (b) $\left(x - \frac{7}{2}\right)^{1/3}$

(c) $\left(\frac{x-2}{7}\right)^{1/3}$ (d) $\left(\frac{x-7}{2}\right)^{1/3}$

36. The inverse of the function $y = \dfrac{10^x - 10^{-x}}{10^x + 10^{-x}}$ is

(a) $\log_{10}(2 - x)$ (b) $\frac{1}{2}\log_{10}\frac{1+x}{1-x}$

(c) $\frac{1}{2}\log_{10}(2x - 1)$ (d) $\frac{1}{4}\log\left(\frac{2x}{2-x}\right)$

37. If $f(x) = \cos(\log x)$, then $f(x)f(y) - \frac{1}{2}\left[f\left(\frac{x}{y}\right) + f(xy)\right]$ has the value

(a) –1 (b) $\frac{1}{2}$

(c) –2 (d) 0

Previous Years' Questions

38. Let $f : N \to Y$ be a function defined as $f(x) = 4x + 3$ where

$Y = \{y \in N : y = 4x + 3 \text{ for some } x \in N\}$.

If f is invertible, then its inverse is [AIEEE 2008]

(a) $g(y) = \frac{y-3}{4}$ (b) $g(y) = \frac{3y+4}{3}$

(c) $g(y) = 4 + \frac{y+3}{4}$ (d) $g(y) = \frac{y+3}{4}$

39. A real valued function $f(x)$ satisfies the functional equation

$$f(x - y) = f(x)f(y) - f(a - x)f(a + y)$$

where a is a given constant and $f(0) = 1$, $f(2a - x)$ is equal to [AIEEE 2005]

(a) $f(-x)$ (b) $f(a) + f(a - x)$

(c) $f(x)$ (d) $-f(x)$

40. The graph of the function $y = f(x)$ is symmetrical about the line $x = 2$, then [AIEEE 2004]

(a) $f(x + 2) = f(x - 2)$ (b) $f(2 + x) = f(2 - x)$

(c) $f(x) = f(-x)$ (d) $f(x) = -f(-x)$

41. If $f : R \to R$ satisfies $f(x + y) = f(x) + f(y)$, for all $x, y \in R$ and $f(1) = 7$, then $\sum_{r=1}^{n} f(r)$ is [AIEEE 2003]

(a) $\frac{7n}{2}$

(b) $\frac{7(n+1)}{2}$

(c) $7n(n + 1)$

(d) $\frac{7n(n+1)}{2}$

the Guidance

Round I

1. $n[(A \times B) \cap (B \times A)] = n[(A \cap B) \times (B \cap A)]$

$= n(A \cap B) \times n(B \cap A) = 99 \times 99 = 99^2$

2. Given, $n(A) = 3, n(B) = 4$

$\therefore \quad n(A \times A \times B) = 3 \times 3 \times 4 = 36$

3. $A \times B = \{1, 2, 3\} \times \{3, 4\}$

$= \{(1, 3), (1, 4), (2, 3), (2, 4), (3, 3), (3, 4)\}$

and $B \times C = \{3, 4\} \times \{4, 5, 6\}$

$= \{(3, 4), (3, 5), (3, 6), (4, 4), (4, 5), (4, 6)\}$

$\therefore \quad (A \times B) \cap (B \times C) = \{(3, 4)\}$

4. $A \cup B = \{1, 2, 3\} \cup \{3, 8\} = 1, 2, 3, 8\}$

and $A \cap B = \{1, 2, 3\} \cap \{3, 8\} = \{3\}$

$\therefore \quad (A \cup B) \times (A \cap B) = \{1, 2, 3, 8\} \times \{3\}$

$= \{(1, 3), (2, 3), (3, 3), (8, 3)\}$

5. **Statement I** If $A \cap B = \phi$, then it is not necessary that $A = \phi$ or $B = \phi$.

Statement II It is true $\{a, b\} = \{b, a\}$ and $(a, b) \neq (b, a)$

Statement III By properties of cartesian product

If $A \leq B$, then $A \times A \subseteq (A \times B) \cap (B \times A)$

Statement IV Also $A \subseteq B$ and $C \subseteq D$, then $A \times C \subseteq B \times D$ by properties of cartesian product.

6. Given, $A = \{x : x^2 - 5x + 6 = 0\}$

$= \{x : (x - 2)(x - 3) = 0\} = \{2, 3\}$

and $B = \{2, 4\}$ and $C = \{4, 5\}$

Now, $B \cap C = \{2, 4\} \cap \{4, 5\} = \{4\}$

$\therefore \quad A \times (B \cap C) = \{2, 3\} \times \{4\} = \{(2, 4), (3, 4)\}$

7. $\because n(A \times A) = n(A) = 3^2 = 9$. So, the total number of subsets of $A \times A$ is 2^9 and a subset of $A \times A$ is a relation over the set A.

8. Given, $n(A) = m$ and $n(B) = n$

$\therefore$ Total number of relations from A to $B = 2^{mn}$

$\therefore$ Total number of non-empty relations from A to $B = 2^{mn} - 1$

9. Given, $R = \{(x, y) : x, y \in I, x^2 + y^2 \leq 4\}$

$= \{(0, 0), (0, -1), (0, 1), (0, -2), \ldots, (-2, 0)\}$

$\therefore$ Domain of $R = \{x : (x, y) \in R\} = \{-2, -1, 0, 1, 2\}$

10. Given, $R = \{(x, y) : x + 2y = 8, x, y \in N\}$

$$x + 2y = 8 \Rightarrow y = \frac{8 - x}{2}$$

$\therefore \quad R = \{(2, 3), (4, 2), (6, 1)\}$

$\therefore$ Domain of $R = \{x : (x, y) \in R\} = \{2, 4, 6\}$

11. Given, set is $A = \{x : |x| < 3, x \in I\}$

$A = \{x : -3 < x < 3, x I\} = \{-2, -1, 0, 1\}$

Also, $R = \{(x, y) : y = |x|\}$

$\therefore \quad R = \{(-2, 2), (-1, 1), (1, 1), (0, 0), (2, 2)\}$

12. Given, $R = \{(a, b) : a - b = 3\} = \{(4, 1), (5, 2), (6, 3), \ldots\}$

13. Given, $A = \{2, 3, 4, 5\}$ and $B = \{3, 6, 7, 10\}$

$\therefore \quad R = \{(2, 6), (2, 10), (3, 3), (3, 6), (5, 10)\}$

$\Rightarrow \quad R^{-1} = \{(6, 2), (10, 2), (3, 3), (6, 3), (10, 5)\}$

14. Let $A = \{11, 12, 13\}, B = \{8, 10, 12\}$

$\therefore \quad R = \{(11, 8), (13, 10)\}$

$R^{-1} = \{(8, 11), (10, 13)\}$

15. Given, $R \subseteq A \times B$ and $S \subseteq B \times C$, we have

$$SoR \subseteq A \times C$$

$\therefore$ SoR is a relation from A to C.

16. Given, $R = \{(4, 5), (1, 4), (4, 6), (7, 6), (3, 7)\}$

$\therefore \quad R^{-1} = \{(5, 4), (4, 1), (6, 4), (6, 7), (7, 3)\}$

$\Rightarrow \quad R^{-1}oR = \{(4, 4), (1, 1), (4, 7), (7, 4), (7, 7), (3, 3)\}$

17. $f(x) = \sqrt{1 + x^2}$

Now, $\quad f(xy) = \sqrt{1 + x^2 y^2} \quad$ ...(i)

and $\quad f(x)f(x) = \sqrt{1 + x^2}\sqrt{1 + y^2}$

$\Rightarrow \quad f(x)f(y) = \sqrt{1 + x^2 y^2 + x^2 + y^2} \quad$ ...(ii)

$\therefore$ From Eqs. (i) and (ii), we get

$$f(x)f(y) \geq f(xy)$$

18. Let $f(x) = \sqrt{a^2 - x^2}$

For $f(x)$ to be defined $a^2 - x^2 \geq 0 \Rightarrow x^2 \leq a \Rightarrow x \in [-a, a]$

19. $(fof)x = f\left(\dfrac{x}{x-1}\right) = \dfrac{\dfrac{x}{x-1}}{\left(\dfrac{x}{x-1}\right) - 1} = x$

$\Rightarrow \quad (fofof)x = f(fof)x = f(x) = \dfrac{x}{x-1}$

$\therefore \quad (fofof \ldots 19 \text{ times})(x) = \dfrac{x}{x-1}$

20. Given, $f(x) = ax + b$

Also, $\quad f(-1) = -5$ and $f(3) = 3$

$\therefore \quad -5 = -a + b$ and $3 = 3a + b$

On solving, we get

$$a = 2, b = -3$$

21. Since, $\quad y = \dfrac{3x + 2}{5x - 3} \Rightarrow x = \dfrac{3y + 2}{5y - 3} = f^{-1}(y)$

$\therefore \quad f^{-1}(x) = \dfrac{3x + 2}{5x - 3} = f(x)$

22. Since, $\quad g(x) = \dfrac{3x + x^3}{1 + 3x^2} = y$, (say) $\quad$ ...(i)

$\therefore \quad f[g(x)] = f(y) = \log\left(\dfrac{1 + y}{1 - y}\right)$

$\Rightarrow \quad f(g(x)) = \log\left\{\dfrac{1 + \dfrac{3x + x^3}{1 + 3x^2}}{1 - \dfrac{3x + x^3}{1 + 3x^2}}\right\}$

$\Rightarrow \quad f(g(x)) = \log\left(\dfrac{1 + x}{1 - x}\right)^3$

$\therefore \quad f(g(x)) = 3\log\left(\dfrac{1 + x}{1 - x}\right) = 3f(x)$

23. Given, $f(x) = \begin{cases} -1, & \text{when } x \text{ is rational} \\ 1, & \text{when } x \text{ is irrational} \end{cases}$

Now, $\quad (fof)(1 - \sqrt{3}) = f[f(1 - \sqrt{3})] = f(1) = -1$

24. Given, $\quad f(x) = \begin{cases} x^2, & 0 \leq x \leq 3 \\ 3x, & 3 \leq x \leq 10 \end{cases}$

$\because \quad f(x) = x^2$ is well defined in $0 \leq x \leq 3$

and $\quad f(x) = 3x$ is also well defined in $3 \leq x \leq 10$

At $x = 3$, $\quad f(x) = x^2 \Rightarrow f(3) = 3^2 = 9$

At $x = 3$, $\quad f(x) = 3x \Rightarrow f(3) = 3 \times 3 = 9$

$\Rightarrow \quad f(x)$ is defined at $x = 3$. Hence, f is a function.

$$g(x) = \begin{cases} x^2, & 0 \leq x \leq 2 \\ 3x, & 2 \leq x \leq 10 \end{cases}$$

$\because \quad g(x) = x^2$ is well defined in $0 \leq x \leq 2$.

and $\quad g(x) = 3x$ is also well defined in $2 \leq x \leq 10$

But at $x = 2$,

$$g(x) = x^2 \Rightarrow g(2) = 2^2 = 4$$

At $x = 2$,

$$g(x) = 3x \Rightarrow g(2) = 3 \times 2 = 6$$

Therefore, $g(x)$ is not defined at $x = 2$. Hence, g is not a function.

25. Given, $f(x) = \sqrt{4 - x} + \dfrac{1}{\sqrt{x^2 - 1}}$

For domain of $f(x)$,

$$4 - x \geq 0 \text{ and } x^2 - 1 > 0$$

$\Rightarrow \quad x \leq 4$ and $x^2 > 1$

$\Rightarrow \quad x \leq 4$ and $x \in (-\infty, -1) \cup (1, \infty)$

$\therefore \quad x \in (-\infty, -1) \cup (1, 4]$

26. Given, $\quad f(x) = \dfrac{4 - x}{x - 4} = -\dfrac{(x - 4)}{(x - 4)}$

$$f(x) = -1$$

$\therefore$ Range of $f(x)$ is $\{-1\}$

For domain of $f(x)$, $x - 4 \neq 0 \Rightarrow x \neq 4$

$$x \in R - \{4\}$$

27. Given, $\quad f(x) = \dfrac{x^2 + 2x + 1}{x^2 - x - 6}$

For domain of $f(x)$, $x^2 - x - 6 \neq 0$

$\therefore \quad (x - 3)(x + 2) \neq 0 \Rightarrow x \neq 3, -2$

$\therefore$ Domain of $f(x)$ is $R - \{3, -2\}$.

28. Given, $f(x) = 2 - |x - 5|$

Domain of $f(x)$ is defined for all real values of x.

Since, $\quad |x - 5| \geq 0$

$\Rightarrow \quad -|x-5| \le 0$

$\Rightarrow \quad 2-|x-5| \le 2$

$\Rightarrow \quad f(x) \le 2$

Hence, range of $f(x)$ is $(-\infty, 2]$

29. Given $f(x) = 3x^2 - 1$ and $g(x) = 3 + x$

$\because \quad 3x^2 - 1 = 3 + x$

$\Rightarrow \quad 3x^2 - x - 4 = 0$

$\Rightarrow \quad 3x^2 - 4x + 3x - 4 = 0$

$\Rightarrow \quad x(3x-4) + 1(3x-4) = 0$

$\Rightarrow \quad (x+1)(3x-4) = 0 \Rightarrow x = -1, x = \frac{4}{3}$

30. Given, $f(x) = \frac{1}{1-2\cos x}$

we know, $\quad -1 \le \cos x \le 1$

$\Rightarrow \quad -2 \le 2\cos x \le 2$

$\Rightarrow \quad -2 \le -2\cos x \le 2$

$\Rightarrow \quad 1-2 \le 1-2\cos x \le 2+1$

$\Rightarrow \quad -1 \le 1-2\cos x \le 3 \Rightarrow -1 \le \frac{1}{1-2\cos x} \le \frac{1}{3}$

31. $fog = f[4x(1-x)] = \frac{1-4x(1-x)}{1+4x(1-x)} = \frac{1-4x+4x^2}{1+4x-4x^2} = \frac{(2x-1)^2}{1+4x-4x^2}$

and $\quad gof = g\left(\frac{1-x}{1+x}\right) = 4\left(\frac{1-x}{1+x}\right)\left(1-\frac{1-x}{1+x}\right)$

$= \frac{4(1-x)}{(1+x)}\left(\frac{1+x-1+x}{1+x}\right) = \frac{8x(1-x)}{(1+x)^2}$

32. $\{ho(gof)\}x = ho\{g(x^2)\} = ho(\tan x^2) = \log(\tan x^2)$

At $x = \sqrt{\frac{\pi}{4}}$, $\quad \{ho(gof)\}(x) = \log\left\{\tan\left(\sqrt{\frac{\pi}{4}}\right)^2\right\}$

$= \log\left(\tan\frac{\pi}{4}\right) = \log 1 = 0$

33. Given $[x]^2 - 5[x] + 6 = 0$

$\Rightarrow \quad [x]^2 - 3[x] - 2[x] + 6 = 0$

$\Rightarrow \quad [x]([x]-3) - 2([x]-3) = 0$

$\Rightarrow \quad ([x]-3)([x]-2) = 0$

$\Rightarrow \quad [x] = 3$ or $[x] = 2$

$\Rightarrow \quad x \in [3, 4)$ or $x \in [2, 3)$

$\therefore \quad x \in [2, 4)$

34. Let $\quad y = x^2 - x + 1 \Rightarrow x = \frac{1 \pm \sqrt{1-4(1-y)}}{2}$

$\because \quad x > \frac{1}{2}$

$\therefore \quad x = \frac{1}{2} + \sqrt{y - \frac{3}{4}} \Rightarrow f^{-1}(x) = \frac{1}{2} + \sqrt{x - \frac{3}{4}}$

Now, $\quad x^2 - x + 1 = \frac{1}{2} + \sqrt{x - \frac{3}{4}}$

$\Rightarrow \quad x = 1$ (by checking the given possibilities)

35. We have, $f(x) = 2x - 3$, $g(x) = x^3 + 5$

$(fog)\,x = f(x^3 + 5) = 2(x^3 + 5 - 3) = 2x^3 + 7$

Let $\quad y = (fog)x = 2x^3 + 7 \Rightarrow x = \left(\frac{y-7}{2}\right)^{1/3}$

$\therefore \quad (fog)^{-1}\,x = \left(\frac{x-7}{2}\right)^{1/3}$

36. Since, $\quad y = \frac{10^{2x} - 1}{10^{2x} + 1}$

$\Rightarrow \quad y10^{2x} + y = 10^{2x} - 1 \Rightarrow 10^{2x} = \frac{1+y}{1-y}$

$\therefore \quad 2x\log_{10} 10 = \log_{10}\frac{1+y}{1-y} \Rightarrow x = \frac{1}{2}\log_{10}\left(\frac{1+y}{1-y}\right)$

Hence, the inverse of y is $\frac{1}{2}\log_{10}\left(\frac{1+x}{1-x}\right)$.

37. We have, $f(x) = \cos(\log x)$

$\therefore \quad f(x)\,f(y) - \frac{1}{2}\left[f\left(\frac{x}{y}\right) + f(xy)\right]$

$= \cos(\log x)\cos(\log y) - \frac{1}{2}[2\cos(\log x)\cos(\log y)]$

$= \cos(\log x)\cos(\log y) - \cos(\log x)\cos(\log y) = 0$

38. Since, $Y = \{y \in N : y = 4x + 3$ for some $x \in N\}$

$\therefore \quad Y = \{7, 11, \ldots \infty\}$

Let $\quad y = 4x + 3 \Rightarrow x = \frac{y-3}{4}$

Inverse of $f(x)$ is $g(y) = \frac{y-3}{4}$.

39. Given, $\quad f(x-y) = f(x)\,f(y) - f(a-x)\,f(a+y)$

Let $\quad x = 0 = y$

$\Rightarrow \quad f(0) = \{f(0)\}^2 - \{f(a)\}^2$

$\Rightarrow \quad 1 = 1 - \{f(a)\}^2 \qquad [f(0) = 1, \text{ given}]$

$\Rightarrow \quad f(a) = 0$

$\therefore \quad f(2a - x) = f\{a - (x - a)\} = f(a)f(x-a) - f(a-a)f(x)$

$= 0 - f(x)\cdot 1 = -f(x)$

40. Since, graph is symmetrical about the line $x = 2$.

$\therefore \quad f(2 + x) = f(2 - x)$

41. $\sum_{r=1}^{n} f(r) = f(1) + f(2) + f(3) + \ldots + f(n)$

$= f(1) + 2f(1) + 3f(1) + \ldots + nf(1)$

[since, $f(x+y) = f(x) + f(y)$]

$= (1 + 2 + 3 + \ldots + n)f(1) = f(1)\Sigma n$

$= \frac{7n(n+1)}{2} \qquad [\because f(1) = 7, \text{ given}]$

3 Sequence and Series

JEE Main MILESTONE

- Sequence

- Progression
- Arithmetic Progression (AP)
- Insertion of Arithmetic Mean (AM) between Two Numbers
- Geometric Progression (GP)
- Insertion of Geometric Mean (GM) between Two Numbers
- Harmonic Progression (HP)
- Insertion of Harmonic Mean (HM) between Two Numbers
- Relation among Arithmetic Mean, Geometric Mean
- Arithmetico-Geometric Progression
- To Find nth Term by Difference Method
- Sum of n Terms of Special Series Σn, Σn^2 and Σn^3

3.1 Sequence

A set of numbers arranged in a definite order according to some definite rule is called a sequence.

OR

A sequence is a function from natural number N domain to real number (complex number) R/C (codomain)

e.g., 2, 4, 6, 8, ... is a sequence.

In Mathematics, the word 'sequence' is used in the same way as it is in ordinary English. When we say that a collection of objects is listed in a sequence, we usually mean that the collection is ordered in such a way that it has an identified first member, second member, third member and so on.

3.2 Series

If $a_1, a_2, \ldots, a_n$ is a sequence, then the expression $a_1 + a_2 + \ldots + a_n + \ldots$ is called the series. The series is said to be finite or infinite according as the given series is finite or infinite.

e.g., (i) $2 + 4 + 6 + 8 + \ldots + 20$ is a finite series.

(ii) $1 + 3 + 5 + \ldots$ is an infinite series.

3.3 Progression

It is not necessary that the terms of a sequence always follow a certain pattern or they are described by some explicity formula for the nth term. Those sequences whose terms follow certain patterns are called progression.

OR

If the terms of a sequence are written under specific conditions, then the sequence is called progression.

3.4 Arithmetic Progression (AP)

A sequence is said to be an arithmetic progression, if the difference of a term and its previous term is always same.

i.e., $a_{n+1} - a_n = \text{Constant } (= d), \forall\, n \in N$

The constant difference, generally denoted by d, is called the common difference.

OR

An arithmetic progression (AP) is a sequence whose terms increase or decrease by a fixed number. This fixed number is called the common difference of the AP.

In other words, if $a_1, a_2, a_3, \ldots, a_n$ are in AP, then

$$a_2 - a_1 = a_3 - a_2 = \ldots = a_n - a_{n-1} = d$$

If a is the first term and d is the common difference, then AP can be written as $a, a + d, a + 2d, \ldots, [a + (n-1)d]$

e.g., (i) 1, 3, 5, 7, ...

(ii) 2, 4, 6, ...

The nth term of an AP

Let a be the first term d be the common difference and l be the last term of an AP, then nth term is given by

$$T_n = l = a + (n-1)d, \text{ where } d = T_n - T_{n-1}$$

The nth term from last is $T_n' = l - (n-1)d$

The sum of n terms of an AP

Suppose there are n terms of a sequence, whose first term is a, common difference is d and last term is l, then sum of n terms is given by

$$S_n = \frac{n}{2}[2a + (n-1)d] = \frac{n}{2}[a + l]$$

***Sample* Problem 1** *The sum of all natural numbers lying between 100 and 1000, which are multiples of 5, is* [NCERT]

(a) 98400 (b) 98450

(c) 98436 (d) 98455

Interpret (b) The numbers are 105, 110, 115, ... , 995.

Here, first term $(a) = 105$

and common difference $(d) = 110 - 105 = 5$

Now, nth term, $T_n = a + (n-1)d$

$\Rightarrow$ $995 = 105 + (n-1)5$ $(\because a = 105, T_n = 995)$

$\Rightarrow$ $995 - 105 = (n-1)5$

$\Rightarrow$ $890 = (n-1)5$

$\Rightarrow$ $n - 1 = \frac{890}{5} = 178$

$\Rightarrow$ $n = 178 + 1 = 179$

Now, required sum, $S_n = \frac{n}{2}[2a + (n-1)d]$

$$= \frac{179}{2}[2 \times 105 + (179-1)5]$$

$$= \frac{179}{2}(210 + 178 \times 5)$$

$$= \frac{179}{2}(210 + 890) = \frac{179}{2} \times 1100$$

$$= 179 \times 550 = 98450$$

***Sample* Problem 2** *The ratio of sums of m and n terms of an AP is $m^2 : n^2$. Then, the ratio of the mth and nth term is* [NCERT]

(a) $(2m+1):(2n+1)$ (b) $m:n$

(c) $(2m-1):(2n-1)$ (d) *None of these*

Interpret (c) Let a and d be the first term and common difference of given AP.

$\therefore$ $S_m = \frac{m}{2}[2a + (m-1)d]$

and $S_n = \frac{n}{2}[2a + (n-1)d]$

According to the question,

$$\frac{S_m}{S_n} = \frac{m^2}{n^2}$$

$\Rightarrow$ $\frac{2a + (m-1)d}{2a + (n-1)d} = \frac{m}{n}$

$\Rightarrow$ $2a(n-m) = d\{(n-1)m - (m-1)n\}$

$\Rightarrow$ $d = 2a$

Now, $\frac{T_m}{T_n} = \frac{a + (m-1)d}{a + (n-1)d}$

$$= \frac{a + (m-1)2a}{a + (n-1)2a} = \frac{2m-1}{2n-1}$$

Thus, $T_m : T_n = (2m-1):(2n-1)$

***Sample* Problem 3** *In a potato race 20 potatoes are placed in a line at intervals of 4 m with the first potato 24 m from the starting point. A contestant is required to being the potatoes back to the starting place on at a time. How far would he run in bringing back all the potatoes?* [NCERT Exemplar]

(a) 2485 *m* (b) 2480 *m*

(c) 2482 *m* (d) *None of these*

Interpret (b) According to the given condition, the sequence becomes,

$$24, 28, \ldots, 20\text{th term},$$

Here, $a = 24, d = 28 - 24 = 4, n = 20$

$\therefore$ $S_n = \frac{n}{2}[2a + (n-1)d]$

$$= \frac{20}{2}[2 \times 24 + (20-1)4]$$

$$= 10(48 + 76) = 10 \times 124 = 1240$$

The contestant is required to bring the potatoes back to the starting place $= 2S_n = 2 \times 1240 = 2480$ m

Important Results Related to AP

(i) If a fixed constant C is added to (or subtracted from) each term of a given AP, then the resulting sequence is also an AP with the same common difference as that of the given AP.

(ii) If each term of an AP is multiplied by (or divided by) a non-zero fixed constant C, then the resulting sequence is also an AP with common difference C times $\left(\text{or } \frac{1}{C} \text{ times}\right)$ the previous.

(iii) If $a_1, a_2, a_3, \ldots$ and $b_1, b_2, b_3, \ldots$ are two AP's, then $a_1 \pm b_1$, $a_2 \pm b_2, a_3 \pm b_3, \ldots$ is also an AP with common difference $d_1 \pm d_2$.

(iv) A sequence obtained by multiply or division of corresponding terms of two AP is not an AP.

(v) If in an AP, $S_p = q$ and $S_q = p$, then $S_{p+q} = -(p+q)$.

(vi) Three numbers in AP can be taken as $a-d, a, a+d$, five numbers in AP can be taken as $a-2d, a-d, a, a+d, a+2d$, where the common difference is d.

(vii) Four numbers in AP can be taken as $a-3d, a-d, a+d, a+3d$, where common difference is $2d$.

(viii) In an AP, the sum of terms equidistant from the beginning and end is constant and equal to the sum of first and last term,

i.e., $a_1 + a_n = a_2 + a_{n-1} = a_3 + a_{n-2} = \ldots$

(ix) Any term of an AP (except the first) is equal to half the sum of terms which are equidistant from it, *i.e.*,

$$a_n = \frac{1}{2}(a_{n-k} + a_{n+k}), k < n$$

and for $k = 1, a_n = \frac{1}{2}(a_{n-1} + a_{n+1})$

(x) $T_n = S_n - S_{n-1}\ (n \geq 2)$.

(xi) A sequence is an AP, if its nth term is of the form $An + B$, *i.e.*, a linear expression in n. In such a case the common difference is A *i.e.*, the coefficient of n.

(xii) If sum of n terms of any sequence is quadratic expression in n (*i.e.*, $S_n = an^2 + bn + c$), then sequence is AP.

(xiii) The common difference of an AP can be zero, positive or negative.

***Sample* Problem 4** *The sum of three numbers in AP is –3 and their product is 8. Then, sum of squares of the numbers is*

(a) 9 (b) 10
(c) 21 (d) 12

Interpret (c) Let the three numbers in AP are $a-d, a, a+d$.

$\therefore \quad (a-d) + a + (a+d) = -3$

$\Rightarrow \quad 3a = -3$

$\Rightarrow \quad a = -1$

and $\quad (a-d)(a)(a+d) = 8$

$\Rightarrow \quad (-1)\{(-1)^2 - d^2\} = 8$

$\Rightarrow \quad d^2 = 9$

$\Rightarrow \quad d = \pm 3$

If $d = 3$, then numbers are $-4, -1$ and 2.

If $d = -3$, then numbers are $2, -1$ and -4.

Hence, the sum of squares of numbers $= (-4)^2 + (-1)^2 + (2)^2$

$= 16 + 1 + 4 = 21$

3.5 Insertion of Arithmetic Mean (AM) between Two Numbers

Let $A_1, A_2, \ldots, A_n$; n arithmetic means are inserted between two numbers a and b such that $a, A_1, A_2, \ldots, A_n, b$ form an AP.

Here, total number of terms are $(n+2)$ and common difference be d (say).

$\therefore \ b = (n+2)$ th term $= a + (n+2-1)d$

$\Rightarrow \quad d = \dfrac{b-a}{n+1}$

$\therefore \quad A_1 = a + d = a + \left(\dfrac{b-a}{n+1}\right) = \dfrac{na+b}{n+1}$

and $\quad A_2 = a + 2d = a + 2\left(\dfrac{b-a}{n+1}\right)$

$= \dfrac{(n-1)a + 2b}{n+1}$

In general, $\quad A_r = a + r\left(\dfrac{b-a}{n+1}\right)$

$= \dfrac{(n-r+1)a + rb}{n+1}, \quad \forall\, r = 1, 2, \ldots, n$

(i) If $r = 1$ and $n = 1$, then

$$A_1 = \frac{(1-1+1)a + 1(b)}{1+1}$$

$\Rightarrow \quad A_1 = \dfrac{a+b}{2} = \text{Mean}$

Arithmetic Mean

If we insert one arithmetic mean between two numbers a and b, then

$$\text{Arithmetic mean} = \frac{a+b}{2}$$

Note

- The sum of n arithmetic means between a and b is n times of arithmetic mean of a and b

i.e., $\quad A_1 + A_2 + \ldots + A_n = n\left(\dfrac{a+b}{2}\right) = nA$

- The arithmetic mean of n positive numbers $a_1, a_2, a_3, \ldots, a_n$ is

$$\text{AM} = \frac{a_1 + a_2 + a_3 + \ldots + a_n}{n}$$

***Sample* Problem 5** *If we insert five numbers between 8 and 26 such that the resulting sequence is an AP, then the resulting sequence is* [NCERT]

(a) 8, 11, 14, 16, 20, 23, 26 (b) 8, 11, 14, 17, 20, 23, 26
(c) 8, 11, 14, 17, 20, 22, 26 (d) *None of these*

Interpret (b) Let five numbers are A_1, A_2, A_3, A_4, A_5, then $8, A_1, A_2, A_3, A_4, A_5, 26$ are in AP.

$\because \quad T_n = a + (n-1)d$

$\therefore \quad 26 = 8 + (7-1)d$

($\because n = 7$ since, 2 terms and 5 numbers)

$\Rightarrow \quad 26 - 8 = 6d$

$\Rightarrow \quad 18 = 6d$

$\Rightarrow \quad d = \frac{18}{6}$

$\Rightarrow \quad d = 3$

Now, $A_1 = a + d = 8 + 3 = 11$

$\Rightarrow \quad A_2 = a + 2d = 8 + 2 \times 3 = 14$

$A_3 = a + 3d = 8 + 3 \times 3 = 17$

$A_4 = a + 4d = 8 + 4 \times 3 = 20$

and $A_5 = a + 5d = 8 + 5 \times 3 = 23$

Hot Spot

Words Problem Based on AP

Word problems are directly asked in consecutive years of AIEEE (JEE Main) 2011, 2010. *To solve such types of problem following steps are given below.*

Step I Firstly, write all the given information in a order.

Step II Using the formula, sum of an AP, $S_n = \frac{n}{2}[2a + (n-1)d]$

Step III Use another condition, if it is given.

Step IV Simplify the relations and get the result.

***Sample* Problem 6** *A man arranges to pay off a debt of ₹ 3600 by 40 annual instalents which are in AP, when 30 of the instalments are paid, he dies leaving one-third of the debt unpaid. Find the 8th instalment.*

(a) ₹ 65
(b) ₹ 60
(c) ₹ 70
(d) *None of the above*

Interpret (a) **Step I** Firstly, we write all the given information in a order.

Here, $S =$ ₹ 3600, $n = 40$

Let a and d be the first term and common difference of an AP.

Step II Using the formula of sum of an AP.

$$S_n = \frac{n}{2}[2a + (n-1)d]$$

$$3600 = \frac{40}{2}[2a + (40-1)d]$$

$\Rightarrow \quad 180 = 2a + 39d \quad \ldots(i)$

Step III Now, we write another given condition. After 30 instalments one-third of the debt is unpaid

$\therefore \quad \frac{3600}{3} = 1200$ is unpaid and 2400 is paid.

Step IV Again, using the formula of sum of an AP.

$\therefore \quad S_n = \frac{n}{2}[2a + (n-1)d]$

$\therefore \quad 2400 = \frac{30}{2}[2a + (30-1)d]$

$\Rightarrow \quad 160 = 2a + 29d \quad \ldots(ii)$

On solving Eqs. (i) and (ii), we get

$$a = 51, d = 2$$

Step V Finding required results.

$\therefore$ 8th instalment,

$$T_8 = a + (8-1)d$$
$$= 51 + 7 \times 2$$
$$= 51 + 14 = ₹\ 65$$

Check Point 1

1. Which term of the AP, 19, $18\frac{1}{5}$, $18\frac{2}{5}$, ... is the first negative term?
(a) 24 (b) 25 (c) 26 (d) 23

2. The sum of all two digit numbers which when divided by 4, yield unity as remainder, is
(a) 1012 (b) 1201 (c) 1212 (d) 1210

3. If $\log_5 2$, $\log_5 (2^x - 3)$ and $\log_5\left(\frac{17}{2} + 2^{x-1}\right)$ are in AP, then the value of x is
(a) 0 (b) –1
(c) 3 (d) None of these

4. If S_1, S_2 and S_3 denote the sum of n_1, n_2 and n_3 terms respectively of an AP, then
$$\frac{S_1}{n_1}(n_2 - n_3) + \frac{S_2}{n_2}(n_3 - n_1) + \frac{S_3}{n_3}(n_1 - n_2)$$
is equal to
(a) 0 (b) 1 (c) $S_1S_2S_3$ (d) $n_1n_2n_3$

5. If a^2, b^2, c^2 are in AP, then $\frac{a}{b+c}, \frac{b}{c+a}, \frac{c}{a+b}$ are in
(a) AP (b) GP
(c) HP (d) None of these

6. If S_n denotes the sum of n terms of an AP, then $S_{n+3} - 3S_{n+2} + 3S_{n+1} - S_n$ is equal to
(a) 0 (b) 1 (c) $\frac{1}{2}$ (d) 2

7. If $\frac{1}{p+q}, \frac{1}{q+r}, \frac{1}{r+p}$ are in AP, then
(a) p, q, r are in AP (b) q^2, p^2, r^2 are in AP
(c) p^2, q^2, r^2 are in AP (d) None of these

8. If 1, $\log_y x$, $\log_z y$, $-15 \log_x z$ are in AP, then
(a) $z^3 = x$ (b) $x = y^{-1}$
(c) $z^{-3} = y$ (d) All of these

9. A farmer buys a used tractor of ₹ 12000. He pays ₹ 6000 cash and agrees to pay the balance in annual instalment of ₹ 500 plus 12% interest on the unpaid amount. The tractor cost for farmer is
(a) ₹ 16680 (b) ₹ 16670
(c) ₹ 16650 (d) None of these

10. A circle is completely divided into n sectors in such a way that the angles of the sectors are in AP. If the smallest of these angles is 8° and the largest is 72°, then the angle in the fifth sector is
(a) 40° (b) 35° (c) 42° (d) 43°

3.6 Geometric Progression (GP)

A sequence of non-zero numbers is called a geometric progression, if the ratio of a term and the term preceding to it is always a constant quantity. This constant factor is called the common ratio of the GP.

OR

A geometric progression (GP) is a sequence of numbers, whose first term is non-zero and each of the term is obtained by multiplying its just preceding term by a constant quantity. This constant quantity is called the common ratio of the GP.

In other words, if $a_1, a_2, a_3, \ldots, a_n$ are in GP, then
$$\frac{a_2}{a_1} = \frac{a_3}{a_2} = \ldots = \frac{a_n}{a_{n-1}} = r \quad \text{(say)}$$
r is known as common ratio of GP.

If a is the first term and r is the common ratio, then GP can be written as $a, ar, ar^2, \ldots, ar^{n-1}$. $(a \neq 0)$

e.g., 2, 4, 8, 16, ...

The nth term of a GP (General Term)

Let a be the first term, r be the common ratio and l be the last term of a GP, then nth term is given by
$$T_n = l = ar^{n-1}, \text{ where } r = \frac{T_n}{T_{n-1}}$$

The nth term from last is, $T_n' = \frac{l}{r^{n-1}}$

The sum of n terms of a GP

Suppose there are n terms of a sequence, whose first term is a, common ratio is r and last term is l, then sum of n terms is given by
$$S_n = \begin{cases} \frac{a(r^n - 1)}{r - 1}, & \text{when } r > 1 \\ \frac{a(1 - r^n)}{1 - r}, & \text{when } r < 1 \\ \text{not define}, & \text{when } r = 1 \end{cases}$$

If, terms are infinite, then sum of GP is,
$$S_\infty = \frac{a}{1-r}, \text{ when } |r| < 1$$

Note If first term of a GP is positive *i.e.*, if $a > 0$, then GP is increasing, if $r > 1$ and decreasing, if $0 < r < 1$. And if $a < 0$, then GP is increasing, if $0 < r < 1$ and decreasing if $r > 1$.

- If a, b, c, d ... are in GP, they are also in continued proportion
i.e., $\frac{a}{b} = \frac{b}{c} = \frac{c}{d} = \ldots = \frac{1}{r}$ (say)
- If first term of a GP of n terms is a and last term is l. Then, the product of all the terms of the GP is $(al)^{n/2}$.
- If a, b, c are in AP, as well as in GP, then $a = b = c$.

Problem Solving Trick

Value of Recurring Decimal A number is of the form of $a \cdot bbb\ldots$ is recurring decimal.

e.g., Suppose any general terms of the form like $\underbrace{0 \cdot X}_{n \text{ terms}}\ \underbrace{Y}_{m \text{ terms}}$

where X is the non-recurring part and Y is the recurring part.

$$\therefore \qquad \text{Resultant} = \frac{XY - X}{10^{m+n} - 10^n}$$

***Sample* Problem 7** *The number of bacteria in a certain culture doubles every hour. If there were 30 bacteria present in the culture originally, then number of bacteria will be present at the end of 2nd hour, 4th hour and nth hour will be* [NCERT]

(a) 120, 460, $30(2^n)$ (b) 120, 485, $30(2^{n-1})$

(c) 120, 480, $30(2^n)$ (d) *None of these*

Interpret (c) Number of bacteria present in the culture, form a GP whose first term $(a) = 30$ and common ratio $(r) = 2$

Bacteria present after 2nd hour $= ar^2 = 30 \times (2)^2 = 120$

$(\because T_n = ar^{n-1})$

Bacteria present after 4th hour

$= ar^4 = 30 \times (2)^4 = 30 \times 16 = 480$

Bacteria present after nth hour $= ar^n = 30 \times 2^n = (30) \cdot (2^n)$

***Sample* Problem 8** *The sum of the series* $5 + 55 + 555 + \ldots$ *to n terms is* [NCERT]

(a) $\frac{1}{80}(10^{n+1})$ (b) $\frac{5}{81}(10^{n+1} - 9n - 10)$

(c) $\frac{5}{81}(10^{n-1} - 8n - 1)$ (d) $\frac{5}{81}(10^{n+1} + 9n + 10)$

Interpret (b) $5 + 55 + 555 + \ldots$ to n terms

$= 5\{1 + 11 + 111 + \ldots \text{ to } n \text{ terms}\}$

$= \frac{5}{9}\{9 + 99 + 999 + \ldots \text{ to } n \text{ terms}\}$

(multiply numerator and denominator by 9)

$= \frac{5}{9}\{(10-1) + (100-1) + (1000-1) + \ldots \text{ to } n \text{ terms}\}$

$= \frac{5}{9}\{10 + 100 + 1000 + \ldots + n \text{ terms} - (1 + 1 + \ldots + n \text{ terms})\}$

$= \frac{5}{9}\left\{\frac{10(10^n - 1)}{10 - 1} - n\right\} = \frac{5}{81}\{10^{n+1} - 10 - 9n\}$

***Sample* Problem 9** *If a, b, c are pth, qth and rth terms of a GP, then* $(q - r)\log a + (r - p)\log b + (p - q)\log c$ *is equal to*

(a) $p + q + r$

(b) 1

(c) $-pqr$

(d) 0

Interpret (d) Let A and R be the first term and common ratio of the given GP. Then, $a = AR^{p-1}$

$\Rightarrow \qquad \log a = \log A + (p-1)\log R \qquad \ldots(i)$

Similarly, $\qquad \log b = \log A + (q-1)\log R \qquad \ldots(ii)$

and $\qquad \log c = \log A + (r-1)\log R \qquad \ldots(iii)$

Now, $\qquad (q - r)\log a + (r - p)\log b + (p - q)\log c$

$= (q - r)\{\log A + (p-1)\log R\}$

$+ (r - p)\{\log A + (q-1)\log R\}$

$+ (p - q)\{\log A + (r-1)\log R\}$

$= \log A\,[q - r + r - p + p - q]$

$+ \log R\,[p(q - r) + q(r - p) + r(p - q)$

$- (q - r) - (r - p) - (p - q)]$

$= \log A \cdot 0 + \log R \cdot 0 = 0$

Important Results Related to GP

(i) If each term of a GP is multiplied (or divided) by a non-zero constant $C\,(\neq 0)$, then the resulting sequence is also a GP with same common ratio.

(ii) If $a, ar, ar^2, \ldots$ and $a', a'r', a'r'^2, \ldots$ are two GP's, then the sequences aa', $aa'(rr')$, $aa'(rr')^2$, ... and $\frac{a}{a'}, \frac{a}{a'}\left(\frac{r}{r'}\right), \frac{a}{a'}\left(\frac{r}{r'}\right)^2, \ldots$ obtained by the products and quotients of the corresponding terms of the given GP's are also GP's with common ratios rr' and $\frac{r}{r'}$ respectively.

(iii) The reciprocals of the terms of a GP also form a GP.

(iv) If $a_1, a_2, a_3, \ldots$ is a GP of positive terms (*i.e.*, $a_i > 0, \ \forall\, i$), then $\log a_1, \log a_2, \log a_3, \ldots$ is an AP and the converse is also true in this case.

(v) The odd number of terms in a GP should be taken as ...

$ar^3, ar^2, ar, a, \frac{a}{r}, \frac{a}{r^2}, \frac{a}{r^3}, \ldots$ where common ratio is r while the even number of terms in a GP should be taken as ...

$ar^5, ar^3, ar, \frac{a}{r}, \frac{a}{r^3}, \frac{a}{r^5}, \ldots$ where common ratio is r^2.

(vi) If $a_1, a_2, a_3, \ldots, a_n$ are in GP, then $a_1^k, a_2^k, a_3^k, \ldots, a_n^k$ will also be in GP whose common ratio is r^k.

(vii) If $a_1, a_2, a_3, \ldots, a_n$ are in AP, then $a^{a_1}, a^{a_2}, a^{a_3}, \ldots, a^{a_n}$ will be in GP whose common ratio is a^d.

(viii) If $a_1, a_2, a_3, \ldots$ and $b_1, b_2, b_3, \ldots$ are in GP, then the sequence(s) $a_1 \pm b_1, a_2 \pm b_2, a_3 \pm b_3, \ldots$, will not be a GP.

(ix) In a GP, the product of two terms equidistant from the beginning and end is a constant and is equal to the product of first term and last term, *i.e.*, if $a_1, a_2, a_3, \ldots, a_{n-2}, a_{n-1}, a_n$ are in GP, then

$$a_1 a_n = a_2 a_{n-1} = a_3 a_{n-2} = \ldots$$

***Sample* Problem 10** *Three numbers form an increasing GP. If the middle number is doubled, then the new numbers are in AP. The common ratio of the GP is*

(a) $2-\sqrt{3}$ (b) $2+\sqrt{3}$
(c) $\sqrt{3}-2$ (d) $3+\sqrt{2}$

Interpret (b) Let the three numbers in GP be $\frac{a}{r}, a, ar$. Also, the numbers form an increasing GP. So, $r > 1$. Now, $\frac{a}{r}, 2a, ar$ in AP.

$$\therefore \quad 4a = \frac{a}{r} + ar$$

$$\Rightarrow \quad r^2 - 4r + 1 = 0$$

$$\Rightarrow \quad r = 2 + \sqrt{3} \qquad (\because r \neq 2 - \sqrt{3})$$

***Sample* Problem 11** *If $ax^3 + bx^2 + cx + d$ is divisible by $ax^2 + c$, then a, b, c, d are in*

(a) *AP* (b) *GP*
(c) *HP* (d) *None of these*

Interpret (b) Since, $ax^3 + bx^2 + cx + d$ is divisible by $ax^2 + c$. Therefore, when $ax^3 + bx^2 + cx + d$ is divided by $ax^2 + c$, the remainder is zero.

$$\therefore \quad d - \frac{bc}{a} = 0$$

$$\Rightarrow \quad bc = ad$$

$$\Rightarrow \quad \frac{b}{a} = \frac{d}{c}$$

$\Rightarrow$ a, b, c, d are in GP.

3.7 Insertion of Geometric Mean (GM) between Two Numbers

Let $G_1, G_2, \ldots, G_n$; n geometric means are inserted between two numbers a and b such that $a, A_1, A_2, \ldots, A_n, b$ form a GP.

Here, total number of terms are $(n + 2)$ and let common ratio is r.

$$\therefore \quad b = (n+2)\text{th term} = ar^{n+2-1}$$

$$\Rightarrow \quad r = \left(\frac{b}{a}\right)^{1/(n+1)}$$

$$\therefore \quad G_1 = ar = a\left(\frac{b}{a}\right)^{1/(n+1)}$$

$$G_2 = ar^2 = a\left(\frac{b}{a}\right)^{2/(n+1)}$$

In general, $G_k = a\left(\frac{b}{a}\right)^{k/(n+1)}, \forall\, k = 1, 2, 3, \ldots, n$

If $k = 1$ and $n = 1$, then

$$G_1 = a\left(\frac{b}{a}\right)^{1/(1+1)} = a\left(\frac{b}{a}\right)^{1/2} = \sqrt{ab}$$

Geometric Mean

If we insert one geometric mean between two numbers a and b, then

$$\text{Geometric mean} = \sqrt{ab}.$$

Note

- The product of n geometric means between a and b is equal to the nth power of geometric mean of a and b *i.e.*,
$$G_1 \cdot G_2 \cdot \ldots \cdot G_n = (ab)^{n/2} = G^n$$
- The product of n geometric means between a and $\frac{1}{a}$ is 1.
- The geometric mean of n positive numbers $a_1, a_2, a_3, \ldots, a_n$ is GM $= (a_1\, a_2\, a_3 \ldots a_n)^{1/n}$.
- If A and G be the AM and GM between two positive numbers, then the numbers are $A \pm \sqrt{A^2 - G^2}$.
- If A and G are respectively AM and GM between two positive numbers a and b, then the quadratic equation having a, b as its roots is
$$x^2 - 2Ax + G^2 = 0$$

***Sample* Problem 12** *If we insert two numbers between 3 and 81 so that the resulting sequence is GP. Then, the numbers are*

(a) 9, 27 (b) 8, 27
(c) 9, 25 (d) *None of these*

Interpret (a) Let the two numbers are a and b, then $3, a, b, 81$ are in GP.

$$\because \quad n\text{th term } T_n = AR^{n-1}$$

$$\therefore \quad 81 = 3R^{4-1}$$

$$\Rightarrow \quad R^3 = \frac{81}{3} = 27$$

$$\Rightarrow \quad R^3 = 3^3$$

$$\Rightarrow \quad R = 3$$

$$\therefore \quad a = AR = 3 \times 3 = 9, b = AR^2 = 3 \times 3^2 = 27$$

Check Point 2

1. Let $a_1, a_2, a_3, \ldots$, be in AP and a_p, a_q, a_r be in GP, then $a_q : a_p$ is equal to
   (a) $\frac{r-p}{q-p}$ (b) $\frac{q-p}{r-q}$
   (c) $\frac{r-q}{q-p}$ (d) None of these

2. If $(1+x)(1+x^2)(1+x^4)\ldots(1+x^{128}) = \sum_{r=0}^{n} x^r$, then n is equal to
   (a) 255 (b) 127
   (c) 60 (d) None of these

3. Two numbers whose arithmetic mean is 34 and the geometric mean is 16, then the ratio of numbers is
   (a) 5 or $\frac{1}{5}$ (b) 4 or $\frac{1}{4}$ (c) 2 or $\frac{1}{2}$ (d) 16 or $\frac{1}{16}$

4. Let $< a_n >$ be a GP such that $\frac{a_4}{a_6} = \frac{1}{4}$ and $a_2 + a_5 = 216$. Then, a_1 is equal to
   (a) 12 or $\frac{108}{7}$ (b) 10
   (c) 7 or $\frac{54}{7}$ (d) None of these

5. If $x = \sum_{n=0}^{\infty} a^n$, $y = \sum_{n=0}^{\infty} b^n$, $z = \sum_{n=0}^{\infty} (ab)^n$, where $|a|, |b| < 1$, then
   (a) $xyz = x + y + z$ (b) $xz + yz = xy + z$
   (c) $xy + yz = xz + y$ (d) $xy + xz = yz + x$

6. If a, b, c are in GP, then $\frac{b-a}{b-c} + \frac{b+a}{b+c}$ is equal to
   (a) $b^2 - c^2$ (b) ac
   (c) ab (d) 0

7. If the roots of equation $(b^2 + c^2)x^2 - 2(a+b)cx + (c^2 + a^2) = 0$ are equal, then
   (a) a, b, c are in GP (b) a, b, c are in AP
   (c) a, c, b are in GP (d) a, c, b are in AP

8. $4 + 44 + 444 + \ldots$ is equal to
   (a) $\frac{4}{81}[10^{n+1} - 10 - 9n]$ (b) $\frac{4}{9}[10^{n+1} - 10 - 9n]$
   (c) $\frac{4}{81}[10^{n+1} - 10 + 9n]$ (d) $\frac{4}{9}[10^{n+1} - 10 + 9n]$

9. The sum of sequence 0.15, 0.015, 0.0015, . . . , 20 terms is
   (a) $\frac{1}{6}[1-(0.1)^{20}]$ (b) $\frac{1}{6}[1+(0.1)^{20}]$
   (c) $\frac{1}{3}[1-(0.1)^{20}]$ (d) None of these

10. One side of an equilateral triangle is 24 cm. The mid-points of its sides are joined to form another triangle whose mid-points in term are joined to form still another triangle. The process continues indefinitely. The sum of perimeters of all the triangles is
    (a) 144 cm
    (b) 140 cm
    (c) 145 cm
    (d) None of the above

3.8 Harmonic Progression (HP)

A sequence is said be a harmonic progression, if reciprocal of terms of the sequence form an AP *i.e.*, $a_1, a_2, a_3, \ldots, a_n$ are in HP, if $\frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \ldots, \frac{1}{a_n}$ are in AP.

*n*th term of HP from beginning,

$$T_n = \frac{1}{\frac{1}{a_1} + (n-1)\left(\frac{1}{a_2} - \frac{1}{a_1}\right)} = \frac{a_1 a_2}{a_2 + (n-1)(a_1 - a_2)}$$

*n*th term of HP from end,

$$T_n' = \frac{1}{\frac{1}{a_n} - (n-1)\left(\frac{1}{a_2} - \frac{1}{a_1}\right)} = \frac{a_1 a_2 a_n}{a_1 a_2 - a_n(n-1)(a_1 - a_2)}$$

Note

- No one term of an HP can be zero.
- *n*th term of a HP is the reciprocal of the *n*th term of the corresponding AP.
- There is no formula for determining the sum of HP sequence.

***Sample* Problem 13** *If 20th term of a HP is 1 and 30th term is* $-\frac{1}{17}$, *then its largest term is*

(a) $\frac{1}{3}$ (b) 2
(c) 1 (d) *None of these*

Interpret (c) Here, $\frac{1}{a+19d} = 1$ and $\frac{1}{a+29d} = -\frac{1}{17}$

$\Rightarrow$ $a + 19d = 1$ ...(i)
and $a + 29d = -17$ ...(ii)

On solving Eqs. (i) and (ii), we get

$$a = \frac{176}{5} \text{ and } d = -\frac{9}{5}$$

Now, assume that its *n*th term is largest term.

$$T_n = \frac{1}{\frac{176}{5} + (n-1)\left(-\frac{9}{5}\right)} = \frac{5}{185 - 9n}$$

This term will be largest, if $185 - 9n$ is least. The least positive integer value is possible only for $n = 20$.

Hence, $T_n = \frac{5}{185 - 9n} = \frac{5}{185 - 180} = 1$

3.9 Insertion of Harmonic Mean (HM) between Two Numbers

Let $H_1, H_2, \ldots, H_n$; n harmonic means are inserted between two numbers a and b such that $a, A_1, A_2, \ldots, A_n, b$ form a HP.

Here, total number of terms is $(n+2)$. Also, $\frac{1}{a}, \frac{1}{H_1}, \frac{1}{H_2}, \ldots, \frac{1}{H_3}, \frac{1}{b}$ are in AP.

Let d be the common difference of this AP.

$$\therefore \quad \frac{1}{b} = \frac{1}{a} + (n+2-1)\,d$$

$$\Rightarrow \quad d = \frac{a-b}{(n+1)\,ab}$$

Now, $$\frac{1}{H_1} = \frac{1}{a} + d = \frac{1}{a} + \frac{(a-b)}{(n+1)\,ab}$$

$$\Rightarrow \quad \frac{1}{H_1} = \frac{bn+a}{(n+1)ab}$$

and $$\frac{1}{H_n} = \frac{1}{a} + nd = \frac{1}{a} + \frac{n(a-b)}{(n+1)\,ab}$$

$$\Rightarrow \quad \frac{1}{H_n} = \frac{an+b}{(n+1)\,ab}$$

If $r = 1$ and $n = 1$, then

$$\frac{1}{H_1} = \frac{a(1)+b}{(1+1)ab} = \frac{a+b}{2ab} \Rightarrow H_1 = \frac{2ab}{a+b}$$

i.e., If we insert one harmonic mean between two humbers, then

$$\text{HM} = \frac{2ab}{(a+b)}$$

Note

- The harmonic mean of n positive numbers $a_1, a_2, \ldots, a_n$ is $\frac{1}{H} = \frac{1}{n}\left(\frac{1}{a_1} + \frac{1}{a_2} + \frac{1}{a_3} + \ldots + \frac{1}{a_n}\right)$.
- If A, G, H are arithmetic, geometric and harmonic means between three given numbers a, b and c, then the equation having a, b, c as its roots is

$$x^3 - 3Ax^2 + \frac{3G^3}{H}x - G^3 = 0$$

3.10 Relation among Arithmetic Mean, Geometric Mean

Let a and b be two real positive and unequal numbers and A, G, H are arithmetic, geometric and harmonic mean respectively between them.

Then, $$A = \frac{a+b}{2}, G = \sqrt{ab}$$

Now, $$A - G = \frac{a+b}{2} - \sqrt{ab} = \frac{a+b-2\sqrt{ab}}{2}$$

$$= \left(\frac{\sqrt{a}-\sqrt{b}}{\sqrt{2}}\right)^2 > 0$$

$$\therefore \quad A - G > 0 \qquad (\because a \text{ and } b \text{ are positive})$$

$$\Rightarrow \quad A > G \qquad \ldots(\text{i})$$

Note

- If $a = b$, then $A = G = H$
- If $a \neq b$, then $A > G > H$
- $G^2 = AH$

***Sample* Problem 14** *Let $n \in N, n > 25$. Let A, G, H denote arithmetic mean, geometric mean and harmonic mean respectively of 25 and n. The least value of n for which $A, G, H \in \{25, 26, \ldots, n\}$ is*

(a) 49 (b) 81
(c) 169 (d) 225

Interpret (d) Here, $A = \frac{25+n}{2}, G = 5\sqrt{n}$

and $$H = \frac{50n}{25+n}$$

Also, A, G, H are natural numbers, so n must be an odd perfect square.

For $n = 225$, all of A, G and H are natural number.

3.11 Arithmetico-Geometric Progression (AGP)

A sequence whose each term is obtained by multiplying corresponding terms of AP and GP is called an arithmetico-geometric progression.

If $a, (a+d), (a+2d), \ldots, [a+(n-1)\,d]$ is an AP and $1, r, r^2, \ldots, r^{n-1}$ is a GP, then on multiplying corresponding terms of AP and GP, a progression $a, (a+d)\,r, (a+2d)\,r^2, \ldots, [a+(n-1)\,d]\,r^{n-1}$ is formed which is called an arithmetico-geometric progression.

Steps for Solving the AGP Series

Step I Multiply the common ratio of the corresponding GP.

Step II Shift the new obtained series in step I by one term.

Step III Subtract the given series from obtained series in step II.

Method of Solving AGP Series

Let AGP series

$$a + (a + d)r + (a + 2d)r^2 + \ldots + [a + (n-1)d]r^{n-1}$$

Types of problem can be solved by using the direct method given below.

The sum of n terms of arithmetico-geometric is

$$S_n = \frac{a}{1-r} + \frac{dr(1-r^{n-1})}{(1-r)^2} - \frac{[a + (n-1)\,d]\,r^n}{1-r},\ r \neq 1$$

The sum of infinite terms of arithmetico-geometric progression,

$$S_\infty = \frac{a}{1-r} + \frac{dr}{(1-r)^2},\ |r| < 1$$

***Sample* Problem 15** *The sum of the series*

$$1 + 2\cdot 2 + 3\cdot 2^2 + 4\cdot 2^3 + \ldots + 100\cdot 2^{99} \text{ is}$$

(a) $100\cdot 2^{100} + 1$ (b) $99\cdot 2^{100} + 1$

(c) $99\cdot 2^{99} - 1$ (d) $100\cdot 2^{100} - 1$

Interpret (b) Let

$$S = 1 + 2\cdot 2 + 3\cdot 2^2 + 4\cdot 2^3 + \ldots + 100\cdot 2^{99} \quad \ldots\text{(i)}$$

It is an arithmetico-geometric series.

On multiplying Eq. (i) by 2 and then subtracting, we get

$$S = 1 + 2\cdot 2 + 3\cdot 2^2 + 4\cdot 2^3 + \ldots + 100\cdot 2^{99}$$

$$2S = \quad 1\cdot 2 + 2\cdot 2^2 + 3\cdot 2^3 + \ldots + 99\cdot 2^{99} + 100\cdot 2^{100}$$

$$-S = 1 + 2 + 2^2 + 2^3 + \ldots + 2^{99} - 100\cdot 2^{100}$$

$$\Rightarrow \quad -S = \frac{1(2^{100}-1)}{2-1} - 100\cdot 2^{100}$$

$$\Rightarrow \quad -S = 2^{100} - 1 - 100\cdot 2^{100}$$

$$\Rightarrow \quad -S = -1 - 99\cdot 2^{100}$$

$$\Rightarrow \quad S = 99\cdot 2^{100} + 1$$

3.12 To Find nth Term by Difference Method

If $T_1, T_2, \ldots, T_n$ are terms of any series and their difference $(T_2 - T_1), (T_3 - T_2), (T_4 - T_3), \ldots, (T_n - T_{n-1})$ are either in AP or in GP, then T_n and S_n of series may be found by the method of differences.

Let $\quad S_n = T_1 + T_2 + T_3 + \ldots + T_n$

Again, $\quad S_n = \quad T_1 + T_2 + \ldots + T_{n-1} + T_n$

$$S_n - S_n = T_1 + (T_2 - T_1) + (T_3 - T_2) + \ldots + (T_n - T_{n-1}) - T_n$$

$$\Rightarrow \quad T_n = T_1 + (T_2 - T_1) + (T_3 - T_2) + \ldots + (T_n - T_{n-1})$$

$$\Rightarrow \quad T_n = T_1 + t_1 + t_2 + t_3 + \ldots + t_{n-1}$$

where $t_1, t_2, \ldots$ are terms of the new series.

***Sample* Problem 16** *The sum of the infinite series*

$$1 + \frac{4}{3} + \frac{9}{3^2} + \frac{16}{3^3} + \ldots \infty \text{ is}$$

(a) 4/2 (b) 9/2

(c) 4/9 (d) 1

Interpret (b) This is clearly not an arithmetico-geometric series, since 1, 4, 9, 16, … are not in AP. However, their successive differences $(4-1), (9-4), (16-9)$, … are in AP.

Let $\quad S_\infty = 1 + \frac{4}{3} + \frac{9}{3^2} + \frac{16}{3^3} + \ldots \infty$

$$\frac{1}{3}S_\infty = \quad \frac{1}{3} + \frac{4}{3^2} + \frac{9}{3^3} + \ldots \infty$$

On subtraction, we get

$$\frac{2}{3}S_\infty = 1 + \frac{3}{3} + \frac{5}{3^2} + \frac{7}{3^3} + \ldots \infty$$

$$\Rightarrow \quad \frac{1}{3}\cdot\frac{2}{3}S_\infty = \frac{1}{3} + \frac{3}{3^2} + \frac{5}{3^3} + \ldots \infty$$

$$\left(\text{multiplying both sides by } \frac{1}{3}\right)$$

On subtracting the two series, we get

$$\left(\frac{4}{9}\right)\cdot S_\infty = 1 + \frac{2}{3} + \frac{2}{3^2} + \frac{2}{3^3} + \ldots \infty$$

$$= 1 + \frac{2}{3}\left(1 + \frac{1}{3} + \frac{1}{3^2} + \ldots \infty\right) = 1 + \frac{2}{3} \times \frac{1}{\left(1 - \frac{1}{3}\right)} = 2$$

$$\therefore \quad S_\infty = \left(2 \times \frac{9}{4}\right) = \frac{9}{2}$$

3.13 Sum of n terms of Special Series Σn, Σn^2 and Σn^3

Generally, find the sum of n terms of any series, we use Σ before the nth term of the series.

Sum of some special series is given below.

(i) Sum of n natural numbers

$$= 1 + 2 + 3 + 4 + \ldots + n$$

$$= \Sigma n = \frac{n(n+1)}{2}$$

(ii) Sum of squares of n natural numbers

$$= 1^2 + 2^2 + 3^2 + 4^2 + \ldots + n^2$$

$$= \Sigma n^2 = \frac{n(n+1)(2n+1)}{6}$$

(iii) Sum of cubes of n natural numbers

$$= 1^3 + 2^3 + 3^3 + \ldots + n^3$$

$$= \Sigma n^3 = \frac{n^2(n+1)^2}{4} = \left[\frac{n(n+1)}{2}\right]^2 = (\Sigma n)^2$$

Note

- $\frac{1}{1\cdot 2}+\frac{1}{2\cdot 3}+\frac{1}{3\cdot 4}+\ldots+\frac{1}{n(n+1)}=\frac{n}{n+1}$
- $\frac{1}{1\cdot 2\cdot 3}+\frac{1}{2\cdot 3\cdot 4}+\ldots+\frac{1}{n(n+1)(n+2)}=\frac{1}{4}-\frac{1}{2(n+1)(n+2)}$
- $1\cdot 2+2\cdot 3+\ldots+n(n+1)=\frac{n(n+1)(n+2)}{3}$
- $1\cdot 2\cdot 3\cdot 4+2\cdot 3\cdot 4\cdot 5+\ldots+n(n+1)(n+2)(n+3)$
  $=\frac{1}{5}n(n+1)(n+2)(n+3)(n+4)$

***Sample* Problem 17** *The sum of the series*

$$3\times 1^2+5\times 2^2+7\times 3^2+\ldots \text{ is}$$ **[NCERT]**

(a) $\frac{n(n+1)(n^2-5n-1)}{6}$ (b) $\frac{n(n+1)(3n^2+5n+1)}{6}$

(c) $\frac{n(n-1)(3n^2-5n-1)}{6}$ (d) *None of these*

Interpret (*b*) Let given series is $S=3\times 1^2+5\times 2^2+7\times 3^2+\ldots$

First, we will split the given series into two parts which are 3, 5, 7, ... and $1^2, 2^2, 3^2, \ldots$ and find the *n*th term of each part separately to find the *n*th term of the given series.

$T_n=(n\text{th term of } 3,5,7,\ldots)\times(n\text{th term of } 1,2,3,\ldots)^2$

$=[3+(n-1)2][1+(n-1)1]^2=(3+2n-2)(n)^2=(2n+1)n^2=2n^3+n^2$

Now, $S=\Sigma T_n=2\Sigma n^3+\Sigma n^2$

$$=2\left[\frac{n(n+1)}{2}\right]^2+\frac{n(n+1)(2n+1)}{6}\quad\left[\because \Sigma n^3=\left\{\frac{n(n+1)}{2}\right\}^2,\ \Sigma n^2=\frac{n(n+1)(2n+1)}{6}\right]$$

$$=\frac{n(n+1)}{2}\left[2\times\frac{n(n+1)}{2}+\frac{2n+1}{3}\right]$$

$$=\frac{n(n+1)}{2}\left[\frac{3n(n+1)+2n+1}{3}\right]$$

$$=\frac{n(n+1)}{6}\times(3n^2+3n+2n+1)=\frac{n(n+1)(3n^2+5n+1)}{6}$$

***Sample* Problem 18** *The sum of n terms of the series* $1^2+3^2+5^2+\ldots$ *to n terms, is*

(a) $4n^2-1$ (b) $4n^2+1$ (c) $\frac{n}{3}(4n^2-1)$ (d) $\frac{n}{3}(4n^2+1)$

Interpret (*c*) *n*th term, $t_n=[1+(n-1)\times 2]^2$
$=(2n-1)^2=(4n^2-4n+1)$

$$\therefore\quad S_n=\sum_{k=1}^{n}(4k^2-4k+1)$$

$$=\left[4\left(\sum_{k=1}^{n}k^2\right)-4\left(\sum_{k=1}^{n}k\right)+n\right]$$

$$=4\cdot\frac{1}{6}n(n+1)(2n+1)-4\cdot\frac{1}{2}n(n+1)+n$$

$$=\frac{n}{3}[2(n+1)(2n+1)-6(n+1)+3]=\frac{n}{3}(4n^2-1)$$

Check Point 3

1. The sum $\frac{1^3}{1}+\frac{1^3+2^3}{1+3}+\frac{1^3+2^3+3^3}{1+3+5}+\ldots$ to 16 terms is
   (a) 246 (b) 646 (c) 446 (d) 746
2. The sum $1+3+7+15+31+\ldots$ to n terms is
   (a) 2^n-2-n (b) $2^{n-1}-1-n$
   (c) $2^{n+1}-2-n$ (d) None of these
3. The sum of series $1+\frac{4}{5}+\frac{7}{5^2}+\frac{10}{5^3}+\ldots\infty$ is
   (a) $\frac{7}{16}$ (b) $\frac{5}{16}$ (c) $\frac{105}{64}$ (d) $\frac{35}{16}$
4. The sum of the series $3\cdot 6+4\cdot 7+5\cdot 8+\ldots$ upto $(n-2)$ terms is
   (a) n^3+n^2+n+2 (b) $\frac{1}{6}(2n^3+12n^2+10n-84)$
   (c) n^3+n^2+n (d) None of these
5. The sum to n terms of the series, whose nth term is (n^2+2^n), is
   (a) $\frac{n(n+1)(2n+1)+2(2^n-1)}{3}$ (b) $\frac{n(n+1)(2n+1)+2(2^n-1)}{6}$
   (c) $\frac{n(n+1)(2n+1)+(2^n-1)}{6}$ (d) None of these
6. The sum of n terms of the series $\frac{1}{2\times 5}+\frac{1}{5\times 8}+\frac{1}{8\times 11}+\ldots$ to n terms is
   (a) $\frac{n}{2(3n+2)}$ (b) $\frac{n}{2(3n-2)}$
   (c) $\frac{n}{3(3n+4)}$ (d) None of these
7. For the series $S=1+\frac{1}{(1+3)}(1+2)^2+\frac{1}{(1+3+5)}(1+2+3)^2+\frac{1}{(1+3+5+7)}(1+2+3+4)^2+\ldots$ the 7th term is
   (a) 16 (b) 17
   (c) 15 (d) −16
8. If $b_i=1-a_i, n_a=\sum_{i=1}^{n}a_i, nb=\sum_{i=1}^{n}b_i$, then $\sum_{i=1}^{n}a_ib_i+\sum_{i=1}^{n}(a_i-a)^2$ is equal to
   (a) ab (b) −nab
   (c) (n + 1)ab (d) nab

WORKED OUT Examples

Example 1 *The sum of all two digit numbers which when divided by 4, yield as remainder is* [**NCERT**]

(*a*) 1211 (*b*) 1210
(*c*) 1200 (*d*) *None of these*

Solution (*b*) The two digit numbers which when divided by 4, leave 1 as remainder will be the number which are one more than the multiple of 4 *i.e.*,

$$13, 17, 21, \ldots, 97$$

Clearly, they form an AP, where

$$a = 13, d = 4, T_n = 97$$

$$\because \quad T_n = a + (n-1)d$$

$$\therefore \quad 97 = 13 + (n-1)4$$

$$\Rightarrow \quad 97 - 13 = (n-1)4$$

$$\Rightarrow \quad 84 = (n-1)4$$

$$\Rightarrow \quad 21 = n - 1$$

$$\Rightarrow \quad n = 21 + 1 = 22$$

Now, $$S_{22} = \frac{22}{2}[2 \times 13 + (22-1)4]$$

$$= 11(26 + 84)$$

$$= 11 \times 110 = 1210$$

Example 2 *If the sum of three numbers in AP is 24 and their product is 440, then numbers are* [**NCERT**]

(*a*) 4, 7, 10 (*b*) 5, 8, 11
(*c*) 6, 9, 12 (*d*) *None of these*

Solution (*b*) Let the three numbers are $a - d, a, a + d$.

Given, sum of the numbers = 24

$$\therefore \quad a - d + a + a + d = 24$$

$$\Rightarrow \quad 3a = 24 \quad \Rightarrow \quad a = 8$$

And product of the numbers = 440

$$\therefore \quad (a-d)a(a+d) = 440$$

$$\Rightarrow \quad a(a^2 - d^2) = 440$$

$$\Rightarrow \quad 8(64 - d^2) = 440$$

$$\Rightarrow \quad 64 - d^2 = 55$$

$$\Rightarrow \quad d^2 = 64 - 55 = 9 \quad \Rightarrow \quad d = \pm 3$$

When, $a = 8$ and $d = 3$, then numbers are

$$a - d = 8 - 3 = 5$$

and $$a = 8$$

and $$a + d = 8 + 3 = 11$$

$$\Rightarrow \quad 5, 8, 11$$

When $a = 8$ and $d = -3$, then numbers are

$$a - d = 8 + 3 = 11$$

$$a = 8$$

$$a + d = 8 - 3 = 5$$

$$\Rightarrow \quad 11, 8, 5$$

Hence, the numbers are 5, 8, 11 or 11, 8, 5.

Example 3 *Let the sum of $n, 2n, 3n$ terms of an AP be S_1, S_2 and S_3 respectively, then $3(S_2 - S_1)$ is* [**NCERT**]

(*a*) $2S_3$ (*b*) S_3
(*c*) $4S_3$ (*d*) *None of these*

Solution (*b*) Let a and d be the first term and common difference respectively of an AP.

Given, $$S_1 = \text{Sum of } n \text{ terms} = \frac{n}{2}[2a + (n-1)d] \quad \ldots(i)$$

$$S_2 = \text{Sum of } 2n \text{ terms} = \frac{2n}{2}[2a + (2n-1)d] \quad \ldots(ii)$$

and $$S_3 = \text{Sum of } 3n \text{ terms} = \frac{3n}{2}[2a + (3n-1)d] \quad \ldots(iii)$$

$$\therefore \quad 3(S_2 - S_1)$$

$$= 3\left[\frac{2n}{2}\{2a + (2n-1)d\} - \frac{n}{2}\{2a + (n-1)d\}\right]$$

[from Eqs. (i) and (ii)]

$$= \frac{3n}{2}[2(2a + (2n-1)d\} - \{2a + (n-1)d\}]$$

$$= \frac{3n}{2}[4a + 2(2n-1)d - 2a - (n-1)d]$$

$$= \frac{3n}{2}[(4a - 2a) + d(4n - 2 - n + 1)]$$

$$= \frac{3n}{2}[2a + (3n-1)d] = S_3 \quad \text{[from Eq. (iii)]}$$

Example 4 *The sum of the first four terms of an AP is 56. The sum of last four terms is 112. If its first term is 11, then the number of terms are* [**NCERT**]

(*a*) 10 (*b*) 11
(*c*) 12 (*d*) 13

Solution (*b*) Let AP series is $a, a+d, a+2d, \ldots$

Given, sum of first four terms = 56

i.e., $T_1 + T_2 + T_3 + T_4 = 56$

$\Rightarrow \quad a + a + d + a + 2d + a + 3d = 56$

$\Rightarrow \quad 4a + 6d = 56$

$\Rightarrow \quad 4 \times 11 + 6d = 56 \qquad (\because a = 11)$

$\Rightarrow \quad 6d = 56 - 44 = 12$

$\Rightarrow \quad d = \frac{12}{6} \Rightarrow d = 2$

If last term is T_n, then sum of last four terms = 112

$T_n + T_{n-1} + T_{n-2} + T_{n-3} = 112 \qquad [\because T_n = a + (n-1)d]$

$\therefore \quad a + (n-1)d + a + (n-1-1)d + a + (n-2-1)d + a + (n-3-1)d = 112$

$\Rightarrow \quad 4a + d(n-1+n-2+n-3+n-4) = 112$

$\Rightarrow \quad 4 \times 11 + 2(4n - 10) = 112 \qquad (\because a = 11, d = 2)$

$\Rightarrow \quad 44 + 8n - 20 = 112$

$\Rightarrow \quad 8n = 112 - 44 + 20 = 132 - 44 = 88$

$\Rightarrow \quad n = \frac{88}{8} = 11$

Hence, total numbers of terms in the series = 11

Example 5 *Shamshad Ali buys a scooter for ₹ 22000. He pays ₹ 4000 each and agrees to pay the balance in annual instalments of ₹ 1000 plus 10% interest on the unpaid amount. How much will scooter cost him?* **[NCERT]**

(*a*) ₹ 39150 (*b*) ₹ 39100
(*c*) ₹ 39200 (*d*) *None of these*

Solution (b) Scooter cost = ₹ 22000

Down payment = ₹ 4000, Balance payment = ₹ 18000

Now, interest on Ist instalment $= \frac{18000 \times 10 \times 1}{100} =$ ₹ 1800

$\left(\because I = \frac{P \times R \times T}{100}\right)$

Unpaid amount = 18000 − 1000 = 17000

Interest on IInd instalment $= \frac{17000 \times 10 \times 1}{100} =$ ₹ 1700

Unpaid amount = 17000 − 1000 = 16000

Interest on IInd instalment $= \frac{16000 \times 10 \times 1}{100} =$ ₹ 1600

.....

.....

∴ Total interest paid by him = 1800 + 1700 + 1600 + … + 18 terms which is an AP with $a = 1800, d = 1700 - 1800 = -100$

Therefore, total interest $= \frac{18}{2}[2 \times 1800 + (18-1)(-100)]$

$[\because \text{sum of AP}, = S_n = \frac{n}{2}\{2a + (n-1)d\}]$

$= 9(3600 - 1700) = 9 \times 1900 = 17100$

Hence, total amount or actual cost = 22000 + 17100
= ₹ 39100

Example 6 *If $a_1, a_2, a_3, \ldots, a_{2n}$ are in AP, then the value of $a_1^2 - a_2^2 + a_3^2 - a_4^2 + \ldots + a_{2n-1}^2 - a_{2n}^2$ is equal to*

(*a*) $\frac{n}{2n-1}(a_1^2 - a_{2n}^2)$ (*b*) $\frac{n}{2n+1}(a_1^2 - a_{2n}^2)$

(*c*) $\frac{n}{2n-1}(a_1^2 + a_{2n}^2)$ (*d*) *None of these*

Solution (a) $\because a_1, a_2, a_3, \ldots, a_{2n}$ are in AP.

$\therefore \quad a_2 - a_1 = a_3 - a_2 = \ldots = d$

$\therefore \quad a_1^2 - a_2^2 + a_3^2 - a_4^2 + \ldots + a_{2n-1}^2 - a_{2n}^2$

$= (a_1 - a_2)(a_1 + a_2) + (a_3 - a_4)(a_3 + a_4) + \ldots + (a_{2n-1} - a_{2n})(a_{2n-1} + a_n)$

$= (-d)(a_1 + a_2) + (-d)(a_3 + a_4) + \ldots + (-d)(a_{2n-1} + a_{2n})$

$= (-d)(a_1 + a_2 + \ldots + a_{2n}) = (-d)\left[\frac{2n}{2}(a_1 + a_{2n})\right]$

$= -\left(\frac{a_{2n} - a_1}{2n-1}\right)[n(a_1 + a_{2n})] \qquad \left(\because d = \frac{a_{2n} - a_1}{2n-1}\right)$

$= \frac{n}{2n-1}(a_1^2 - a_{2n}^2)$

Example 7 *If the roots of the equation $x^3 - 12x^2 + 39x - 28 = 0$ are in AP, then their common difference will be*

(*a*) ± 1 (*b*) ± 2 (*c*) ± 3 (*d*) ± 4

Solution (*c*) Since, the given equation is cubic, therefore we take three roots.

Let the roots be $a - d, a, a + d$.

Sum of three numbers in AP = $3a = 12$

$\Rightarrow \quad a = 4$ is a root.

∴ The given equation $x^3 - 12x^2 + 39x - 28 = 0$ can be rewritten as

$(x-4)(x^2 - 8x + 7) = 0$

$\therefore \quad x = 1, 4, 7$ or $7, 4, 1$

$\therefore \quad d = \pm 3$

Example 8 *If α and β are roots of the equation $x^2 - 3x + a = 0$ and γ and δ are roots of the equation $x^2 - 12x + b = 0$ and α, β, γ, δ form an increasing GP, then the values of a and b are respectively*

(*a*) 2, 16 (*b*) 4, 8
(*c*) 2, 32 (*d*) *None of these*

Solution (*c*) $\because \alpha, \beta, \gamma, \delta$ are in GP.

Let $\alpha = A, \beta = Ar, \gamma = Ar^2, \delta = Ar^3$

$\because$ α and β are the roots of the equation $x^2 - 3x + a = 0$, then

$\alpha + \beta = 3 \Rightarrow A(1 + r) = 3 \qquad \ldots$ (i)

γ and δ are the roots of the equation $x^2 - 12x + b = 0$, then

$$\gamma + \delta = 12$$

$$\Rightarrow \quad Ar^2(1 + r) = 12 \quad \ldots \text{(ii)}$$

On solving Eqs. (i) and (ii), we get

$$A = 1, r = 2$$

$$\Rightarrow \quad \alpha = 1, \beta = 2, \gamma = 4, \delta = 8$$

$$\therefore \quad a = \alpha\beta = 1 \times 2 = 2$$

and $\quad b = \gamma\delta = 4 \times 8 = 32$

Example 9 *The sum of n terms of the series* $1.4 + 3.04 + 5.004 + 7.0004 + \ldots$ *is*

(a) $n^2 + \frac{4}{9}\left(1 + \frac{1}{10^n}\right)$ (b) $n^2 + \frac{4}{9}\left(1 - \frac{1}{10^n}\right)$

(c) $n + \frac{4}{9}\left(1 - \frac{1}{10^n}\right)$ (d) *None of these*

Solution (b) $1.4 + 3.04 + 5.004 + \ldots$

$$= (1 + 3 + 5 + \ldots) + (0.4 + 0.04 + 0.004 + \ldots)$$

$$= \frac{n}{2}[2 + (n-1) \cdot 2] + \left[\frac{4}{10} + \frac{4}{10^2} + \ldots \text{upto } n \text{ terms}\right]$$

$$= n^2 + \frac{4}{10}\left[\frac{1 - \left(\frac{1}{10}\right)^n}{1 - \frac{1}{10}}\right]$$

$$= n^2 + \frac{4}{9}\left(1 - \frac{1}{10^n}\right)$$

Example 10 *If the ratio of HM and GM of two quantities is* $12 : 13$, *then the ratio of the number is*

(a) $1 : 2$ (b) $2 : 3$

(c) $3 : 4$ (d) *None of these*

Solution (d) Given, $\frac{\text{HM}}{\text{GM}} = \frac{12}{13} \Rightarrow \frac{\frac{2ab}{a+b}}{\sqrt{ab}} = \frac{12}{13}$

or $$\frac{a+b}{2\sqrt{ab}} = \frac{13}{12}$$

$$\Rightarrow \quad \frac{(a+b) + 2\sqrt{ab}}{(a+b) - 2\sqrt{ab}} = \frac{13+12}{13-12} = \frac{25}{1}$$

$$\Rightarrow \quad \frac{(\sqrt{a} + \sqrt{b})^2}{(\sqrt{a} - \sqrt{b})^2} = \frac{5^2}{1} \Rightarrow \frac{\sqrt{a} + \sqrt{b}}{\sqrt{a} - \sqrt{b}} = \frac{5}{1}$$

$$\Rightarrow \quad \frac{(\sqrt{a} + \sqrt{b}) + (\sqrt{a} - \sqrt{b})}{(\sqrt{a} + \sqrt{b}) - (\sqrt{a} - \sqrt{b})} = \frac{5+1}{5-1}$$

$$\Rightarrow \quad \frac{2\sqrt{a}}{2\sqrt{b}} = \frac{6}{4}$$

$$\Rightarrow \quad \left(\frac{a}{b}\right)^{1/2} = \frac{6}{4}$$

$$\Rightarrow \quad a : b = 9 : 4$$

Example 11 *The sum of three numbers in GP is 56. If we subtract the 1, 7, 21 from these numbers in that order, we obtain an Arithmetic Progression (AP). Find the numbers.* **[NCERT]**

(a) 32, 16, 8 (b) 30, 14, 6

(c) 33, 17, 9 (d) *None of these*

Solution (a) Let three numbers in GP are a, ar, ar^2.

Given, $$a + ar + ar^2 = 56 \quad \ldots\text{(i)}$$

Again, $a - 1, ar - 7, ar^2 - 21$ are in AP.

$$\Rightarrow \quad 2(ar - 7) = (a - 1) + (ar^2 - 21)$$

($\because$ if a, b, c are in AP, then $2b = a + c$)

$$\Rightarrow \quad 2ar - 14 = a + ar^2 - 22$$

$$\Rightarrow \quad a + ar^2 - 2ar = 8 \quad \ldots\text{(ii)}$$

On dividing Eq. (i) by Eq. (ii), we get

$$\frac{a + ar + ar^2}{a + ar^2 - 2ar} = \frac{56}{8}$$

$$\Rightarrow \quad \frac{1 + r + r^2}{1 + r^2 - 2r} = \frac{7}{1}$$

$$\Rightarrow \quad 1 + r + r^2 = 7 + 7r^2 - 14r$$

$$\Rightarrow \quad 6r^2 - 15r + 6 = 0 \Rightarrow 2r^2 - 5r + 2 = 0$$

$$\Rightarrow \quad (r - 2)(2r - 1) = 0 \Rightarrow r = 2, \frac{1}{2}$$

If $r = 2$, then from Eq.(i),

$$a + 2a + 4a = 56 \Rightarrow a = 8$$

Then, numbers are

$$a = 8, ar = 8 \times 2 = 16,$$

or $$ar^2 = 8 \times 4 = 32$$

Hence, numbers are 8, 16, 32.

If $r = \frac{1}{2}$, then from Eq. (i),

$$\frac{a}{1} + \frac{a}{2} + \frac{a}{4} = 56$$

$$\Rightarrow \quad \frac{7a}{4} = 56 \Rightarrow a = 32$$

Then, numbers are

$$a = 32,$$

$$ar = 32 \times \frac{1}{2} = 16 \text{ or } ar^2 = 32 \times \frac{1}{4} = 8$$

So, numbers are 32, 16, 8.

Hence, required numbers are 8, 16, 32 or 32, 16, 8.

Example 12 *If a be the AM between b and c and GM's are* G_1 *and* G_2, *then* $G_1^3 + G_2^3$ *is equal to*

(a) abc (b) $2abc$

(c) $3abc$ (d) $4abc$

Solution (b) $\because b, a, c$ are in AP.

$$\therefore \quad 2a = b + c \quad \ldots\text{(i)}$$

and b, G_1, G_2, c are in GP.

$\therefore \quad G_1 = br, \quad G_2 = br^2$ and $c = br^3$,

where r be the common ratio of GP.

Now, $G_1^3 + G_2^3 = (br)^3 + (br^2)^3$

$$= b^3r^3 + b^3r^6 = b^3\left(\frac{c}{b}\right) + b^3\left(\frac{c}{b}\right)^2$$

$$= b^2c + bc^2 = bc(b + c) = 2abc$$

$\therefore \quad G_1^3 + G_2^3 = 2abc$

Example 13 *A person writes a letter to four of his friends. He asks each one of them, to copy the letter and mail to four different persons with instructions that they move the chain similarly. Assuming that the chain is not broken and that it costs 50 paise to mail one letter. When the 8th set of letter is mailed, then the amount on postage will be* [**NCERT**]

(a) ₹ 42780 (b) ₹ 43690

(c) ₹ 43680 (d) *None of these*

Solution (b) Firstly, one person post four letters to four of his friends. Then, those four persons post 4-4 letters *i.e.*, a total $4 \times 4 = 16$ letters.Similarly, in next step $4 \times 4 \times 4 = 64$ letters are posted.

Thus, there will be a GP series

i.e., 4, 16, 64, 256, ...

where, $a = 4$ and $r = 4$

Now, total number of letters till 8th set

$$S_n = \frac{a(r^n - 1)}{r - 1} \Rightarrow S_8 = \frac{4(4^8 - 1)}{4 - 1} \Rightarrow S_8 = \frac{4}{3}(4^8 - 1)$$

$$\left[\because S_n = \frac{a(r^n - 1)}{(r - 1)}, r > 1\right]$$

Cost for one letter = ₹ 0.50

Hence, total cost $= \frac{4}{3}(4^8 - 1) \times 0.50 = \frac{4}{3} \times (65536 - 1) \times 0.50$

$$= \frac{4}{3} \times 65535 \times 0.50 = ₹\ 43690$$

Example 14 *If a, b, c are in HP, b, c, d are in GP and c, d, e are in AP, then $\frac{ab^2}{(2a - b)^2}$ is equal to*

(a) b (b) a

(c) e (d) d

Solution (c) $\because a, b, c$ are in HP.

$$\therefore \quad b = \frac{2ac}{a + c} \quad \text{...(i)}$$

b, c, d are in GP.

$$\therefore \quad c^2 = bd \quad \text{...(ii)}$$

and c, d, e are in AP.

$$\therefore \quad d = \frac{c + e}{2} \quad \text{...(iii)}$$

From Eq. (i), $ab + bc = 2ac$

$$\Rightarrow \quad c = \frac{ab}{2a - b} \quad \text{...(iv)}$$

From Eqs. (iii) and (iv), we get

$$d = \frac{1}{2}\left(\frac{ab}{2a - b} + e\right) \quad \text{...(v)}$$

On putting the value of c and d from Eqs. (iv) and (v) in Eq. (ii), we get

$$\frac{a^2b^2}{(2a - b)^2} = \frac{b}{2}\left[\frac{ab}{2a - b} + e\right]$$

$$\therefore \quad \frac{2a^2b}{(2a - b)^2} - \frac{ab}{2a - b} = e$$

$$\Rightarrow \quad e = \frac{2a^2b - 2a^2b + ab^2}{(2a - b)^2}$$

Hence, $e = \frac{ab^2}{(2a - b)^2}$

Example 15 *The nth term of the series $1 + 2 + 5 + 12 + 25 + \ldots$ is*

(a) $(n - 1)(n - 2)$ (b) $\frac{1}{3}n(n - 1)(n - 2) + n$

(c) n (d) *None of these*

Solution (b) Let nth term of the series is T_n and sum is S, then

$$S = 1 + 2 + 5 + 12 + 25 + 46 + 77 + \ldots + T_n$$

$$S = \quad 1 + 2 + 5 + 12 + 25 + 46 + \ldots + T_{n-1} + T_n$$

On subtraction, we get

$$0 = 1 + 1 + 3 + 7 + 13 + 21 + 31 + \ldots + (T_n - T_{n-1}) - T_n$$

$\therefore \quad T_n = 1 + \{1 + 3 + 7 + 13 + 21 + \ldots + \text{upto } (n - 1)\}$

Let $(n - 1)$th term and S of the series $1 + 3 + 7 + 13 + \ldots$ are t_{n-1} and S' respectively, then

$$S' = 1 + 3 + 7 + 13 + 21 + \ldots + t_{n-1}$$

$$S' = \quad 1 + 3 + 7 + 13 + \ldots + t_{n-2} + t_{n-1}$$

On subtraction, we get

$$0 = 1 + 2 + 4 + 6 + 8 + \ldots + (t_{n-1} - t_{n-2}) - t_{n-1}$$

$\therefore \quad t_{n-1} = 1 + 2\{1 + 2 + 3 + 4 + \ldots \text{upto } (n - 2)\}$

$$= 1 + 2 \cdot \frac{1}{2}(n - 2)(n - 1) = n^2 - 3n + 3$$

$\Rightarrow \quad t_n = (n + 1)^2 - 3(n + 1) + 3$

$$= n^2 - n + 1$$

$\therefore \quad T_n = 1 + \{1 + 3 + 7 + \ldots \text{upto } (n - 1)\}$

$$= 1 + \sum_1^{n-1}(n^2 - n + 1) = 1 + \sum_1^{n-1} n^2 - \sum_1^{n-1} n + \sum_1^{n-1} 1$$

$$= 1 + \frac{1}{6}n(n - 1)(2n - 1) - \frac{1}{2}n(n - 1) + (n - 1)$$

$$= \frac{1}{3}n(n - 1)(n - 2) + n$$

Hence, $T_n = \frac{1}{3}n(n - 1)(n - 2) + n$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Arithmetic Progression

1. $\{a_n\}$ and $\{b_n\}$ be two sequences given by $a_n = (x)^{\frac{1}{2^n}} + (y)^{\frac{1}{2^n}}$ and $b_n = (x)^{\frac{1}{2^n}} - (y)^{\frac{1}{2^n}}$ for all $n \in N$, then $a_1 a_2 a_3 \ldots a_n$ is equal to

(a) $x - y$ (b) $\frac{x+y}{b_n}$

(c) $\frac{x-y}{b_n}$ (d) $\frac{xy}{b_n}$

2. If the sum of n terms of an AP is given by $S_n = 3n + 2n^2$, then the common difference of the AP is [NCERT Exemplar]

(a) 3 (b) 2 (c) 6 (d) 4

3. If 9 times the 9th term of an AP is equal to 13 times the 13th term, then the 22nd term of the AP is [NCERT Exemplar]

(a) 0 (b) 22 (c) 220 (d) 198

4. In an AP, the first term is 2 and the sum of the first five terms is one-fourth of the next five terms. The 20th term is [NCERT]

(a) 112 (b) –112 (c) 114 (d) –114

5. If a, b, c, d, e, f are in AP, then the value of $e - c$ will be

(a) $2(c - a)$ (b) $2(f - d)$

(c) $2(d - c)$ (d) $d - c$

6. Let S_n denote the sum of the first n terms of an AP. If $S_{2n} = 3S_n$, then $S_{3n} : S_n$ is equal to [NCERT Exemplar]

(a) 4 (b) 6 (c) 8 (d) 10

7. If the angles of a quadrilateral are in AP, whose common difference is 10°, then the angles of the quadrilateral are

(a) 65°, 85°, 95°, 105° (b) 75°, 85°, 95°, 105°

(c) 65°, 75°, 85°, 95° (d) 65°, 95°, 105°, 115°

8. The interior angles of a polygon are in AP. If the smallest angle be 120° and the common difference be 5, then the number of side is

(a) 8 (b) 10 (c) 9 (d) 6

9. In an AP, if the pth term is $\frac{1}{q}$ and qth term is $\frac{1}{p}$. Then, the sum of first pq terms is [NCERT]

(a) $(pq + 1)$ (b) $\frac{1}{2}(pq + 1)$

(c) $\frac{1}{2}(pq - 1)$ (d) None of these

10. If the sum of a certain n number of terms of the AP, 25, 22, 19, … is 116, then the last term is [NCERT]

(a) 4 (b) 3 (c) 2 (d) –4

11. If $\frac{1}{b-c}, \frac{1}{c-a}, \frac{1}{a-b}$ be consecutive terms of an AP, then $(b-c)^2, (c-a)^2, (a-b)^2$ will be in

(a) GP (b) AP

(c) HP (d) None of these

12. If $\log 2, \log(2^n - 1)$ and $\log(2^n + 3)$ are in AP, then n is equal to

(a) $\frac{5}{2}$ (b) $\log_2 5$ (c) $\log_3 5$ (d) $\frac{3}{2}$

13. If the arithmetic mean of a and b is $\frac{a^n + b^n}{a^{n-1} + b^{n-1}}$, then the value of n is [NCERT]

(a) –1 (b) 0

(c) 1 (d) None of these

14. Sum of the first p, q and r terms of an AP are a, b and c respectively. Then,

$$\frac{a}{p}(q - r) + \frac{b}{q}(r - p) + \frac{c}{r}(p - q) \text{ is equal to}$$ [NCERT]

(a) pq (b) 0

(c) rp (d) 3

15. If the ratio of the sum of n terms of two AP's be $(7n+1):(4n+27)$, then the ratio of their 11th terms will be
(a) 2 : 3 (b) 3 : 4 (c) 4 : 3 (d) 5 : 6

16. Given that n AM's are inserted between two sets of numbers $a, 2b$ and $2a, b$ where $a, b \in R$. Suppose further that mth mean between these sets of numbers is same, then the ratio $a:b$ is equal to
(a) $(n-m+1):m$ (b) $(n-m+1):n$
(c) $n:(n-m+1)$ (d) $m:(n-m+1)$

17. A man saved ₹ 66000 in 20 yr. In each succeeding year after the first year he saved ₹ 200 more than what he saved in the previous year. How much did he save in the first year? [NCERT Exemplar]
(a) ₹ 1450 (b) ₹ 1400
(c) ₹ 1470 (d) ₹ 1480

18. A carpenter was hired to build 192 window frames. The first day he made five frames and each day, thereafter he made two more frames than he made the day before. How many days did it take him to finish the job? [NCERT Exemplar]
(a) 11 (b) 10 (c) 12 (d) 14

19. The sum of n terms of three AP's whose first term is 1 and common differences are 1, 2, 3 respectively are S_1, S_2, S_3 respectively. The true relation is
(a) $S_1 + S_3 = S_2$ (b) $S_1 + S_3 = 2S_2$
(c) $S_1 + S_2 = 2S_3$ (d) $S_1 + S_2 = S_3$

20. If the first term of an AP is a and the sum of the first p terms is zero, then the sum of its next q terms is [NCERT Exemplar]
(a) $\frac{a(p+q)q}{p-1}$ (b) $\frac{-a(p+q)q}{p-1}$
(c) $\frac{a(p-q)q}{p-1}$ (d) None of these

21. In a cricket tournament 16 school terms participated. A sum of ₹ 8000 is to be awarded among themselves as prize money. If the last placed team is awarded ₹ 275 in prize money and the award increases by the same amount for successive finishing places, amount will the first place team received is [NCERT Exemplar]
(a) ₹ 720 (b) ₹ 725 (c) ₹ 735 (d) ₹ 780

22. If a, b, c are in AP, then the straight line $ax + by + c = 0$ will always pass through the point
(a) $(-1, -2)$ (b) $(1, -2)$ (c) $(-1, 2)$ (d) $(1, 2)$

23. If $\theta_1, \theta_2, \theta_3, \ldots, \theta_n$ are in AP, whose common difference is d, then
$\sin d(\sec\theta_1 \sec\theta_2 + \sec\theta_2 \sec\theta_3 + \ldots + \sec\theta_{n-1} \sec\theta_n)$
is equal to [NCERT Exemplar]
(a) $\tan\theta_n - \tan\theta_2$ (b) $\tan\theta_n + \tan\theta_1$
(c) $\tan\theta_n - \tan\theta_1$ (d) None of these

24. If $a_1, a_2, a_3, \ldots, a_{24}$ are in arithmetic progression and $a_1 + a_5 + a_{10} + a_{15} + a_{20} + a_{24} = 225$, then $a_1 + a_2 + a_3 + \ldots + a_{23} + a_{24}$ is equal to
(a) 909 (b) 75
(c) 750 (d) 900

25. If $a_1, a_2, a_3, \ldots, a_n$ are in AP, where $a_i > 0$ for all i, then value of $\frac{1}{\sqrt{a_1}+\sqrt{a_2}} + \frac{1}{\sqrt{a_2}+\sqrt{a_3}} + \ldots + \frac{1}{a_{n-1}+\sqrt{a_n}}$ is equal to [NCERT Exemplar]
(a) $\frac{n-1}{\sqrt{a_1}+\sqrt{a_n}}$ (b) $\frac{n+1}{\sqrt{a_1}+\sqrt{a_n}}$
(c) $\frac{n-1}{\sqrt{a_1}-\sqrt{a_n}}$ (d) $\frac{n+1}{\sqrt{a_1}-\sqrt{a_n}}$

26. Let the sequence, $a_1, a_2, a_3, .., a_{2n}$, form an AP, then $a_1^2 - a_2^2 + a_3^2 - \ldots + a_{2n-1}^2 - a_{2n}^2$ is equal to
(a) $\frac{n}{2n-1}(a_1^2 - a_{2n}^2)$ (b) $\frac{2n}{n-1}(a_{2n}^2 - a_1^2)$
(c) $\frac{n}{n+1}(a_1^2 + a_{2n}^2)$ (d) None of these

27. If $a_1, a_2, a_3, \ldots, a_{4001}$ are terms of an AP such that $\frac{1}{a_1a_2} + \frac{1}{a_2a_3} + \ldots + \frac{1}{a_{4000}a_{4001}} = 10$ and $a_2 + a_{4000} = 50$, then $|a_1 - a_{4001}|$ is equal to
(a) 20 (b) 30
(c) 40 (d) None of these

28. If $a_1, a_2, \ldots, a_n$ are in AP with common difference d, then the sum of the series
$\sin d(\operatorname{cosec} a_1 \operatorname{cosec} a_2 + \operatorname{cosec} a_2 \operatorname{cosec} a_3 + \ldots + \operatorname{cosec} a_{n-1} \operatorname{cosec} a_n)$ is
(a) $\sec a_1 - \sec a_n$ (b) $\cot a_1 - \cot a_n$
(c) $\tan a_1 - \tan a_n$ (d) $\operatorname{cosec} a_1 - \operatorname{cosec} a_n$

29. Let $S_1, S_2, \ldots$ be squares such that for each $n \geq 1$, the length of a side of S_n equals the length of a diagonal of S_{n+1}. If the length of a side of S_1 is 10 cm, then for which of the following values of n, the area of S_n less than 1 sq cm ?
(a) 7 (b) 6
(c) 9 (d) None of these

30. If a, b, c are in AP, then $10^{ax+10}, 10^{bx+10}, 10^{cx+10}$ $(x \neq 0)$ are in
(a) AP (b) GP only when $x > 0$
(c) GP for all x (d) GP only when $x < 0$

31. The solution of the equation
$(x+1) + (x+4) + (x+7) + \ldots + (x+28) = 155$ is
(a) 1 (b) 2
(c) 3 (d) 4

32. Consider the following statements

I. If a_n denotes the nth term of an AP, then

$$a_n = \frac{a_{n+k} + a_{n-k}}{2}$$

II. In an AP, if the sum of m terms is equal to the sum of n terms, then the sum of $(m + n)$ terms is always zero.

Which of the statement is given above is/are correct ?

(a) Only I (b) Only II
(c) Both I and II (d) None of these

33. The sum of all two digit numbers which, when divided by 4, yield unity as a remainder is

(a) 1190 (b) 1197
(c) 1210 (d) None of these

34. The sum of integers from 1 to 100 that are divisible by 2 or 5 is

(a) 3000 (b) 3050
(c) 4050 (d) None of these

35. The sum of the integers from 1 to 100 which are not divisible by 3 or 5 is

(a) 2489 (b) 4735 (c) 2317 (d) 2632

36. If a^2, b^2, c^2 are in AP, then which of the following is also in AP ?

(a) $\sin A, \sin B, \sin C$ (b) $\tan A, \tan B, \tan C$
(c) $\cot A, \cot B, \cot C$ (d) None of these

37. Insert three arithmetic means between 3 and 19

(a) 6, 10, 14 (b) 7, 11, 15
(c) 8, 12, 16 (d) None of these

Geometric Progression

38. If a, b, c are in GP and $\log a - \log 2b$, $\log 2b - \log 3c$ and $\log 3c - \log a$ are in AP, then a, b, c are the length of the sides of a triangle which is

(a) acute angled (b) obtuse angled
(c) right angled (d) equilateral

39. If the 4th, 10th and 16th terms of a GP are x, y and z respectively, then x, y, z are in [NCERT]

(a) AP (b) GP
(c) AGP (d) HP

40. The sum of n terms of the sequence 8, 88, 888, 8888,... is [NCERT]

(a) $\frac{80}{81}(10^n - 1) - \frac{8n}{9}$ (b) $\frac{80}{81}(10^n + 1) + \frac{8n}{9}$
(c) $\frac{80}{81}(10^n - 1) - \frac{8n^2}{9}$ (d) None of these

41. Find four numbers forming a GP in which the third term is greater than the first term by 9 and the second term is greater than 4th by 18. [NCERT]

(a) 2, –6, 12, –24 (b) 3, 6, 12, 24
(c) 3, –6, 12, –24 (d) None of these

42. The number which should be added to the numbers 2, 14, 62, so that the resulting numbers may be in GP, is

(a) 1 (b) 2
(c) 3 (d) 4

43. Let a_n be nth term of the GP of positive numbers. Let $\sum_{n=1}^{100} a_{2n} = \alpha$ and $\sum_{n=1}^{100} a_{2n-1} = \beta$, such that $\alpha \neq \beta$, then the common ratio is

(a) $\frac{\alpha}{\beta}$ (b) $\frac{\beta}{\alpha}$
(c) $\sqrt{\frac{\alpha}{\beta}}$ (d) $\sqrt{\frac{\beta}{\alpha}}$

44. If the pth, qth, rth terms of a GP are a, b and c respectively, then $a^{q-r}b^{r-p}c^{p-q}$ is equal to [NCERT]

(a) 0 (b) 2 (c) 1 (d) 4

45. If a, b, c and d are in GP, then $(a^2 + b^2 + c^2)(b^2 + c^2 + d^2)$ is equal to [NCERT]

(a) $(ab + bc + cd)^2$ (b) $(ab - bc - cd)^2$
(c) $(ab + bc + cd)$ (d) None of these

46. The third term of GP is 4. The product of its first 5 terms is [NCERT Exemplar]

(a) 4^3 (b) 4^4
(c) 4^5 (d) None of these

47. If $x, 2y$ and $3z$ are in AP, where the distinct numbers x, y, z are in GP, then the common ratio of the GP is [NCERT Exemplar]

(a) 3 (b) $\frac{1}{3}$ (c) 2 (d) $\frac{1}{2}$

48. The length of three unequal edges of a rectangular solid block are in GP. The volume of the block is 216 cm^3 and the total surface area is 252 cm^2. The length of the longest edge is [NCERT Exemplar]

(a) 12 cm (b) 6 cm (c) 18 cm (d) 3 cm

49. If a, b, c and d are in GP, then $a^n + b^n, b^n + c^n, c^n + d^n$ are in [NCERT]

(a) AP (b) GP
(c) HP (d) None of these

50. If A is the arithmetic mean and G_1, G_2 be two geometric means between any two numbers, then $\frac{G_1^2}{G_2} + \frac{G_2^2}{G_1}$ is equal to [NCERT Exemplar]

(a) $2A$ (b) A
(c) $3A$ (d) None of these

51. If the pth and qth terms of a GP are q and p, respectively, then $(p-q)$th term is [NCERT Exemplar]

(a) $\left(\frac{q^p}{p^q}\right)^{\frac{1}{p-q}}$ (b) $\left(\frac{q^q}{p^p}\right)^{\frac{1}{p-q}}$

(c) $\left(\frac{p^q}{q^p}\right)^{\frac{1}{p-q}}$ (d) None of these

52. If a, b, c, d and p are different real numbers such that $(a^2+b^2+c^2)\ p^2 - 2(ab+bc+cd)p + (b^2+c^2+d^2) \le 0$, then a, b, c, d are in

(a) AP (b) GP

(c) HP (d) $ab = cd$

53. $(\underset{n \text{ digits}}{666\ldots6})^2 + (\underset{n \text{ digits}}{888\ldots8})$ is equal to

(a) $\frac{4}{9}(10^n - 1)$ (b) $\frac{4}{9}(10^{2n} - 1)$

(c) $\frac{4}{9}(10^n - 1)^2$ (d) None of these

54. The sum of 100 terms of the series $0.9 + 0.09 + 0.009 \ldots$ will be

(a) $1-\left(\frac{1}{10}\right)^{100}$ (b) $1+\left(\frac{1}{10}\right)^{100}$

(c) $1-\left(\frac{1}{10}\right)^{106}$ (d) $1+\left(\frac{1}{10}\right)^{10}$

55. The value of $0.2\dot{3}\dot{4}$ is

(a) $\frac{232}{990}$ (b) $\frac{232}{9990}$

(c) $\frac{232}{900}$ (d) $\frac{232}{9909}$

56. 0.14189189189 … can be expressed as a rational number

(a) $\frac{7}{3700}$ (b) $\frac{7}{50}$

(c) $\frac{525}{111}$ (d) $\frac{21}{148}$

57. The sum of the geometric progression 0.15, 0.015, 0.0015, … 20 terms is [NCERT]

(a) $\frac{1}{6}[1-(0.1)^{20}]$ (b) $[1-(0.1)^{20}]$

(c) $\frac{1}{6}[1+(0.1)^{20}]$ (d) None of these

58. If $x > 1, y > 1, z > 1$ are in GP, then $\frac{1}{1+\log x}, \frac{1}{1+\log y}, \frac{1}{1+\log z}$ are in

(a) AP (b) HP

(c) GP (d) None of these

59. If a, b, c be in GP, then $\log a^n, \log b^n, \log c^n$ will be

(a) AP (b) GP

(c) HP (d) None of these

60. If $1+\lambda+\lambda^2+\ldots+\lambda^n = (1+\lambda)(1+\lambda^2)(1+\lambda^4)(1+\lambda^8)(1+\lambda^{16})$, then the value of n is (where $n \in N$)

(a) 32 (b) 16

(c) 31 (d) 15

61. If $x, 1, z$ are in AP and $x, 2, z$ are in GP, then $x, 4, z$ will be in

(a) AP (b) GP

(c) HP (d) None of these

62. In the four numbers first three are in GP and last three are in AP whose common difference is 6. If the first and last numbers are same, then first number will be

(a) 2 (b) 4

(c) 6 (d) 8

63. If $a^{1/x} = b^{1/y} = c^{1/z}$ and a, b, c are in GP, then x, y, z will be in

(a) AP (b) GP

(c) HP (d) None of these

64. In a GP the sum of three numbers is 14, if 1 is added to first two numbers and subtracted from third number the series becomes AP, then the greatest number is

(a) 8 (b) 4

(c) 24 (d) 16

65. Which of the following statement is correct ?

(a) If each term of an AP a number is added or subtracted, then the series so obtained is also an AP.

(b) The nth term of geometric series whose first term is a and common ratio r, is ar^{n-1}.

(c) If each term of a GP be raised to the same power the resulting terms are in GP.

(d) All of the above

66. Suppose a, b, c are in AP and a^2, b^2, c^2 are in GP. If $a < b < c$ and $a+b+c = \frac{3}{2}$, then the value of a is

(a) $\frac{1}{2\sqrt{2}}$ (b) $\frac{1}{2\sqrt{3}}$

(c) $\frac{1}{2}-\frac{1}{\sqrt{3}}$ (d) $\frac{1}{2}-\frac{1}{\sqrt{2}}$

67. If the AM and GM of roots of a quadratic equations are 8 and 5 respectively, then the quadratic equation will be

(a) $x^2 - 16x - 25 = 0$

(b) $x^2 - 8x + 5 = 0$

(c) $x^2 - 16x + 25 = 0$

(d) $x^2 + 16x - 25 = 0$

68. Three numbers form a GP. If the 3rd term is decreased by 64, then the three numbers thus obtained will constitute an AP. If the second term of this AP is decreased by 8, a GP will be formed again, then the numbers will be
(a) 4, 20, 36 (b) 4, 12, 36
(c) 4, 20, 100 (d) None of these

69. The number 111...1 (91 times) is a/an
(a) even number (b) prime number
(c) not prime (d) None of these

70. The value of the sum $\sum_{r=1}^{n} \sum_{s=1}^{n} S_{rs}\, 2^r 3^s$, where $S_{rs} = 0$, if $r \neq s$ and $S_{rs} = 1$, if $r = s$, is
(a) $\frac{(5^n - 1)}{4}$ (b) $\frac{6}{5}(6^n - 1)$
(c) $\frac{5^n 6^n}{n+1}$ (d) $\frac{5}{4}(5^n - 1)$

71. Let $n(>1)$ be a positive integer, then the largest integer m such that $(n^m + 1)$ divides $(1 + n + n^2 + \ldots + n^{127})$, is
(a) 32 (b) 63 (c) 64 (d) 127

72. The sum of
$$(x+2)^{n-1} + (x+2)^{n-2}(x+1) + (x+2)^{n-3}(x+1)^2 + \ldots + (x+1)^{n-1}$$
is equal to
(a) $(x+2)^{n-2} - (x+1)^n$ (b) $(x+2)^{n-1} - (x+1)^{n-1}$
(c) $(x+2)^n - (x+1)^n$ (d) None of these

73. Let two numbers have arithmetic mean 9 and geometric mean 4. Then, these numbers are the roots of the quadratic equation
(a) $x^2 - 18x - 16 = 0$ (b) $x^2 - 18x + 16 = 0$
(c) $x^2 + 18x - 16 = 0$ (d) $x^2 + 18x + 16 = 0$

74. If sum of the series $\sum_{n=0}^{\infty} r^n = S$, for $|r| < 1$, then sum of the series $\sum_{n=0}^{\infty} r^{2n}$ is
(a) S^2 (b) $\frac{S^2}{2S+1}$
(c) $\frac{2S}{S^2 - 1}$ (d) $\frac{S^2}{2S-1}$

75. If AM of two numbers is twice of their GM, then the ratio of greatest number to smallest number is
(a) $7 - 4\sqrt{3}$ (b) $7 + 4\sqrt{3}$ (c) 21 (d) 5

76. If n geometric means between a and b be $G_1, G_2, \ldots, G_n$ and a geometric mean be G, then the true relation is
(a) $G_1 G_2 \ldots G_n = G$ (b) $G_1 G_2 \ldots G_n = G^{1/n}$
(c) $G_1 G_2 \ldots G_n = G^n$ (d) $G_1 G_2 \ldots G_n = G^{2/n}$

77. If $1 + \cos\alpha + \cos^2\alpha + \ldots \infty = 2 - \sqrt{2}$, then $\alpha, (0 < \alpha < \pi)$ is
(a) $\frac{\pi}{8}$ (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{4}$ (d) $\frac{3\pi}{4}$

78. An infinite GP has the first term 'x' and sum 5, then x belongs to
(a) $x < -10$ (b) $-10 < x < 0$
(c) $0 < x < 10$ (d) $x > 10$

Harmonic Progression

79. If a, b, c, d are any four consecutive coefficients of any expanded binomial, then $\frac{a+b}{a}, \frac{b+c}{b}, \frac{c+d}{c}$ are in
(a) AP (b) GP
(c) HP (d) None of these

80. If the 7th term of a HP is $\frac{1}{10}$ and the 12th term is $\frac{1}{25}$, then the 20th term is
(a) $\frac{1}{41}$ (b) $\frac{1}{45}$
(c) $\frac{1}{49}$ (d) $\frac{1}{37}$

81. If $\log_a x, \log_b x, \log_c x$ be in HP, then a, b, c are in
(a) AP (b) HP
(c) GP (d) None of these

82. If the altitudes of a triangle are in AP, then the sides of the triangle are in
(a) AP
(b) HP
(c) GP
(d) arithmetico-geometric progression

Relation Among AM, GM and HM

83. The minimum value of $4^x + 4^{1-x}, x \in R$ is
[NCERT Exemplar]
(a) 2 (b) 4 (c) 1 (d) 0

84. The AM, HM and GM between two numbers are $\frac{144}{15}$, 15 and 12, but not necessarily in this order. Then, HM, GM and AM respectively are
(a) 15, 12, $\frac{144}{15}$ (b) $\frac{144}{15}$, 12, 15
(c) 12, 15, $\frac{144}{15}$ (d) $\frac{144}{15}$, 15, 12

85. If a, b and c are in AP and p, p' are the AM and GM respectively between a and b, while q, q' are the AM and GM respectively between b and c, then
(a) $p^2 + q^2 = p^2 + q'^2$ (b) $pq = p'q'$
(c) $p^2 - q^2 = p'^2 - q'^2$ (d) None of these

86. The product of n positive numbers is unity. Their sum is

(a) a positive integer (b) equal to $n + \frac{1}{n}$

(c) divisible by n (d) never less than n

87. If $2p + 3q + 4r = 15$, then the maximum value of $p^3q^5r^7$ is

(a) 2180 (b) $\frac{5^4 \cdot 3^5}{2^{15}}$ (c) $\frac{5^5 \cdot 7^7}{2^{17} \cdot 9}$ (d) 2285

88. If $a + 2b + 3c = 12$, $(a, b, c \in R^+)$, then ab^2c^3 is

(a) $\geq 2^3$ (b) $\geq 2^6$

(c) $\leq 2^6$ (d) None of these

Arithmetico-Geometric Progression

89. nth term of the series $1 + \frac{4}{5} + \frac{7}{5^2} + \frac{10}{5^3} + \ldots$ will be

(a) $\frac{3n+1}{5^{n-1}}$ (b) $\frac{3n-1}{5^n}$ (c) $\frac{3n-2}{5^{n-1}}$ (d) $\frac{3n+2}{5^{n-1}}$

90. If $|x| < 1$, then the sum of the series $1 + 2x + 3x^2 + 4x^3 + \ldots\infty$ will be

(a) $\frac{1}{1-x}$ (b) $\frac{1}{1+x}$ (c) $\frac{1}{(1+x^2)}$ (d) $\frac{1}{(1-x)^2}$

91. The sum of n terms of the infinite series

$$1 \cdot 3^2 + 2 \cdot 5^2 + 3 \cdot 7^2 + \ldots\infty \text{ is}$$

(a) $\frac{n}{6}(n+1)(6n^2 + 14n + 7)$ (b) $\frac{n}{6}(n+1)(2n+1)(3n+1)$

(c) $4n^3 + 4n^2 + n$ (d) None of these

92. $1 + \frac{3}{2} + \frac{5}{2^2} + \frac{7}{2^3} \ldots\infty$ is equal to

(a) 3 (b) 6 (c) 9 (d) 12

93. If T_n denotes the nth term of the series $2 + 3 + 6 + 11 + 18 + \ldots$, then T_{50} is [NCERT Exemplar]

(a) $49^2 - 1$ (b) 49^2 (c) $50^2 + 1$ (d) $49^2 + 2$

94. Sum of n terms of series $12 + 16 + 24 + 40 + \ldots$ will be

(a) $2(2^n - 1) + 8n$ (b) $2(2^n - 1) + 6n$

(c) $3(2^n - 1) + 8n$ (d) $4(2^n - 1) + 8n$

Sum of n Terms of Special Series

95. The sum of the series $1 + 3x + 6x^2 + 10x^3 + \ldots\infty$ will be

(a) $\frac{1}{(1-x)^2}$ (b) $\frac{1}{1-x}$

(c) $\frac{1}{(1+x)^2}$ (d) $\frac{1}{(1-x)^3}$

96. Let S_n denote the sum of the cubes of the first n natural numbers and s_n denote the sum of the first n natural numbers. Then, $\sum_{r=1}^{n} \frac{S_r}{s_r}$ is equal to [NCERT Exemplar]

(a) $\frac{n(n+1)(n+2)}{6}$ (b) $\frac{n(n+1)}{2}$

(c) $\frac{n^2 + 3n + 2}{2}$ (d) None of these

97. The sum of the series

$$\frac{1}{1+1^2+1^4} + \frac{2}{1+2^2+2^4} + \frac{3}{1+3^2+3^4} + \ldots \text{ to } n$$

terms is

(a) $\frac{n(n^2+1)}{n^2+n+1}$ (b) $\frac{n(n+1)}{2(n^2+n+1)}$

(c) $\frac{n(n^2-1)}{2(n^2+n+1)}$ (d) None of these

98. The sum of the series $\frac{1}{3 \times 7} + \frac{1}{7 \times 11} + \frac{1}{11 \times 15} + \ldots$ is

(a) $\frac{1}{3}$ (b) $\frac{1}{6}$ (c) $\frac{1}{9}$ (d) $\frac{1}{12}$

99. The sum of the series $1 \cdot 3 \cdot 5 + 2 \cdot 5 \cdot 8 + 3 \cdot 7 \cdot 11 + \ldots$ upto n terms is

(a) $\frac{n(n+1)(9n^2 + 23n + 13)}{6}$

(b) $\frac{n(n-1)(9n^2 + 23n + 12)}{6}$

(c) $\frac{(n+1)(9n^2 + 23n + 13)}{6}$

(d) $\frac{n(9n^2 + 23n + 13)}{6}$

100. The nth term of the series

$$\frac{1^3}{1} + \frac{1^3 + 2^3}{1+3} + \frac{1^3 + 2^3 + 3^3}{1+3+5} + \ldots \text{ will be}$$

(a) $n^2 + 2n + 1$ (b) $\frac{n^2 + 2n + 1}{8}$

(c) $\frac{n^2 + 2n + 1}{4}$ (d) $\frac{n^2 - 2n + 1}{4}$

101. For any odd integer $n \geq 1$,

$$n^3 - (n-1)^3 + \ldots + (-1)^{n-1}1^3 \text{ is equal to}$$

(a) $\frac{1}{2}(n-1)^2(2n-1)$ (b) $\frac{1}{4}(n-1)^2(2n-1)$

(c) $\frac{1}{2}(n+1)^2(2n-1)$ (d) $\frac{1}{4}(n+1)^2(2n-1)$

Round II (Mixed Bag)

Only One Correct Option

1. Number of identical terms in the sequence 2, 5, 8, 11, ... upto 100 terms and 3, 5, 7, 9, 11, ... upto 100 terms, are
(a) 17 (b) 33
(c) 50 (d) 147

2. If positive numbers a^{-1}, b^{-1}, c^{-1} are in AP, then the product of roots of the equation $x^2 - kx + 2b^{101} - a^{101} - c^{101} = 0, (k \in R)$ is
(a) > 0 (b) < 0
(c) $= 0$ (d) None of these

3. If $a_1, a_2, a_3, \ldots, a_{20}$ are AM's between 13 and 67, then the maximum value of $a_1\, a_2\, a_3 \ldots a_{20}$ is equal to
(a) $(20)^{20}$ (b) $(40)^{20}$
(c) $(60)^{20}$ (d) $(80)^{20}$

4. If the set of natural numbers is partitioned into subsets $S_1 = \{1\}$, $S_2 = \{2, 3)$, $S_3 = \{4, 5, 6\}$ and so on. Then, the sum of the terms in S_{50} is
(a) 62525 (b) 25625
(c) 62500 (d) None of these

5. Jairam purchased a house in ₹ 15000 and paid ₹ 5000 at once. Rest money he promised to pay in annual instalment of ₹ 1000 with 10% per annum interest. How much money is to be paid by Jairam ?
(a) ₹ 21555 (b) ₹ 20475
(c) ₹ 20500 (d) ₹ 20700

6. 150 workers were engaged to finish a piece of work in a certain number of days. 4 workers dropped the second day, 4 more workers dropped the third day and so on. It takes eight more days to finish the work now. The number of days in which the work was completed is
(a) 15 (b) 20 (c) 25 (d) 30

7. If the sum of the roots of the equation $ax^2 + bx + c = 0$ be equal to the sum of the reciprocals of their squares, then bc^2, ca^2, ab^2 will be in
(a) AP (b) GP
(c) HP (d) None of these

8. If p, q, r are in AP and are positive, the roots of the quadratic equation $px^2 + qx + r = 0$ are all real for
(a) $\left|\frac{r}{p} - 7\right| \geq 4\sqrt{3}$ (b) $\left|\frac{p}{r} - 7\right| < 4\sqrt{3}$
(c) All p and r (d) No p and r

9. The sixth term of an AP is equal to 2. The value of the common difference of the AP which makes the product $T_1\, T_4\, T_5$ least, is given by
(a) 8/5 (b) 5/4
(c) 2/3 (d) None of these

10. After striking the floor, a certain ball rebounds (4/5)th of height from which it has fallen. Then, the total distance that it travels before coming to rest, if it is gently dropped from a height of 120 m is
(a) 1260 m (b) 600 m
(c) 1080 m (d) None of these

11. Concentric circles of radii 1, 2, 3, ... , 100 cm are drawn. The interior of the smallest circle is coloured red and the angular regions are coloured alternately green and red, so that no two adjacent regions are of the same colour. Then, the total area of the green regions in sq cm is equal to
(a) 1000π (b) 5050π
(c) 4950π (d) 5151π

12. For $0 < \theta < \frac{\pi}{2}$, if $x = \sum_{n=0}^{\infty} \cos^{2n}\theta$, $y = \sum_{n=0}^{\infty} \sin^{2n}\theta$, $z = \sum_{n=0}^{\infty} \cos^{2n}\theta \sin^{2n}\theta$, then
(a) $xyz = xz + y$ (b) $xyz = xy + z$
(c) $xyz = x + y + z$ (d) $xyz = yz + x$

13. The sum of n terms of an AP is $a\, n(n-1)$. The sum of the squares of these terms is
(a) $a^2 n^2 (n-1)^2$ (b) $\frac{a^2}{6} n(n-1)(2n-1)$
(c) $\frac{2a^2}{3} n(n-1)(2n-1)$ (d) $\frac{2a^2}{3} n(n+1)(2n+1)$

14. Let $S = \frac{8}{5} + \frac{16}{65} + \ldots + \frac{128}{2^{18}+1}$, then
(a) $S = \frac{1088}{545}$ (b) $S = \frac{545}{1088}$
(c) $S = \frac{1056}{545}$ (d) $S = \frac{545}{1056}$

15. The sum of the infinite terms of the series $\frac{5}{3^2+7^2} + \frac{9}{7^2+11^2} + \frac{13}{11^2+15^2} + \ldots$ is
(a) $\frac{1}{18}$ (b) $\frac{1}{36}$ (c) $\frac{1}{54}$ (d) $\frac{1}{72}$

16. If the ratio of AM between two positive real numbers a and b to their HM is $m : n$, then $a : b$ is equal to
(a) $\frac{\sqrt{(m-n)} + \sqrt{n}}{\sqrt{m-n} - \sqrt{n}}$ (b) $\frac{\sqrt{n} + \sqrt{m-n}}{\sqrt{n} - \sqrt{m-n}}$
(c) $\frac{\sqrt{m} + \sqrt{m-n}}{\sqrt{m} - \sqrt{m-n}}$ (d) $\frac{\sqrt{m-n} + \sqrt{m}}{\sqrt{m-n} - \sqrt{m}}$

17. The sum of

$$\frac{\frac{1}{2}\cdot\frac{2}{2}}{1^3}+\frac{\frac{2}{2}\cdot\frac{3}{2}}{1^3+2^3}+\frac{\frac{3}{2}\cdot\frac{4}{2}}{1^3+2^3+3^3}+\ldots \text{ upto } n \text{ terms is}$$

equal to

(a) $\frac{n-1}{n}$ (b) $\frac{n}{n+1}$ (c) $\frac{n+1}{n+2}$ (d) $\frac{n+1}{n}$

18. If the sum of first n terms of an AP is cn^2, then the sum of squares of these n terms is

(a) $\frac{n(4n^2-1)c^2}{6}$ (b) $\frac{n(4n^2+1)c^2}{3}$

(c) $\frac{n(4n^2-1)c^2}{3}$ (d) $\frac{n(4n^2+1)c^2}{6}$

More Than One Correct Option

19. If the non-zero numbers x, y, z are in AP and $\tan^{-1}x, \tan^{-1}y, \tan^{-1}z$ are in AP, then

(a) $x = y = z$ (b) $y^2 = zx$

(c) $x^2 = yz$ (d) $z^2 = xy$

20. The consecutive digits of a three digit number are in GP. If the middle digit be increased by 2, then they form an AP. If 792 is subtracted from this, then we get the number constituting of same three digits but in reverse order. Then, number is divisible by

(a) 7 (b) 49

(c) 19 (d) None of these

21. For an increasing AP $a_1, a_2, \ldots, a_n$, if $a_1 + a_3 + a_5 = -12$ and $a_1a_3a_5 = 80$, then which of the following is/are true?

(a) $a_1 = -10$ (b) $a_2 = -1$

(c) $a_3 = -4$ (d) $a_5 = -2$

Comprehension Based Questions

Passage

Directions (Q. Nos. 22-24) *In a GP the sum of the first and last term is* 66, *the product of the second and the last but one is* 128 *and the sum of the terms is* 126.

22. If an increasing GP is considered, then the number of terms in GP is

(a) 9 (b) 8 (c) 12 (d) 6

23. If the decreasing GP is considered, then the sum of infinite terms is

(a) 64 (b) 128 (c) 256 (d) 729

24. In any case, the difference of the least and greatest term is

(a) 78 (b) 126

(c) 127 (d) None of these

Assertion and Reason

Directions (Q. Nos. 25-33) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*), (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.

(c) Statement I is true; Statement II is false.

(d) Statement I is false; Statement II is true.

25. **Statement I** The sums of n terms of two arithmetic progressions are in the ratio $(7n+1):(4n+17)$, then the ratio of their nth terms is $7:4$.

Statement II If $S_n = ax^2 + bx + c$, then $T_n = S_n - S_{n-1}$

26. Let sum of n terms of a series $S_n = 6n^2 + 3n + 1$.

Statement I The series S_n is in AP.

Statement II Sum of n terms of an AP is always of the form $an^2 + bn$.

27. Consider first three terms of a sequence S_n is $|x-1|, 3, |x-3|$, which are in AP.

Statement I The sixth term of S_n is $7 <$ third term.

Statement II If $a, a+d, a+2d, \ldots$ are in AP $(d \neq 0)$, then sixth term is $(a+5d)$.

28. **Statement I** 3, 6, 12 are in GP, then 9, 12, 18 are in HP.

Statement II If middle term is added in three consecutive terms of a GP, resultant will be in HP.

29. **Statement I** Let $F_1(n) = 1 + \frac{1}{2} + \frac{1}{3} + \ldots + \frac{1}{n}$, then $\sum_{r=1}^{n} F_1(r) = (n+1)F_1(n) - n$.

Statement II $\frac{1^{-1}+2^{-1}+3^{-1}+\ldots+n^{-1}}{n} > \left(\frac{1+2+3+\ldots+n}{n}\right)^{-1}$

or $\left(1+\frac{1}{2}+\frac{1}{3}++\ldots+\frac{1}{n}\right) > \frac{n^2}{\Sigma n}$

or $\left(1+\frac{1}{2}+\frac{1}{3}+\ldots+\frac{1}{n}\right) > \frac{2n}{(n+1)}$

30. **Statement I** There are infinite geometric progressions for which 27, 8 and 12 are three of its terms (not necessarily consecutive).

Statement II Given terms are integers.

31. Let us define the sum of cubic number is $\Sigma n^3 = \left[\frac{n(n+1)}{2}\right]^2$.

Statement I Sum of the series

$$1^3 - 2^3 + 3^3 - 4^3 + \ldots + 11^3 = 378$$

Statement II For any odd integer

$$n \geq 1,\ n^3 - (n-1)^3 + \ldots + (-1)^{n-1}\, 1^3 = \frac{1}{4}(2n-1)(n+1)^2.$$

32. **Statement I** If the AM of two numbers is 5/2, GM of the numbers is 2, then the HM will be 8/5.

Statement II For a group of positive numbers $(\text{GM})^2 = (\text{AM}) \times (\text{HM})$.

33. **Statement I** The sum of the series

$$1 + (1+2+4) + (4+6+9) + (9+12+16) + \ldots + (361+380+400) \text{ is } 8000.$$

Statement II $\sum_{k=1}^{n} \{k^3 - (k-1)^3\} = n^3$, for any natural number n.

Previous Years' Questions

34. The sum of first 20 terms of the sequence 0.7, 0.77, 0.777, ... , is [JEE Main 2013]

(a) $\frac{7}{81}(179 - 10^{20})$ (b) $\frac{7}{9}(99 - 10^{-20})$

(c) $\frac{7}{81}(179 + 10^{-20})$ (d) $\frac{7}{9}(99 + 10^{-20})$

35. If 100 times the 100th term of an AP with non-zero common difference equals the 50 times its 50th term, then the 150th term of this AP is [AIEEE 2012]

(a) –150 (b) 150 times its 50th term

(c) 150 (d) zero

36. A man saves ₹ 200 in each of the first three months of his service. In each of the subsequent months his saving increases by ₹ 40 more than the saving of immediately previous month. His total saving from the start of service will be ₹ 11040 after [AIEEE 2011]

(a) 19 months (b) 20 months

(c) 21 months (d) 18 months

37. A person is to count 4500 currency notes. Let a_n denotes the number of notes he counts in the nth minute. If $a_1 = a_2 = \ldots = a_{10} = 150$ and $a_{10}, a_{11}, \ldots$ are in AP with common difference –2, then the time taken by him to count all notes, is [AIEEE 2010]

(a) 24 min (b) 34 min (c) 125 min (d) 135 min

38. The sum of the infinity of the series

$$1 + \frac{2}{3} + \frac{6}{3^2} + \frac{10}{3^3} + \frac{14}{3^4} + \ldots \text{ is}$$

[AIEEE 2009]

(a) 3 (b) 4 (c) 6 (d) 2

39. The first two terms of a geometric progression add upto 12. The sum of the third and the fourth terms is 48. If the terms of the geometric progression are alternately positive and negative, then first term is [AIEEE 2008]

(a) 4 (b) –4

(c) –12 (d) 12

40. If p and q are positive real numbers such that $p^2 + q^2 = 1$, then the maximum value of $(p+q)$ is [AIEEE 2007]

(a) 2 (b) $\frac{1}{2}$

(c) $\frac{1}{\sqrt{2}}$ (d) $\sqrt{2}$

41. In a geometric progression consisting of positive terms, each term equals the sum of the next two terms. Then, the common ratio of this progression is equal to [AIEEE 2007]

(a) $\frac{1}{2}(1-\sqrt{5})$ (b) $\frac{1}{2}\sqrt{5}$

(c) $\sqrt{5}$ (d) $\frac{1}{2}(\sqrt{5}-1)$

42. Let $a_1, a_2, a_3, \ldots$ be terms of an AP. If $\frac{a_1 + a_2 + \ldots + a_p}{a_1 + a_2 + \ldots + a_q} = \frac{p^2}{q^2}$, $p \neq q$, then $\frac{a_6}{a_{21}}$ is equal to [AIEEE 2006]

(a) $\frac{7}{2}$ (b) $\frac{2}{7}$

(c) $\frac{11}{41}$ (d) $\frac{41}{11}$

43. If $a_1, a_2, \ldots, a_n$ are in HP, then the expression $a_1a_2 + a_2a_3 + \ldots + a_{n-1}a_n$ is equal to [AIEEE 2006]

(a) $(n-1)(a_1 - a_n)$

(b) na_1a_n

(c) $(n-1)a_1a_n$

(d) $n(a_1 - a_n)$

44. If $x = \sum_{n=0}^{\infty} a^n$, $y = \sum_{n=0}^{\infty} b^n$, $z = \sum_{n=0}^{\infty} c^n$, where a, b, c are in AP and $|a| < 1$, $|b| < 1$, $|c| < 1$, then x, y, z are in [AIEEE 2005]

(a) HP (b) AGP

(c) AP (d) GP

the **Guidance**

Round I

1. $a_1a_2 \ldots a_n = b_n\left(\dfrac{a_1a_2 \ldots a_n}{b_n}\right) = a_nb_n\left(\dfrac{a_1a_2 \ldots a_{n-1}}{b_n}\right)$

$$= \left[(x)^{\frac{1}{2^{n-1}}} - (y)^{\frac{1}{2^{n-1}}}\right]\left(\frac{a_1a_2 \ldots a_{n-1}}{b_n}\right)$$

$$= b_{n-1} \cdot a_{n-1}\left(\frac{a_1a_2 \ldots a_{n-2}}{b_n}\right) = \ldots = \frac{x-y}{b_n}$$

2. $S_n = 3n + 2n^2$

We know, $T_n = S_n - S_{n-1}$

$\Rightarrow$ $T_n = 2n^2 + 3n - \{2(n-1)^2 + 3(n-1)\} = 4n + 1$

And $d = T_n - T_{n-1}$

$\Rightarrow$ $d = 4n + 1 - \{4(n-1) + 1\} = 4$

3. Let Ist term of AP = a and common difference = d

Given, $9 \times T_9 = 13 \times T_{13}$

$\Rightarrow$ $9(a + 8d) = 13(a + 12d)$

$\Rightarrow$ $4a + 84d = 0$

$\Rightarrow$ $a + 21d = 0$

Now, $T_{22} = a + 21d = 0$

4. Let AP series is $a, a + d, a + 2d, a + 3d, \ldots$

Now, given $a = 2$

According to the given condition,

Sum of first five terms = $\frac{1}{4}$ (Sum of next five terms)

$\Rightarrow$ $a + (a + d) + (a + 2d) + (a + 3d) + (a + 4d)$

$$= \frac{1}{4}[a + 5d + a + 6d + a + 7d + a + 8d + a + 9d]$$

$\Rightarrow$ $$5a + 10d = \frac{1}{4}(5a + 35d)$$

$\Rightarrow$ $$4(5a + 10d) = 5a + 35d$$

$\Rightarrow$ $$20a + 40d = 5a + 35d \Rightarrow 20a - 5a = 35d - 40d$$

$\Rightarrow$ $$15a = -5d$$

$\Rightarrow$ $$15 \times 2 = -5d$$

$\Rightarrow$ $$30 = -5d \qquad (\because a = 2)$$

$\Rightarrow$ $$d = \frac{-30}{5} = -6$$

Now, $$T_n = a + (n-1)d$$

$\Rightarrow$ $$T_{20} = 2 + (20-1)(-6) = 2 + 19(-6)$$
$$= 2 - 19 \times 6 = 2 - 114 = -112$$

5. Since, a, b, c, d, e, f are in AP.

So, $b - a = c - b = d - c = e - d = f - e = k$,

where k is the common difference.

Now, $d - c = e - d \Rightarrow e + c = 2d$

$\Rightarrow$ $e - c + 2c = 2d \Rightarrow e - c = 2(d - c)$

6. Let Ist term $= a$ and common difference $= d$

Given, $$S_{2n} = 3S_n$$

$\Rightarrow$ $$\frac{2n}{2}[2a + (2n-1)d] = 3\left\{\frac{n}{2}[2a + (n-1)d]\right\}$$

$$4a + (4n-2)d = 6a + (3n-3)d$$

$\Rightarrow$ $$2a = (n+1)d \qquad \ldots(i)$$

Now, $$\frac{S_{3n}}{S_n} = \frac{\frac{3n}{2}[2a + (3n-1)d]}{\frac{n}{2}[2a + (n-1)d]}$$

$$= \frac{\{3(n+1)d + (3n-1)d\}}{(n+1)d + (n-1)d} \qquad [\because \text{from Eq. (i)}]$$

$$= \frac{3(4nd)}{2nd} = 6$$

7. Suppose that $\angle A = x$, then $\angle B = x + 10°$,

$$\angle C = x + 20° \quad \text{and} \quad \angle D = x + 30°$$

So, we know that $\angle A + \angle B + \angle C + \angle D = 360°$

On putting these values, we get

$$(x) + (x + 10°) + (x + 20°) + (x + 30°) = 360°$$

$\Rightarrow$ $$x = 75°$$

Hence, the angles of the quadrilateral are 75°, 85°, 95°, 105°.

8. Let the number of sides of the polygon be n. Then, the sum of interior angles of the polygon

$$= (2n-4)\frac{\pi}{2} = (n-2)\pi$$

Since, the angles are in AP and $a = 120°$, $d = 5$

Therefore, $$S_n = \frac{n}{2}[2a + (n-1)d]$$

$\Rightarrow$ $$\frac{n}{2}[2 \times 120 + (n-1)5] = (n-2)180$$

$\Rightarrow$ $$n^2 - 25n + 144 = 0$$

$\Rightarrow$ $$(n-9)(n-16) = 0$$

$\Rightarrow$ $$n = 9, 16$$

Take $n = 16$

$T_{16} = a + 15d = 120° + 15(5°) = 195°$, which is impossible, an interior angle cannot be greater than 180°.

Hence, $n = 9$

9. $\because$ $$T_n = a + (n-1)d$$

Therefore, $$T_p = a + (p-1)d = \frac{1}{q} \qquad \text{(given) } \ldots(i)$$

and $$a + (q-1) = \frac{1}{p} \qquad \text{(given) } \ldots(ii)$$

On subtracting Eq. (ii) from Eq. (i),

$$d(p - 1 - q + 1) = \frac{1}{q} - \frac{1}{p}$$

$\Rightarrow$ $$d(p - q) = \frac{p - q}{pq} \Rightarrow d = \frac{1}{pq}$$

On putting the value of d in Eq. (i), we get

$$a + \frac{(p-1)}{pq} = \frac{1}{q}$$

$\Rightarrow$ $$a = \frac{1}{q} - \frac{p-1}{pq}$$

$\Rightarrow$ $$a = \frac{p - p + 1}{pq} = \frac{1}{pq}$$

Now, $$S_{pq} = \frac{pq}{2}[2a + (pq-1)d]$$

$$\left[\because S_n = \frac{n}{2}\{2a + (n-1)d\}\right]$$

$$= \frac{pq}{2}\left[2 \times \frac{1}{pq} + (pq-1)\frac{1}{pq}\right]$$

$$= \frac{pq}{2} \times \frac{1}{pq}(2 + pq - 1) = \frac{1}{2}(pq + 1)$$

10. Given, AP is 25, 22, 19, ...

Here, $a = 25, d = -3$ and $S_n = 116$

$\because$ $$S_n = \frac{n}{2}[2a + (n-1)d]$$

$\therefore$ $$116 = \frac{n}{2}[2 \times 25 + (n-1)(-3)]$$

$\Rightarrow$ $$116 \times 2 = n(50 - 3n + 3)$$

$\Rightarrow$ $$232 = n(53 - 3n)$$

$\Rightarrow$ $$232 = 53n - 3n^2$$

$\Rightarrow$ $$3n^2 - 53n + 232 = 0$$

$\Rightarrow$ $$3n^2 - 24n - 29n + 232 = 0$$

$\Rightarrow$ $$3n(n-8) - 29(n-8) = 0$$

$\Rightarrow \quad (3n-29)(n-8)=0$

$\Rightarrow \quad n=\frac{29}{3}, n=8$

$n=\frac{29}{3}$ is useless as n cannot be fraction, only $n=8$ is valid.

Now, $\quad T_n = a+(n-1)d$

$T_8 = 25+(8-1)(-3)$

$= 25+7\times(-3) = 25-21 = 4$

11. Now, we assume $(b-c)^2, (c-a)^2, (a-b)^2$ are in AP, then we have

$$(c-a)^2-(b-c)^2=(a-b)^2-(c-a)^2$$

$\Rightarrow \quad (b-a)(2c-a-b)=(c-b)(2a-b-c) \quad \ldots(i)$

Also, if $\frac{1}{b-c}, \frac{1}{c-a}, \frac{1}{a-b}$ are in AP, then

$$\frac{1}{c-a}-\frac{1}{b-c}=\frac{1}{a-b}-\frac{1}{c-a}$$

$\Rightarrow \quad \frac{b+a-2c}{(c-a)(b-c)}=\frac{c+b-2a}{(a-b)(c-a)}$

$\Rightarrow \quad (a-b)(b+a-2c)=(b-c)(c+b-2a)$

$\Rightarrow \quad (b-a)(2c-a-b)=(c-b)(2a-b-c)$

which is equal to Eq.(i), so our hypothesis is true.

12. Since, $\log 2, \log(2^n-1)$ and $\log(2^n+3)$ are in AP.

$\therefore \quad 2\log(2^n-1)=\log 2+\log(2^n+3)$

$\Rightarrow \quad (2^n-1)^2=2(2^n+3)$

$\Rightarrow \quad (2^n-5)(2^n+1)=0$

As 2^n cannot be negative hence, $2^n-5=0$

$\Rightarrow \quad 2^n=5 \Rightarrow n=\log_2 5$

13. We know that, arithmetic mean of a and $b=\frac{a+b}{2}$

But given that $\frac{a+b}{2}=\frac{a^n+b^n}{a^{n-1}+b^{n-1}}$

$\Rightarrow \quad a^n+b^n+\frac{ab^n}{b}+\frac{ba^n}{a}=2(a^n+b^n)$

$\Rightarrow \quad \frac{a}{b}b^n+\frac{b}{a}a^n=a^n+b^n$

$\Rightarrow \quad a^n\left(\frac{a-b}{a}\right)=-b^n\left(\frac{b-a}{b}\right)$

$\Rightarrow \quad \left(\frac{a}{b}\right)^n=\left(\frac{a}{b}\right)$

$\therefore \quad n=1$

14. Let the first term is A and common difference is d.

Given, $\quad S_p=a \Rightarrow \frac{p}{2}[2A+(p-1)d]=a \quad \ldots(i)$

$S_q=b \Rightarrow \frac{q}{2}[2A+(q-1)d]=b \quad \ldots(ii)$

and $\quad S_r=c \Rightarrow \frac{r}{2}[2A+(r-1)d]=c \quad \ldots(iii)$

$\therefore \quad \frac{a}{p}(q-r)+\frac{b}{q}(r-p)+\frac{c}{r}(p-q)$

$=\frac{1}{p}\times\frac{p}{2}[2A+(p-1)d](q-r)+\frac{1}{q}\times\frac{q}{2}$

$[2A+(q-1)d](r-p)+\frac{1}{r}\times\frac{r}{2}[2A+(r-1)d](p-q)$

[$\because$ from Eqs. (i), (ii), (iii)]

$=\frac{1}{2}[2A+(p-1)d](q-r)+[2A+(q-1)d](r-p)$

$+[2A+(r-1)d\}(p-q)$

$=\frac{1}{2}[2A(q-r)+(p-1)d(q-r)+2A(r-p)$

$+(q-1)d(r-p)+2A(p-q)+(r-1)d(p-q)]$

$=\frac{1}{2}2A(q-r+r-p+p-q)$

$+d[(p-1)(q-r)+(q-1)(r-p)+(r-1)(p-q)]$

$=\frac{1}{2}[2A\times(0)+d(pq-pr-q+r+qr-pq-r$

$+p+rp-rq-p+q)]$

$=\frac{1}{2}(0+d\times 0)=0$

15. Let S_n and S' be the sums of n terms of two AP's and T_{11} and T'_{11} be the respective 11th term, then

$$\frac{S_n}{S_n'}=\frac{\frac{n}{2}[2a+(n-1)d]}{\frac{n}{2}[2a'+(n-1)d']}=\frac{7n+1}{4n+27} \quad \text{(given)}$$

$\Rightarrow \quad \frac{a+\frac{(n-1)}{2}d}{a'+\frac{(n-1)}{2}d'}=\frac{7n+1}{4n+27}$

Now, put $n=21$, we get

$$\frac{a+10d}{a'+10d'}=\frac{T_{11}}{T'_{11}}=\frac{148}{111}$$

$$=\frac{4}{3}$$

16. mth mean between a and $2b$ is $a+\frac{m(2b-a)}{n+1}$.

and mth mean between $2a$ and b is $2a+\frac{m(b-2a)}{n+1}$.

According to the given condition,

$$a+\frac{m(2b-a)}{n+1}=2a+\frac{m(b-2a)}{n+1}$$

$\Rightarrow \quad m(2b-a)=a(n+1)+m(b-2a)$

$\Rightarrow \quad a(n-m+1)=bm$

$\Rightarrow \quad \frac{a}{b}=\frac{m}{n-m+1}$

17. Here, $n=20, S_n=66000, d=200$

Let first term is a.

$\because \quad S_n=\frac{n}{2}[2a+(n-1)d]$

$\therefore \quad 66000 = \frac{20}{2}[2 \times a + (20-1)200]$

$\Rightarrow \quad 6600 = 2a + 19 \times 200$

$\Rightarrow \quad 2a = 6600 - 3800$

$\Rightarrow \quad 2a = 2800$

$\Rightarrow \quad a = 1400$

Hence, he save in the first year is ₹ 1400.

18. Clearly, the series is 5, 7, 9, 11, ...

It is an AP, where $a = 5$ and $d = 2$, $S_n = 192$

$\Rightarrow \quad S_n = \frac{n}{2}[2a + (n-1)d]$

$\Rightarrow \quad 192 = \frac{n}{2}[2 \times 5 + (n-1)2]$

$\Rightarrow \quad 192 = \frac{n}{2} \times 2(5 + n - 1)$

$\Rightarrow \quad 192 = n(n+4)$

$\Rightarrow \quad 192 = n^2 + 4n$

$\Rightarrow \quad n^2 + 4n - 192 = 0$

$\Rightarrow \quad n^2 + 16n - 12n - 192 = 0$

$\Rightarrow \quad n(n+16) - 12(n+16) = 0$

$\Rightarrow \quad (n+16)(n-12) = 0$

$\Rightarrow \quad n = -16, 12$

But $\quad n \neq -16$

$\because$ Number of days are always positive.

$\therefore$ Required number of days $= 12$

19. Let a_1, a_2, a_3 and d_1, d_2, d_3 are the first term and common difference of the three AP's, respectively.

We have, $a_1 = a_2 = a_3 = 1$ and $d_1 = 1, d_2 = 2, d_3 = 3$, therefore

$$S_1 = \frac{n}{2}(n+1) \quad \text{...(i)}$$

$$S_2 = \frac{n}{2}(2n) \quad \text{...(ii)}$$

$$S_3 = \frac{n}{2}(3n-1) \quad \text{...(iii)}$$

On adding Eqs. (i) and (iii), we get

$$S_1 + S_3 = \frac{n}{2}[(n+1) + (3n-1)] = 2\left[\frac{n}{2}(2n)\right] = 2S_2$$

Hence, correct relation is $S_1 + S_3 = 2S_2$

20. Let the common difference be d.

Sum of first p terms $= 0$

Given, $\quad S_p = 0$

$\Rightarrow \quad \frac{p}{2}[2a + (p-1)d] = 0$

$\Rightarrow \quad 2a + (p-1)d = 0$

$\Rightarrow \quad d = -\frac{2a}{p-1} \quad \text{...(i)}$

$\therefore$ Required sum of next q terms = Sum of first $(p+q)$ terms – Sum of first p terms

$= S_{p+q} - S_p$

$= \frac{p+q}{2}[2a + (p+q-1)d] - 0$

$= \frac{p+q}{2}\left[2a + (p+q-1)\left(\frac{-2a}{p-1}\right)\right]$ [from Eq. (i)]

$= \frac{p+q}{2} \times 2a\left[\frac{1}{1} - \frac{p+q-1}{p-1}\right]$

$= (p+q)\,a\left[\frac{p-1-p-q+1}{p-1}\right] = \frac{-a(p+q)q}{p-1}$

21. Here, $n = 16, S_n = 8000$

Since, we consider last place team as a first term,

$a = 275$

Let common difference be d.

$\because \quad S_n = \frac{n}{2}[2a + (n-1)d]$

$\therefore \quad 8000 = \frac{16}{2}[2 \times 275 + (16-1)d]$

$\Rightarrow \quad 1000 = (550 + 15d)$

$\Rightarrow \quad 15d = 450$

$\Rightarrow \quad d = 30$

Now, $\quad T_{16} = 275 + (16-1)30$

$= 275 + 450 = 725$

$\therefore$ The first place team will get the prize ₹ 725.

22. Since, a, b, c are in AP.

$\Rightarrow 2b = a + c$, then straight line $ax + by + c = 0$ will pass through (1,–2) because it satisfies condition $a - 2b + c = 0$ or $2b = a + c$

23. Since, $\theta_1, \theta_2, \theta_3, \ldots, \theta_n$ are in AP.

$\Rightarrow \quad \theta_2 - \theta_1 = \theta_3 - \theta_2 = \ldots = \theta_n - \theta_{n-1} = d \quad \text{...(i)}$

Now, taking only first term

$\sin d \sec\theta_1 \sec\theta_2 = \frac{\sin d}{\cos\theta_1 \cos\theta_2} = \frac{\sin(\theta_2 - \theta_1)}{\cos\theta_1 \cos\theta_2}$

[from Eq. (i)]

$= \frac{\sin\theta_2 \cos\theta_1 - \cos\theta_2 \sin\theta_1}{\cos\theta_1 \cos\theta_2}$

$= \frac{\sin\theta_2 \cos\theta_1}{\cos\theta_1 \cos\theta_2} - \frac{\cos\theta_2 \sin\theta_1}{\cos\theta_1 \cos\theta_2}$

$= \tan\theta_2 - \tan\theta_1$

Similarly, we can solve other terms which will be

$\tan\theta_3 - \tan\theta_2, \tan\theta_4 - \tan\theta_3, \ldots$

$\therefore \sin d(\sec\theta_1 \sec\theta_2 + \sec\theta_2 \sec\theta_3 + \ldots + \sec\theta_{n-1} \sec\theta_n)$

$= \tan\theta_2 - \tan\theta_1 + \tan\theta_3 - \tan\theta_2 + \ldots + \tan\theta_n - \tan\theta_{n-1}$

$= -\tan\theta_1 + \tan\theta_n = \tan\theta_n - \tan\theta_1$

24. Given that,

$a_1 + a_5 + a_{10} + a_{15} + a_{20} + a_{24} = 225$

$\Rightarrow \quad (a_1 + a_{24}) + (a_5 + a_{20}) + (a_{10} + a_{15}) = 225$

$\Rightarrow \quad 3(a_1 + a_{24}) = 225$

$\Rightarrow \quad a_1 + a_{24} = 75 \quad \ldots(i)$

($\because$ in an AP the sum of the terms equidistant from the beginning and the end is same and is equal to the sum of the first and last term)

$\therefore \quad a_1 + a_2 + \ldots + a_{24} = \frac{n}{2}(a + l) = \frac{24}{2}(a_1 + a_{24})$

$= 12 \times 75 = 900$ [from Eq. (i)]

25. Since, $a_1, a_2, a_3, \ldots, a_n$ are in AP.

Then, $a_2 - a_1 = a_3 - a_2 = \ldots = a_n - a_{n-1} = d$

where d is the common difference of the given AP.

Also, $a_n = a_1 + (n-1)d$

Then, by rationalizing each term

$$\frac{1}{\sqrt{a_2}+\sqrt{a_1}} + \frac{1}{\sqrt{a_3}+\sqrt{a_2}} + \ldots + \frac{1}{\sqrt{a_n}+\sqrt{a_{n-1}}}$$

$$= \frac{\sqrt{a_2}-\sqrt{a_1}}{a_2-a_1} + \frac{\sqrt{a_3}-\sqrt{a_2}}{a_3-a_2} + \ldots + \frac{\sqrt{a_n}-\sqrt{a_{n-1}}}{a_n-a_{n-1}}$$

$$= \frac{1}{d}(\sqrt{a_2}-\sqrt{a_1}+\sqrt{a_3}-\sqrt{a_2}+\ldots+\sqrt{a_n}-\sqrt{a_{n-1}})$$

$$= \frac{1}{d}(\sqrt{a_n}-\sqrt{a_1}) \times \frac{\sqrt{a_n}+\sqrt{a_1}}{\sqrt{a_n}+\sqrt{a_1}}$$

$$= \frac{1}{d}\left(\frac{a_n - a_1}{\sqrt{a_n}+\sqrt{a_1}}\right)$$

$$= \frac{1}{d}\left[\frac{(n-1)d}{\sqrt{a_n}+\sqrt{a_1}}\right] = \frac{n-1}{\sqrt{a_n}+\sqrt{a_1}}$$

26. Since, $a_1, a_2, a_3, \ldots, a_n$ form an AP.

$\therefore \quad a_2 - a_1 = a_4 - a_3 = \ldots = a_{2n} - a_{2n-1} = d$

Let $S = a_1^2 - a_2^2 + a_3^2 - a_4^2 + \ldots + a_{2n-1}^2 - a_{2n}^2$

$= (a_1 - a_2)(a_1 + a_2) + (a_3 - a_4)(a_3 + a_4) + \ldots + (a_{2n-1} - a_{2n})(a_{2n-1} + a_{2n})$

$= -d(a_1 + a_2 + \ldots + a_{2n}) = -d\left[\frac{2n}{2}(a_1 + a_{2n})\right] \ldots(i)$

Also, we know $a_{2n} = a_1 + (2n-1)d$

$\Rightarrow \quad d = \frac{a_{2n} - a_1}{2n-1} \Rightarrow -d = \frac{a_1 - a_{2n}}{2n-1}$

On putting the value of d in Eq. (i), we get

$$S = \frac{n(a_1 - a_{2n})(a_1 + a_{2n})}{2n-1} = \frac{n}{2n-1}(a_1^2 - a_{2n}^2)$$

27. Now, $\frac{1}{a_1a_2} + \frac{1}{a_2a_3} + \ldots + \frac{1}{a_{4000}a_{4001}}$

$$= \frac{1}{d}\left(\frac{a_2-a_1}{a_1a_2} + \frac{a_3-a_2}{a_2a_3} + \ldots + \frac{a_{4001}-a_{4000}}{a_{4000}a_{4001}}\right)$$

$$= \frac{1}{d}\left(\frac{1}{a_1} - \frac{1}{a_2} + \frac{1}{a_2} - \frac{1}{a_3} + \ldots + \frac{1}{a_{4000}} - \frac{1}{a_{4001}}\right)$$

$$= \frac{1}{d}\left(\frac{1}{a_1} - \frac{1}{a_{4001}}\right) = \frac{4000}{a_1a_{4001}} = 10 \quad \text{(given)}$$

$\Rightarrow \quad a_1a_{4001} = 400 \quad \ldots(i)$

$a_1 + a_{4001} = a_2 + a_{4000} = 50 \quad \ldots(ii)$

$\therefore \quad (a_1 - a_{4001})^2 = (a_1 + a_{4001})^2 - 4a_1a_{4001}$

$= (50)^2 - 1600$

$\Rightarrow \quad |a_1 - a_{4001}| = 30$

28. Since, $a_1, a_2, a_3, \ldots, a_n$ are in AP.

$\Rightarrow \quad d = a_2 - a_1 = a_3 - a_2 = \ldots = a_n - a_{n-1}$

$\therefore \sin d(\operatorname{cosec} a_1 \operatorname{cosec} a_2 + \ldots + \operatorname{cosec} a_{n-1} \operatorname{cosec} a_n)$

$$= \frac{\sin(a_2 - a_1)}{\sin a_1 \sin a_2} + \ldots + \frac{\sin(a_n - a_{n-1})}{\sin a_{n-1} \sin a_n}$$

$$= \frac{(\sin a_2 \cos a_1 - \cos a_2 \sin a_1)}{\sin a_1 \sin a_2} + \ldots + \frac{(\sin a_n \cos a_{n-1} + \cos a_n \sin a_{n-1})}{\sin a_{n-1} \sin a_n}$$

$= (\cot a_1 - \cot a_2) + (\cot a_2 - \cot a_3) + \ldots + (\cot a_{n-1} - \cot a_n)$

$= \cot a_1 - \cot a_n$

29. Given, $x_n = x_{n+1}\sqrt{2}$

$\therefore \quad x_1 = x_2\sqrt{2}, x_2 = x_3\sqrt{2}, \ldots, x_n = x_{n+1}\sqrt{2}$

On multiplying $x_1 = x_{n+1}(\sqrt{2})^n$

$\Rightarrow \quad x_{n+1} = \frac{x_1}{(\sqrt{2})^n}$

Hence, $x_n = \frac{x_1}{(\sqrt{2})^{n-1}}$

Area of $S_n = x_n^2 = \frac{x_1^2}{2^{n-1}} < 1 \Rightarrow 2^{n-1} > x_1^2 \quad (\because x_1 = 10)$

$\therefore \quad 2^{n-1} > 100$

But $2^7 > 100, 2^8 > 100$ etc.

$\therefore \quad n - 1 = 7, 8, 9, \ldots \Rightarrow n = 8, 9, 10, \ldots$

30. Since a, b, c are in AP.

$\therefore \quad 2b = a + c$

$\Rightarrow \quad 2bx = (a + c)x$ for all x

$\Rightarrow \quad 2bx + 20 = (a + c)x + 20$ for all x

$\Rightarrow \quad 2(bx + 10) = (ax + 10) + (cx + 10)$

$\therefore \quad 10^{2(bx+10)} = 10^{(ax+10)+(cx+10)}$

$\Rightarrow \quad (10^{bx+10})^2 = 10^{ax+10} \cdot 10^{cx+10}$

$\Rightarrow \quad 10^{ax+10}, 10^{bx+10}, 10^{cx+10}$ are in GP for all x

31. $\because (x+1) + (x+4) + (x+7) + \ldots + (x+28) = 155$

Let n be the number of terms in the AP on LHS.

$\therefore \quad x + 28 = (x+1) + (n-1)3$

$\Rightarrow \quad n = 10$

$\therefore \quad \frac{10}{2}[(x+1) + (x+28)] = 155$

$\Rightarrow \quad x = 1$

32. **Statement I** Since, nth term of an AP is a_n.

$$\therefore \quad a_n = \frac{a_{n+k} + a_{n-k}}{2} \quad \left(\because \text{AM} = \frac{a+b}{2}\right)$$

Statement II Let a be the first term and d be the common difference of an AP.

According to the given condition,

$$S_m = S_n$$

$$\therefore \quad \frac{m}{2}[2a + (m-1)d] = \frac{n}{2}[2a + (n-1)d]$$

$$\Rightarrow \quad (m-n)2a + (m^2 - n^2 - m + n)d = 0$$

$$\Rightarrow \quad (m-n)[2a + (m+n-1)d] = 0 \quad \ldots\text{(i)}$$

$$\therefore \quad S_{(m+n)} = \frac{m+n}{2}[2a + (m+n-1)d] = 0$$

$$= \frac{m+n}{2}(0) \quad [\because \text{from Eq. (i)}]$$

$$= 0$$

33. The given numbers are 13, 17, ... , 97. This is an AP with the first term 13 and common difference 4. Let the number of terms be n. Then,

$$97 = 13 + (n-1)\,4$$

$$\Rightarrow \quad 4n = 88 \quad \Rightarrow \quad n = 22$$

Therefore, the sum of the numbers

$$S = \frac{n}{2}(a+l) = \frac{22}{2}(13+97) = 11(110) = 1210$$

34. The sum of integers from 1 to 100 that are divisible by 2 or 5

= Sum of series divisible by 2 + Sum of series divisible by 5 − Sum of series divisible by 2 and 5

$$= (2+4+6+\ldots+100) + (5+10+15+\ldots+100) - (10+20+30+\ldots+100)$$

$$= \frac{50}{2}\{2\times 2 + (50-1)\,2\} + \frac{20}{2}\{2\times 5 + (20-1)\,5\} - \frac{10}{2}\{10\times 2 + (10-1)\,10\}$$

$$= 25(102) + 10(105) - 5(110)$$

$$= 2550 + 1050 - 550 = 3050$$

35. Let $S = 1+2+3+\ldots+100$

$$= \frac{100}{2}(1+100) = 50(101) = 5050$$

Let $S_1 = 3+6+9+12+\ldots+99$

$$= 3(1+2+3+4+\ldots+33)$$

$$= 3\cdot\frac{33}{2}(1+33) = 99\times 17 = 1683$$

Let $S_2 = 5+10+15+\ldots+100$

$$= 5(1+2+3+\ldots+20)$$

$$= 5\cdot\frac{20}{2}(1+20) = 50\times 21 = 1050$$

Let $S_3 = 15+30+45+\ldots+90$

$$= 15(1+2+3+\ldots+6)$$

$$= 15\cdot\frac{6}{2}(1+6) = 45\times 7 = 315$$

$\therefore$ Required sum $= S - S_1 - S_2 + S_3$

$$= 5050 - 1683 - 1050 + 315 = 2632$$

36. $\because a^2, b^2, c^2$ are in AP.

$$\Rightarrow \quad \sin^2 B - \sin^2 A = \sin^2 C - \sin^2 B$$

$$\Rightarrow \quad \sin C(\sin B\cos A - \cos B\sin A)$$

$$= \sin A(\sin C\cos B - \cos C\sin B)$$

On dividing by $\sin A\sin B\sin C$, we get

$$2\cot B = \cot A + \cot C$$

$\Rightarrow$ $\cot A, \cot B, \cot C$ are in AP.

37. Let A_1, A_2, A_3 be 3 AM's between 3 and 19.

Then, $3, A_1, A_2, A_3, 19$ are in AP whose common difference is

$$d = \frac{19-3}{3+1} = 4$$

$$\therefore \quad A_1 = 3 + d = 3 + 4 = 7;\ A_2 = 3 + 2d = 3 + 2\times 4 = 11,$$

$$A_3 = 3 + 3d = 3 + 3\times 4 = 15$$

38. Since, a, b, c are in GP.

$$\Rightarrow \quad b^2 = ac$$

and $\log a - \log 2b, \log 2b - \log 3c$ and $\log 3c - \log a$ are in AP.

$$\Rightarrow 2(\log 2b - \log 3c) = \log a - \log 2b + \log 3c - \log a$$

$$\therefore \quad b^2 = ac \quad \text{and} \quad 2b = 3c$$

$$\Rightarrow \quad b = \frac{2a}{3} \quad \text{and} \quad c = \frac{4a}{9}$$

Since, $\quad a + b = \frac{5a}{3} > c, b + c = \frac{10a}{9} > a,$

$$c + a = \frac{13a}{9} > b$$

It implies that a, b, c form a triangle with a as the greatest side.

Now, let us find the greatest $\angle A$ of ΔABC by using the cosine formula.

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc} = \frac{\frac{4a^2}{9} + \frac{16a^2}{81} - a^2}{\frac{4a}{3}\cdot\frac{4a}{9}} = -\frac{29}{48} < 0$$

$\therefore$ The $\angle A$ is obtuse.

39. Given, $\quad T_4 = x \Rightarrow ar^{4-1} = x \Rightarrow ar^3 = x \quad \ldots\text{(i)}$

$$T_{10} = y \Rightarrow ar^{10-1} = y \Rightarrow ar^9 = y \quad \ldots\text{(ii)}$$

$$T_{16} = z \Rightarrow ar^{16-1} = z \Rightarrow ar^{15} = z \quad \ldots\text{(iii)}$$

Now, multiplying Eq. (i) by Eq. (iii),

$$\Rightarrow \quad ar^3 \times ar^{15} = x \times z$$

$\Rightarrow \quad a^2r^{3+15} = xz$

$\Rightarrow \quad a^2r^{18} = xz$

$\Rightarrow \quad (ar^9)^2 = xz$

$\Rightarrow \quad y^2 = xz$ [from Eq. (ii)]

Therefore, x, y, z are in GP.

40. Let $S = 8 + 88 + 888 + 8888 + \ldots + n$ terms

$\Rightarrow \quad S = 8(1 + 11 + 111 + 1111 + \ldots + n \text{ terms})$

$= \frac{8}{9}[9 + 99 + 999 + 9999 + \ldots + n \text{ terms}]$

$= \frac{8}{9}[(10-1) + (100-1) + (1000-1) + \ldots + n \text{ terms}]$

$= \frac{8}{9}[(10 + 100 + 1000 + \ldots + n \text{ terms})$

$- (1 + 1 + 1 + 1 + \ldots + n \text{ terms})]$

$= \frac{8}{9}\left[10\frac{(10^n - 1)}{10 - 1} - n\right] \quad \left[\because S_n = \frac{a(r^n - 1)}{r - 1}, \text{ as } r > 1\right]$

$= \frac{8}{9}\left[\frac{10(10^n - 1)}{9} - n\right]$

$= \frac{8}{9} \times \frac{10}{9} \times (10^n - 1) - \frac{8}{9} \times n = \frac{80}{81}(10^n - 1) - \frac{8n}{9}$

41. Let the GP sequence is $a, ar, ar^2, ar^3, \ldots$

Given, third term = first term + 9

$\therefore \quad T_3 = a + 9 \Rightarrow ar^2 = a + 9$

$\Rightarrow \quad ar^2 - a = 9$ ...(i)

Again, second term = fourth term + 18

$T_2 = T_4 + 18 \Rightarrow ar = ar^3 + 18$

$\Rightarrow \quad ar - ar^3 = 18$ ...(ii)

On dividing Eq. (i) by Eq. (ii), we get

$$\frac{ar^2 - a}{ar - ar^3} = \frac{9}{18} \Rightarrow \frac{a(r^2 - 1)}{ar(1 - r^2)} = \frac{1}{2}$$

$\Rightarrow \quad -\frac{1}{r} = \frac{1}{2} \Rightarrow r = -2$

On putting $r = -2$ in Eq. (ii), we get

$a(-2) - a(-2)^3 = 18$

$\Rightarrow \quad -2a + 8a = 18$

$\Rightarrow \quad 6a = 18 \Rightarrow a = 3$

Hence, GP series is $3, 3(-2), 3(-2)^2, 3(-3)^3, \ldots$

i.e., $3, -6, 12, -24, \ldots$

42. Suppose that the added number be x, then $x + 2, x + 14, x + 62$ are in GP.

$\therefore \quad (x + 14)^2 = (x + 2)(x + 62)$

$\Rightarrow \quad x^2 + 196 + 28x = x^2 + 64x + 124$

$\Rightarrow \quad 36x = 72 \quad \Rightarrow \quad x = 2$

43. Let r be the common ratio.

$$\therefore \quad \frac{\sum_{n=1}^{100} a_{2n}}{\sum_{n=1}^{100} a_{2n-1}} = \frac{a_2 + a_4 + a_6 + \ldots + a_{200}}{a_1 + a_3 + a_5 + \ldots + a_{199}}$$

$$= \frac{a_1(r + r^3 + r^5 + \ldots + r^{199})}{a_1(1 + r^2 + r^4 + \ldots + r^{198})} = r$$

$\Rightarrow \quad \frac{\alpha}{\beta} = r$

44. Let the first term of GP is A and common ratio is R.

Given, pth term $= T_p = a \Rightarrow AR^{p-1} = a$ ...(i)

qth term $= T_q = b \Rightarrow AR^{q-1} = b$ ...(ii)

rth term $= T_r = c \Rightarrow AR^{r-1} = c$ ...(iii)

$\therefore \quad a^{q-r}b^{r-p}c^{p-q}$

$= (AR^{p-1})^{q-r}(AR^{q-1})^{r-p}(AR^{r-1})^{p-q}$

$= A^{q-r}R^{(p-1)(q-r)}A^{r-p}R^{(q-1)(r-p)}A^{p-q}R^{(r-1)(p-q)}$

$= A^{q-r+r-p+p-q}R^{(p-1)(q-r)+(q-1)(r-p)+(r-1)(p-q)}$

$= A^0R^{pq-pr-q+r+qr-pq+r+p+rp-rq-p+q}$

$= A^0R^0 = 1$

45. Since, a, b, c and d are in GP.

$\therefore \quad \frac{b}{a} = \frac{c}{b} = \frac{d}{c} = r$ (say)

$\Rightarrow \quad b = ar, c = br, d = cr$

$\Rightarrow \quad b = ar, c = (ar)r, d = (br)r$

$\Rightarrow \quad b = ar, c = ar^2, d = br^2$

$\Rightarrow \quad b = ar, c = ar^2, d = (ar)r^2 = ar^3$ ...(i)

$\therefore \quad (a^2 + b^2 + c^2)(b^2 + c^2 + d^2)$

$= (a^2 + b^2 + c^2)(b^2 + c^2 + d^2)$

$= (a^2 + a^2r^2 + a^2r^4)(a^2r^2 + a^2r^4 + a^2r^6)$

$= a^2(1 + r^2 + r^4)a^2r^2(1 + r^2 + r^4)$

$= a^4r^2(1 + r^2 + r^4)^2 = [a^2r(1 + r^2 + r^4)]^2$

$= (a^2r + a^2r^3 + a^2r^5)^2$

$= (a \cdot ar + ar \cdot ar^2 + ar^2 \cdot ar^3)^2 = (ab + bc + cd)^2$

[from Eq. (i)]

46. Let a be the first term and r be the common ratio.

Now, $T_3 = 4$

$\Rightarrow \quad ar^2 = 4$ ...(i)

$\therefore$ Product of first 5 terms $= a_1 \cdot a_2 \cdot a_3 \cdot a_4 \cdot a_5$

$= a(ar)(ar^2)(ar^3)(ar^4)$

$= a^5r^{10}$

$= (ar^2)^5 = (4)^5$ [from Eq. (i)]

47. Since, $x, 2y$ and $3z$ are in AP.

$\therefore \quad 4y = x + 3z \quad \ldots(i)$

And $\quad x, y, z$ are in GP.

$\therefore \quad y = rx$ and $z = xr^2$

On putting the values of y and z in Eq. (i), we get

$4xr = x + 3xr^2$

$\Rightarrow \quad 3r^2 - 4r + 1 = 0$

$\Rightarrow \quad (3r - 1)(r - 1) = 0$

$\Rightarrow \quad r = \frac{1}{3}, 1$

$\therefore \quad r = \frac{1}{3} \quad (\because r \neq 1)$

48. Let the edges of rectangular block are

$a, ar, ar^2 \quad \ldots(i)$

Now, volume $= 216$ cm^3

$a(ar)(ar^2) = 216 \quad (\because$ volume of cuboid $= l \times b \times h)$

$\Rightarrow \quad (ar)^3 = 216$

$\Rightarrow \quad ar = 6$ cm $\quad \ldots(ii)$

And total surface area $= 252$ cm^2

$2[a(ar) + ar(ar^2) + a(ar^2)] = 252$

$\therefore$ From Eq. (ii),

$2(6a + 36r + 36) = 252$

$\Rightarrow \quad 12(a + 6r + 6) = 252$

$\Rightarrow \quad a + 6r = 15 \quad \ldots(iii)$

$\Rightarrow \quad a + 6 \times \left(\frac{6}{a}\right) = 15 \quad [\because$ from Eq. (ii)]

$\Rightarrow \quad a^2 - 15a + 36 = 0$

$\Rightarrow \quad (a - 12)(a - 3) = 0$

$\Rightarrow \quad a = 3, 12$

$\therefore$ From Eq. (iii),

when $a = 3, r = 2$

when $a = 12, r = \frac{1}{2}$

On putting above values in Eq. (i), we get

Edges are 3, 6, 12 or 12, 6, 3.

Hence, the length of the longest edge is 12 cm.

49. $\because a, b, c, d$ are in GP.

$\Rightarrow \quad b = ar, c = ar^2, d = ar^2 \quad \ldots(i)$

Now, $(a^n + b^n)(c^n + d^n)$

$= (a^n + a^n r^n) \times (a^n r^{2n} + a^n r^{3n}) \quad$ [from Eq. (i)]

$= a^n(1 + r^n) a^n r^{2n}(1 + r^n)$

$= a^{2n} r^{2n}(1 + r^n)^2 = (a^n r^n (1 + r^n))^2 = [a^n r^n + a^n r^{2n}]^2$

$= [(ar)^n + (ar^2)^n]^2 = (b^n + c^n)^2 \quad$ [from Eq. (i)]

Hence, they are in GP.

50. Let A be the arithmetic mean between two numbers a and b. Again, let G_1 and G_2 be the two geometric mean between two numbers a and b.

$\therefore \quad A = \frac{a + b}{2}$ and $G_1 = ar, G_2 = ar^2,$

where $\quad r = \left(\frac{b}{a}\right)^{\frac{1}{2+1}} = \left(\frac{b}{a}\right)^{1/3} \quad \ldots(i)$

$\therefore \quad \frac{G_1^2}{G_2} + \frac{G_2^2}{G_1} = \frac{a^2 r^2}{ar^2} + \frac{a^2 r^4}{ar}$

$= a + ar^3 = a + a\left(\frac{b}{a}\right) \quad [\because$ from Eq. (i)]

$= a + b = 2A \quad \left(\because A = \frac{a + b}{2}\right)$

51. Let first term be A and common ratio be R.

Given, pth term, $T_p = q$ and qth term, $T_q = p$.

$AR^{p-1} = q$ and $AR^{q-1} = p \quad \ldots(i)$

$\therefore \quad \frac{AR^{p-1}}{AR^{q-1}} = \frac{q}{p}$

$\Rightarrow \quad R^{p-q} = \frac{q}{p} \Rightarrow R = \left(\frac{q}{p}\right)^{\frac{1}{p-q}}$

On putting the value of R in Eq. (i), we get

$$A \cdot \left(\frac{q}{p}\right)^{\frac{p-1}{p-q}} = q \Rightarrow A = q \cdot \left(\frac{p}{q}\right)^{\frac{p-1}{p-q}}$$

Now, $(p + q)$th term, $T_{p+q} = AR^{p+q-1}$

$$= q \cdot \left(\frac{p}{q}\right)^{\frac{p-1}{p-q}} \times \left(\frac{q}{p}\right)^{\frac{p+q-1}{p-q}}$$

$$= \frac{q^{1 - \frac{p-1}{p-q} + \frac{p+q-1}{p-q}}}{p^{\frac{p+q-1}{p-q} - \frac{p-1}{p-q}}} = \frac{q^{\frac{p-q-p+1+p+q-1}{p-q}}}{p^{\frac{p+q-1-p+1}{p-q}}}$$

$$= \frac{q^{\frac{p}{p-q}}}{p^{\frac{q}{p-q}}} = \left(\frac{q^p}{p^q}\right)^{\frac{1}{p-q}} = \left(\frac{q^p}{p^q}\right)^{\frac{1}{(p-q)}}$$

52. We have,

$(a^2 + b^2 + c^2)p^2 - 2(ab + bc + cd)p + (b^2 + c^2 + d^2) \leq 0 \quad \ldots(i)$

LHS $= (a^2p^2 - 2abp + b^2) + (b^2p^2 - 2bcp + c^2)$
$+ (c^2p^2 - 2cdp + d^2)$

$= (ap - b)^2 + (bp - c)^2 + (cp - d)^2 \geq 0 \quad \ldots(ii)$

Since, the sum of squares of real number is non-negative.

From Eqs. (i) and (ii), we get

$(ap - b)^2 + (bp - c)^2 + (cp - d)^2 = 0$

$\Rightarrow \quad ap - b = 0 = bp - c = cp - d$

$\Rightarrow \quad \frac{b}{a} = \frac{c}{b} = \frac{d}{c} = p$

$\therefore a, b, c$ and d are in GP.

53. $\underset{n \text{ digits}}{(666\ldots6)} = 6 + 6\times10 + 6\times10^2 + \ldots + 6\times10^{n-1}$

$$= 6(1 + 10 + 10^2 + \ldots + 10^{n-1})$$

$$= \frac{6}{9}(10^n - 1) = \frac{2}{3}(10^n - 1)$$

Similarly, $\underset{n \text{ digits}}{(888\ldots8)} = \frac{8}{9}(10^n - 1)$

Hence, required sum

$$= \frac{4}{9}(10^n - 1)^2 + \frac{8}{9}(10^n - 1)$$

$$= \frac{4}{9}(10^{2n} - 2\cdot10^n + 1 + 2\cdot10^n - 2)$$

$$= \frac{4}{9}(10^{2n} - 1)$$

54. Here, $a = 0.9 = \frac{9}{10}$ and $r = \frac{1}{10} = 0.1$

$$\therefore \quad S_{100} = a\left(\frac{1-r^{100}}{1-r}\right)$$

$$= \frac{9}{10}\left(\frac{1-\frac{1}{10^{100}}}{1-\frac{1}{10}}\right) = 1 - \frac{1}{10^{100}}$$

55. $0.2\dot{3}\dot{4} = 0.2343434\ldots$

$$= 0.2 + 0.034 + 0.00034 + \ldots$$

$$= \frac{2}{10} + 34\left(\frac{1}{10^3} + \frac{1}{10^5} + \ldots\right)$$

$$= \frac{2}{10} + 34\times\frac{1}{1000}\times\frac{100}{99}$$

$$= \frac{2}{10} + \frac{34}{990} = \frac{232}{990}$$

56. $0.14189189189\ldots$

$$= 0.14 + 0.00189 + 0.00000189 + \ldots$$

$$= \frac{14}{100} + 189\left[\frac{1}{10^5} + \frac{1}{10^8} + \ldots\infty\right]$$

$$= \frac{7}{50} + \frac{189}{999\times100}$$

$$= \frac{7}{50} + \frac{7}{3700} = \frac{21}{148}$$

57. Here, $a = 0.15, r = \frac{0.015}{0.15} = \frac{15}{1000}\times\frac{100}{15}$

$$r = \frac{1}{10} < 1 \text{ and } n = 20$$

Now, $S_n = \frac{a(1-r^n)}{1-r}$

$$\Rightarrow \quad S_{20} = \frac{0.15\left[1-\left(\frac{1}{10}\right)^{20}\right]}{1-\frac{1}{10}} = \frac{0.15\left(1-\frac{1}{10^{20}}\right)}{\frac{10-1}{10}}$$

$$= \frac{0.15\times10}{9}\left(1-\frac{1}{10^{20}}\right)$$

$$= \frac{15\times10}{900}\left[1-\left(\frac{1}{10}\right)^{20}\right] = \frac{1}{6}[1-(0.1)^{20}]$$

58. Since, x, y, z are in GP.

$$\therefore \quad y^2 = xz$$

$$\Rightarrow \quad 2\log y = \log x + \log z$$

$$\Rightarrow \quad 2(\log y + 1) = (1 + \log x) + (1 + \log z)$$

$\Rightarrow 1 + \log x, 1 + \log y, 1 + \log z$ are in AP.

$\Rightarrow \frac{1}{1+\log x}, \frac{1}{1+\log y}, \frac{1}{1+\log z}$ are in HP.

59. If a, b, c are in GP, then $b^2 = ac$

Taking log on both sides, we get

$$2\log_e b = \log_e a + \log_e c$$

$$\Rightarrow \quad 2n\log_e b = n\log_e a + n\log_e c$$

$$\Rightarrow \quad 2\log_e b^n = \log_e a^n + \log_e c^n$$

$\Rightarrow \log_e a^n, \log_e b^n, \log_e c^n$ be in AP.

60. LHS $= \frac{1(1-\lambda^{n+1})}{1-\lambda} = \frac{1-\lambda^{n+1}}{1-\lambda}$

and RHS $= (1+\lambda)(1+\lambda^2)(1+\lambda^4)(1+\lambda^8)(1+\lambda^{16})$

$$= \frac{(1-\lambda)(1+\lambda)(1+\lambda^2)(1+\lambda^4)(1+\lambda^8)(1+\lambda^{16})}{(1-\lambda)}$$

$$= \frac{(1-\lambda^2)(1+\lambda^2)(1+\lambda^4)(1+\lambda^8)(1+\lambda^{16})}{1-\lambda}$$

$$= \frac{(1-\lambda^{32})}{1-\lambda}$$

$$\therefore \quad \frac{1-\lambda^{n+1}}{1-\lambda} = \frac{1-\lambda^{32}}{1-\lambda}$$

$$\Rightarrow \quad 1-\lambda^{n+1} = 1-\lambda^{32}$$

$$\therefore \quad n+1 = 32 \Rightarrow n = 31$$

61. $x, 1, z$ are in AP, then $2 = x + z$ ...(i)

and $x, 2, z$ are in GP, then $4 = xz$ ...(ii)

On divide Eq. (ii) by Eq. (i), we get

$$\frac{xz}{x+z} = \frac{4}{2} \Rightarrow \frac{2xz}{x+z} = 4$$

Hence, $x, 4, z$ will be in HP.

62. Let the four numbers be $\frac{a}{r}, a, ar, 2ar - a$ ...(i)

where first three numbers are in GP and last three in AP.

Given that, the common difference of AP is 6, so

$$ar - a = 6 \quad \text{...(ii)}$$

and also given $\frac{a}{r} = 2ar - a$

$$\Rightarrow \quad \frac{a}{r} = 2(ar - a) + a$$

$\Rightarrow \quad \frac{a}{r} = 2(6) + a$ [from Eq. (ii)]

$\Rightarrow \quad \left(\frac{a}{r}\right) - a = 12$

$\Rightarrow \quad a(1-r) = 12r$

$\Rightarrow \quad -6 = 12r$ [from Eq. (ii)]

$\Rightarrow \quad r = -\frac{1}{2}$

From Eq. (ii), we get

$$a\left[\left(-\frac{1}{2}\right) - 1\right] = 6$$

$\Rightarrow \quad a = -4$

On putting the value of a and r in Eq. (i), the required numbers are $8, -4, 2, 8$.

63. Let $a^{1/x} = b^{1/y} = c^{1/z} = k$

$\Rightarrow \quad a = k^x, b = k^y, c = k^z$

Now, a, b, c are in GP.

$\Rightarrow \quad b^2 = ac \Rightarrow k^{2y} = k^x \cdot k^z = k^{x+z}$

$\Rightarrow \quad 2y = x + z$

$\therefore$ x, y, z are in AP.

64. Let three numbers in GP are $\frac{a}{r}, a, ar$.

From the given condition,

$$\frac{a}{r} + a + ar = 14$$

$\Rightarrow \quad a\left(\frac{1}{r} + 1 + r\right) = 14$ ...(i)

and $\frac{a}{r} + 1, a + 1$ and $ar - 1$ will be in AP, then

$$2(a+1) = \frac{a}{r} + 1 + ar - 1 = \frac{a}{r}(1 + r^2) \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$a = 4$

and $r = 2$

So, required numbers are 2, 4, 8.

Hence, greatest number is 8.

65. (a) By the property an AP, it is correct statement.

(b) By the property a GP, it is a correct statement.

(c) By the property a GP, it is a correct statement.

66. Since, a, b, c are in AP.

$\therefore \quad b = a + d, \quad c = a + 2d,$

where d is a common difference, $d > 0$

Again, since a^2, b^2, c^2 are in GP.

$\therefore$ $a^2, (a+d)^2$ and $(a+2d)^2$ are in GP.

$\Rightarrow \quad (a+d)^4 = a^2(a+2d)^2$

or $\quad (a+d)^2 = \pm a(a+2d)$

$\Rightarrow \quad a^2 + d^2 + 2ad = \pm(a^2 + 2ad)$

On taking (+) sign, $d = 0$ (not possible as $a < b < c$)

On taking (–) sign,

$$2a^2 + 4ad + d^2 = 0$$

$\Rightarrow \quad 2a^2 + 4a\left(\frac{1}{2} - a\right) + \left(\frac{1}{2} - a\right)^2 = 0$

$$\left(\because a + b + c = \frac{3}{2} \Rightarrow a + d = \frac{1}{2}\right)$$

$\Rightarrow \quad 4a^2 - 4a - 1 = 0$

$\therefore \quad a = \frac{1}{2} \pm \frac{1}{\sqrt{2}}$

Here, $\quad d = \frac{1}{2} - a > 0$

So, $\quad a < \frac{1}{2}$

Hence, $\quad a = \frac{1}{2} - \frac{1}{\sqrt{2}}$

67. Given that, AM = 8, GM = 5, if α, β are the roots of quadratic equation, then the required quadratic equation is

$$x^2 - x(\alpha + \beta) + \alpha\beta = 0 \quad \text{...(i)}$$

Here, $\text{AM} = \frac{\alpha + \beta}{2} = 8 \Rightarrow \alpha + \beta = 16$

and $\text{GM} = \sqrt{\alpha\beta} = 5 \Rightarrow \alpha\beta = 25$

From Eq. (i),

$$x^2 - 16x + 25 = 0$$

68. Let a, ar, ar^2 are in GP and $a, ar, ar^2 - 64$ are in AP, we get

$$a(r^2 - 2r + 1) = 64 \quad \text{...(i)}$$

Again, $a, ar - 8, ar^2 - 64$ are in GP.

$\therefore \quad (ar - 8)^2 = a(ar^2 - 64)$

$\Rightarrow \quad a(16r - 64) = 64$ ...(ii)

On solving Eqs. (i) and (ii), we get $r = 5, a = 4$

Thus, required numbers are 4, 20, 100.

69. Let $S = 1 + 10 + 10^2 + \ldots + 10^{90}$

$$= \frac{1 \cdot (10^{91} - 1)}{10 - 1} = \frac{(10^{13})^7 - 1}{10^{13} - 1} \times \frac{10^{13} - 1}{10 - 1}$$

$$= [(10^{13})^6 + (10^{13})^5 + (10^{13})^4 + \ldots + 1]$$

$$\times (10^{12} + 10^{11} + \ldots + 1)$$

$\therefore$ It is the product of two integers and hence not prime.

70. $\sum_{r=1}^{n} \sum_{s=1}^{n} S_{rs} 2^r 3^s = 2 \cdot 3 + 2^2 \cdot 3^2 + 2^3 \cdot 3^3 + \ldots + 2^n \cdot 3^n$

(as $S_{rs} = 0$, if $r \neq s$ and $S_{rs} = 1$, if $r = s$) $= \frac{6(6^n - 1)}{6 - 1} = \frac{6}{5}(6^n - 1)$

71. Since, $n^m + 1$ divides $1 + n + n^2 + \ldots + n^{127}$

Therefore, $\frac{1 + n + n^2 + \ldots + n^{127}}{n^m + 1}$ is an integer.

$\Rightarrow \dfrac{1-n^{128}}{1-n} \times \dfrac{1}{n^m+1}$ is an integer.

$\Rightarrow \dfrac{(1-n^{64})(1+n^{64})}{(1-n)(n^m+1)}$ is an integer when largest

$$m = 64$$

72. Given, sum

$$= (x+2)^{n-1}\left\{1+\left(\frac{x+1}{x+2}\right)+\left(\frac{x+1}{x+2}\right)^2+\ldots+\left(\frac{x+1}{x+2}\right)^{n-1}\right\}$$

$$= (x+2)^{n-1}\left\{\frac{1-\left(\frac{x+1}{x+2}\right)^n}{1-\left(\frac{x+1}{x+2}\right)}\right\}$$

$$= \frac{(x+2)^{n-1}\{(x+2)^n-(x+1)^n\}\cdot(x+2)}{(x+2)^n} = (x+2)^n-(x+1)^n$$

73. Let the two numbers are x_1 and x_2.

Given, $\dfrac{x_1+x_2}{2} = 9$ and $x_1 \cdot x_2 = 16$

$\Rightarrow$ $x_1 + x_2 = 18$ and $x_1x_2 = 16$

Hence, required equation is

$x^2 -$ (sum of roots) $x +$ product of roots

$\Rightarrow$ $x^2 - 18x + 16 = 0$

74. Given, $\displaystyle\sum_{n=0}^{\infty} r^n = S$

$\Rightarrow$ $1 + r + r^2 + \ldots \infty = S$

$\Rightarrow$ $\dfrac{1}{1-r} = S$

$\Rightarrow$ $1 = S - rS$

$\Rightarrow$ $r = \dfrac{S-1}{S}$

Now, $\displaystyle\sum_{n=0}^{\infty} r^{2n} = 1 + r^2 + r^4 + \ldots \infty$

$$= \frac{1}{1-r^2} = \frac{1}{1-\left(\frac{S-1}{S}\right)^2} = \frac{S^2}{S^2-(S-1)^2}$$

$$= \frac{S^2}{(S-S+1)(S+S-1)}$$

$$= \frac{S^2}{(2S-1)}$$

75. Let the numbers be x and y.

According to the question,

$$\frac{x+y}{2} = 2\sqrt{xy}$$

$\Rightarrow$ $x + y = 4\sqrt{xy}$ ...(i)

$\Rightarrow$ $(x+y)^2 = 16xy$

And we know that,

$$(x-y)^2 = (x+y)^2 - 4xy$$

$\therefore$ $(x-y)^2 = 16xy - 4xy = 12xy$

$\Rightarrow$ $x - y = 2\sqrt{3}xy$ ...(ii)

On solving Eqs. (i) and (ii), we get

$$x = (2+\sqrt{3})\sqrt{xy} \text{ and } y = (2-\sqrt{3})\sqrt{xy}$$

$\therefore$ Required ratio $= \dfrac{x}{y} = \dfrac{(2+\sqrt{3})\sqrt{xy}}{(2-\sqrt{3})\sqrt{xy}}$

$$(2+\sqrt{3})^2 = 7 + 4\sqrt{3}$$

76. Since, G is the geometric mean between a and b.

$\therefore$ $G = (ab)^{1/2}$ and n geometric means $G_1, G_2, \ldots, G_n$ be inserted between a and b.

$\therefore$ $G_1 = ar^1, G_2 = ar^2, \ldots, G_n = ar^n$

Now, $G_1 \cdot G_2 \cdot G_3 \cdots G_n = a^n r^{1+2+\ldots+n}$

$$= a^n r^{n(n+1)/2}$$

But $b = ar^{n+1} \Rightarrow r = \left(\dfrac{b}{a}\right)^{\frac{1}{n+1}}$

Therefore, the required product is

$$a^n\left(\frac{b}{a}\right)^{\left(\frac{1}{n+1}\right)\frac{n(n+1)}{2}} = (ab)^{\frac{n}{2}}$$

$$= \{(ab)^{\frac{1}{2}}\}^n = G^n$$

77. We have,

$$1 + \cos\alpha + \cos^2\alpha + \ldots \infty = 2 - \sqrt{2}$$

$\Rightarrow$ $\dfrac{1}{1-\cos\alpha} = 2 - \sqrt{2}$

$\Rightarrow$ $1 - \cos\alpha = \dfrac{1}{2-\sqrt{2}} = 1 + \dfrac{1}{\sqrt{2}}$

$\Rightarrow$ $\cos\alpha = -\dfrac{1}{\sqrt{2}} \Rightarrow \alpha = \dfrac{3\pi}{4}$

78. As we know, sum of infinite terms of GP,

$$S_\infty = \begin{cases} \dfrac{a}{1-r}, & |r| < 1 \\ \infty, & |r| \geq 1 \end{cases}$$

$\therefore$ $S_\infty = \dfrac{x}{1-r} = 5$ (thus $|r| < 1$)

$\Rightarrow$ $1 - r = \dfrac{x}{5}$

$\Rightarrow$ $r = \dfrac{5-x}{5}$ exists only when $|r| < 1$

$\Rightarrow$ $-1 < \dfrac{5-x}{5} < 1$

$\therefore$ $-10 < -x < 0 \Rightarrow 0 < x < 10$

79. Let $a = {}^nC_{r-1}, b = {}^nC_r, c = {}^nC_{r+1}$ and $d = {}^nC_{r+2}$

On substituting these values in given expression.

$$\frac{a+b}{a}, \frac{b+c}{b}, \frac{c+d}{c}$$

$$\Rightarrow \quad \frac{{}^nC_{r-1}+{}^nC_r}{{}^nC_{r-1}}, \frac{{}^nC_r+{}^nC_{r+1}}{{}^nC_r}, \frac{{}^nC_{r+1}+{}^nC_{r+2}}{{}^nC_{r+1}}$$

$$\Rightarrow \quad \frac{{}^{n+1}C_r}{{}^nC_{r-1}}, \frac{{}^{n+1}C_{r+1}}{{}^nC_r}, \frac{{}^{n+1}C_{r+2}}{{}^nC_{r+1}}$$

$\Rightarrow$ It is in HP.

80. Since, 7th term of HP is $\frac{1}{10}$ and 12th term is $\frac{1}{25}$.

Its corresponding terms of AP is 10 and 25.

$\therefore \quad T_7 = a + (n+1)d = 10$

$\Rightarrow \quad a + (7-1)d = 10$

$\Rightarrow \quad a + 6d = 10 \quad$ ...(i)

and $\quad T_{12} = a + (12-1)d = 25$

$\Rightarrow \quad a + 11d = 25 \quad$ ...(ii)

On solving Eqs. (i) and (ii), we get

$$a = -8, d = 3$$

$\therefore \quad T_{20} = -8 + (20-1)3 = -8 + 57 = 49$

Then, 20th term of HP is $\frac{1}{49}$.

81. Since, the given series $\log_a x, \log_b x, \log_c x$ be in HP.

$\Rightarrow \quad \frac{\log x}{\log a}, \frac{\log x}{\log b}, \frac{\log x}{\log c}$ are in HP.

$\Rightarrow \quad \frac{\log a}{\log x}, \frac{\log b}{\log x}, \frac{\log c}{\log x}$ are in AP.

$\Rightarrow \quad \log_x a, \log_x b, \log_x c$ are in AP.

$\therefore$ a, b and c are in GP.

82. Let P_1, P_2, P_3 be altitudes from P, Q and R.

$\therefore \quad P_1 = c\sin Q = \lambda bc, \quad P_2 = a\sin R = \lambda ca,$

$P_3 = b\sin P = \lambda ab \quad \left(\because \frac{\sin P}{a} = \frac{\sin Q}{b} = \frac{\sin R}{c} = \lambda\right)$

Since, P_1, P_2, P_3 are in AP.

$\Rightarrow \lambda bc, \lambda ca, \lambda ab$ are in AP.

$\Rightarrow bc, ca, ab$ are in AP.

$\Rightarrow \frac{abc}{a}, \frac{abc}{b}, \frac{abc}{c}$ are in AP.

$\therefore$ a, b, c are in HP.

i.e., Sides of the triangle are in HP.

83. We know, AM $\geq$ GM

$$\therefore \quad \frac{4^x + \frac{4}{4^x}}{2} \geq \sqrt{4^x \times \frac{4}{4^x}}$$

$$\Rightarrow \quad 4^x + \frac{4}{4^x} \geq 2\sqrt{4}$$

$$\Rightarrow \quad 4^x + \frac{4}{4^x} \geq 4$$

84. Let AM = 15, GM = 12

We know, $\quad (\text{GM})^2 = \text{AM} \times \text{HM}$

$\Rightarrow \quad \text{HM} = \frac{144}{15}$

85. Since, a, b and c are in AP.

$\therefore \quad 2b = a + c \quad$ ...(i)

Also, p is AM between a and b

$\therefore \quad 2p = a + b \quad$ ...(ii)

Also, p' is GM between a and b

$\therefore \quad p' = \sqrt{ab} \quad$ ...(iii)

Similarly, $\quad 2q = b + c$ and $q' = \sqrt{bc} \quad$ ...(iv)

Now, $\quad p^2 - q^2 = \left(\frac{a+b}{2}\right)^2 - \left(\frac{b+c}{2}\right)^2$

$= \frac{1}{4}[a^2 + b^2 + 2ab - (b^2 + c^2 + 2bc)]$

$= \frac{1}{4}[(a^2 - c^2) + 2b(a - c)]$

$= \frac{(a-c)}{4}(a + c + 2b)$

$= \left(\frac{a-c}{4}\right)(2b + 2b) \quad$ [$\because$ from Eq. (i)]

$= \left(\frac{a-c}{4}\right)4b = (a-c)b \quad$ ...(v)

and $\quad p'^2 - q'^2 = (\sqrt{ab})^2 - (\sqrt{bc})^2$

$= ab - bc = b(a - c) \quad$ ...(vi)

$\therefore$ From Eqs. (v) and (vi), we get

$$p^2 - q^2 = p'^2 - q'^2$$

86. Given that, $\quad x_1x_2x_3 \ldots x_n = 1 \quad$ ...(i)

We know that, $\quad$ AM $\geq$ GM

$\therefore \quad \left(\frac{x_1 + x_2 + x_3 + \ldots + x_n}{n}\right) \geq (x_1x_2x_3 \ldots x_n)^{1/n}$

$= (1)^{1/n} = 1 \quad$ [from Eq. (i)]

$\Rightarrow \quad x_1 + x_2 + x_3 + \ldots + x_n \geq n$

$\therefore \quad x_1 + x_2 + x_3 + \ldots + x_n$

can never be less than n.

87. Since, $\dfrac{\dfrac{2p}{3}+\dfrac{2p}{3}+\dfrac{2p}{3}+\underbrace{\dfrac{3q}{5}+\ldots+\dfrac{3q}{5}}_{5\text{ times}}+\underbrace{\dfrac{4r}{7}+\ldots+\dfrac{4r}{7}}_{7\text{times}}}{15}$

$$\geq \sqrt[15]{\left(\frac{2p}{3}\right)^3\left(\frac{3q}{5}\right)^5\left(\frac{4r}{7}\right)^7} \qquad (\because \text{AM} \geq \text{GM})$$

$$\Rightarrow \qquad p^3q^5r^7\,\frac{2^3 3^5 4^7}{3^3\,5^5\,7^7} \leq 1$$

$$\Rightarrow \qquad p^3q^5r^7 \leq \frac{5^5\,7^7}{2^3\,3^2\,4^7}$$

88. Given that, $a+2b+3c=12$

and a, b, c are positive real numbers.

Now, $\text{AM} \geq \text{GM}$

$$\Rightarrow \qquad \frac{a+b+b+c+c+c}{6} \geq \sqrt[6]{ab^2c^3}$$

$$\Rightarrow \qquad \frac{a+2b+3c}{6} \geq \sqrt[6]{ab^2c^3}$$

$$\Rightarrow \qquad ab^2c^3 \leq 2^6$$

89. The given series is clearly an AG, the corresponding AP is $1+4+7+10+\ldots$ having nth term $=3n-2$.

and corresponding GP is $1+\dfrac{1}{5}+\dfrac{1}{5^2}+\ldots$ having nth term $=\dfrac{1}{5^{n-1}}$

Hence, required nth term of the series is $\dfrac{3n-2}{5^{n-1}}$.

90. Let $S=1+2x+3x^2+4x^3+\ldots\infty$ ...(i)

$xS = \quad x+2x^2+3x^3+\ldots\infty$ ...(ii)

On subtracting Eq. (ii) from Eq. (i), we get

$$(1-x)\,S=1+x+x^2+x^3+\ldots\infty$$

$$\Rightarrow \qquad S=\frac{1}{(1-x)}\left(\frac{1}{1-x}\right)=\frac{1}{(1-x)^2}$$

91. Given series is $1\cdot 3^2+2\cdot 5^2+3\cdot 7^2+\ldots\infty$

This is an arithmetico-geometric series whose nth term is equal to

$$T_n=n(2n+1)^2=4n^3+4n^2+n$$

$$\therefore \qquad S_n=\sum_1^n T_n=\sum_1^n (4n^3+4n^2+n)$$

$$=4\sum_1^n n^3+4\sum_1^n n^2+\sum_1^n n$$

$$=4\left[\frac{n}{2}(n+1)\right]^2+\frac{4}{6}n(n+1)(2n+1)+\frac{n}{2}(n+1)$$

$$=n(n+1)\left[n^2+n+\frac{4}{6}(2n+1)+\frac{1}{2}\right]$$

$$=\frac{n}{6}(n+1)(6n^2+14n+7)$$

92. This progression is an arithmetico-geometric series.

$$\therefore \qquad S_\infty=\frac{a}{1-r}+\frac{dr}{(1-r)^2}$$

$$=\frac{1}{1-1/2}+\frac{2}{(1-1/2)^2}$$

$$=\frac{2}{1/2}+\frac{2}{1/4}=4+8=12$$

93. Let $S=2+3+6+11+18+\ldots+T_n$

or $S = \quad 2+3+6+11+\ldots+T_n$

On subtracting, we get

$$0=2+1+3+5+7+\ldots-T_n$$

$$\Rightarrow \qquad T_n=2+[1+3+5+\ldots(n-1)\text{ term}]$$

$$=2+\frac{n-1}{2}[2+(n-1-1)2]$$

$$T_n=2+(n-1)^2$$

$$\therefore \qquad T_{50}=2+(50-1)^2=49^2+2$$

94. Let $S_n=12+16+24+\ldots+T_n$

$S_n=12+16 \quad +\ldots+T_n$

On subtraction

$$0=12+4+8+16+\ldots-T_n$$

$$\Rightarrow \qquad T_n=12+\frac{4(2^{n-1}-1)}{2-1}$$

$$=2^{n+1}+8$$

$$S_n=\Sigma T_n=2^2+2^3+2^4+\ldots+8n$$

$$=\frac{2^2(2^n-1)}{2-1}+8n=4(2^n-1)+8n$$

95. Let $S=1+3x+6x^2+10x^3+\ldots\infty$

$xS = \quad x+3x^2+6x^3+\ldots\infty$

On subtracting, we get

$$S(1-x)=1+2x+3x^2+4x^3+\ldots\infty$$

$$x(1-x)\,S = \quad x+2x^2+3x^3+\ldots\infty$$

Again on subtracting, we get

$$S[(1-x)-x(1-x)]=(1+x+x^2+x^3+\ldots\infty)$$

$$\Rightarrow \qquad S[(1-x)(1-x)]=\frac{1}{1-x} \;\Rightarrow\; S=\frac{1}{(1-x)^3}$$

96. $$\sum_{r=1}^n \frac{S_r}{s_r}=\sum_{r=1}^n \frac{\dfrac{r^2(r+1)^2}{4}}{\dfrac{r(r+1)}{2}}$$

$$=\sum_{r=1}^n \frac{r(r+1)}{2}=\frac{1}{2}\sum_{r=1}^n (r^2+r)$$

$$=\frac{1}{2}\left[\frac{n(n+1)(2n+1)}{6}+\frac{n(n+1)}{2}\right]$$

$$=\frac{1}{12}(n)(n+1)(2n+1+3)=\frac{n(n+1)(n+2)}{6}$$

97. Given series is

$$\frac{1}{1+1^2+1^4}+\frac{2}{1+2^2+2^4}+\frac{3}{1+3^2+3^4}+\ldots+n \text{ terms}$$

Let T_n be the nth term of the series

$$\frac{1}{1+1^2+1^4}+\frac{2}{1+2^2+2^4}+\frac{3}{1+3^2+3^4}+\ldots$$

Then, $T_n=\dfrac{n}{1+n^2+n^4}=\dfrac{n}{(1+n^2)^2-n^2}$

$$=\frac{n}{(n^2+n+1)(n^2-n+1)}$$

$$=\frac{1}{2}\left[\frac{1}{n^2-n+1}-\frac{1}{n^2+n+1}\right]$$

$$=\frac{1}{2}\left[\frac{1}{1+(n-1)n}-\frac{1}{1+n(n+1)}\right]$$

$\therefore$ $T_1=\dfrac{1}{2}\left[\dfrac{1}{1}-\dfrac{1}{1+1\cdot 2}\right]$

$$T_2=\frac{1}{2}\left[\frac{1}{1+1\cdot 2}-\frac{1}{1+2\cdot 3}\right]$$

$$T_3=\frac{1}{2}\left[\frac{1}{1+2\cdot 3}-\frac{1}{1+3\cdot 4}\right]$$

$$\ldots\quad\ldots\quad\ldots$$

$$\ldots\quad\ldots\quad\ldots$$

$$T_n=\frac{1}{2}\left[\frac{1}{1+(n-1)n}-\frac{1}{1+n(n+1)}\right]$$

On adding all these equations, we get

$$\sum_{r=1}^{n}T_r=\frac{1}{2}\left[1-\frac{1}{1+n(n+1)}\right]=\frac{n(n+1)}{2(n^2+n+1)}$$

98. Let $S=\dfrac{1}{3\times 7}+\dfrac{1}{7\times 11}+\dfrac{1}{11\times 15}+\ldots\infty$

$$=\frac{1}{4}\left[\left\{\frac{1}{3}-\frac{1}{7}\right\}+\left\{\frac{1}{7}-\frac{1}{11}\right\}+\ldots\right]$$

$$=\frac{1}{4}\left(\frac{1}{3}+0\right)=\frac{1}{12}$$

99. Let $S_n=1\cdot 3\cdot 5+2\cdot 5\cdot 8+3\cdot 7\cdot 11+\ldots+n$th term

$\therefore$ $T_n=n(2n+1)(3n+2)$

$\therefore$ $S_n=\Sigma T_n=\Sigma n(2n+1)(3n+2)$

$$=\Sigma n(6n^2+7n+2)$$

$$=\Sigma(6n^3+7n^2+2n)$$

$$=6\Sigma n^3+7\Sigma n^2+2\Sigma n$$

$$=6\left[\frac{n(n+1)}{2}\right]^2+\frac{7n(n+1)(2n+1)}{6}+2\frac{n(n+1)}{2}$$

$$=\frac{n(n+1)}{2}\left[\frac{6n(n+1)}{2}+\frac{7(2n+1)}{3}+2\right]$$

$$=\frac{n(n+1)}{2}\left[\frac{18(n^2+n)+28n+14+12}{6}\right]$$

$$=\frac{n(n+1)}{2}\left(\frac{18n^2+46n+26}{6}\right)$$

$$=\frac{n(n+1)}{2}\times\frac{2(9n^2+23n+13)}{6}$$

$$=\frac{n(n+1)(9n^2+23n+13)}{6}$$

100. Let $S_n=\dfrac{1^3}{1}+\dfrac{1^3+2^3}{1+3}+\dfrac{1^3+2^3+3^3}{1+3+5}+\ldots$

$\therefore$ $T_n=\dfrac{1^3+2^3+3^3+\ldots+n^3}{1+3+\ldots+(2n-1)}$

$$=\frac{\Sigma n^3}{n^2}\qquad[\because 1+3+\ldots+(2n-1)=n^2]$$

$$=\frac{[n(n+1)/2]^2}{n^2}=\frac{(n+1)^2}{4}=\frac{n^2+2n+1}{4}$$

101. Let $S_n=n^3-(n-1)^3+\ldots+(-1)^{n-1}1^3$

Here, n is an odd integer.

$$S_n=1^3-2^3+3^3-4^3+\ldots+n^3$$

$$=[1^3+2^3+3^3+\ldots+(n-1)^3+n^3]$$

$$-2[2^3+4^3+6^3+\ldots+(n-1)^3]$$

$$=\Sigma n^3-2\times 2^3\left[1^3+2^3+3^3+\ldots\left(\frac{n-1}{2}\right)^3\right]$$

$$=\Sigma n^3-16\left[\Sigma\left(\frac{n-1}{2}\right)^3\right]$$

$$=\left[\frac{n(n+1)}{2}\right]^2-16\left[\left(\frac{n-1}{2}\right)\left(\frac{n-1}{2}+1\right)\right]^2$$

$$=\frac{n^2(n+1)^2}{4}-\frac{16\left[\left(\frac{n-1}{2}\right)^2\left(\frac{n+1}{2}\right)^2\right]}{4}$$

$$=\frac{(n+1)^2}{4}[n^2-(n^2+1-2n)]$$

$$=\frac{(n+1)^2}{4}(2n-1)$$

Round II

1. $\because$ Common terms are 5, 11, 17, ...

$\therefore \quad T_n = 5 + (n-1)\,6$

$= 6n - 1$

100th term of the first sequence

$= 2 + (100-1)\,3 = 299$

and 100th term of the second sequence

$= 3 + (100-1)\,2 = 201$

Now, $\quad 201 > 6n - 1$

$\Rightarrow \quad n \le 33\frac{2}{3}$

$\Rightarrow \quad n = 33 \qquad (\because n \in N)$

2. $\because$ a^{-1}, b^{-1}, c^{-1} are in AP.

$\therefore$ a, b, c are in HP.

Now, for numbers $a^{101}, b^{101}, c^{101}$

AM > GM

$\Rightarrow \quad \frac{a^{101} + c^{101}}{2} > (\sqrt{ac})^{101} > b^{101} \qquad (\because \sqrt{ac} > b)$

$\Rightarrow \quad 2b^{101} - a^{101} - c^{101} < 0 \qquad$ ...(i)

Now, product of roots of given equation

$= \frac{2b^{101} - a^{101} - c^{101}}{1} < 0 \qquad$ [from Eq. (i)]

3. $\because 13, a_1, a_2, \ldots, a_{20}, 67$ are in AP.

$\therefore a_1 + a_2 + a_3 + \ldots + a_{20} = 20\left(\frac{13+67}{2}\right) = 800$

Also, $\quad$ AM > GM

$\Rightarrow \quad \frac{a_1 + a_2 + \ldots + a_{20}}{20} \ge (a_1 a_2 a_3 \ldots a_{20})^{1/20}$

$\Rightarrow \quad 40 \ge (a_1 \cdot a_2 \cdot a_3 \ldots a_{20})^{1/20}$

Hence, maximum value of $a_1 \cdot a_2 \cdot a_3 \ldots a_{20}$ is $(40)^{20}$.

4. From symmetry, we observe that S_{50} has 50 terms. First term of $S_1, S_2, S_3, S_4, \ldots, S_{50}$ are 1, 2, 4, 7, ... , 50.

Let T_n be the first term of nth set. Then,

$S = T_1 + T_2 + T_3 + \ldots + T_n$

$\Rightarrow \quad S = 1 + 2 + 4 + 7 + 11 + \ldots + T_{n-1} + T_n$

or $\quad S = \quad 1 + 2 + 4 + 7 + \ldots \quad + T_{n-1} + T_n$

Therefore, on subtracting

$0 = 1 + [1 + 2 + 3 + 4 + \ldots + (T_n - T_{n-1})] - T_n$

or $\quad 0 = 1 + \frac{n(n-1)}{2} - T_n$

$\Rightarrow \quad T_n = 1 + \frac{n(n-1)}{2}$

$\Rightarrow \quad T_{50} =$ First term in $S_{50} = 1226$

Therefore, sum of the terms in S_{50}

$= \frac{50}{2}[2 \times 1226 + (50-1) \times 1]$

$= 25(2452 + 49) = 25(2501) = 62525$

5. It will take 10 yr for Jairam to pay off ₹ 10000 in 10 yearly installments.

$\because$ He pays 10% annual interest on remaining amount.

$\therefore$ Money given in the first year

$= 1000 + \frac{10000 \times 10}{100} = 1000 + 1000 =$ ₹ 2000

Money given in second year

$= 1000 +$ interest of $(10000 - 1000)$

$= 1000 + \frac{9000 \times 10}{100} = 1000 + 900 =$ ₹ 1900

Similarly, money paid in third year = Rs 1800 etc.

So, money given by Jairam in 10 yr will be Rs 2000, ₹ 1900, ₹ 1800, ₹ 1700, ...

Which is in arithmetic progression, whose first term

$a = 2000 \quad$ and $\quad d = -100$

Total money given in 10 yr

$= \frac{10}{2}[2(2000) + (10-1)(-100)] =$ ₹ 15500

Therefore, total money given by Jairam

$= 5000 + 15500 =$ ₹ 20500

6. Let the number of days be n. Hence, a worker can do $\left(\frac{1}{150n}\right)$th part of the work in a day.

According to the given condition,

$[150 + 146 + 142 + \ldots + \underset{\text{terms}}{\text{upto}}\,(n+8)] \times \frac{1}{150n} = 1$

$\Rightarrow \quad \frac{n+8}{2}[300 + (n+8-1)(-4)] = 1$

$\Rightarrow \quad (n+8)(272 - 4n) = 300n$

$\Rightarrow \quad 4n^2 + 60n - 2176 = 0$

$\Rightarrow \quad n^2 + 15n - 544 = 0$

$\Rightarrow \quad n = 17, -32$

We do not take negative value

$\therefore \quad n = 17$

Therefore, number of total days

$= 17 + 8 = 25$

7. Given equation is $ax^2 + bx + c = 0$ and let the roots are α, β.

So, $\alpha + \beta = -\frac{b}{a}$ and $\alpha\beta = \frac{c}{a}$.

Now, $\quad \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$

$= \frac{b^2}{a^2} - \frac{2c}{a}$

Now, $\dfrac{1}{\alpha^2}+\dfrac{1}{\beta^2}=\dfrac{\alpha^2+\beta^2}{\alpha^2\beta^2}=\dfrac{\dfrac{b^2}{a^2}-\dfrac{2c}{a}}{\dfrac{c^2}{a^2}}=\dfrac{b^2-2ac}{c^2}$

According to the given condition,

$$\alpha+\beta=\frac{1}{\alpha^2}+\frac{1}{\beta^2}$$

$\Rightarrow$ $$-\frac{b}{a}=\frac{b^2-2ac}{c^2}$$

$\Rightarrow$ $$-bc^2=ab^2-2a^2c$$

Hence, $$2a^2c=ab^2+bc^2$$

$\Rightarrow$ ab^2, ca^2, bc^2 or bc^2, ca^2, ab^2 be in AP.

8. Since, p, q and r are positive and are in AP.

$\therefore$ $$q=\frac{p+r}{2} \quad \text{...(i)}$$

$\because$ The roots of the equation $px^2+qx+r=0$ are real.

$\Rightarrow$ $$q^2\ge 4pr \Rightarrow \left[\frac{p+r}{2}\right]^2\ge 4pr \quad \text{[from Eq. (i)]}$$

$\Rightarrow$ $$p^2+r^2-14pr\ge 0$$

$\Rightarrow$ $$\left(\frac{r}{p}\right)^2-14\left(\frac{r}{p}\right)+1\ge 0 \quad (\because p>0)$$

$\Rightarrow$ $$\left(\frac{r}{p}-7\right)^2-48\ge 0$$

$\Rightarrow$ $$\left(\frac{r}{p}-7\right)^2-(4\sqrt{3})^2\ge 0 \Rightarrow \left|\frac{r}{p}-7\right|\ge 4\sqrt{3}$$

9. $\because$ $T_6=2 \Rightarrow a+5d=2$

Now, let $P=T_1T_4T_5$

$$=a(a+3d)(a+4d)=(2-5d)(2-2d)(2-d)$$
$$=2(4-16d+17d^2-5d^3)$$

On differentiating w.r.t. d, we get

Now, $$\frac{dP}{dd}=2(-16+34d-15d^2)$$

Put $\dfrac{dP}{dd}=0$ for maxima or minima

$$-16+34d-15d^2=0\Rightarrow d=\frac{2}{3} \text{ and } \frac{8}{5}$$

Also, $$\frac{d^2P}{dd^2}=2(34-30d)$$

$$\left(\frac{d^2P}{dd^2}\right)_{d=2/3}>0$$

Thus, P is least.

Thus, the value of $d=2/3$.

10. Initially the ball falls from a height of 120 m. After striking the floor, it rebounds and goes to a height of $\frac{4}{5}\times(120)$ m. Now, it falls from a height of $\frac{4}{5}\times(120)$ m and after rebounding goes to a height of $\frac{4}{5}\left[\frac{4}{5}(120)\right]$ m. This process is continued till the ball comes to rest.

Hence, the total distance travelled is

$$120+2\left[\frac{4}{5}(120)+\left(\frac{4}{5}\right)^2(120+\ldots\infty)\right]$$

$$=120+2\left[\frac{\frac{4}{5}(120)}{1-\frac{4}{5}}\right]=1080 \text{ m}$$

11.

$$\pi[(r_2^2-r_1^2)+(r_4^2-r_3^2)+\ldots+(r_{100}^2-r_{99}^2)]$$
$$=\pi(r_1+r_2+r_3+r_4+\ldots+r_{100})$$
$$(\because r_2-r_1=r_4-r_3=\ldots=r_{100}-r_{99}=1)$$
$$=\pi(1+2+3+\ldots+r_{100})=5050\pi \text{ sq cm}$$

12. Since, $$x=\sum_{n=0}^{\infty}\cos^{2n}\theta$$

$\Rightarrow$ $$x=\cos^0\theta+\cos^2\theta+\cos^4\theta+\ldots\infty$$

which is an infinite GP with first term 1 and common ratio $\cos^2\theta$ such that $0\le\cos^2\theta\le 1$

$\therefore$ $$x=\frac{1}{1-\cos^2\theta} \quad \text{(sum of an infinite GP)}$$

$\Rightarrow$ $$x=\frac{1}{\sin^2\theta} \quad \text{...(i)}$$

Similarly, $$y=\frac{1}{\cos^2\theta} \quad \text{...(ii)}$$

and $$z=\frac{1}{1-\cos^2\theta\sin^2\theta} \quad \text{...(iii)}$$

On substituting respective values of x, y, z in the given options, we get the option (b) is correct.

13. Since, $S_n=an(n-1)$

Now, nth term of the series is

$$T_n=S_n-S_{n-1}$$

$\Rightarrow$ $$T_n=an(n-1)-a(n-1)(n-2)$$

$\Rightarrow$ $$T_n=a(n-1)[n-(n-2)]=2a(n-1)$$

Again, let the sum of squares of n terms of the series is S_1 such that

$$S = T_1^2 + T_2^2 + T_3^2 + \ldots + T_n^2 = \sum_{r=1}^{n} T_r^2$$

$$\Rightarrow \quad S = \sum_{r=1}^{n} \{2a(r-1)\}^2$$

$$\Rightarrow \quad S = \sum_{r=1}^{n} 4a^2(r-1)^2$$

$$\Rightarrow \quad S = 4a^2\left[\frac{1}{6}(n-1)n\{2(n-1)+1)\}\right]$$

$$\therefore \quad S = \frac{2a^2}{3}n(n-1)(2n-1)$$

14. $$S = \sum_{r=1}^{16n}\left(\frac{8r}{4r^4+1}\right)$$

$$= 2\sum_{r=1}^{16n}\left(\frac{1}{2r^2-2r+1} - \frac{1}{2r^2+2r+1}\right)$$

$$= 2\left(1 - \frac{1}{5} + \frac{1}{5} - \frac{1}{13} + \frac{1}{13} - \ldots + \frac{1}{481} - \frac{1}{545}\right)$$

$$= 2\left(1 - \frac{1}{545}\right) = \frac{1088}{545}$$

15. $$\because \quad T_n = \frac{5+(n-1)4}{[3+(n-1)4]^2[7+(n-1)4]^2}$$

$$= \frac{1}{8}\left\{\frac{1}{(4n-1)^2} - \frac{1}{(4n+3)^2}\right\}$$

$$\therefore \quad S_n = T_1 + T_2 + \ldots + T_n$$

$$= \frac{1}{8}\left\{\frac{1}{3^2} - \frac{1}{7^2} + \frac{1}{7^2} - \frac{1}{11^2} + \frac{1}{11^2} - \ldots + \frac{1}{(4n-1)^2} - \frac{1}{(4n+3)^2}\right\}$$

$$= \frac{1}{8}\left\{\frac{1}{3^2} - \frac{1}{(4n+3)^2}\right\} \Rightarrow S_\infty = \frac{1}{8}\left(\frac{1}{9} - 0\right) = \frac{1}{72}$$

16. Let $\quad A = m\lambda, \quad H = n\lambda$

$$\therefore \quad G^2 = AH = mn\lambda^2$$

Also, a and b be the roots of

$$x^2 - (a+b)x + ab = 0$$

$$\Rightarrow \quad x^2 - 2m\lambda x + mn\lambda^2 = 0$$

$$\Rightarrow \quad x = \lambda\sqrt{m}\{\sqrt{m} \pm \sqrt{m-n}\}$$

$$\therefore \quad a : b = (\sqrt{m} + \sqrt{m-n}) : (\sqrt{m} - \sqrt{m-n})$$

or $\quad (\sqrt{m} - \sqrt{m-n}) : (\sqrt{m} + \sqrt{m-n})$

17. The general term is

$$T_n = \frac{\frac{n}{2}\cdot\frac{n+1}{2}}{1^3 + 2^3 + 3^3 + \ldots + n^3}$$

$$= \frac{1}{n(n+1)} = \frac{1}{n} - \frac{1}{n+1}$$

$$\therefore \quad S_n = 1 - \frac{1}{n+1} = \frac{n}{n+1}$$

18. $S_n = cn^2$

$$S_{n-1} = c(n-1)^2 = cn^2 + c - 2cn$$

$$T_n = 2cn - c$$

$$T_n^2 = (2cn-c)^2 = 4c^2n^2 + c^2 - 4c^2n$$

Sum $= \Sigma T_n^2$

$$= \frac{4c^2 + n(n+1)(2n+1)}{6} + nc^2 - 2c^2n(n+1)$$

$$= \frac{2c^2n(n+1)(2n+1) + 3nc^2 - 6c^2n(n+1)}{3}$$

$$= \frac{nc^2(4n^2+6n+2+3-6n-6)}{3} = \frac{nc^2(4n^2-1)}{3}$$

19. We have, $2y = x + z$ and $2\tan^{-1}y = \tan^{-1}x + \tan^{-1}z$.

$$\Rightarrow \quad \frac{2y}{1-y^2} = \frac{x+z}{1-xz}$$

$$\Rightarrow \quad y^2 = xz$$

So, x, y, z are in GP which is possible, if $x = y = z$.

20. Let the three digit number be xyz. According to the given condition, we have

$$y^2 = xz \quad \ldots(i)$$

$$2(y+2) = x + z \quad \ldots(ii)$$

$$\Rightarrow \quad 100x + 10y + z - 792 = 100z + 10y + x$$

$$\Rightarrow \quad x - z = 8 \quad \ldots(iii)$$

On squaring Eqs. (ii) and (iii) and subtracting, we have

$$4xz = 4(y+2)^2 - 64$$

$$\Rightarrow \quad y^2 = (y+2)^2 - 16 \quad \text{[using Eq. (i)]}$$

$$\Rightarrow \quad y = 3$$

$$\Rightarrow \quad x + z = 10 \quad \text{[using Eq. (ii)]}$$

$$\Rightarrow \quad x = 9, z = 1$$

Hence, the number is $931 = 7^2 \times 19$.

21. $a_1 + a_3 + a_5 = -12$

$$a + a + 2d + a + 4d = -12 (d > 0)$$

$$a + 2d = -4 \quad \ldots(i)$$

$$a_1a_3a_5 = 80$$

$$a(a+2d)(a+4d) = 80$$

or $\quad a(-4)(-4-2d+4d) = 20 \quad$ [from Eq. (i)]

or $\quad (-4-2d)(-4+2d) = -20 \Rightarrow d = \pm 3$

Since, AP is increasing, so $d = +3$; $a = -10$. Hence,

$$\left.\begin{aligned} a_1 &= -10;\ a_2 = -7 \\ a_3 &= a + 2d = -10 + 6 = -4 \\ a_5 &= a + 4d = -10 + 8 = -2 \end{aligned}\right\}$$

Solutions (Q. Nos. 22-24)

Let a be the first term and r be the common ratio of the given GP.

Further, let there be n terms in the given GP. Then,

$$a_1 + a_n = 66$$

$\Rightarrow \quad a + ar^{n-1} = 66 \quad \ldots(i)$

$a_2 \times a_{n-1} = 128$

$\Rightarrow \quad ar \times ar^{n-2} = 128$

$\Rightarrow \quad a^2 r^{n-1} = 128$

$\Rightarrow \quad a \times (ar^{n-2}) = 128 \Rightarrow ar^{n-1} = \dfrac{128}{a}$

On putting this value of ar^{n-1} in Eq. (i), we get

$$a + \frac{128}{a} = 66$$

$\Rightarrow \quad a^2 - 66a + 128 = 0$

$\Rightarrow \quad (a-2)(a-64) = 0$

$\Rightarrow \quad a = 2, 64$

On putting $a = 2$ in Eq. (i), we get

$$2 + 2 \times r^{n-1} = 66 \Rightarrow r^{n-1} = 32$$

On putting $a = 64$ in Eq. (i), we get

$$64 + 64r^{n-1} = 66 \Rightarrow r^{n-1} = \frac{1}{32}$$

22. For an increasing GP, $r > 1$. Now,

$$S_n = 126$$

$\Rightarrow \quad 2\left(\dfrac{r^n - 1}{r - 1}\right) = 126$

$\Rightarrow \quad \dfrac{r^n - 1}{r - 1} = 63$

$\Rightarrow \quad \dfrac{r^{n-1} \times r - 1}{r - 1} = 63$

$\Rightarrow \quad \dfrac{32r - 1}{r - 1} = 63$

$\Rightarrow \quad r = 2$

$\therefore \quad r^{n-1} = 32 \Rightarrow 2^{n-1} = 32 = 2^5 \Rightarrow n - 1 = 5 \Rightarrow n = 6$

23. For decreasing GP, $a = 64$ and $r = 1/2$. Hence, the sum of infinite terms is $64/[1 - 1/2] = 128$.

24. Hence, the required difference $= 128 - 64 = 64$

25. $\because \quad \dfrac{S_n}{S'_n} = \dfrac{(7n+1)}{(4n+17)} = \dfrac{n(7n+1)}{n(4n+17)}$

$\therefore \quad S_n = (7n^2 + n)\lambda, \quad S'_n = (4n^2 + 17n)\lambda$

Then, $\quad \dfrac{T_n}{T'_n} = \dfrac{S_n - S_{n-1}}{S'_n - S'_{n-1}} = \dfrac{7(2n-1)+1}{4(2n-1)+17} = \dfrac{14n-6}{8n+13}$

$\Rightarrow \quad T_n : T'_n = (14n - 6) : (8n + 13)$

26. $\because$ Sum of n terms of an AP is $S_n = \dfrac{n}{2}[2A + (n-1)D]$,

where A and D are first term and common difference.
Hence, sum always of the form $an^2 + bn$.

27. ***Case I*** $x < 1$

Then, $1 - x, 3, 3 - x$ are in AP.

$$6 = 4 - 2x \Rightarrow x = -1$$

$\therefore$ Terms are 2, 3, 4.

$\therefore$ Sixth term $= 7$

Case II $1 < x < 3$

Then, $x - 1, 3, x - 3$ are in AP.

$$6 = 2 \quad \text{(impossible)}$$

Case III $x > 3$

Then, $x - 1, 3, x - 3$ are in AP.

$\therefore \quad 6 = 2x - 4 \Rightarrow x = 5$

Then, terms are 4, 3, 2.

$\therefore$ Sixth term is -1.

28. If a, b, c are in GP, then $a + b, b + b, c + b$ are in HP.

$\Rightarrow \quad (2b) = \dfrac{2(a+b)(b+c)}{(a+b)+(c+b)}$

$\Rightarrow \quad b(a + 2b + c) = (a + b)(b + c)$

$\Rightarrow \quad b(a + c) + 2b^2 = ab + ac + b^2 + bc$

$\Rightarrow \quad b^2 = ac \quad (\because a, b, c \text{ are in GP})$

29. $\therefore \quad \displaystyle\sum_{r=1}^{n} F_1(r) = \sum_{r=1}^{n}\left\{1 + \frac{1}{2} + \frac{1}{3} + \ldots + \frac{1}{r}\right\}$

$= 1 \cdot n + \dfrac{1}{2}(n-1) + \dfrac{1}{3}(n-2) + \ldots + 1 \cdot \dfrac{1}{n}$

$= n\left(1 + \dfrac{1}{2} + \dfrac{1}{3} + \ldots + \dfrac{1}{n}\right) - \left\{\dfrac{1}{2} + \dfrac{2}{3} + \ldots + \left(\dfrac{n-1}{n}\right)\right\}$

$= nF_1(n) - \left\{\left(1 - \dfrac{1}{2}\right) + \left(1 - \dfrac{1}{3}\right) + \left(1 - \dfrac{1}{4}\right) + \ldots + \left(1 - \dfrac{1}{n}\right)\right\}$

$= nF_1(n) - \{n - F_1(n)\} = (n+1)F_1(n) - n$

30. Let, if possible, 8 be the first term and 12 and 27 be mth and nth terms, respectively. Then,

$12 = ar^{m-1} = 8r^{m-1}, 27 = 8r^{n-1}$

$\Rightarrow \quad \dfrac{3}{2} = r^{m-1}, \left(\dfrac{3}{2}\right)^3 = r^{n-1} = r^{3(m-1)}$

$\Rightarrow \quad n - 1 = 3m - 3$ or $3m = n + 2$

$\Rightarrow \quad \dfrac{m}{1} = \dfrac{n+2}{3} = k$ (say)

By giving k different values, we get the integral values of m and n.

Hence, there can be infinite number of GP's whose any three terms will be 8, 12, 27 (not consecutive). Obviously, statement II is not a correct explanation of statement I.

31. For odd integer n, we have

$S_n = n^3 - (n-1)^3 + \ldots + (-1)^{n-1}1^3$

$= 1^3 - 2^3 + 3^3 - 4^3 + \ldots + n^3$

$= [1^3 + 2^3 + 3^3 + \ldots + (n-1)^3 + n^3]$
$\quad - 2[2^3 + 4^3 + 6^3 + \ldots + (n-1)^3]$

$= \dfrac{n^2(n+1)^2}{4} - 2 \times 2^3\left[1^3 + 2^3 + \ldots + \left(\dfrac{n-1}{2}\right)^3\right]$

$= \dfrac{n^2(n+1)^2}{4} - 2^4 \dfrac{\left(\dfrac{n-1}{2}\right)^2\left(\dfrac{n-1}{2} + 1\right)^2}{4}$

$$= \frac{n^2(n+1)^2}{4} - \frac{(n-1)^2(n+1)^2}{4} = \frac{(n+1)^2}{4}[n^2 - (n-1)^2]$$

$$= \frac{1}{4}(2n-1)(n+1)^2$$

Now, putting $n = 11$ in above formula, $S_{11} = 756$. Hence, statement I is false and statement II is correct.

32. For two positive numbers $(GH)^2 = (AM) \times (HM)$. This is not true for numbers greater than 2. Hence, statement I is true but statement II is false.

33. **Statement I**

$S = (1) + (1 + 2 + 4) + (4 + 6 + 9) + (9 + 12 + 16) + .. + (361 + 380 + 400)$

$S = (0 + 0 + 1) + (1 + 2 + 4) + (4 + 6 + 9) + (9 + 12 + 16) + \ldots + (361 + 380 + 400)$

Now, we can clearly observe the first elements in reach bracket.

In second bracket, the first element is $1 = 1^2$

In third bracket, the first element is $4 = 2^2$

In fourth bracket, the first elements is $9 = 3^2$

... ...

In last bracket, the first element is $361 = 19^2$

Hence, we can conclude that there are 20 brackets in all. Also, in each of the brackets there are 3 terms out of which the first and last terms are perfect squares of consecutive integers and the middle term is their product.

$\therefore$ The general term of the series is

$$T_r = (r-1)^2 + (r-1)r + (r^2)$$

The sum of the n terms of the series is

$$S_n = \sum_{r=1}^{n} [(r-1)^2 + (r-1)r + (r)^2]$$

$$S_n = \sum_{r=1}^{n} \left[\frac{r^3 - (r-1)^3}{r - (r-1)}\right]$$

$$[\because a^3 - b^3 = (a-b)(a^2 + ab + b^2)]$$

$$\Rightarrow \quad S_n = \sum_{r=1}^{n} [r^3 - (r-1)^3]$$

$$\therefore \quad S_n = (1^3 - 0^3) + (2^3 - 1^3) + (3^3 - 2^3) + \ldots + [n^3 - (n-1)^3]$$

$$S_n = -0^3 + (1^3 - 1^3) + (2^3 - 2^3) + (3^3 - 3^3) + \ldots + [(n-1)^3 - (n-1)^3] + n^3$$

$$S_n = n^3$$

Since, the number of terms is 20, hence substitituting $n = !20$, we get $S_{20} = 8000$

Hence, statement I is correct.

Statement II We have, already proved in the statement I that

$$S_n = \sum_{r=1}^{n} [r^3 - (r-1)^3] = n^3$$

Hence, statement II is also correct and it is a correct explanation of statement I.

34. Let $S = 0.7 + 0.77 + 0.777 + \ldots$

$$= \frac{7}{10} + \frac{77}{10^2} + \frac{777}{10^3} + \ldots + \text{upto 20 terms}$$

$$= 7\left[\frac{1}{10} + \frac{11}{10^2} + \frac{111}{10^3} + \ldots + \text{upto 20 terms}\right]$$

$$= \frac{7}{9}\left[\frac{9}{10} + \frac{99}{100} + \frac{999}{1000} + \ldots + \text{upto 20 terms}\right]$$

$$= \frac{7}{9}\left[\left(1 - \frac{1}{10}\right) + \left(1 - \frac{1}{10^2}\right) + \left(1 - \frac{1}{10^3}\right) + \ldots + \text{upto 20 terms}\right]$$

$$= \frac{7}{9}\left[(1 + 1 + \ldots + \text{upto 20 terms}) - \left(\frac{1}{10} + \frac{1}{10^2} + \frac{1}{10^3} + \ldots + \text{upto 10 terms}\right)\right]$$

$$= \frac{7}{9}\left[20 - \frac{\frac{1}{10}\left\{1 - \left(\frac{1}{10}\right)^{20}\right\}}{1 - \frac{1}{10}}\right]$$

$$\left[\because \sum_{i=1}^{\infty} = 20 \text{ and sum of } n \text{ terms of GP, } S_n = \frac{a(1-r^n)}{1-r} \text{ where } (r < 1)\right]$$

$$= \frac{7}{9}\left[20 - \frac{1}{9}\left\{1 - \left(\frac{1}{10}\right)^{20}\right\}\right]$$

$$= \frac{7}{9}\left[\frac{179}{9} + \frac{1}{9}\left(\frac{1}{10}\right)^{20}\right] = \frac{7}{81}[179 + (10)^{-20}]$$

35. Let a be the first term and $d (d \neq 0)$ be the common difference of a given AP, then

$$T_{100} = a + (100 - 1)d = a + 99d$$

$$T_{50} = a + (50 - 1)d = a + 49d$$

$$T_{150} = a + (150 - 1)d = a + 149d$$

Now, according to the given condition,

$$100 \times T_{100} = 50 \times T_{50}$$

$$\Rightarrow \quad 100(a + 99d) = 50(a + 49d)$$

$$\Rightarrow \quad 2(a + 99d) = (a + 49d)$$

$$\Rightarrow \quad 2a + 198d = a + 49d$$

$$\Rightarrow \quad a + 149d = 0$$

$$T_{150} = 0$$

36. Let the time taken to save ₹ 11040 be $(n + 3)$ months.

For first 3 months he saves ₹ 200 each month.

$\therefore$ In $(n + 3)$ month,.

$$3 \times 200 + \frac{n}{2}\{2(240) + (n-1) \times 40\} = 11040$$

$$\Rightarrow \quad 600 + \frac{n}{2}\{40(12 + n - 1)\} = 11040$$

$$\Rightarrow \quad 600 + 20n(n + 11) = 11040$$

$$\Rightarrow \quad 30 + n^2 + 11n = 552$$

$$\Rightarrow \quad n^2 + 11n - 522 = 0$$

$$\Rightarrow \quad n^2 + 29n - 18n - 522 = 0$$

$\Rightarrow \quad n(n+29)-(n+29)=0$

$\Rightarrow \quad (n-18)(n+29)=0$

$\therefore \quad n=18$, neglecting $n=-29$

$\therefore$ Total time $=(n+3)=21$ months

37. Number of notes that the person counts in 10 min $=10\times 150=1500$

Since, $a_{10}, a_{11}, a_{12}, \ldots$ are in AP with common difference -2.

Let n be the time taken to count remaining 3000 notes, then

$$\frac{n}{2}[2\times 148+(n-1)\times -2]=3000$$

$\Rightarrow \quad n^2-149n+3000=0$

$\Rightarrow \quad (n-24)(n-125)=0$

$\therefore \quad n=24$ and 125

Then, the total time taken by the person to count all notes

$$=10+24=34 \text{ min}$$

38. Let $S=1+\frac{2}{3}+\frac{6}{3^2}+\frac{10}{3^3}+\frac{14}{3^4}+\ldots$

$\Rightarrow \quad S-1=\frac{2}{3}+\frac{6}{3^2}+\frac{10}{3^3}+\frac{14}{3^4}+\ldots \quad \ldots(i)$

$\Rightarrow \quad \frac{S-1}{3}=\frac{2}{3^2}+\frac{6}{3^3}+\frac{10}{3^4}+\frac{14}{3^5}+\ldots \quad \ldots(ii)$

On subtracting Eq. (ii) from Eq. (i), we get

$$\frac{2}{3}(S-1)=\frac{2}{3}+\frac{4}{3^2}+\frac{4}{3^3}+\frac{4}{3^4}+\ldots$$

$\Rightarrow \quad S-1=1+\frac{2}{3}+\frac{2}{3^2}+\frac{2}{3^3}+\ldots$

$\Rightarrow \quad S=2+\dfrac{\frac{2}{3}}{1-\frac{1}{3}}=2+1=3$

39. Since, $\quad a+ar=a(1+r)=12 \quad \ldots(i)$

and $\quad ar^2+ar^3=ar^2(1+r)=48 \quad \ldots(ii)$

From Eqs. (i) and (ii), we get

$$r^2=4 \therefore r=-2$$

(since, the series is alternately sign, so we take negative values)

On putting the value of r in Eq. (i), we get

$$a=-12$$

40. Applying AM-GM inequality in the positive real numbers p and q.

$$\frac{p^2+q^2}{2}\geq pq \qquad (\because \text{AM} \geq \text{GM})$$

$\Rightarrow \quad pq\leq \frac{1}{2} \qquad (\because p^2+q^2=1) \ldots(i)$

Now, $\quad (p+q)^2=p^2+q^2+2pq$

$\Rightarrow \quad (p+q)^2=1+2pq$

$\Rightarrow \quad (p+q)^2\leq 1+1$

$\Rightarrow \quad p+q\leq \sqrt{2}$

41. Since, each term is equal to the sum of two preceeding terms.

$\therefore \quad ar^{n-1}=ar^n+ar^{n+1}$

$\Rightarrow \quad \frac{1}{r}=1+r \Rightarrow r^2+r-1=0$

$\Rightarrow \quad r=\frac{\sqrt{5}-1}{2} \qquad \left(\because r\neq \frac{-\sqrt{5}-1}{2}\right)$

42. Given that, $\quad \frac{a_1+a_2+\ldots+a_p}{a_1+a_2+\ldots+a_q}=\frac{p^2}{q^2}$

$\therefore \quad \dfrac{\frac{p}{2}[2a_1+(p-1)d]}{\frac{q}{2}[2a_1+(q-1)d]}=\frac{p^2}{q^2},$

where d be a common difference of an AP.

$\Rightarrow \quad \frac{(2a_1-d)+pd}{(2a_1-d)+qd}=\frac{p}{q}$

$\Rightarrow \quad (2a_1-d)(p-q)=0 \Rightarrow a_1=\frac{d}{2}$

Now, $\quad \frac{a_6}{a_{21}}=\frac{a_1+5d}{a_1+20d}=\dfrac{\frac{d}{2}+5d}{\frac{d}{2}+20d}=\frac{11}{41}$

43. Since, $a_1, a_2, a_3, \ldots, a_n$ are in HP.

$\therefore \frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \ldots, \frac{1}{a_n}$ are in AP.

Let d be the common difference of AP.

$\therefore \quad \frac{1}{a_2}-\frac{1}{a_1}=d \Rightarrow a_1-a_2=a_1a_2d$

Similarly, $\quad a_2-a_3=a_2a_3d$

$\ldots \ldots \ldots \ldots \ldots$

$\ldots \ldots \ldots \ldots \ldots$

$a_{n-1}-a_n=a_{n-1}a_nd$

On adding all of these, we get

$a_1-a_n=d(a_1a_2+a_2a_3+\ldots+a_{n-1}a_n) \quad \ldots(i)$

Also, $\quad \frac{1}{a_n}=\frac{1}{a_1}+(n-1)d \Rightarrow d=\frac{a_1-a_n}{a_1a_n(n-1)}$

On putting the value of d in Eq. (i), we get

$$a_1-a_n=\frac{a_1-a_n}{a_1a_n(n-1)}(a_1a_2+a_2a_3+\ldots+a_{n-1}a_n)$$

$\Rightarrow \quad a_1a_2+a_2a_3+\ldots+a_{n-1}a_n=a_1a_n(n-1)$

44. Given that, $\quad x=\sum_{n=0}^{\infty}a^n, \quad y=\sum_{n=0}^{\infty}b^n, \quad z=\sum_{n=0}^{\infty}c^n$

$\Rightarrow \quad x=1+a+a^2+\ldots=\frac{1}{1-a} \quad \ldots(i)$

Similarly, $\quad y=\frac{1}{1-b}$ and $z=\frac{1}{1-c} \quad \ldots(ii)$

Now, a, b and c are in AP.

$\Rightarrow -a, -b$ and $-c$ are in AP.

$\Rightarrow 1-a, 1-b$ and $1-c$ are also in AP.

$\Rightarrow \frac{1}{1-a}, \frac{1}{1-b}$ and $\frac{1}{1-c}$ are in HP.

$\Rightarrow x, y$ and z are in HP.

4.1 Complex Numbers

The numbers of the form $x + iy$ are known as complex numbers. Here, x and y are real numbers and $i = \sqrt{-1}$ is iota.

OR

A complex number may also be defined as an **ordered pair of real numbers** and it is denoted by the symbol (x, y). If we write $z = (x, y)$, then x is called the real part and y is called the imaginary part of z.

The Italian Mathematician Gerolamo Cardano is the first known to have introduced complex numbers. Complex numbers extend the idea of the one dimensional number line to the two dimensional complex plane by using the horizontal axis for the real part and the vertical axis for the imaginary part.

The complex number is usually denoted by z and its set is denoted by C.

$\therefore \quad C = \{x + iy : x, y \in R, i = \sqrt{-1}\}$

e.g., $7 + 2i$, $0 + i$, $1 + 0i$, etc., are complex numbers.

Integral Powers of Iota $i = \sqrt{-1}$ is called the imaginary unit.

Also, $i^2 = -1$, $i^3 = -i$, $i^4 = 1$

In general $i^{4n} = 1$, $i^{4n+1} = -i$, $i^{4n+2} = -1$, $i^{4n+3} = -i$, for any integer n.

e.g., $i^{1998} = i^{4 \times 499 + 2} = -1$

Note

- $i = -\dfrac{1}{i}$
- The sum of any four consecutive powers of i is zero. *i.e.*,
$$i^{4n+1} + i^{4n+2} + i^{4n+3} + i^{4n+4} = 0$$
- $\sqrt{-a} = i\sqrt{a}$, when a is any real number.

  Then, $\sqrt{-a}\sqrt{-b} = i\sqrt{a}\, i\sqrt{b} = -\sqrt{ab}$

  But $\sqrt{-a}\sqrt{-b} = \sqrt{(-a)(-b)} = \sqrt{ab}$ is wrong.

***Sample* Problem 1** *The value of* $(1+i)^4\left(1+\frac{1}{i}\right)^4$ *is*

(a) 12 (b) 2
(c) 8 (d) 16

Interpret (d) $(1+i)^4 \times \left(1+\frac{1}{i}\right)^4 = (1+i)^4 \times (1-i)^4$

$= (1-i^2)^4 = (1+1)^4 = 2^4 = 16$

Representation of Complex Numbers in the form $x + iy$

Let $z = x + iy$ is a complex number, then x is called the real part of z and is denoted by Re (z) and y is called the imaginary part of z and is denoted by Im (z).

e. g., If $z = 7 + 4i$, then Re $(z) = 7$ and Im $(z) = 4$.

A complex number z is said to be purely real, if Im$(z) = 0$ and is said to be purely imaginary, if Re $(z) = 0$. The complex number $0 = 0 + i0$ is both purely real and purely imaginary.

Every real number a can be written as $a + i0$. Therefore, every real number is considered as a complex number, whose imaginary part is zero.

4.2 Equality of Complex Numbers

Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ are two complex numbers, then these two numbers are equal, if

$$x_1 = x_2 \text{ and } y_1 = y_2$$

i.e., $\text{Re}(z_1) = \text{Re}(z_2)$

and $\text{Im}(z_1) = \text{Im}(z_2)$

e. g., If $z_1 = 2 - iy$ and $z_2 = x + 3i$ are equal, then

$$2 - iy = x + 3i$$

$\Rightarrow$ $x = 2$ and $y = -3$

Two complex numbers cannot be compared *i.e.*, no greater complex number can be find in two given complex numbers.

***Sample* Problem 2** *The real values of x and y for which the following equality hold, are respectively*

$$(x^4 + 2xi) - (3x^2 + iy) = (3 - 5i) + (1 + 2iy)$$

(a) 2, 3 *or* -2, 1/3 (b) 1, 3 *or* -1, 1/3
(c) 2, 1/3 *or* -2, 3 (d) *None of these*

Interpret (a) The given equality can be rewritten as

$$(x^4 - 3x^2) + i(2x - y) = 4 + i(2y - 5)$$

$\Rightarrow$ $x^4 - 3x^2 = 4$ and $2x - y = 2y - 5$

$\Rightarrow$ $x^4 - 3x^2 - 4 = 0$ and $2x - 3y + 5 = 0$

$\Rightarrow$ $(x^2 - 4)(x^2 + 1) = 0$

$\Rightarrow$ $x = \pm 2$ $(\because x^2 \neq -1)$

$\therefore$ At $x = 2$, $y = 3$ and at $x = -2$, $y = \frac{1}{3}$

4.3 Representation of a Complex Number in a Plane

Complex numbers can be represented as follows

(i) Geometrical Representation of a Complex Number

The complex number $z = x + iy$ may be represented graphically by the point P, whose rectangular coordinates are (x, y). Thus, each point in the plane is associated with a complex number. In the figure, P defines $z = x + iy$. It is customary to choose x-axis as real axis and y-axis as imaginary axis. Such a plane is called argand plane or argand diagram or complex plane or gaussian plane.

Distance of P from origin is $OP = \sqrt{x^2 + y^2}$. It is called the modulus of z and angle of OP with positive direction of x-axis is called argument of z.

$\therefore$ $\tan\theta = \frac{y}{x}$ or $\theta = \tan^{-1}\left(\frac{y}{x}\right)$

(ii) Trigonometrical or Polar Representation of a Complex Number

Let $z = x + iy$ is a complex number which is denoted by a point $P(x, y)$ in a complex plane, then

$OP = |z|$ and $\angle POX = \theta = \arg(z)$

In ΔPOM,

$$\cos\theta = \frac{OM}{OP} = \frac{x}{|z|}$$

$\Rightarrow$ $x = |z|\cos\theta$

and $\sin\theta = \frac{PM}{OP} = \frac{y}{|z|}$

$\Rightarrow$ $y = |z|\sin\theta$

$\therefore$ $z = x + iy$

$\Rightarrow$ $z = |z|\cos\theta + i|z|\sin\theta$

$\Rightarrow \quad z = |z|(\cos\theta + i\sin\theta)$

$\Rightarrow \quad z = r(\cos\theta + i\sin\theta)$

where, $\quad r = |z|$ and $\theta = \tan^{-1}\left(\frac{y}{x}\right)$

This form of z is known as **polar form.**

In general, polar form is

$$z = r[\cos(2n\pi + \theta) + i\sin(2n\pi + \theta)]$$

where, $\quad r = |z|, \theta = \arg(z)$ and $n \in N$.

(iii) Eulerian Form of a Complex Number

We have, $\quad e^{i\theta} = \cos\theta + i\sin\theta$ and $e^{-i\theta} = \cos\theta - i\sin\theta$

These two are called Euler's notations.

Let z be any complex number such that $|z| = r$ and $\arg(z) = \theta$. Then, $z = x + iy = r(\cos\theta + i\sin\theta)$ can be represented in exponential or Eulerian form as

$$z = re^{i\theta} = r(\cos\theta + i\sin\theta)$$

4.4 Algebra of Complex Numbers

(i) Addition of Complex Numbers

Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ are two complex numbers, then

$$z_1 + z_2 = x_1 + iy_1 + x_2 + iy_2$$
$$= (x_1 + x_2) + i(y_1 + y_2)$$

$\Rightarrow \quad \text{Re}(z_1 + z_2) = \text{Re}(z_1) + \text{Re}(z_2)$

and $\quad \text{Im}(z_1 + z_2) = \text{Im}(z_1) + \text{Im}(z_2)$

Geometrical Representation

Let the complex numbers z_1 and z_2 be represented by the points P and Q on the argand plane.

Complete the parallelogram $OPRQ$. Then, the mid-points of PQ and OR are the same. The mid-point of $PQ = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$.

Here,
$$R = (x_1 + x_2, y_1 + y_2)$$
$$= (x_1 + x_2) + i(y_1 + y_2)$$
$$= (x_1 + iy_1) + (x_2 + iy_2) = z_1 + z_2$$
$$= (x_1, y_1) + (x_2, y_2)$$

Properties of Addition of Complex Numbers

(a) $z_1 + z_2 = z_2 + z_1$ (commutative law)

(b) $z_1 + (z_2 + z_3) = (z_1 + z_2) + z_3$ (associative law)

(c) $z + 0 = 0 + z$ (where, $0 = 0 + i0$) (additive identity law)

***Sample* Problem 3** *The value of $3(7 + i7) + i(7 + i7)$ is* [NCERT]

(a) $15 + 27i$ (b) $14 + 28i$

(c) $14 - 28i$ (d) $14 + 23i$

Interpret (b) We have, $3(7 + i7) + i(7 + i7)$

$$= 21 + 21i + 7i + 7i^2$$
$$= 21 + 28i - 7 \quad (\because i^2 = -1)$$
$$= 14 + 28i$$

(ii) Subtraction of Complex Numbers

Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ are two complex numbers, then

$$z_1 - z_2 = (x_1 + iy_1) - (x_2 + iy_2)$$
$$= (x_1 - x_2) + i(y_1 - y_2)$$

$\Rightarrow \quad \text{Re}(z_1 - z_2) = \text{Re}(z_1) - \text{Re}(z_2)$

and $\quad \text{Im}(z_1 - z_2) = \text{Im}(z_1) - \text{Im}(z_2)$

Geometrical Representation

We first represent $-z_2$ by Q', so that QQ' is bisected at O. Complete the parallelogram $OPRQ'$. Then, the point R represents the difference $z_1 - z_2$.

We see that, $ORPQ$ is a parallelogram, so that

$$\mathbf{OR} = \mathbf{OP}$$

We have, in vectorial notation

$$z_1 - z_2 = \mathbf{OP} - \mathbf{OQ}$$
$$= \mathbf{OP} + \mathbf{QO}$$
$$= \mathbf{OP} + \mathbf{PR}$$
$$= \mathbf{OR} = \mathbf{QP}$$

Note The subtraction of two complex numbers is equivalent to addition of first with additive inverse of second.

***Sample* Problem 4** *The value of*

$$\left[\left(\frac{1}{3}+i\frac{7}{3}\right)+\left(4+i\frac{1}{3}\right)\right]-\left(-\frac{4}{3}+i\right) \text{ is}$$

(a) $\frac{5}{3}-i\frac{17}{3}$ (b) $\frac{17}{3}-i\frac{5}{3}$

(c) $\frac{17}{3}+i\frac{5}{3}$ (d) $\frac{17}{5}-i\frac{4}{3}$

Interpret (c) $\left(\frac{1}{3}+i\frac{7}{3}+4+i\frac{1}{3}\right)+\frac{4}{3}-i$

$$=\left(\frac{1}{3}+4+\frac{4}{3}\right)+i\left(\frac{7}{3}+\frac{1}{3}-1\right)=\left(\frac{1}{3}+\frac{4}{1}+\frac{4}{3}\right)+i\left(\frac{7}{3}+\frac{1}{3}-\frac{1}{1}\right)$$

$$=\frac{(1+12+4)}{3}+i\left(\frac{7+1-3}{3}\right)=\frac{17}{3}+i\frac{5}{3}$$

(iii) Multiplication of Complex Numbers

Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ are two complex numbers, then

$$z_1 \cdot z_2 = (x_1 + iy_1)(x_2 + iy_2)$$
$$= (x_1x_2 - y_1y_2) + i(x_1y_2 + x_2y_1)$$
$$\Rightarrow \quad z_1 \cdot z_2 = [\text{Re}(z_1)\,\text{Re}(z_2) - \text{Im}(z_1)\,\text{Im}(z_2)] + i[\text{Re}(z_1)\,\text{Im}(z_2) + \text{Re}(z_2)\,\text{Im}(z_1)]$$

Geometrical Representation

Let $z_1 = r_1(\cos\theta_1 + i\sin\theta_1)$

$\therefore \quad |z_1| = r_1$ and $\arg(z_1) = \theta_1$

and $\quad z_2 = r_2(\cos\theta_2 + i\sin\theta_2) = r_2e^{i\theta_2}$

$\therefore \quad |z_2| = r_2$ and $\arg(z_2) = \theta_2$

Then, $\quad z_1z_2 = r_1r_2(\cos\theta_1 + i\sin\theta_1)(\cos\theta_2 + i\sin\theta_2)$

$$= r_1r_2\{\cos(\theta_1+\theta_2) + i\sin(\theta_1+\theta_2)\}$$

$\therefore \quad |z_1z_2| = r_1r_2$

and $\quad \arg(z_1z_2) = \theta_1 + \theta_2$

Let P and Q represent the complex numbers z_1 and z_2, respectively.

$\therefore \quad OP = r_1, OQ = r_2$

$\angle POX = \theta_1$ and $\angle QOX = \theta_2$

Take a point A on the real axis OX, such that $OA = 1$ unit. Complete the ΔOPA. Now, taking OQ as the base, construct a ΔOQR similar to OPA so that

$$\frac{OR}{OQ} = \frac{OP}{OA}$$

i.e., $\quad OR = OP \cdot OQ = r_1r_2 \quad (\because OA = 1)$

and $\quad \angle ROX = \angle ROQ + \angle QOX = \theta_1 + \theta_2$

Hence, R is the point representing product of complex numbers z_1 and z_2.

Properties of Multiplication of Complex Numbers

(a) $z_1 \cdot z_2 = z_2 \cdot z_1$ (commutative law)

(b) $(z_1 \cdot z_2)z_3 = z_1(z_2 \cdot z_3)$ (associative law)

(c) If $z_1 \cdot z_2 = 1 = z_2 \cdot z_1$, then z_1 and z_2 are multiplicative inverse of each other.

(d) (i) $z_1(z_2 + z_3) = z_1 \cdot z_2 + z_1 \cdot z_3$ (left distribution law)

(ii) $(z_2 + z_3)z_1 = z_2 \cdot z_1 + z_3 \cdot z_1$ (right distribution law)

***Sample* Problem 5** *The real values of x and y, if*

$$\frac{(1+i)x-2i}{(3+i)}+\frac{(2-3i)y+i}{(3-i)} = i, \text{ are respectively}$$

(a) 3, −1 (b) 3, 1

(c) −3, 1 (d) −3, −1

Interpret (a) $\frac{(1+i)x-2i}{(3+i)}+\frac{(2-3i)y+i}{(3-i)} = i$

$$\Rightarrow \quad \{(1+i)x-2i\}(3-i) + \{(2-3i)y+i\}(3+i) = i(3+i)(3-i)$$

$$\Rightarrow (1+i)(3-i)x - 2i(3-i) + (2-3i)(3+i)y + i(3+i) = 10i$$

$$\Rightarrow \quad (4+2i)x - 6i - 2 + (9-7i)y + 3i - 1 = 10i$$

$$\Rightarrow \quad (4x - 2 + 9y - 1) + i(2x - 6 - 7y + 3) = 10i$$

$$\Rightarrow \quad (4x + 9y - 3) + i(2x - 7y - 3) = 10i$$

On equating real and imaginary parts on both sides, we get

$$4x + 9y = 3 \quad \text{...(i)}$$

and $\quad 2x - 7y = 13 \quad$ ...(ii)

On solving Eqs. (i) and (ii), we get $x = 3, \quad y = -1$

***Sample* Problem 6** *The multiplicative inverse of* $4 - 3i$ *is* **[NCERT]**

(a) $\frac{4}{25}-\frac{3i}{25}$ (b) $\frac{4}{25}+\frac{3i}{25}$

(c) $\frac{4}{16}+\frac{3i}{25}$ (d) *None of these*

Interpret (b) Let $z = 4 - 3i$

Then, its multiplicative inverse is

$$\frac{1}{z} = \frac{1}{4-3i} = \frac{1}{4-3i} \times \frac{4+3i}{4+3i} = \frac{4+3i}{16-9i^2}$$

$$[\because (a-b)(a+b) = a^2 - b^2]$$

$$= \frac{4+3i}{16+9} \quad (\because i^2 = -1)$$

$$= \frac{4+3i}{25} = \frac{4}{25} + \frac{3i}{25}$$

(iv) Division of Complex Numbers

Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ $(\neq 0)$ are two complex numbers, then

$$\frac{z_1}{z_2} = \frac{x_1 + iy_1}{x_2 + iy_2}$$

$$= \frac{1}{x_2^2 + y_2^2}[(x_1x_2 + y_1y_2) + i(x_2y_1 - x_1y_2)]$$

Geometrical Representation

Let $z_1 = r_1(\cos\theta_1 + i\sin\theta_1) = r_1e^{i\theta_1}$

$\therefore$ $|z_1| = r_1$ and $\arg(z_1) = \theta_1$

and $z_2 = r_2(\cos\theta_2 + i\sin\theta_2) = r_2e^{i\theta_2}$

$\therefore$ $|z_2| = r_2$ and $\arg(z_2) = \theta_2$

Then, $$\frac{z_1}{z_2} = \frac{r_1}{r_2}\frac{(\cos\theta_1 + i\sin\theta_1)}{(\cos\theta_2 + i\sin\theta_2)} \qquad (z_2 \neq 0, r_2 \neq 0)$$

$$\frac{z_1}{z_2} = \frac{r_1}{r_2}[\cos(\theta_1 - \theta_2) + i\sin(\theta_1 - \theta_2)]$$

$\therefore$ $$\left|\frac{z_1}{z_2}\right| = \frac{r_1}{r_2}, \arg\left(\frac{z_1}{z_2}\right) = \theta_1 - \theta_2$$

Let P and Q represent the complex numbers z_1 and z_2, respectively.

$\therefore$ $$OP = r_1, OQ = r_2$$
$$\angle POX = \theta_1 \text{ and } \angle QOX = \theta_2$$

Let OS be new position of OP. Take a point A on the real axis OX, such that $OA = 1$ unit and through A draw a line making with OA an angle equal to the $\angle OQP$ and meeting OS in R. Then, R represented by (z_1/z_2).

Now, in similar ΔOPQ and ΔOAR,

$$\frac{OR}{OA} = \frac{OP}{OQ}$$

$\Rightarrow$ $$OR = \frac{r_1}{r_2}, \text{ since } OA = 1$$

and $$\angle AOR = \angle POR - \angle POX = \theta_2 - \theta_1$$

Hence, the vecterial $\angle R$ is $-(\theta_2 - \theta_1)$.

i.e., $$\theta_1 - \theta_2$$

Note The division of two complex numbers is equivalent to multiplication of first with multiplicative inverse of second.

***Sample* Problem 7** *The value of* $\frac{z_1}{z_2}$, *where* $z_1 = 2 + 3i$ *and* $z_2 = 1 + 2i$, *is*

(a) $\frac{8}{5} + \frac{1}{5}i$ (b) $\frac{8}{5} - \frac{1}{5}i$

(c) $\frac{1}{5} - \frac{8}{5}i$ (d) *None of these*

Interpret (b) $\because$ $z_1 = 2 + 3i$ and $z_2 = 1 + 2i$

$\therefore$ $$z_2^{-1} = \frac{1}{1+2i} = \frac{1-2i}{(1+2i)(1-2i)}$$

$$= \frac{1-2i}{1+4} = \frac{1}{5} - \frac{2}{5}i$$

Thus, $$\frac{z_1}{z_2} = z_1 \cdot z_2^{-1} = (2+3i)\left(\frac{1}{5} - \frac{2}{5}i\right)$$

$$= \left(\frac{2}{5} + \frac{6}{5}\right) + i\left(-\frac{4}{5} + \frac{3}{5}\right) = \frac{8}{5} - \frac{1}{5}i$$

Alternate Solution

Here, $x_1 = 2, y_1 = 3, x_2 = 1$ and $y_2 = 2$

$\therefore$ $$\frac{z_1}{z_2} = \frac{1}{x^2 + y^2}\{(x_1x_2 + y_1y_2) + i(x_2y_1 - x_1y_2)\}$$

$$= \frac{1}{1^2 + 2^2}\{(2 \times 1 + 3 \times 2) + i(3 \times 1 - 2 \times 2)\}$$

$$= \frac{1}{5}\{(6 + 2) + i(3 - 4)\} = \frac{8}{5} - \frac{1}{5}i$$

4.5 Conjugate of a Complex Number

Let $z = x + iy$ is a complex number, then conjugate of z is denoted by $\bar{z}$ or z' and is equal to $x - iy$.

Thus, $$\bar{z} = x - iy$$

Geometrically, the conjugate of z is the reflection of point image of z in the real axis.

e. g., If $z = 3 + 4i$, then $\bar{z} = 3 - 4i$

Note From the definition it is clear that conjugate of a complex number can be obtained by replacing i by $-i$.

Properties of Conjugate of Complex Numbers

If z, z_1 and z_2 are complex numbers, then

(i) $\overline{(\bar{z})} = z$

(ii) $z + \bar{z} = 2\,\mathrm{Re}(z)$

(iii) $z - \bar{z} = i\,[2\,\mathrm{Im}(z)]$

(iv) $z = \bar{z} \Rightarrow z$ is purely real.

(v) $z = -\bar{z} \Rightarrow z$ is purely imaginary.

(vi) $z\bar{z} = \{\mathrm{Re}(z)\}^2 + \{\mathrm{Im}(z)\}^2$

(vii) $\overline{z_1 + z_2} = \bar{z}_1 + \bar{z}_2$

(viii) $\overline{z_1 - z_2} = \bar{z}_1 - \bar{z}_2$

(ix) $\overline{z_1 z_2} = \bar{z}_1 \cdot \bar{z}_2$

(x) $\overline{\left(\dfrac{z_1}{z_2}\right)} = \dfrac{\bar{z}_1}{\bar{z}_2}, z_2 \neq 0$

(xi) $\bar{z}^n = (\bar{z})^n$

***Sample* Problem 8** *If $(x - iy)(3 + 5i)$ is the conjugate of $(-6 - 24i)$, then values of x and y are respectively* [NCERT]

(a) 3, –3 (b) 3, 4

(c) – 3, 4 (d) – 3, – 4

Interpret (a) $(x - iy)(3 + 5i) = 3x + 5xi - 3yi - 5yi^2$

$= 3x + (5x - 3y)i + 5y \quad (\because i^2 = -1)$

$= (3x + 5y) + (5x - 3y)i \quad \ldots(i)$

Given, $(x - iy) \cdot (3 + 5i) = (-6 - 24i)$

$\Rightarrow (3x + 5y) + i(5x - 3y) = -6 + 24i$

[using Eq. (i) and $z = (a + ib) \Rightarrow \bar{z} = (a - ib)$]

Comparing the real and imaginary parts on both sides, we get

$3x + 5y = -6$ and $5x - 3y = 24$

Solving the above equations by substitution or elimination method, we get $x = 3, y = -3$.

***Sample* Problem 9** *If $x + iy = (1 + i)(1 + 2i) \ldots (1 + ni)$, then the value of $x^2 + y^2$ is equal to*

(a) $2.5 \ldots (1 + n^2)$ (b) $2.4 \ldots (1 + n^2)$

(c) $2.5 \ldots (1 - n^2)$ (d) *None of these*

Interpret (a) Given, $x + iy = (1 + i)(1 + 2i) \ldots (1 + ni) \quad \ldots(i)$

$\therefore$ Conjugate of above complex number is

$x - iy = (1 - i)(1 - 2i) \ldots (1 - ni) \quad \ldots(ii)$

On multiplying Eqs. (i) and (ii), we get

$x^2 - (iy)^2 = (1^2 - i^2)[1 - (2i)^2] \ldots [1^2 - (ni)^2]$

$\Rightarrow x^2 + y^2 = (1 + 1)(1 + 4) \ldots (1 + n^2)$

$= 2 \cdot 5 \ldots (1 + n^2)$

Hot Spot 1 Modulus of a Complex Number

Let $z = x + iy$ is a complex number, then modulus of a complex number z is denoted by $|z|$.

$\therefore \quad |z| = \sqrt{x^2 + y^2} = \sqrt{\{\mathrm{Re}(z)\}^2 + \{\mathrm{Im}(z)\}^2}$

e.g., If $z = 4 + 3i$ is a complex number, then

$|z| = \sqrt{4^2 + 3^2} = \sqrt{16 + 9} = \sqrt{25} = 5$

In geometrical representation, the modulus of a complex number is equal to the distance between origin and point P. *i.e.*, $|OP| = \sqrt{x^2 + y^2}$

Properties of Modulus of Complex Numbers

(i) $|z| \geq 0 \Rightarrow |z| = 0$, iff $z = 0$ and $|z| > 0$, iff $z \neq 0$

(ii) $-|z| \leq \mathrm{Re}(z) \leq |z|$ and $-|z| \leq \mathrm{Im}(z) \leq |z|$

(iii) $|z| = |\bar{z}| = |-z| = |-\bar{z}|$

(iv) $z\bar{z} = |z|^2$

(v) $|z_1 z_2| = |z_1||z_2|$

In general, $|z_1 z_2 z_3 \ldots z_n| = |z_1|\,|z_2|\,|z_3| \ldots |z_n|$

(vi) $\left|\dfrac{z_1}{z_2}\right| = \dfrac{|z_1|}{|z_2|}, (z_2 \neq 0)$

(vii) $|z_1 \pm z_2| \leq |z_1| + |z_2|$

In general, $|z_1 \pm z_2 \pm z_3 \pm \ldots \pm z_n|$

$\leq |z_1| + |z_2| + |z_3| + \ldots + |z_n|$

(viii) $|z_1 \pm z_2| \geq ||z_1| - |z_2||$

(ix) $|z^n| = |z_2|^n$

(x) $||z_1| - |z_2|| \leq |z_1 + z_2| \leq |z_1| + |z_2|$

Thus, $|z_1| + |z_2|$ is the greatest possible value of $|z_1 + z_2|$ and $||z_1| - |z_2||$ is the least possible value of $|z_1 + z_2|$.

(xi) $|z_1 \pm z_2|^2 = (z_1 \pm z_2)(\bar{z}_1 \pm \bar{z}_2) = |z_1|^2 + |z_2|^2 \pm (z_1\bar{z}_2 + \bar{z}_1 z_2)$

$= |z_1|^2 + |z_2|^2 \pm \text{Re}(z_1\bar{z}_2)$

$= |z_1|^2 + |z_2|^2 \pm 2|z_1||z_2|\cos(\theta_1 - \theta_2)$

(xii) $z_1\bar{z}_2 + \bar{z}_1 z_2 = 2|z_1||z_2|\cos(\theta_1 - \theta_2)$

where, $\theta_1 = \arg(z_1)$ and $\theta_2 = \arg(z_2)$

(xiii) $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2 \Leftrightarrow \frac{z_1}{z_2}$ is purely imaginary.

(xiv) $|z_1 + z_2|^2 + |z_1 - z_2|^2 = 2\{|z_1|^2 + |z_2|^2\}$

(xv) $|az_1 - bz_2|^2 + |bz_1 + az_2|^2$

$= (a^2 + b^2)(|z_1|^2 + |z_2|^2)$, where $a, b \in R$

Note If z is unimodular, then $|z| = 1$. Now, if $f(z)$ is a unimodular, then it always be expressed as $f(z) = \cos\theta + i\sin\theta$, $\theta \in R$.

These types of problems are indirectly asked in the various years in AIEEE (JEE Main) 2010, 2009, 2007, 2005, 2004, 2003. *To solve such types of problems, following steps are given below*

Step I Either put $z = x + iy$ or use the step II in the given equation.

Step II Use the property of modulus.

Step III Simplify it and get the result.

***Sample* Problem 10** *Find the locus of a complex number $z = x + iy$, which satisfy the equation* $\left|\frac{z - 5i}{z + 5i}\right| = 1$.

(a) x-axis (b) y-axis

(c) origin (d) *None of these*

Interpret (a) **Step I** Put $z = x + iy$ in the given equation.

$$\therefore \quad \left|\frac{x + iy - 5i}{x + iy + 5i}\right| = 1$$

$$\Rightarrow \quad \left|\frac{x + i(y - 5)}{x + i(y + 5)}\right| = 1$$

Step II Using the property of modulus,

i.e., $\left|\frac{z_1}{z_2}\right| = \frac{|z_1|}{|z_2|} \quad \therefore \left|\frac{x + i(y - 5)}{x + i(y + 5)}\right| = 1$

Step III Simplify it

$$\therefore \quad \sqrt{x^2 + (y - 5)^2} = \sqrt{x^2 + (y + 5)^2}$$

$$\Rightarrow \quad x^2 + (y - 5)^2 = x^2 + (y + 5)^2$$

$$\Rightarrow \quad x^2 + y^2 - 10y + 25 = x^2 + y^2 + 25 + 10y$$

$$\Rightarrow \quad 20y = 0 \Rightarrow y = 0$$

Hence, it lies on x-axis.

***Sample* Problem 11** *If $x - iy = \sqrt{\frac{a - ib}{c - id}}$, then $(x^2 + y^2)^2$ is equal to* [NCERT Exemplar]

(a) $\frac{a^2 - b^2}{c^2 - d^2}$ (b) $\frac{a^2 + b^2}{c^2 + d^2}$

(c) $\frac{a^2 + b^2}{c^2 - d^2}$ (d) *None of these*

Interpret (b) Given, $x - iy = \sqrt{\frac{a - ib}{c - id}} \Rightarrow x + i(-y) = \left(\frac{a - ib}{c - id}\right)^{1/2}$

On taking modulus both sides, we get

$$|x + i(-y)| = \left|\left(\frac{a - ib}{c - id}\right)^{\frac{1}{2}}\right|$$

$$\Rightarrow \quad \sqrt{x^2 + (-y)^2} = \left|\frac{a - ib}{c - id}\right|^{\frac{1}{2}} \quad \left(\because |x + iy| = \sqrt{x^2 + y^2} \text{ and } |z^n| = |z|^n\right)$$

$$\Rightarrow \quad \sqrt{x^2 + y^2} = \left|\frac{a - ib}{c - id}\right|^{\frac{1}{2}}$$

On squaring both sides, we get

$$x^2 + y^2 = \left|\frac{a - ib}{c - id}\right|$$

$$\Rightarrow \quad x^2 + y^2 = \frac{|a - ib|}{|c - id|} \quad \left(\because \left|\frac{z_1}{z_2}\right| = \frac{|z_1|}{|z_2|}\right)$$

$$\Rightarrow \quad (x^2 + y^2) = \frac{\sqrt{a^2 + b^2}}{\sqrt{c^2 + d^2}} \quad (\because |x - iy| = \sqrt{x^2 + y^2})$$

On squaring both sides, we get

$$(x^2 + y^2)^2 = \frac{a^2 + b^2}{c^2 + d^2}$$

4.6 Argument/Amplitude of Complex Numbers

Let $z = x + iy$ be a non-zero complex number and can be represented in the form $z = r(\cos\theta + i\sin\theta)$ where, r is the modulus and θ is the argument of z. From the figure, let z be represented by a line OP inclined at an angle θ with the positive direction of x-axis or the angle measured in the counter clockwise direction and the distance of the point from O in the direction θ is r, *i.e.*, $|z|$. Then, in right angled ΔOPM, right angled at M, we have

$$\tan\theta = \frac{y}{x} \Rightarrow \theta = \tan^{-1}\left(\frac{y}{x}\right)$$

or $\arg(z) = \tan^{-1}\left(\frac{y}{x}\right)$

Principal Value of Argument

The value of θ of the argument which satisfies the inequality $-\pi < \theta \le \pi$ is called the principal value of the argument.

Principal values of the argument are $\theta, \pi - \theta, -\pi + \theta, -\theta$ according as the complex number lies on the Ist, IInd, IIIrd or IVth quadrant.

Note Argument of 0 is not defined.

Properties of Argument of Complex Numbers

If z_1, z_2 and z_3 are three complex numbers, then

(i) $\arg(z_1 z_2) = \arg(z_1) + \arg(z_2) + 2k\pi$ ($k = 0$ or 1 or – 1)

In general, $\arg(z_1 z_2 z_3 \ldots z_n) = \arg(z_1) + \arg(z_2) + \arg(z_3) + \ldots + \arg(z_n) + 2k\pi$ ($k = 0$ or 1 or – 1)

(ii) $\arg\left(\frac{z_1}{z_2}\right) = \arg(z_1) - \arg(z_2) + 2k\pi$ ($k = 0$ or 1 or – 1)

(iii) $\arg\left(\frac{z}{\bar{z}}\right) = 2\arg(z) + 2k\pi$ ($k = 0$ or 1 or – 1)

(iv) $\arg(z^n) = n\arg(z) + 2k\pi$ ($k = 0$ or 1 or – 1)

(v) If $\arg\left(\frac{z_2}{z_1}\right) = \theta$, then $\arg\left(\frac{z_1}{z_2}\right) = 2k\pi - \theta$, where $k \in I$

(vi) $\arg(\bar{z}) = -\arg(z)$

(vii) If $\arg(z) = 0 \Rightarrow z$ is real.

(viii) $\arg(z_1 \bar{z}_2) = \arg(z_1) - \arg(z_2)$

(ix) $|z_1 + z_2| = |z_1 - z_2|$

$\Rightarrow \arg(z_1) - \arg(z_2) = \frac{\pi}{2}$

(x) $|z_1 + z_2| = |z_1| + |z_2|$

$\Rightarrow \arg(z_1) = \arg(z_2)$

(xi) $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2$

$\Rightarrow \frac{z_1}{z_2}$ is purely imaginary.

(xii) If $|z_1| \le 1, |z_2| \le 1$, then

(a) $|z_1 - z_2|^2 \le (|z_1| - |z_2|)^2 + [\arg(z_1) - \arg(z_2)]^2$

(b) $|z_1 + z_2|^2 \ge (|z_1| + |z_2|)^2 - [\arg(z_1) - \arg(z_2)]^2$

***Sample* Problem 12** *Let z and w be two non-zero complex numbers such that $|z| = |w|$ and $\arg(z) + \arg(w) = \pi$. Then, z is equal to*

(a) w (b) $-w$ (c) $-\bar{w}$ (d) $\bar{w}$

Interpret (c) Let $|z| = |w| = r$ and $\arg(w) = \theta$

Also, $\arg(z) + \arg(w) = \pi$

$\Rightarrow \arg(z) = \pi - \theta$

Now, $z = r[\cos(\pi - \theta) + i\sin(\pi - \theta)]$

$= r[-\cos\theta + i\sin\theta]$

$= -r(\cos\theta - i\sin\theta)$

$= -\bar{w}$

***Sample* Problem 13** *The modulus and argument of the complex number $\frac{1+2i}{1-3i}$ is* [NCERT]

(a) $\frac{1}{\sqrt{2}}, \frac{3\pi}{4}$ (b) $\frac{1}{\sqrt{2}}, -\frac{3\pi}{4}$

(c) $\frac{1}{2}, \frac{3\pi}{4}$ (d) *None of these*

Interpret (a) Let $z = \frac{1+2i}{1-3i}$

$\therefore \quad z = \frac{1+2i}{1-3i} \times \frac{1+3i}{1+3i} = \frac{1+3i+2i+6i^2}{1^2-(3i)^2}$

$[\because (a+b)(a-b) = a^2 - b^2]$

$= \frac{1+5i+6(-1)}{1-9i^2}$ $(\because i^2 = -1)$

$= \frac{1+5i-6}{1+9} = \frac{-5+5i}{10} = \frac{-1+i}{2}$

$\Rightarrow \quad z = -\frac{1}{2} + \frac{1}{2}i$

$\therefore \quad |z| = \sqrt{\left(-\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^2}$ $(\because |a+ib| = \sqrt{a^2+b^2})$

$= \sqrt{\frac{1}{4} + \frac{1}{4}} = \sqrt{\frac{2}{4}} = \sqrt{\frac{1}{2}} = \frac{1}{\sqrt{2}}$

$\therefore$ Now, $\tan\theta = \left|\frac{\frac{1}{2}}{-\frac{1}{2}}\right|$ $\left[\because \theta = \tan^{-1}\left|\left(\frac{\text{Im}(z)}{\text{Re}(z)}\right)\right|\right]$

$\Rightarrow \quad \tan\theta = 1 = \tan\frac{\pi}{4}$

$\Rightarrow \quad \theta = \frac{\pi}{4}$

Since, the real part of z is negative and imaginary part of z is positive, so the point lies in IInd quadrant.

$\therefore \quad \arg(z) = \pi - \theta = \pi - \frac{\pi}{4} = \frac{3\pi}{4}$

Hence, modulus $= \frac{1}{\sqrt{2}}$ and $\arg(z) = \frac{3\pi}{4}$

4.7 Triangle Inequality

In any triangle, sum of any two sides is greater than the third side and difference of any two sides is less than the third side.

(i) $|z_1 \pm z_2| \le |z_1| + |z_2|$

(ii) $|z_1 \pm z_2| \ge \big||z_1| - |z_2|\big|$

(iii) In general, $|z_1 + z_2 + \ldots + z_n| \le |z_1| + |z_2| + |z_3| + \ldots + |z_n|$

Sample **Problem 14** *For any complex number z the minimum value of* $|z| + |z - 2|$ *is*

(a) 4 (b) 2
(c) 1 (d) 3

Interpret (b) $\therefore$ $|z| + |z - 2| = |z| + |2 - z|$

$\ge |z + (2 - z)|$ $(\because |z_1 + z_2| \le |z_1| + |z_2|)$

$\Rightarrow$ $|z| + |z - 2| \ge 2$

Check Point 1

1. If n is a positive integer, then $\left(\frac{1+i}{1-i}\right)^{4n+1}$ is equal to
(a) 1 (b) -1 (c) i (d) $-i$

2. $a + ib > c + id$ can be explained only when
(a) $b = 0, c = 0$ (b) $b = 0, d = 0$
(c) $a = 0, c = 0$ (d) $a = 0, d = 0$

3. Let z_1 and z_2 be two complex numbers such that $z_1 + z_2$ and $z_1 z_2$ both are real, then
(a) $z_1 = -z_2$ (b) $z_1 = \overline{z_2}$
(c) $z_1 = -\overline{z_2}$ (d) None of these

4. The conjugate of complex number $\frac{2-3i}{4-i}$ is
(a) $\frac{3i}{4}$ (b) $\frac{11+10i}{17}$
(c) $\frac{11-10i}{17}$ (d) $\frac{2+3i}{4i}$

5. If $\frac{z-i}{z+i}(z \ne -i)$ is purely imaginary number, then $z\bar{z}$ is equal to
(a) 0 (b) 1
(c) 2 (d) None of these

6. If $\frac{2z_1}{3z_2}$ is purely imaginary number, then $\left|\frac{z_1 - z_2}{z_1 + z_2}\right|$ is equal to
(a) $\frac{3}{2}$ (b) 1 (c) $\frac{2}{3}$ (d) $\frac{4}{9}$

7. If $z = \frac{1 - i\sqrt{3}}{1 + i\sqrt{3}}$, then arg (z) is equal to
(a) $\frac{\pi}{3}$ (b) $\frac{2\pi}{3}$
(c) $-\frac{2\pi}{3}$ (d) None of these

8. If $(\sqrt{8} + i)^{50} = 3^{49}(a + ib)$, then $a^2 + b^2$ is equal to
(a) 3 (b) 8 (c) 9 (d) $\sqrt{8}$

9. If arg $z < 0$, then arg $(-z)$ – arg (z) is equal to
(a) π (b) $-\pi$
(c) $-\frac{\pi}{2}$ (d) $\frac{\pi}{2}$

10. For any complex number z, the minimum value of $|z| + |z - 2i|$ is equal to
(a) 0 (b) 1
(c) 2 (d) None of these

4.8 Square Root of a Complex Number

Let $a + ib$ is a complex number such that $\sqrt{a + ib} = x + iy$, where x and y are real numbers.

Now, $\sqrt{a + ib} = x + iy \Rightarrow (x + iy)^2 = a + ib$

$\Rightarrow$ $(x^2 - y^2) + 2ixy = a + ib$

$\Rightarrow$ $x^2 - y^2 = a$ ...(i)

and $2xy = b$ ...(ii)

Now, $(x^2 + y^2)^2 = (x^2 - y^2)^2 + 4x^2y^2$

$\Rightarrow$ $(x^2 + y^2)^2 = a^2 + b^2$

$\Rightarrow$ $(x^2 + y^2) = \sqrt{a^2 + b^2}$ ...(iii)

$(\because x^2 + y^2 > 0)$

On solving Eqs. (i) and (iii), we get

$$x^2 = \left(\frac{1}{2}\right)(\sqrt{a^2 + b^2} + a)$$

and
$$y^2 = \left(\frac{1}{2}\right)(\sqrt{a^2 + b^2} - a)$$

$\Rightarrow$
$$x = \pm\sqrt{\left(\frac{1}{2}\right)[\sqrt{a^2 + b^2} + a]}$$

and
$$y = \pm\sqrt{\left(\frac{1}{2}\right)[\sqrt{a^2 + b^2} - a]}$$

If b is positive, then the sign of x and y from Eq. (ii) will be same *i.e.*,

$$\sqrt{a + ib} = \pm\left[\sqrt{\left(\frac{1}{2}\right)(\sqrt{a^2 + b^2} + a)} + i\sqrt{\left(\frac{1}{2}\right)(\sqrt{a^2 + b^2} - a)}\right]$$

If b is negative, then the sign of x and y will be opposite,

i.e.,

$$\sqrt{a+ib} = \pm\left[\sqrt{\left(\frac{1}{2}\right)\left(\sqrt{a^2+b^2}+a\right)} - i\sqrt{\left(\frac{1}{2}\right)\left(\sqrt{a^2+b^2}-a\right)}\right]$$

Note If $x, y \in R$, then

- $\sqrt{x+iy} + \sqrt{x-iy} = \sqrt{2\left(\sqrt{x^2+y^2}+x\right)}$
- $\sqrt{x+iy} - \sqrt{x-iy} = i\sqrt{2\left(\sqrt{x^2+y^2}-x\right)}$

***Sample* Problem 15** *The value of*

$$(4+3\sqrt{-20})^{1/2} + (4-3\sqrt{-20})^{1/2} \text{ is}$$

(a) ± 6 (b) 0
(c) $\pm\sqrt{5}$ (d) ± 3

Interpret (a) We may write,

$$(4+3\sqrt{-20}) = (4+6i\sqrt{5})$$

Let $(4+3\sqrt{-20})^{1/2} = (x+iy)$

Then, $(4+6i\sqrt{5})^{1/2} = (x+iy)$

$\Rightarrow$ $4+6i\sqrt{5} = (x^2-y^2)+(2xy)i$

$\Rightarrow$ $x^2-y^2 = 4$ and $2xy = 6\sqrt{5}$

$\therefore$ $x^2+y^2 = \sqrt{(x^2-y^2)^2+4x^2y^2}$

$= \sqrt{(16+180)} = \sqrt{196} = 14$

On solving the equations $x^2+y^2 = 14$ and $x^2-y^2 = 4$, we get

$$x^2 = 9 \text{ and } y^2 = 5$$

$\therefore$ $x = \pm 3$ and $y = \pm\sqrt{5}$

Since, $xy > 0$, it follows that x and y are of the same sign.

$\therefore$ $x = 3, y = \sqrt{5}$ or $x = -3, y = -\sqrt{5}$

So, $(4+3\sqrt{-20})^{1/2} = (4+6i\sqrt{5})^{1/2}$

$= \pm(3+\sqrt{5}\,i)$ ...(i)

$\therefore$ $(4-3\sqrt{-20})^{1/2} = \pm(3-\sqrt{5}\,i)$ ...(ii)

Hence, $(4+3\sqrt{-20})^{1/2} + (4-3\sqrt{-20})^{1/2} = \pm 6$

[on adding Eqs. (i) and (ii)]

Alternate Solution Here, $x = 4, y = 6\sqrt{5}$

$\therefore$ $(4+3\sqrt{-20})^{1/2} + (4-3\sqrt{-20})^{1/2}$

$= \sqrt{2\{\sqrt{4^2+(6\sqrt{5})^2}+4\}} = \sqrt{2(\sqrt{16+180}+4)}$

$= \sqrt{2(14+4)} = \sqrt{36} = \pm 6$

4.9 Concept of Rotation

Let z_1, z_2 and z_3 be the vertices of a ΔABC described in anti-clockwise sense. Draw OP and OQ parallel and equal to AB and AC, respectively. Then, point P is $z_2 - z_1$ and Q is $z_3 - z_1$. If OP is rotated through $\angle\alpha$ in anti-clockwise sense it coincides with OQ.

Then, $\dfrac{z_3-z_1}{z_2-z_1} = \dfrac{OQ}{OP}(\cos\alpha + i\sin\alpha) = \dfrac{CA}{BA}e^{i\alpha} = \dfrac{|z_3-z_1|}{|z_2-z_1|}e^{i\alpha}$

$\left(\because \Delta OPQ \text{ and } \Delta ABC \text{ are congruent}, \therefore \dfrac{OQ}{OP} = \dfrac{CA}{BA}\right)$

or $\text{amp}\left(\dfrac{z_3-z_1}{z_2-z_1}\right) = \alpha$

***Sample* Problem 16** *The point represented by the complex number $2-i$ is rotated about origin through an angle $\frac{\pi}{2}$ in the clockwise direction, the new position of point is*

[NCERT Exemplar]

(a) $1+2i$ (b) $-1-2i$ (c) $2+i$ (d) $-1+2i$

Interpret (b) Here, $z = 2-i$

Let z_1 be the required complex number.

$\therefore$ $|z_1| = |z| = \sqrt{2^2+1^2} = \sqrt{5}$

$\because$ $\dfrac{z_1}{z} = \dfrac{|z_1|}{|z|}e^{-i\frac{\pi}{2}}$

$\therefore$ $z_1 = \dfrac{(2-i)\sqrt{5}}{\sqrt{5}}\left[\cos\left(-\dfrac{\pi}{2}\right) + i\sin\left(-\dfrac{\pi}{2}\right)\right]$

$= (2-i)\left(\cos\dfrac{\pi}{2} - i\sin\dfrac{\pi}{2}\right) = (2-i)(0-i)$

$= -(2i-i^2) = -2i-1$

4.10 De-Moivre's Theorem

A simple formula for calculating powers of complex numbers in the form of $\cos\theta$ and $\sin\theta$ is known as de-Moivre's theorem. If n is a rational number, then

$$(\cos\theta + i\sin\theta)^n = \cos n\theta + i\sin n\theta$$

Applications of De-Moivre's Theorem

(i) If $z = (\cos\theta_1 + i\sin\theta_1)(\cos\theta_2 + i\sin\theta_2)\ldots(\cos\theta_n + i\sin\theta_n)$

Then, $z = \cos(\theta_1+\theta_2+\ldots+\theta_n) + i\sin(\theta_1+\theta_2+\ldots+\theta_n)$

(ii) If $z = r(\cos\theta + i\sin\theta)$ and n is a positive integer, then

$$(z)^{1/n} = r^{1/n}\left[\cos\left(\frac{2k\pi+\theta}{n}\right) + i\sin\left(\frac{2k\pi+\theta}{n}\right)\right]$$

where, $k = 0, 1, 2, 3, \ldots, (n-1)$

(iii) $(\cos\theta - i\sin\theta)^n = \cos n\theta - i\sin n\theta$

(iv) $\dfrac{1}{\cos\theta + i\sin\theta} = (\cos\theta + i\sin\theta)^{-1} = \cos\theta - i\sin\theta$

(v) $(\sin\theta \pm i\cos\theta)^n \neq \sin n\theta \pm i\cos n\theta$

(vi) $(\sin\theta + i\cos\theta)^n = \left[\cos\left(\dfrac{\pi}{2} - \theta\right) + i\sin\left(\dfrac{\pi}{2} - \theta\right)\right]^n$

$$= \left[\cos\left(\frac{n\pi}{2} - n\theta\right)\right] + i\left[\sin\left(\frac{n\pi}{2} - n\theta\right)\right]$$

(vii) $(\cos\theta + i\sin\phi)^n \neq \cos n\theta \pm i\sin n\phi$

Note

- $1 = \cos 0 + i\sin 0$
- $-1 = \cos\pi + i\sin\pi$
- $i = \cos\dfrac{\pi}{2} + i\sin\dfrac{\pi}{2}$
- $-i = \cos\dfrac{\pi}{2} - i\sin\dfrac{\pi}{2}$

***Sample* Problem 17** *If $a = \cos\theta + i\sin\theta$, then the value of $\dfrac{1+a}{1-a}$ is* **[NCERT]**

(a) $i\tan\dfrac{\theta}{2}$ (b) $i\cot\dfrac{\theta}{2}$

(c) $\cot\dfrac{\theta}{2}$ (d) *None of these*

Interpret (b) $a = \cos\theta + i\sin\theta$

$$\therefore \quad \frac{1+a}{1-a} = \frac{1+\cos\theta + i\sin\theta}{1-(\cos\theta + i\sin\theta)}$$

(applying componendo and dividendo)

$$= \frac{\left(2\cos^2\dfrac{\theta}{2}\right) + i\left(2\sin\dfrac{\theta}{2}\cos\dfrac{\theta}{2}\right)}{(1-\cos\theta) - i\sin\theta} \quad \left(\because 1+\cos\theta = 2\cos^2\frac{\theta}{2}\right)$$

$$= \frac{2\cos^2\dfrac{\theta}{2} + 2i\sin\dfrac{\theta}{2}\cos\dfrac{\theta}{2}}{2\sin^2\dfrac{\theta}{2} - 2i\sin\dfrac{\theta}{2}\cos\dfrac{\theta}{2}} \quad \left(\because 1-\sin\theta = 2\sin^2\frac{\theta}{2}\right)$$

On multiplying by i in numerator and denominator,

$$= \frac{2\cos\dfrac{\theta}{2}\left(\cos\dfrac{\theta}{2} + i\sin\dfrac{\theta}{2}\right)}{2\sin\dfrac{\theta}{2}\left(\sin\dfrac{\theta}{2} - i\cos\dfrac{\theta}{2}\right)} = \frac{i\cot\dfrac{\theta}{2}\left(\cos\dfrac{\theta}{2} + i\sin\dfrac{\theta}{2}\right)}{\left(i\sin\dfrac{\theta}{2} - i^2\cos\dfrac{\theta}{2}\right)}$$

$$= \frac{i\cot\dfrac{\theta}{2}\left(\cos\dfrac{\theta}{2} + i\sin\dfrac{\theta}{2}\right)}{\left(\cos\dfrac{\theta}{2} + i\sin\dfrac{\theta}{2}\right)} = i\cot\frac{\theta}{2}$$

***Sample* Problem 18** *If $x_r = \cos\left(\dfrac{\pi}{2^r}\right) + i\sin\left(\dfrac{\pi}{2^r}\right)$, then the value of $x_1x_2x_3\ldots\infty$ is*

(a) -1 (b) 1

(c) 0 (d) *None of these*

Interpret (a) $\because \quad x_r = \cos\left(\dfrac{\pi}{2^r}\right) + i\sin\left(\dfrac{\pi}{2^r}\right)$

$$\therefore \quad x_1 = \cos\frac{\pi}{2} + i\sin\frac{\pi}{2}$$

$$x_2 = \cos\frac{\pi}{2^2} + i\sin\frac{\pi}{2^2}$$

$$\ldots \quad \ldots \quad \ldots \quad \ldots$$

$$\ldots \quad \ldots \quad \ldots \quad \ldots$$

$$\therefore \; x_1 x_2 x_3 \ldots = \left(\cos\frac{\pi}{2} + i\sin\frac{\pi}{2}\right)\left(\cos\frac{\pi}{2^2} + i\sin\frac{\pi}{2^2}\right)\ldots$$

$$= \cos\left(\frac{\pi}{2} + \frac{\pi}{2^2} + \ldots\right) + i\sin\left(\frac{\pi}{2} + \frac{\pi}{2^2} + \ldots\right)$$

$$= \cos\left(\frac{\frac{\pi}{2}}{1-\frac{1}{2}}\right) + i\sin\left(\frac{\frac{\pi}{2}}{1-\frac{1}{2}}\right) = \cos\pi + i\sin\pi = -1$$

Hot Spot 2

Cube Roots of Unity

Let $\quad x = \sqrt[3]{1} \Rightarrow x^3 - 1 = 0$

$\Rightarrow \quad (x-1)(x^2 + x + 1) = 0$

Therefore, $\quad x = 1, \dfrac{-1+i\sqrt{3}}{2}, \dfrac{-1-i\sqrt{3}}{2}$

If second root be represented by ω, then third root will be ω^2.

$\therefore$ Cube roots of unity are $1, \omega, \omega^2$; 1 is a real root of unity and other two *i.e.*, ω and ω^2 are conjugate complex of each other.

Properties of Cube Roots of Unity

(i) $\omega^3 = 1$ or $\omega^{3r} = 1$

(ii) $\omega^{3r+1} = \omega, \; \omega^{3r+2} = \omega^2$

(iii) $1 + \omega^r + \omega^{2r} = 0$, if r is not a multiple of 3

$= 3$, if r is multiple of 3

(iv) Each complex cube root of unity is square of other and also reciprocal of each other.

(v) If a is any positive number, then $a^{1/3}$ has roots $a^{1/3}(1)$, $a^{1/3}(\omega)$, $a^{1/3}(\omega^2)$ and if a is any negative number, then $a^{1/3}$ has roots $-|a|^{1/3}, -|a|^{1/3}\omega, -|a|^{1/3}\omega^2$.

(vi) The cube roots of unity when represented on complex plane lie on vertices of an equilateral triangle inscribed in a unit circle having centre at origin. One vertex being on positive real axis.

Important Relations

(i) $x^2 + xy + y^2 = (x - y\omega)(x - y\omega^2)$

(ii) $x^2 - xy + y^2 = (x + y\omega)(x + y\omega^2)$

(iii) $x^3 + y^3 = (x + y)(x + y\omega)(x + y\omega^2)$

(iv) $x^3 - y^3 = (x - y)(x - y\omega)(x - y\omega^2)$

These types of problems are directly or indirectly asked in various years in AIEEE (JEE Main) 2011, 2006, 2005, 2002. *The level of the question is on average. To solve such types of problems, following steps are given below*

Step I Firstly, if the roots of unity are not given, then we determine all the roots. In among them, some are real and some are complex roots.

Step II Use the property of cube roots of unity.

Step III Simplify it and get the result.

Sample **Problem 19** *If $z^2 + z + 1 = 0$, where z is a complex number, then find the value of*

$$\left(z + \frac{1}{z}\right)^2 + \left(z^2 + \frac{1}{z^2}\right)^2 + \left(z^3 + \frac{1}{z^3}\right)^2 + \ldots \left(z^6 + \frac{1}{z^6}\right)^2$$

(a) 5 (b) 12 (c) –12 (d) 5

Interpret (b) **Step I** Find all roots of given equation

$\therefore \quad z^2 + z + 1 = 0$

$$z = \frac{-1 \pm \sqrt{1^2 - 4(1)}}{2(1)} = \frac{-1 \pm \sqrt{3}i}{2}$$

$\Rightarrow \quad z = \omega, \omega^2$, where $\omega = \dfrac{-1 + \sqrt{3}i}{2}$

and $\quad \omega^2 = \dfrac{-1 - \sqrt{3}i}{2}$

$$\therefore \quad \left(z + \frac{1}{z}\right)^2 + \left(z^2 + \frac{1}{z^2}\right)^2 + \left(z^3 + \frac{1}{z^3}\right)^2 + \left(z^4 + \frac{1}{z^4}\right)^2 + \left(z^5 + \frac{1}{z^5}\right)^2 + \left(z^6 + \frac{1}{z^6}\right)^2$$

Put $z = \omega$, we get

$$\left(\omega + \frac{1}{\omega}\right)^2 + \left(\omega^2 + \frac{1}{\omega^2}\right)^2 + \left(\omega^3 + \frac{1}{\omega^3}\right)^2 + \left(\omega^4 + \frac{1}{\omega^4}\right)^2 + \left(\omega^5 + \frac{1}{\omega^5}\right)^2 + \left(\omega^6 + \frac{1}{\omega^6}\right)^2$$

$$= (\omega + \omega^2)^2 + (\omega^2 + \omega)^2 + (1 + 1)^2 + (\omega + \omega^2)^2 + (\omega^2 + \omega)^2 + (1 + 1)^2$$

$$= (-1)^2 + (-1)^2 + 4 + (-1)^2 + (-1)^2 + 4 \quad (\because 1 + \omega + \omega^2 = 0)$$

$$= 1 + 1 + 4 + 1 + 1 + 4 = 12$$

Similarly, for putting $z = \omega^2$, we get the result 12.

Sample **Problem 20** *If 1, ω and ω^2 be the cube roots of unity. Then, the value of $(1 - \omega + \omega^2)(1 - \omega^2 + \omega^4)(1 - \omega^4 + \omega^8)$ … upto $2n$ factors is*

(a) 2^{2n-1} (b) 2^{2n} (c) 2^{n-1} (d) 2^{2n+1}

Interpret (b) $(1 - \omega + \omega^2)(1 - \omega^2 + \omega^4)(1 - \omega^4 + \omega^8)$ … upto $2n$ factors.

$= (1 - \omega + \omega^2)(1 - \omega^2 + \omega^3 \cdot \omega)(1 - \omega^3 \cdot \omega + \omega^6 \cdot \omega^2)$ … upto $2n$ factors

$= (1 - \omega + \omega^2)(1 - \omega^2 + \omega)(1 - \omega + \omega^2)$ … upto $2n$ factors

$= (-2\omega)(-2\omega^2)(-2\omega)(-2\omega^2)$ … upto $2n$ factors

$= [(-2\omega)(-2\omega^2)] \times [(-2\omega)(-2\omega^2)] \times \ldots$ upto $2n$ factors

$= (2^2\omega^3) \times (2^2\omega^3) \times \ldots$ to n factors

$= (2^2 \times 2^2 \times 2^2 \times \ldots$ to n factors$) = 2^{2n}$

4.11 nth Roots of Unity

Let $z = 1^{1/n}$, then $z = (\cos 0° + i \sin 0°)^{1/n}$

$\Rightarrow \quad z = (\cos 2r\pi + i \sin 2r\pi)^{1/n}, r \in I$

$\Rightarrow \quad z = \cos\dfrac{2r\pi}{n} + i \sin\dfrac{2r\pi}{n}, r = 0, 1, 2, \ldots, (n - 1)$

(using De-Moivre's theorem)

$\Rightarrow \quad z = [e^{\frac{i2\pi}{n}}]^r, r = 0, 1, 2, \ldots, (n - 1)$

$\Rightarrow \quad z = \alpha^r, \alpha = e^{\frac{i2\pi}{n}} = \cos\dfrac{2\pi}{n} + i \sin\dfrac{2\pi}{n}, r = 0, 1, 2, \ldots, (n - 1)$

Thus, nth roots of unity are $1, \alpha, \alpha^2, \ldots, \alpha^{n-1}$, where

$$\alpha = e^{\frac{i2\pi}{n}} = \cos\frac{2\pi}{n} + i \sin\frac{2\pi}{n}.$$

Also, $\quad 1 + \alpha + \alpha^2 + \ldots + \alpha^{n-1} = 0$

$$\sum_{k=0}^{n-1} \alpha^k = 0 \Rightarrow \sum_{k=0}^{n-1} \cos\frac{2\pi k}{n} + i \sum_{k=0}^{n-1} \sin\frac{2\pi k}{n} = 0$$

Properties of nth Roots of Unity

(i) nth roots of unity form a GP with common ratio $e^{\frac{i2\pi}{n}}$.

(ii) Sum of nth roots of unity is always zero.

(iii) Product of nth roots of unity is $(-1)^{n-1}$.

(iv) nth roots of unity are the vertices of the regular polygon of n sides inscribed in a circle of radius unity centred at origin. One vertex being on the positive real axis.

If we put $n=3$ in $X^n=1$, $X^3=1$ Roots are $I_1\ \omega_1\ \omega_2$

Epuilitral

$n=4$
$X^4=1$ Roots are $I_1\ i_1 - i, -i$

Square

$n=5$ Root are $1, \alpha, \alpha^2, \alpha^3, \alpha^4$

Pentegon

***Sample* Problem 21** *If* $1, a_1, a_2 \ldots, a_{n-1}$ *are the nth roots of unity, then the value of* $(1-a_1)(1-a_2)\ldots(1-a_{n-1})$ *is equal to*

(a) $\sqrt{3}$ (b) $\frac{1}{2}$

(c) n (d) 0

Interpret (c) Since, $1, a_1, a_2, \ldots, a_{n-1}$ are the nth roots of unity.

$$\therefore \quad x^n - 1 = (x-1)(x-a_1)\ldots(x-a_{n-1})$$

$$\Rightarrow \quad \frac{x^n-1}{x-1} = (x-a_1)(x-a_2)\ldots(x-a_{n-1})$$

$$\therefore \quad x^{n-1} + x^{n-2} + \ldots + x^2 + x + 1$$
$$= (x-a_1)(x-a_2)\ldots(x-a_{n-1})$$

Put $x=1$, we get

$$(1-a_1)(1-a_2)\ldots(1-a_{n-1}) = 1+1+\ldots+n \text{ times}$$
$$= n$$

Check Point **2**

1. The square root of $(-15-8i)$ is
(a) $\pm(1-4i)$ (b) $\pm(1+4i)$
(c) $\pm(-2+4i)$ (d) None of these

2. The common roots of the equations
$x^{12}-1=0$ and $x^4+x^2+1=0$ are
(a) $\pm\omega$ (b) $\pm\omega^2$
(c) $\pm\omega, \pm\omega^2$ (d) None of these

3. If α and β are imaginary cube roots of unity, then the value of $\alpha^4+\beta^{28}+\frac{1}{\alpha\beta}$ is
(a) 1 (b) -1
(c) 0 (d) None of these

4. $\dfrac{\left(\sin\frac{\pi}{8}+i\cos\frac{\pi}{8}\right)^8}{\left(\sin\frac{\pi}{8}-i\cos\frac{\pi}{8}\right)^8}$ is equal to
(a) -1 (b) 0
(c) 1 (d) $2i$

5. If $x+\frac{1}{x}=2\cos\frac{\pi}{10}$, then $x^5+\frac{1}{x^5}$ is equal to
(a) 0 (b) 32
(c) 10 (d) 2

6. One root of the equation $z^2-az+a-1=0$, is $(1+i)$, where a is a complex number, then other root is
(a) 1 (b) $1+i$
(c) $1-i$ (d) None of these

7. If $iz^4+1=0$, then z can take the value
(a) $\frac{1+i}{\sqrt{2}}$ (b) $\cos\frac{\pi}{8}+i\sin\frac{\pi}{8}$
(c) $\frac{1}{4i}$ (d) i

8. The value of the expression
$1(2-\omega)(2-\omega^2)+2(3-\omega)(3-\omega^2)+\ldots+(n-1)(n-\omega)(n-\omega^2)$,
where ω is an imaginary cube root of unity is
(a) $\left[\frac{n(n+1)}{2}\right]^2$ (b) $\left[\frac{n(n+1)}{2}\right]^2-n$
(c) $\left[\frac{n(n+1)}{2}\right]^2+n$ (d) None of these

9. The value of the expression
$$\frac{(\cos 2\theta - i\sin 2\theta)^4(\cos 4\theta + i\sin 4\theta)^{-5}}{(\cos 3\theta + i\sin 3\theta)^{-2}(\cos 3\theta - i\sin 3\theta)^{-9}} \text{ is}$$
(a) $\cos 49\theta + i\sin 49\theta$ (b) $\cos 49\theta - i\sin 49\theta$
(c) $-\cos 49\theta + i\sin 49\theta$ (d) None of these

4.12 Application of Complex Numbers in Coordinate Geometry

(i) Distance between Two Points

Distance between two points $P(z_1)$ and $Q(z_2)$ is

$$PQ = |z_2 - z_1|$$

(ii) Section Formula

Let $R(z)$ divides a join of $P(z_1)$ and $Q(z_2)$ in the ratio $m : n$.

(a) If $R(z)$ divides the line segment PQ internally, then

$$z = \frac{mz_2 + nz_1}{m + n}$$

(b) If $R(z)$ divides the line segment PQ externally, then

$$z = \frac{mz_2 - nz_1}{m - n}$$

Note

- Distance of a point $P(z)$ from the origin $= |z|$.
- If $R(z)$ is a mid-point of PQ, then $z = \dfrac{z_1 + z_2}{2}$.

- Three points will be collinear, if for $A(z_1)$, $B(z_2)$, $C(z_3)$,

$$AB + BC = AC$$

i.e., $\quad |z_1 - z_2| + |z_2 - z_3| = |z_1 - z_3|$

(iii) Equation of Perpendicular Bisector

If $P(z_1)$ and $Q(z_2)$ are two fixed points and $R(z)$ is an equidistant point from P and Q. Then,

$$|z - z_1| = |z - z_2|$$

$$\Rightarrow \quad |z - z_1|^2 = |z - z_2|^2$$

$$\Rightarrow (z - z_1)(\bar{z} - \bar{z}_1) = (z - z_2)(\bar{z} - \bar{z}_2)$$

$$\Rightarrow z(\bar{z}_1 - \bar{z}_2) + \bar{z}(z_1 - z_2) = |z_1|^2 - |z_2|^2$$

Hence, $R(z)$ lies on perpendicular bisector of $P(z_1)$ and $Q(z_2)$.

(iv) Equation of Straight Line

(a) **Parametric form** Equation of line joining points $P(z_1)$ and $Q(z_2)$ is $z = tz_1 + (1 - t)z_2$, where $t \in R$.

(b) **Non-parametric form** Equation of line joining points $P(z_1)$ and $Q(z_2)$ is

$$\begin{vmatrix} z & \bar{z} & 1 \\ z_1 & \bar{z}_1 & 1 \\ z_2 & \bar{z}_2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow \quad z(\bar{z}_1 - \bar{z}_2) - \bar{z}(z_1 - z_2) + z_1\bar{z}_2 - z_2\bar{z}_1 = 0$$

(c) **General equation** General equation of straight line is $\bar{a}z + a\bar{z} + b = 0$, where a is a complex number and b is a real number.

Note

- Three points z_1, z_2 and z_3 will be collinear, if $\begin{vmatrix} z_1 & \bar{z}_1 & 1 \\ z_2 & \bar{z}_2 & 1 \\ z_3 & \bar{z}_3 & 1 \end{vmatrix} = 0$
- Slope of line $\bar{a}z + a\bar{z} + b = 0$ is $-\dfrac{a}{\bar{a}}$.
- If α_1 and α_2 are slopes of two lines in a complex plane, then
  (a) lines will be parallel, if $\alpha_1 = \alpha_2$.
  (b) lines will be perpendicular, if $\alpha_1 + \alpha_2 = 0$.
- Slope of a line PQ joining two points $P(z_1)$ and $Q(z_2) = \dfrac{z_1 - z_2}{\bar{z}_1 - \bar{z}_2}$.
- Length of perpendicular from a point $P(z_1)$ to the line $\bar{a}z + a\bar{z} + b = 0 = \dfrac{|a\bar{z}_1 + \bar{a}z_1 + b|}{|a| + |\bar{a}|} = \dfrac{|a\bar{z}_1 + \bar{a}z_1 + b|}{2|\bar{a}|}$

Some Important Results

(i) The coordinates of centroid of a ΔABC whose vertex are $A(z_1)$, $B(z_2)$ and $C(z_3)$, is $G(z) = \dfrac{z_1 + z_2 + z_3}{3}$

(ii) The triangle whose vertices are z_1, z_2 and z_3 is equilateral iff

$$\frac{1}{z_1 - z_2} + \frac{1}{z_2 - z_3} + \frac{1}{z_3 - z_1} = 0$$

or $\quad z_1^2 + z_2^2 + z_3^2 = z_1z_2 + z_2z_3 + z_3z_1$

(iii) If $\arg\left[\dfrac{(z_2 - z_3)(z_1 - z_4)}{(z_1 - z_3)(z_2 - z_4)}\right] = \pm\pi$, 0 (or purely real), then the points z_1, z_2, z_3 and z_4 are concyclic.

(iv) $\arg\left(\dfrac{z - z_1}{z - z_2}\right) = 0 \Rightarrow$ Locus of z is a straight line passing through z_1 and z_2.

4.13 Equation of a Circle

A circle is the locus of all those points which are equidistant from the given fixed point. This fixed point is called the centre and the fixed distance is called radius.

(i) Equation of a circle whose radius is r and centre is $C(z_0)$, is $|z - z_0| = r$.

If the centre of circle lies on the origin, then equation of circle is $|z| = r$.

(ii) The general equation of a circle is $z\bar{z} + a\bar{z} + \bar{a}z + b = 0$, where $a \in C$ and $b \in R$. Centre of circle is at $-a$ and radius is $\sqrt{|a|^2 - b}$.

(iii) If $P(z_1)$ and $Q(z_2)$ are the vertices of diameter of a circle, then equation of circle is

$$(z - z_1)(\bar{z} - \bar{z}_2) + (z - z_2)(\bar{z} - \bar{z}_1) = 0$$

Nature of Circle

The general equation of circle $z\bar{z} + a\bar{z} + \bar{a}z + b = 0$ represents a

(a) real circle, if $|a|^2 > b$

(b) point circle, if $|a|^2 = b$

(c) an imaginary circle, if $|a|^2 < b$

Position of a Point with Respect to Circle

Let the general equation of circle is $z\bar{z} + a\bar{z} + \bar{a}z + b = 0$ whose centre z_0 and radius a. There are following position with respect to circle are given below.

(a) If the point (z_0) lies inside the circle, then $|z - z_0| < a$.

(b) If the point (z_0) lies on the circle, then $|z - z_0| = a$.

(c) If the point (z_0) lies outside the circle, then $|z - z_0| > a$.

***Sample* Problem 22** *If* $\left|\frac{z-2}{z-3}\right| = 2$ *represents a circle, then centre and radius are* **[NCERT Exemplar]**

(a) $\left(\frac{10}{3}, 0\right), \frac{2}{3}$ (b) $\left(\frac{-10}{3}, 0\right), \frac{2}{3}$

(c) $\left(\frac{10}{3}, 1\right), \frac{2}{3}$ (d) *None of these*

Interpret (a) Let $z = x + iy$

$\therefore$ Given equation becomes, $\left|\frac{x+iy-2}{x+iy-3}\right| = 2$

$$\Rightarrow \quad |(x-2) + iy| = 2\,|(x-3) + iy|$$

$$\Rightarrow \quad \sqrt{(x-2)^2 + y^2} = 2\sqrt{(x-3)^2 + y^2}$$

$$\Rightarrow \quad (x-2)^2 + y^2 = 4[(x-3)^2 + y^2]$$

$$\Rightarrow \quad x^2 + 4 - 4x + y^2 = 4(x^2 + 9 - 6x + y^2)$$

$$\Rightarrow \quad 3x^2 + 3y^2 - 20x + 32 = 0$$

$$\Rightarrow \quad x^2 + y^2 - \frac{20}{3}x + \frac{32}{3} = 0$$

Standard equation of circle is $x^2 + y^2 + 2gx + 2fy + c = 0$.

$$\therefore \quad g = \frac{-10}{3}, f = 0, c = \frac{32}{3}$$

$\therefore$ Certre of circle $= (-g, -f) = \left(\frac{10}{3}, 0\right)$

$$\therefore \quad \text{Radius} = \sqrt{g^2 + f^2 - c} = \sqrt{\left(\frac{10}{3}\right)^2 + (0)^2 - \frac{32}{3}} = \sqrt{\frac{100}{9} - \frac{32}{3}}$$

$$= \sqrt{\frac{100 - 96}{9}} = \sqrt{\frac{4}{9}} = \frac{2}{3}$$

***Sample* Problem 23** *If z lies on the circle* $|z - 1| = 1$, *then* $\frac{z-2}{z}$ *is equal to*

(a) 0 (b) 2

(c) −1 (d) −2

Interpret (d) Since, $|z - 1| = 1$ represents a circle whose diameter is a line segment joining the points $z = 0$ and $z = 2$. If z lies on a circle, then $\frac{z-2}{z-0}$ *i.e.*, $\frac{z-2}{z}$ is purely imaginary.

Check Point 3

1. If $|z_1| = |z_2| = |z_3| = 1$ and $z_1 + z_2 + z_3 = 0$, then the area of triangle whose vertices are z_1, z_2 and z_3, is

(a) $\frac{3\sqrt{3}}{4}$ (b) $\frac{\sqrt{3}}{4}$ (c) 1 (d) 2

2. If z_1, z_2, z_3 and z_4 are the affixes of the vertices of a parallelogram taken in order in argand plane, then

(a) $z_1 + z_3 = z_2 + z_4$ (b) $z_1 + z_2 = z_3 + z_4$

(c) $z_1 - z_3 = z_2 - z_4$ (d) None of these

3. If z be any complex number such that $|3z - 2| + |3z + 2| = 4$, then locus of z is

(a) a circle (b) an ellipse

(c) a line segment (d) None of these

4. If $z = x + iy$, then the equation $\left|\frac{2z - i}{z + 1}\right| = m$ represents a circle when m is not equal to

(a) $\frac{1}{2}$ (b) 1

(c) 2 (d) 3

5. A curve represented by $\text{Im}(z^2) = k$, where k is a non-zero real number is

(a) a pair of straight lines (b) an ellipse

(c) a parabola (d) a hyperbola

6. The region of the argand diagram defined by $|z - 1| + |z + 1| \le 4$ is

(a) interior of an ellipse

(b) exterior of an ellipse

(c) interior and boundary of an ellipse

(d) None of the above

7. If $|z + \bar{z}| + |z - \bar{z}| = 2$, then z lies on

(a) a straight line (b) a square

(c) a line (d) None of these

WORKED OUT Examples

Example 1 *For a positive integer n, the expression* $(1-i)^n\left(1-\frac{1}{i}\right)^n$ *is equal to* [NCERT]

(a) 0 (b) $2i^n$

(c) 2^n (d) 4^n

Solution (c) $(1-i)^n\left(1-\frac{1}{i}\right)^n$

$$= (1-i)^n(1+i)^n \qquad \left(\because -i = \frac{1}{i}\right)$$

$$= (1-i^2)^n = (1+1)^n = 2^n$$

Example 2 *If* $a + ib = \frac{(x+i)^2}{2x^2+1}$, *then* $a^2 + b^2$ *is equal to* [NCERT]

(a) $\frac{x^2+1}{(2x^2+1)^2}$ (b) $\frac{(x^2+1)^2}{(2x^2+1)^2}$

(c) $\frac{(x^2+1)^2}{(2x^2+1)}$ (d) *None of these*

Solution (b) Given, $a + ib = \frac{(x+i)^2}{2x^2+1}$

On taking modulus of both sides, we get

$$|a+ib| = \left|\frac{(x+i)^2}{2x^2+1}\right|$$

$$\Rightarrow \quad \sqrt{a^2+b^2} = \frac{|(x+i)^2|}{|2x^2+1|} = \frac{|x+i|^2}{2x^2+1}$$

$\because \quad \left|\frac{z_1}{z_2}\right| = \frac{|z_1|}{|z_2|}$, ($|z^n| = |z^n|$) and $\text{Re}|(z)| = \text{Re}(z)$]

$$\Rightarrow \quad \sqrt{a^2+b^2} = \frac{(\sqrt{x^2+1})^2}{2x^2+1}$$

On squaring both sides, we get

$$a^2 + b^2 = \frac{(x^2+1)^2}{(2x^2+1)^2}$$

Example 3 *A real value of x satisfies the equation* $\left(\frac{3-4ix}{3+4ix}\right) = \alpha - i\beta$ $(\alpha, \beta \in R)$, *if* $\alpha^2 + \beta^2$ *is equal to* [NCERT Exemplar]

(a) 1 (b) –1 (c) 2 (d) –2

Solution (a) Given, $\left(\frac{3-4ix}{3+4ix}\right) = \alpha - i\beta$

$$\therefore \quad \frac{3-4ix}{3+4ix} \times \frac{3-4ix}{3-4ix} = \alpha - i\beta$$

$$\Rightarrow \quad \frac{9-16x^2-24ix}{9+16x^2} = \alpha - i\beta$$

On equating real and imaginary parts both sides, we get

$$\alpha = \frac{9-16x^2}{9+16x^2} \text{ and } \beta = \frac{24x}{9+16x^2}$$

$$\therefore \quad \alpha^2 + \beta^2 = \sqrt{\frac{(9-16x^2)^2}{(9+16x^2)^2} + \frac{(24x)^2}{(9+16x^2)^2}}$$

$$= \frac{1}{9+16x^2}\sqrt{81+256x^4-288x^2+576x^2}$$

$$= \frac{1}{9+16x^2}\sqrt{81+256x^4+288x^2}$$

$$= \frac{1}{9+16x^2}\sqrt{(9+16x^2)^2}$$

$$= \frac{9+16x^2}{9+16x^2} = 1$$

Example 4 *Which of the following is correct for any two complex numbers* z_1 and z_2? [NCERT Exemplar]

(a) $|z_1z_2| = |z_1||z_2|$ (b) $\arg(z_1z_2) = \arg(z_1)\cdot\arg(z_2)$

(c) $|z_1+z_2| = |z_1| + |z_2|$ (d) $|z_1+z_2| \geq |z_1| - |z_2|$

Solution (a) $|z_1z_2| = |z_1z_2|$

(b) $\arg(z_1z_2) = \arg(z_1) + \arg(z_2)$

(c) $|z_1+z_2| \neq |z_1| + |z_2|$

(d) $|z_1+z_2| \leq |z_1| + |z_2|$

Example 5 *The square root of* $7 + 24i$ *are*

(a) $\pm(3+4i)$ (b) $\pm(3-4i)$

(c) $\pm(4+3i)$ (d) $\pm(4-3i)$

Solution (c) Let $(x+iy)^2 = 7 + 24i$

$$\Rightarrow \quad x^2 - y^2 = 7 \quad \text{and} \quad 2xy = 24$$

Now, $\quad (x^2+y^2)^2 = (x^2-y^2)^2 + 4a^2b^2$

$$= 7^2 + 24^2 = 625$$

$\Rightarrow \quad x^2 + y^2 = 25$

$\Rightarrow \quad x = \pm 4$ and $y = \pm 3$

Hence, square root of $7 + 24i = \pm(4 + 3i)$.

Example 6 *If the conjugate of $(x + iy)(1 - 2i)$ be $1 + i$, then*

(a) $x = \frac{1}{5}$ (b) $y = \frac{3}{5}$

(c) $x + iy = \frac{1-i}{1-2i}$ (d) $x - iy = \frac{1-i}{1+2i}$

Solution (c) Since, conjugate of $(x + iy)(1 - 2i)$ be $1 + i$.

$\therefore \quad \overline{(x + iy)(1 - 2i)} = 1 + i$

$\Rightarrow \quad x - iy = \frac{1+i}{1+2i}$

$\Rightarrow \quad x + iy = \frac{1-i}{1-2i}$

Example 7 *If $z(1 + a) = b + ic$ and $a^2 + b^2 + c^2 = 1$, then $\frac{1+iz}{1-iz}$ is equal to*

(a) $\frac{a+ib}{1+c}$ (b) $\frac{b-ic}{1+a}$

(c) $\frac{a+ic}{1+b}$ (d) *None of these*

Solution (a) $\frac{1+iz}{1-iz} = \frac{1 + i\frac{(b+ic)}{1+a}}{1 - i\frac{(b+ic)}{1+a}} = \frac{1+a-c+ib}{1+a+c-ib}$

$= \frac{(1+a-c+ib)(1+a+c+ib)}{(1+a+c)^2 + b^2}$

$= \frac{a^2 + a + iab + ib}{1 + a + ac + c}$

$= \frac{(a+1)(a+ib)}{(a+1)(1+c)} = \frac{a+ib}{1+c}$

Example 8 *If z be a complex number. Then, the angle between z and iz is*

(a) π (b) 0

(c) $-\frac{\pi}{2}$ (d) *None of these*

Solution (c) We know that, multiplication of a complex number by $-i$ rotates through it by a right angle in clockwise direction.

Thus, required angle $= -\frac{\pi}{2}$

Example 9 *If $\frac{1}{x} + x = 2\cos\theta$, then $x^n + \frac{1}{x^n}$ is equal to*

(a) $2\cos n\theta$ (b) $2\sin n\theta$

(c) $\cos n\theta$ (d) $\sin n\theta$

Solution (a) $\because x + \frac{1}{x} = 2\cos\theta \Rightarrow x^2 - 2x\cos\theta + 1 = 0$

$\Rightarrow \quad x = \cos\theta \pm i\sin\theta$

$\Rightarrow \quad x^n = \cos n\theta \pm i\sin n\theta$

and $\quad \frac{1}{x^n} = \cos n\theta \mp i\sin n\theta$

$\therefore \quad x^n + \frac{1}{x^n} = 2\cos n\theta$

Example 10 *If $z(2 - i2\sqrt{3})^2 = i(\sqrt{3} + i)^4$, then amplitude of z is*

(a) $\frac{5\pi}{6}$ (b) $-\frac{\pi}{6}$ (c) $\frac{\pi}{3}$ (d) $\frac{7\pi}{6}$

Solution (b) $z = \frac{i(\sqrt{3}+i)^4}{4(1-\sqrt{3}i)^2} = \frac{i}{4}\cdot\frac{(2+2\sqrt{3}i)^2}{-2-2\sqrt{3}i} = \frac{i(-2+2\sqrt{3}i)}{2(-1-\sqrt{3}i)}$

$= \frac{\sqrt{3}+i}{1+\sqrt{3}i} = \frac{(\sqrt{3}+i)(1-\sqrt{3}i)}{1+3}$

$= \frac{2\sqrt{3}-2i}{4} = \frac{\sqrt{3}}{2} - \frac{i}{2}$

$\therefore \quad \text{amp}(z) = -\tan^{-1}\frac{1}{\sqrt{3}} = -\frac{\pi}{6}$

Example 11 $(\cos 2\theta + i\sin 2\theta)^{-5}$ $(\cos 3\theta - i\sin 3\theta)^6(\sin\theta - i\cos\theta)^3$ *in the form of $a + ib$ is*

(a) $\cos 25\theta + i\sin 25\theta$ (b) $i(\cos 25\theta + i\sin 25\theta)$

(c) $i(\cos 25\theta - i\sin 25\theta)$ (d) $\cos 25\theta - i\sin 25\theta$

Solution (c) $\because \sin\theta - i\cos\theta = -i(\cos\theta + i\sin\theta)$

$\therefore (\cos 2\theta + i\sin 2\theta)^{-5}(\cos 3\theta - i\sin 3\theta)^6(\sin\theta - i\cos\theta)^3$

$= (-i)^3[\cos(-10\theta - 18\theta + 3\theta) + i\sin(-10\theta - 18\theta + 3\theta)]$

$= i(\cos 25\theta - i\sin 25\theta)$

Example 12 *The inequality $|z - 4| < |z - 2|$ represents the region given by*

(a) $Re(z) > 0$ (b) $Re(z) < 0$

(c) $Re(z) > 2$ (d) *None of these*

Solution (d) $\because \quad |z - 4| < |z - 2|$

$\Rightarrow \quad |z - 4|^2 < |z - 2|^2$

$\Rightarrow \quad (x-4)^2 + y^2 < (x-2)^2 + y^2$ (let $z = x + iy$)

$\Rightarrow \quad x^2 - 8x + 16 < x^2 - 4x + 4$

$\Rightarrow \quad x > 3$

$\Rightarrow \quad \text{Re}(z) > 3$

Example 13 *The complex number z, satisfying the condition $\arg\left(\frac{z-1}{z+1}\right) = \frac{\pi}{4}$ lies on a* [NCERT Exemplar]

(a) *circle* (b) *line* (c) *x-axis* (d) *y-axis*

Solution (*a*) Let $z = x + iy$

$$\frac{z-1}{z+1} = \frac{x+iy-1}{x+iy+1} = \frac{(x-1)+iy}{(x+1)+iy} \times \frac{(x+1)-iy}{(x+1)-iy}$$

$$= \frac{(x-1)(x+1) - iy(x-1) + iy(x+1) - i^2y^2}{(x+1)^2 - i^2y^2}$$

$$= \frac{x^2 - 1 + iy(x+1-x+1) + y^2}{(x+1)^2 + y^2} = \frac{(x^2+y^2-1) + 2iy}{(x+1)^2+y^2}$$

$$\Rightarrow \quad \frac{z-1}{z+1} = \frac{x^2+y^2-1}{(x+1)^2+y^2} + \frac{i \times 2y}{(x+1)^2+y^2}$$

Now, $$\arg\left(\frac{z-1}{z+1}\right) = \tan^{-1}\left[\frac{\dfrac{2y}{(x+1)^2+y^2}}{\dfrac{x^2+y^2-1}{(x+1)^2+y^2}}\right]$$

$$\frac{\pi}{4} = \tan^{-1}\left(\frac{2y}{x^2+y^2-1}\right)$$

$$\Rightarrow \quad \tan\frac{\pi}{4} = \frac{2y}{x^2+y^2-1} \Rightarrow 1 = \frac{2y}{x^2+y^2-1}$$

$$\Rightarrow \quad x^2+y^2-1 = 2y \Rightarrow x^2+y^2-2y-1=0$$

Hence, this equation represents a circle.

Example 14 *The complex number* $z = \dfrac{1-i}{\cos\frac{\pi}{3} + i\sin\frac{\pi}{3}}$ *in polar form is* **[NCERT Exemplar]**

(*a*) $\sqrt{2}\left(\dfrac{\cos 5\pi}{12} + \dfrac{i\sin 5\pi}{12}\right)$

(*b*) $\dfrac{1}{\sqrt{2}}\left(\dfrac{\cos\pi}{12} + \dfrac{i\sin\pi}{12}\right)$

(*c*) $\left(\dfrac{\cos\pi}{12} + \dfrac{i\sin\pi}{12}\right)$

(*d*) *None of the above*

Solution (*d*) $$z = \frac{1-i}{\cos\frac{\pi}{3} + i\sin\frac{\pi}{3}} = \frac{\sqrt{2}\left(\frac{1}{\sqrt{2}} - \frac{i}{\sqrt{2}}\right)}{e^{i\pi/3}}$$

$$= \frac{\sqrt{2}\left[\cos\left(-\frac{\pi}{4}\right) + i\sin\left(-\frac{\pi}{4}\right)\right]}{e^{i\frac{\pi}{3}}} = \frac{\sqrt{2}\left(e^{-\frac{\pi i}{4}}\right)}{e^{i\pi/3}}$$

$$= \sqrt{2}\, e^{-\frac{\pi i}{4} - \frac{i\pi}{3}} = \sqrt{2}\, e^{-\frac{7\pi}{12}}$$

$$= \sqrt{2}\left(\cos\frac{7\pi}{12} - i\sin\frac{7\pi}{12}\right)$$

Example 15 *If the real part of* $\dfrac{\bar{z}+2}{\bar{z}-1}$ *is 4, then the locus of the point representing z in the complex plane is a* **[NCERT Exemplar]**

(*a*) *line* (*b*) *circle* (*c*) *parabola* (*d*) *ellipse*

Solution (*b*) Let $z = x + iy$

$$\Rightarrow \quad \bar{z} = x - iy$$

Now, $$\frac{\bar{z}+2}{\bar{z}-1} = \frac{x-iy+2}{x-iy-1} = \frac{(x+2)-iy}{(x-1)-iy} \times \frac{(x-1)+iy}{(x-1)+iy}$$

$$= \frac{(x+2)(x-1) + iy(x+2) - iy(x-1) - i^2y^2}{(x-1)^2 - i^2y^2}$$

$$= \frac{(x^2+2x-x-2) + iy(x+2-x+1) + y^2}{(x-1)^2+y^2}$$

$$= \frac{(x^2+x-2+y^2)}{(x-1)^2+y^2} + \frac{3iy}{(x-1)^2+y^2}$$

$$\because \ \text{Re}\left(\frac{\bar{z}+2}{\bar{z}-1}\right) = 4$$

$$\therefore \quad \frac{x^2+y^2+x-2}{(x-1)^2+y^2} = 4$$

$$\Rightarrow \quad x^2+y^2+x-2 = 4(x^2+1-2x+y^2)$$

$$\Rightarrow \quad x^2+y^2+x-2 = 4x^2+4-8x+4y^2$$

$$\Rightarrow \quad 3x^2+3y^2-9x+2=0$$

$$\Rightarrow \quad x^2+y^2-3x+\frac{2}{3}=0$$

Clearly, it represents a circle.

Example 16 *For all complex numbers* z_1 and z_2 *satisfying* $|z_1| = 12$ *and* $|z_2 - 3 - 4i| = 5$, *the minimum value of* $|z_1 - z_2|$ *is*

(*a*) 0 (*b*) 2

(*c*) 7 (*d*) 17

Solution (*b*) The two circles whose centre and radius are $C_1(0,0), r_1 = 12$, $C_2(3,4), r_2 = 5$ and it passes through origin, then the centre of C_1.

Now, $$C_1C_2 = \sqrt{3^2+4^2} = 5$$

and $$r_1 - r_2 = 12 - 5 = 7$$

$$\therefore \quad C_1C_2 < r_1 - r_2$$

Hence, circle C_2 lies inside circle C_1.

From figure, the minimum distance between them is

$$AB = C_1B - C_1A = r_1 - 2r_2 = 12 - 10 = 2$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Algebraic Operations and Square Root

1. The multiplicative inverse of $\sqrt{5} + 3i$ is [NCERT]

(a) $\frac{\sqrt{5}}{14} + \frac{3i}{14}$ (b) $\frac{\sqrt{5}}{14} - \frac{3i}{14}$

(c) $\frac{\sqrt{5}}{13} - \frac{3i}{13}$ (d) $\frac{\sqrt{5}}{13} + \frac{3i}{13}$

2. If $\left(\frac{1+i}{1-i}\right)^3 - \left(\frac{1-i}{1+i}\right)^3 = x + iy$, then (x, y) is equal to [NCERT Exemplar]

(a) $(0, -2)$ (b) $(-2, 0)$

(c) $(0, 2)$ (d) $(2, 0)$

3. If $\frac{(1+i)^2}{2-i} = x + iy$, then the value of $x + y$ is equal to [NCERT Exemplar]

(a) $\frac{5}{2}$ (b) $-\frac{2}{5}$ (c) $\frac{2}{5}$ (d) $-\frac{5}{2}$

4. The real value of α for which the expression $\frac{1 - i\sin\alpha}{1 + 2i\sin\alpha}$ is purely real is, where $n \in N$ [NCERT Exemplar]

(a) $(n + 1)\frac{\pi}{2}$ (b) $(2n + 1)\frac{\pi}{2}$

(c) $n\pi$ (d) None of these

5. If $\text{Re}(z^2) = 0, |z| = 2$, then [NCERT Exemplar]

(a) $z = \mp\sqrt{2} \pm i\sqrt{2}$ (b) $z = \mp\sqrt{3} \pm i\sqrt{3}$

(c) $z = \mp\sqrt{3} \pm i\sqrt{2}$ (d) None of these

6. The value of $1 + i^2 + i^4 + i^6 + \ldots + i^{2n}$ is

(a) positive (b) negative

(c) zero (d) cannot be determined

7. The value of sum $\sum_{n=1}^{13}(i^n + i^{n+1})$, where $i = \sqrt{-1}$, is equal to [NCERT]

(a) i (b) $i - 1$

(c) $-i$ (d) 0

8. If $\left(\frac{1+i}{1-i}\right)^x = 1$, then [NCERT Exemplar]

(a) $x = 2n + 1$ (b) $x = 4n$

(c) $x = 2n$ (d) $x = 4n + 1$, where $n \in N$

9. The real value of θ for which the expression $\frac{1 + i\cos\theta}{1 - 2i\cos\theta}$ is a real number is [NCERT Exemplar]

(a) $n\pi + \frac{\pi}{4}$ (b) $n\pi + (-1)^n\frac{\pi}{4}$

(c) $2n\pi \pm \frac{\pi}{2}$ (d) None of these

10. Given $z = \frac{q + ir}{1 + p}$, then $\frac{p + iq}{1 + r} = \frac{1 + iz}{1 - iz}$, if

(a) $p^2 + q^2 + r^2 = 1$ (b) $p^2 + q^2 + r^2 = 2$

(c) $p^2 + q^2 - r^2 = 1$ (d) None of these

Conjugate, Modulus and Argument

11. If $z = x + iy$ lies in the third quadrant, then $\frac{\bar{z}}{z}$ also lies in the third quadrant, if [NCERT Exemplar]

(a) $x > y > 0$ (b) $x < y < 0$

(c) $y < x < 0$ (d) $y > x > 0$

12. The conjugate of $\frac{2-i}{(1-2i)^2}$ is [NCERT Exemplar]

(a) $\frac{2}{25} - \frac{i11}{25}$ (b) $\frac{-2}{25} - \frac{i11}{25}$

(c) $\frac{-2}{25} + \frac{i11}{25}$ (d) $\frac{2}{25} + \frac{i11}{25}$

13. $\sin x + i\cos 2x$ and $\cos x - i\sin 2x$ are conjugate to each other for [NCERT Exemplar]

(a) $x = n\pi$ (b) $x = \left(n + \frac{1}{2}\right)\frac{\pi}{2}$

(c) $x = 0$ (d) No value of x

14. The value of $(z+3)(\bar{z}+3)$ is equivalent to [NCERT Exemplar]

(a) $|z+3|^2$ (b) $|z-3|$
(c) z^2+3 (d) None of these

15. If $\frac{z-1}{z+1}$ is a purely imaginary number $(z \neq -1)$, then the value of $|z|$ is [NCERT Exemplar]

(a) -1 (b) 1 (c) 2 (d) -2

16. If $|z_1| = |z_2| = \ldots = |z_n| = 1$, then the value of $|z_1 + z_2 + z_3 + \ldots + z_n|$ is [NCERT]

(a) 1 (b) $|z_1| + |z_2| + \ldots + |z_n|$
(c) $\left|\frac{1}{z_1} + \frac{1}{z_2} + \ldots + \frac{1}{z_n}\right|$ (d) None of these

17. If α and β are different complex numbers with $|\beta| = 1$, then $\left|\frac{\beta - \alpha}{1 - \bar{\alpha}\beta}\right|$ is equal to [NCERT]

(a) 0 (b) 1/2
(c) 1 (d) 2

18. If $|z+1| = z + 2(1+i)$, then the value of z is

(a) $\frac{1}{2} - 2i$ (b) $\frac{1}{2} + 2i$
(c) $\frac{1}{2} - 3i$ (d) $\frac{1}{3} - 2i$

19. If z is a complex number, then $(\bar{z}^{-1})(\bar{z})$ is equal to

(a) 1 (b) -1
(c) 0 (d) None of these

20. The complex number z which satisfies the condition $\left|\frac{i+z}{i-z}\right| = 1$ lies on [NCERT Exemplar]

(a) circle $x^2 + y^2 = 1$ (b) the x-axis
(c) the y-axis (d) the line $x + y = 1$

21. $|z_1 + z_2| = |z_1| + |z_2|$ is possible, if [NCERT Exemplar]

(a) $z_2 = \bar{z}_1$ (b) $z_2 = \frac{1}{z_1}$
(c) $\arg(z_1) = \arg(z_2)$ (d) $|z_1| = |z_2|$

22. If $|z-2| = \min\{|z-1|, |z-5|\}$, where z is a complex number, then

(a) $\text{Re}(z) = \frac{3}{2}$ (b) $\text{Re}(z) = \frac{7}{2}$
(c) $\text{Re}(z) \in \left\{\frac{3}{2}, \frac{7}{2}\right\}$ (d) None of these

23. If z is a complex number, then $|3z-1| = 3|z-2|$ represents

(a) y-axis
(b) a circle
(c) x-axis
(d) a line parallel to y-axis

24. The region of the complex plane for which $\left|\frac{z-a}{z+\bar{a}}\right| = 1$ $[\text{Re}(a) \neq 0]$, is

(a) x-axis (b) y-axis
(c) the straight line $x = a$ (d) None of these

25. If $|a_k| < 1, \lambda_k \geq 0$ for $k = 1, 2, \ldots, n$ and $\lambda_1 + \lambda_2 + \ldots + \lambda_n = 1$, then the value of $|\lambda_1 a_1 + \lambda_2 a_2 + \ldots + \lambda_n a_n|$ is

(a) equal to one (b) greater than one
(c) zero (d) less than one

26. $\arg(\bar{z})$ is equal to

(a) $\pi - \arg(z)$ (b) $2\pi - \arg(z)$
(c) $\pi + \arg(z)$ (d) $2\pi + \arg(z)$

27. If $\arg(z-1) = \arg(z+3i)$, then $x - 1 : y$ is equal to [NCERT Exemplar]

(a) 3 : 1 (b) 1 : 3
(c) 3 : 2 (d) 2 : 3

28. z_1 and z_2 are two complex numbers such that $|z_1| = |z_2|$ and $\arg(z_1) + \arg(z_2) = \pi$, then z_1 is equal to [NCERT Exemplar]

(a) $2\bar{z}_2$ (b) $\bar{z}_2$
(c) $-\bar{z}_2$ (d) None of these

29. If $f(z) = \frac{7-z}{1-z^2}$, where $z = 1 + 2i$, then $|f(z)|$ is [NCERT Exemplar]

(a) $\frac{|z|}{2}$ (b) $|z|$
(c) $2|z|$ (d) None of these

30. If $\tan^{-1}(\alpha + i\beta) = x + iy$, then x is equal to

(a) $\frac{1}{2}\tan^{-1}\left(\frac{2\alpha}{1-\alpha^2-\beta^2}\right)$
(b) $\frac{1}{2}\tan^{-1}\left(\frac{2\alpha}{1+\alpha^2+\beta^2}\right)$
(c) $\tan^{-1}\left(\frac{2\alpha}{1-\alpha^2-\beta^2}\right)$
(d) None of the above

31. If $\bar{z}$ be the conjugate of the complex number z, then which of the following relations is false?

(a) $|z| = |\bar{z}|$ (b) $z \cdot \bar{z} = |\bar{z}|^2$
(c) $\overline{z_1 + z_2} = \bar{z}_1 + \bar{z}_2$ (d) $\arg(z) \neq \arg(\bar{z})$

32. Let z_1 and z_2 be two complex numbers with α and β as their principal arguments such that $\alpha + \beta > \pi$, then principal $\arg(z_1 z_2)$ is given by

(a) $\alpha + \beta + \pi$
(b) $\alpha + \beta - \pi$
(c) $\alpha + \beta + 2\pi$
(d) $\alpha + \beta$

33. If z_1, z_2 and z_3, z_4 are two pairs of conjugate complex numbers, then $\arg\left(\frac{z_1}{z_4}\right) + \arg\left(\frac{z_2}{z_3}\right)$ is equal to [NCERT Exemplar]

(a) 0 (b) $\frac{\pi}{2}$

(c) $\frac{3\pi}{2}$ (d) π

34. The argument of $\frac{(1 - i\sqrt{3})}{(1 + i\sqrt{3})}$ is

(a) 60° (b) 120° (c) 210° (d) 240°

35. If z and w are two non-zero complex numbers such that $|zw| = 1$ and $\arg(z) - \arg(w) = \frac{\pi}{2}$, then $\bar{z}w$ is equal to [NCERT Exemplar]

(a) 1 (b) $-i$

(c) i (d) -1

Triangle Inequality

36. If $|z + 4| \le 3$, then the greatest and the least value of $|z + 1|$ are

(a) 6, – 6 (b) 6, 0

(c) 7, 2 (d) 0, – 1

37. If z is a complex number, then the minimum value of $|z| + |z - 1|$ is

(a) 1 (b) 0

(c) $\frac{1}{2}$ (d) None of these

38. If z_1, z_2 and z_3 be three complex numbers such that $|z_1 + 1| \le 1$, $|z_2 + 2| \le 2$ and $|z_3 + 4| \le 4$, then the maximum value of $|z_1| + |z_2| + |z_3|$ is

(a) 7 (b) 10

(c) 12 (d) 14

39. The maximum value of $|z|$ where z satisfies the condition $\left| z + \frac{2}{z} \right| = 2$, is

(a) $\sqrt{3} - 1$ (b) $\sqrt{3} + 1$

(c) $\sqrt{3}$ (d) $\sqrt{2} + \sqrt{3}$

40. If $|z_1 - 1| < 1$, $|z_2 - 2| < 2$, $|z_3 - 3| < 3$, then $|z_1 + z_2 + z_3|$

(a) is less than 6 (b) is more than 3

(c) is less than 12 (d) lies between 6 and 12

41. Let z be a complex number satisfying $|z - 5i| \le 1$ such that amp(z) is minimum. Then, z is equal to

(a) $\frac{2\sqrt{6}}{5} + \frac{24i}{5}$ (b) $\frac{24}{5} + \frac{2\sqrt{6}\,i}{5}$

(c) $\frac{2\sqrt{6}}{5} - \frac{24i}{5}$ (d) None of these

De-Moivre's Theorem

42. The value of $\frac{4(\cos 75° + i\sin 75°)}{0.4(\cos 30° + i\sin 30°)}$ is

(a) $\frac{\sqrt{2}}{10}(1 + i)$ (b) $\frac{\sqrt{2}}{10}(1 - i)$

(c) $\frac{10}{\sqrt{2}}(1 - i)$ (d) $\frac{10}{\sqrt{2}}(1 + i)$

43. If $(\cos\theta + i\sin\theta)(\cos 2\theta + i\sin 2\theta)\ldots(\cos n\theta + i\sin n\theta) = 1$, then the value of θ is

(a) $4m\pi$ (b) $\frac{2m\pi}{n(n+1)}$

(c) $\frac{4m\pi}{n(n+1)}$ (d) $\frac{m\pi}{n(n+1)}$

44. $\sqrt{1 - c^2} = nc - 1$ and $z = e^{i\theta}$, then $\frac{c}{2n}(1 + nz)\left(1 + \frac{n}{z}\right)$ is equal to

(a) $1 - c\cos\theta$ (b) $1 + 2c\cos\theta$

(c) $1 + c\cos\theta$ (d) $1 - 2c\cos\theta$

45. The real part of $(1 - \cos\theta + 2i\sin\theta)^{-1}$ is

(a) $\frac{1}{3 + 5\cos\theta}$ (b) $\frac{1}{5 - 3\cos\theta}$

(c) $\frac{1}{3 - 5\cos\theta}$ (d) $\frac{1}{5 + 3\cos\theta}$

46. If $a = \cos\theta + i\sin\theta$, then $\frac{1 + a}{1 - a}$ is equal to

(a) $\cot\frac{\theta}{2}$ (b) $\cot\theta$

(c) $i\cot\frac{\theta}{2}$ (d) $i\tan\frac{\theta}{2}$

47. If $x + iy = \frac{3}{2 + \cos\theta + i\sin\theta}$, then $x^2 + y^2$ is equal to

(a) $3x - 4$ (b) $4x - 3$

(c) $4x + 3$ (d) None of these

48. If $z_r = \cos\frac{r\alpha}{n^2} + i\sin\frac{r\alpha}{n^2}$, where $r = 1, 2, 3, \ldots, n$, then $\lim_{n\to\infty} z_1 z_2 z_3 \ldots z_n$ is equal to

(a) $\cos\alpha + i\sin\alpha$ (b) $\cos\left(\frac{\alpha}{2}\right) - i\sin\left(\frac{\alpha}{2}\right)$

(c) $e^{i\alpha/2}$ (d) $\sqrt[3]{e^{i\alpha}}$

49. The value of $\sum_{k=1}^{6}\left(\sin\frac{2\pi k}{7} - i\cos\frac{2\pi k}{7}\right)$ is

(a) -1 (b) 0

(c) $-i$ (d) i

50. The imaginary part of

$(z - 1)(\cos\alpha - i\sin\alpha) + (z - 1)^{-1} \times (\cos\alpha + i\sin\alpha)$ is zero, if

(a) $|z - 1| = 2$ (b) $\arg(z - 1) = 2\alpha$

(c) $\arg(z - 1) = \alpha$ (d) $|z| = 1$

51. If $a = \cos\alpha + i\sin\alpha$, $b = \cos\beta + i\sin\beta$, $c = \cos\gamma + i\sin\gamma$ and $\frac{b}{c} + \frac{c}{a} + \frac{a}{b} = 1$, then $\cos(\beta - \gamma) + \cos(\gamma - \alpha) + \cos(\alpha - \beta)$ is equal to

(a) $\frac{3}{2}$ (b) $-\frac{3}{2}$
(c) 0 (d) 1

52. If $\cos\alpha + \cos\beta + \cos\gamma = \sin\alpha + \sin\beta + \sin\gamma = 0$, then $\cos 3\alpha + \cos 3\beta + \cos 3\gamma$ is equal to

(a) 0 (b) $\cos(\alpha + \beta + \gamma)$
(c) $3\cos(\alpha + \beta + \gamma)$ (d) $3\sin(\alpha + \beta + \gamma)$

53. The values of $(16)^{1/4}$ are

(a) $\pm 2, \pm 2i$ (b) $\pm 4, \pm 4i$
(c) $\pm 1, \pm i$ (d) None of these

Cube Roots and *n*th Roots of Unity

54. Let $\omega_n = \cos\left(\frac{2\pi}{n}\right) + i\sin\left(\frac{2\pi}{n}\right)$, $i^2 = -1$, then $(x + y\omega_3 + z\omega_3^2)(x + y\omega_3^2 + z\omega_3)$ is equal to

(a) 0
(b) $x^2 + y^2 + z^2$
(c) $x^2 + y^2 + z^2 - yz - zx - xy$
(d) $x^2 + y^2 + z^2 + yz + zx + xy$

55. The value of $\frac{a + b\omega + c\omega^2}{b + c\omega + a\omega^2} + \frac{a + b\omega + c\omega^2}{c + a\omega + \omega^2}$ is

(a) 1 (b) -1
(c) 2 (d) -2

56. If α, β and γ are the cube roots of a positive number p, then for any real x, y and z, the expression $\left(\frac{\alpha x + \beta y + \gamma z}{\beta x + \gamma y + \alpha z}\right)$ is equal to

(a) $\frac{-1 - \sqrt{3}i}{2}$ (b) $\frac{-1 + \sqrt{3}i}{2}$
(c) $\frac{1 + \sqrt{3}i}{2}$ (d) $\frac{1 - \sqrt{3}i}{2}$

57. The value of $(1 + \omega^2 + 2\omega)^{3n} - (1 + \omega + 2\omega^2)^{3n}$ is equal to

(a) 0 (b) 1
(c) ω (d) ω^2

58. $\sqrt{-1 - \sqrt{1 - \sqrt{-1 - \ldots\infty}}}$ is equal to

(a) 1 (b) -1
(c) ω^2 (d) $-\omega$

59. If $x = a + b$, $y = a\alpha + b\beta$ and $z = a\beta + b\alpha$, where α and β are complex cube roots of unity, then xyz is equal to

(a) $a^2 + b^2$ (b) $a^3 + b^3$
(c) a^3b^3 (d) $a^3 - b^3$

60. If $\omega(\neq 1)$ is a cube root of unity and $(1 + \omega)^7 = A + B\omega$, then A and B are respectively

(a) 0, 1 (b) 1, 1
(c) 1, 0 (d) -1, 1

61. If ω is a complex cube root of unity, then for positive integral value of n, the product of $\omega \cdot \omega^2 \cdot \omega^3 \ldots\ldots \omega^n$ will be

(a) $\frac{1 - i\sqrt{3}}{2}$ (b) $-\frac{1 - i\sqrt{3}}{2}$
(c) 1 (d) Both (b) and (c)

62. If 1, ω and ω^2 are the cube roots of unity, then

$$\Delta = \begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^n & \omega^{2n} & 1 \\ \omega^{2n} & 1 & \omega^n \end{vmatrix} \text{ is equal to}$$

(a) 0 (b) 1 (c) ω (d) ω^2

63. If $\alpha \neq 1$ is any nth root of unity, then $S = 1 + 3\alpha + 5\alpha^2 + \ldots$ upto n terms, is equal to

(a) $\frac{2n}{1 - \alpha}$ (b) $-\frac{2n}{1 - \alpha}$
(c) $\frac{n}{1 - \alpha}$ (d) $-\frac{n}{1 - \alpha}$

64. Common roots of the equations $z^3 + 2z^2 + 2z + 1 = 0$ and $z^{1985} + z^{100} + 1 = 0$ are

(a) ω, ω^2 (b) ω, ω^3
(c) ω^2, ω^3 (d) None of these

65. The value of the expression

$$1 \cdot (2 - \omega)(2 - \omega^2) + 2 \cdot (3 - \omega)(3 - \omega^2) + \ldots + (n - 1) \cdot (n - \omega)(n - \omega^2),$$

where ω is an imaginary cube root of unity, is

(a) $\frac{1}{2}(n - 1)\, n\, (n^2 + 3n + 4)$
(b) $\frac{1}{4}(n - 1)\, n\, (n^2 + 3n + 4)$
(c) $\frac{1}{2}(n + 1)\, n\, (n^2 + 3n + 4)$
(d) $\frac{1}{4}(n + 1)\, n\, (n^2 + 3n + 4)$

66. Let $\omega = -\frac{1}{2} + i\frac{\sqrt{3}}{2}$, then the value of the determinant

$$\begin{vmatrix} 1 & 1 & 1 \\ 1 & -1 - \omega^2 & \omega^2 \\ 1 & \omega^2 & \omega^4 \end{vmatrix} \text{ is}$$

(a) 3ω (b) $3\omega(\omega - 1)$
(c) $3\omega^2$ (d) $3\omega(1 - \omega)$

67. If $1, \alpha_1, \alpha_2, \ldots, \alpha_{n-1}$ are n roots of unity, then the value of $(1 - \alpha_1)(1 - \alpha_2)(1 - \alpha_3)\ldots(1 - \alpha_{n-1})$ is equal to

(a) $\sqrt{3}$ (b) 1/2
(c) n (d) 0

68. If $x^2 - x + 1 = 0$, then the value of $\sum_{n=1}^{5}\left(x^n + \frac{1}{x^n}\right)^2$ is

(a) 8 (b) 10
(c) 12 (d) None of these

Applications in Geometry

69. If $\text{Im}\left(\frac{z-1}{2z+1}\right) = -4$, then locus of z is

(a) an ellipse (b) a parabola
(c) a straight line (d) a circle

70. In the argand plane the complex number $z = 4 - 3i$ is turned in the clockwise sense through 180° and stretched three times. The complex number represented by the new number is

(a) $12 + 9i$ (b) $12 - 9i$ (c) $-12 - 9i$ (d) $-12 + 9i$

71. If the complex numbers z_1 and z_2 and the origin form an equilateral triangle, then $z_1^2 + z_2^2$ is equal to

(a) $z_1 z_2$ (b) $z_1 \bar{z}_2$
(c) $\bar{z}_2 z_1$ (d) $|z_1|^2 = |z_2|^2$

72. In a given parallelogram, if the points P_1 and P_2 represent two complex numbers z_1 and z_2, then the point P_3 represents the number

(a) $z_1 + z_2$
(b) $z_1 - z_2$
(c) $z_1 \times z_2$
(d) $z_1 \div z_2$

73. Let z_1 and z_2 be the non-real roots of the equation $3z^2 + 3z + b = 0$. If the origin together with the points represented by z_1 and z_2 form an equilateral triangle, then the value of b is

(a) 1 (b) 2
(c) 3 (d) None of these

74. Locus of z, if $\arg\left(\frac{z-1}{z+1}\right) = \frac{\pi}{2}$, is

(a) a circle (b) a semi-circle
(c) a straight line (d) None of these

75. The locus of the points z which satisfy the condition $\arg\left(\frac{z-1}{z+1}\right) = \frac{\pi}{3}$, is

(a) a straight line (b) a circle
(c) a parabola (d) None of these

76. Let z be a complex number and a be a real parameter such that $z^2 + ax + a^2 = 0$, then

(a) locus of z is a pair of straight lines
(b) locus of z is a circle
(c) $\arg(z) = \pm\frac{5\pi}{3}$
(d) $|z| = -2|a|$

77. If z_1, z_2, z_3 and z_4 are the affixes of four points in the argand plane and z is the affix of a point, such that $|z - z_1| = |z - z_2| = |z - z_3| = |z - z_4|$, then z_1, z_2, z_3 and z_4 are

(a) concyclic (b) vertices of a parallelogram
(c) vertices of a rhombus (d) in a straight line

78. The points represented by the complex numbers $1 + i$, $-2 + 3i$ and $\frac{5}{3}i$ on the argand diagram are

(a) vertices of an equilateral triangle
(b) vertices of an isosceles triangle
(c) collinear
(d) None of the above

79. If the area of the triangle on the complex plane formed by the points z, $z + iz$ and iz is 200, then the value of $|3z|$ must be equal to

(a) 20 (b) 40 (c) 60 (d) 80

80. $\text{Re}(z^2) = 1$ is represented by

(a) the circle $x^2 + y^2 = 1$ (b) the hyperbola $x^2 - y^2 = 1$
(c) parabola or a circle (d) All of these

81. If the points z_1, z_2 and z_3 are the vertices of an equilateral triangle in the complex plane, then the value of $z_1^2 + z_2^2 + z_3^2$ is equal to

(a) $\frac{z_1}{z_2} + \frac{z_2}{z_3} + \frac{z_3}{z_1}$ (b) $z_1z_2 + z_2z_3 + z_3z_1$
(c) $z_1z_2 - z_2z_3 - z_3z_1$ (d) $-\frac{z_1}{z_2} - \frac{z_2}{z_3} - \frac{z_3}{z_1}$

82. If the complex numbers iz, z and $z + iz$ represent the three vertices of a triangle, then the area of the triangle is

(a) $\frac{1}{2}|z|^2$ (b) $|z|^2$ (c) $\frac{1}{2}|z - 1|$ (d) $|z - 1|^2$

83. The area of the triangle whose vertices are represented by the complex numbers 0, z, $ze^{i\alpha}$, $(0 < \alpha < \pi)$ is equal to

(a) $\frac{1}{2}|z|^2 \cos\alpha$ (b) $\frac{1}{2}|z|^2 \sin\alpha$
(c) $\frac{1}{2}|z|^2 \sin\alpha\cos\alpha$ (d) $\frac{1}{2}|z|^2$

84. If $\left|\frac{z-2}{z+2}\right| = \frac{\pi}{6}$, then the locus of z is **[NCERT]**

(a) a straight line (b) a circle
(c) a parabola (d) an ellipse

85. If the real part of $\frac{\bar{z}+2}{\bar{z}-1}$ is 4, then the locus of the point representing z in the complex plane is

(a) a circle (b) a parabola
(c) a hyperbola (d) an ellipse

86. The equation $z\bar{z} + (2 - 3i)z + (2 + 3i)\bar{z} + 4 = 0$ represents a circle of radius
(a) 2 (b) 3 (c) 4 (d) 6

87. When $\frac{z+i}{z+2}$ is purely imaginary, the locus described by the point z in the argand diagram is a
(a) circle of radius $\frac{\sqrt{5}}{2}$ (b) circle of radius $\frac{5}{4}$
(c) straight line (d) parabola

88. The equation of a circle whose radius and centre are r and z_0 respectively, is
(a) $z\bar{z} - z\bar{z}_0 - \bar{z}z_0 + z_0\bar{z}_0 = r^2$
(b) $z\bar{z} + z\bar{z}_0 - \bar{z}z_0 + z_0\bar{z}_0 = r^2$
(c) $z\bar{z} - z\bar{z}_0 + \bar{z}z_0 - z_0\bar{z}_0 = r^2$
(d) None of the above

89. If $iz^3 + z^2 - z + i = 0$, then $|z|$ is equal to
(a) 1 (b) i (c) -1 (d) $-i$

90. The centre of the circle
$$z\bar{z} - (2 + 3i)z - (2 - 3i)\bar{z} + 9 = 0 \text{ is}$$
(a) $(2, -3)$ (b) $(2, 3)$ (c) $(-2, -3)$ (d) $(-2, 3)$

Miscellaneous

91. If $\sqrt{3} + i = (a + ib)(c + id)$, then $\tan^{-1}\left(\frac{b}{a}\right) + \tan^{-1}\left(\frac{d}{c}\right)$ has the value
(a) $\frac{\pi}{3} + 2n\pi, n \notin I$ (b) $n\pi + \frac{\pi}{6}, n \in I$
(c) $n\pi - \frac{\pi}{3}, n \in I$ (d) $2n\pi - \frac{\pi}{3}, n \in I$

92. The number of non-zero integral solutions of the equation $|1 - i|^x = 2^x$ is [NCERT]
(a) infinite (b) 1
(c) 2 (d) None of these

93. If in polar form $z_1 = (1, \alpha)$, $z_2 = (1, \beta)$, $z_3 = (1, \gamma)$ and $z_1 + z_2 + z_3 = 0$, then $z_1^{-1} + z_2^{-1} + z_3^{-1}$ is equal to
(a) 1 (b) 0
(c) -1 (d) None of these

94. The value of $x^4 + 9x^3 + 35x^2 - x + 4$ for $x = -5 + 2\sqrt{-4}$ is
(a) 0 (b) -160
(c) 160 (d) -164

95. If $\alpha = \cos\left(\frac{2\pi}{7}\right) + i\sin\left(\frac{2\pi}{7}\right)$, then the quadratic equation whose roots are $\alpha = a + a^2 + a^4$ and $\beta = a^3 + a^5 + a^6$, is
(a) $x^2 - x + 2 = 0$ (b) $x^2 + x - 2 = 0$
(c) $x^2 - x - 2 = 0$ (d) $x^2 + x + 2 = 0$

96. The maximum distance from the origin of coordinates to the point z satisfying the equation $\left|z + \frac{1}{z}\right| = a$ is
(a) $\frac{1}{2}(\sqrt{a^2 + 1} + a)$ (b) $\frac{1}{2}(\sqrt{a^2 + 2} + a)$
(c) $\frac{1}{2}(\sqrt{a^2 + 4} + a)$ (d) None of these

97. The closest distance of the origin from a curve given as $a\bar{z} + \bar{a}z + |a|^2 = 0$ is
(a) 1 (b) $\frac{\text{Re}(|a|)}{|a|}$ (c) $\frac{\text{Im}(|a|)}{|a|}$ (d) $\frac{|a|}{2}$

98. Let z_1, z_2 and z_3 be the affixes of the vertices of a triangle having the circumcentre at the origin. If z is the affix of it's orthocentre, then z is equal to
(a) $\frac{z_1 + z_2 + z_3}{3}$ (b) $\frac{z_1 + z_2 + z_3}{2}$
(c) $z_1 + z_2 + z_3$ (d) None of these

99. If $\log_{\sqrt{3}}\left(\frac{|z|^2 - |z| + 1}{2 + |z|}\right) < 2$, then the locus of z is
(a) $|z| = 5$ (b) $|z| < 5$
(c) $|z| > 5$ (d) None of these

100. Given that the equation $z^2 + (p + iq)z + r + is = 0$, where p, q, r and s are real and non-zero roots, then
(a) $pqr = r^2 + p^2s$ (b) $prs = q^2 + r^2p$
(c) $qrs = p^2 + s^2q$ (d) $pqs = s^2 + q^2r$

Round II (Mixed Bag)

Only One Correct Option

1. If $|z - i\text{Re}(z)| = |z - \text{Im}(z)|$ (where $i = \sqrt{-1}$), then z lies on
(a) $\text{Re}(z) = 2$
(b) $\text{Im}(z) = 2$
(c) $\text{Re}(z) + \text{Im}(z) = 2$
(d) None of the above

2. If z_1 is a root of the equation $a_0^n z^n + a_1 z^{n-1} + \ldots + a_{n-1}z + a_n = 3$, where $|a_i| < 2$ for $i = 0, 1, \ldots, n$. Then,
(a) $|z_1| > \frac{1}{3}$ (b) $|z_1| < \frac{1}{4}$
(c) $|z_1| > \frac{1}{4}$ (d) $|z| < \frac{1}{3}$

3. The point of intersection of the curves $\arg(z - 3i) = \frac{3\pi}{4}$ and $\arg(2z + 1 - 2i) = \frac{\pi}{4}$, (where $i = \sqrt{-1}$) is

(a) $\frac{1}{4}(3 + 9i)$ (b) $\frac{1}{4}(3 - 9i)$

(c) $\frac{1}{2}(3 + 2i)$ (d) No point

4. The complex number z satisfies the condition $\left|z - \frac{25}{z}\right| = 24$. The maximum distance from the origin of coordinates to the point z is

(a) 25 (b) 30

(c) 32 (d) None of these

5. The trigonometric form of $z = (1 - i\cot 8)^3$ (where $i = \sqrt{-1}$) is

(a) $\operatorname{cosec}^3 8 \cdot e^{i\left(24 - \frac{3\pi}{2}\right)}$ (b) $\operatorname{cosec}^3 8 \cdot e^{-i\left(24 - \frac{3\pi}{2}\right)}$

(c) $\operatorname{cosec}^3 8 \cdot e^{i\left(36 - \frac{\pi}{2}\right)}$ (d) $\operatorname{cosec}^2 8 \cdot e^{-i\left(24 - \frac{\pi}{2}\right)}$

6. If ω is a complex cube root of unity, then the value of $\begin{vmatrix} x+1 & \omega & \omega^2 \\ \omega & x+\omega^2 & 1 \\ \omega^2 & 1 & x+\omega \end{vmatrix}$ is

(a) x^3 (b) $2x^3$

(c) $3x^3$ (d) None of these

7. If $x = 9^{1/3}9^{1/9}9^{1/27}\ldots\infty$, $y = 4^{1/3}4^{-1/9}4^{1/27}\ldots\infty$ and $z = \sum_{r=1}^{\infty}(1+i)^{-r}$, then $\arg(x + yz)$ is equal to

(a) 0 (b) $\pi - \tan^{-1}\left(\frac{\sqrt{2}}{3}\right)$

(c) $-\tan^{-1}\left(\frac{\sqrt{2}}{3}\right)$ (d) $-\tan^{-1}\left(\frac{2}{\sqrt{3}}\right)$

8. If z_1 and z_2 be complex numbers such that $z_1 \neq z_2$ and $|z_1| = |z_2|$. If z_1 has positive real part and z_2 has negative imaginary part, then $[(z_1 + z_2)/(z_1 - z_2)]$ may be

(a) purely imaginary

(b) real and positive

(c) real and negative

(d) None of the above

9. If $|z_1| = |z_2|$, $\arg(z_1/z_2) = \pi$, then $z_1 + z_2$ is equal to

(a) 0 (b) purely imaginary

(c) purely real (d) None of these

10. If $|z| < \sqrt{2} - 1$, then $|z^2 + 2z\cos\alpha|$ is

(a) less than 1 (b) $\sqrt{2} + 1$

(c) $\sqrt{2} - 1$ (d) None of these

11. If $A(z_1)$, $B(z_2)$ and $C(z_3)$ are the vertices of the ΔABC such that $(z_1 - z_2)/(z_3 - z_2) = (1/\sqrt{2}) - (i/1/\sqrt{2})$, then ΔABC is

(a) equilateral (b) right angled

(c) isosceles (d) obtuse angled

12. If z_1, z_2 and z_3 are the vertices of an equilateral ΔABC such that $|z_1 - i| = |z_2 - i| = |z_3 - i|$, then $|z_1 + z_2 + z_3|$ is equal to

(a) $3\sqrt{3}$ (b) $\sqrt{3}$ (c) 3 (d) $\frac{1}{3\sqrt{3}}$

More Than One Correct Option

13. If $z_1 = a + ib$ and $z_2 = c + id$ are complex numbers such that $|z_1| = |z_2| = 1$ and $\operatorname{Re}(z_1\bar{z}_2) = 0$, then the pair of complex numbers $w_1 = a + ic$ and $w_2 = b + id$ satisfies

(a) $|w_1| = 1$ (b) $|w_2| = 1$

(c) $\operatorname{Re}|w_1\bar{w}_2| = 0$ (d) None of these

14. The real value of θ for which the expression $\frac{1 + i\cos\theta}{1 - 2i\cos\theta}$ is a real number, is

(a) $2n\pi + \frac{\pi}{2}, n \in I$ (b) $2n\pi - \frac{\pi}{2}, n \in I$

(c) $2n\pi \pm \frac{\pi}{2}, n \in I$ (d) $2n\pi \pm \frac{\pi}{4}, n \in I$

15. If $|z_1| = |z_2| = 1$ and amp z_1 + amp $z_2 = 0$, then

(a) $z_1z_2 = 1$ (b) $z_1 + z_2 = 0$

(c) $z_1 = \bar{z}_2$ (d) None of these

16. If $|z_1| = 15$ and $|z_2 - 3 - 4i| = 5$, then

(a) $|z_1 - z_2|_{\min} = 5$ (b) $|z_1 - z_2|_{\min} = 10$

(c) $|z_1 - z_2|_{\max} = 20$ (d) $|z_1 - z_2|_{\max} = 25$

Comprehension Based Questions

Passage

Directions (Q. Nos. 17-19) *Consider the complex numbers z_1 and z_2 satisfying the relation $|z_1 + z_1|^2 = |z_1|^2 + |z_2|^2$.*

17. Complex number $z_1\bar{z}_2$ is

(a) purely real (b) purely imaginary

(c) zero (d) None of the above

18. Complex number z_1/z_2 is

(a) purely real (b) purely imaginary

(c) zero (d) None of these

19. One of the possible argument of complex number $i(z_1/z_2)$

(a) $\frac{\pi}{2}$ (b) $-\frac{\pi}{2}$

(c) 0 (d) None of these

Assertion and Reason

Directions (Q. Nos. 20-28) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*),(*c*) *and* (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

20. Consider z_1 and z_2 are two complex numbers.

Statement I Such that $|z_1| = |z_2| + |z_1 - z_2|$, then $\text{Im}\left(\frac{z_1}{z_2}\right) = 0$.

Statement II $\arg(z) = 0 \Rightarrow z$ is purely real.

21. **Statement I** If $\left|\frac{z\,z_1 - z_2}{z\,z_1 + z_2}\right| = k$, $(z_1, z_2 \neq 0)$, then the locus of z is circle.

Statement II As $\left|\frac{z - z_1}{z - z_2}\right| = \lambda$ represents a circle, if $\lambda \notin \{0, 1\}$.

22. Consider $|z_1| = 1$, $|z_2| = 2$ and $|z_3| = 3$.

Statement I If $|z_1 + 2z_2 + 3z_3| = 6$, then the value of $|z_2z_3 + 8z_3z_1 + 27z_1z_2|$ is 36.

Statement II $|z_1 + z_2 + z_3| \le |z_1| + |z_2| + |z_3|$

23. **Statement I** If $\cos(1 - i) = a + ib$, where $a, b \in R$ and $i = \sqrt{-1}$, then $a = \frac{1}{2}\left(e + \frac{1}{e}\right)\cos 1$, $b = \frac{1}{2}\left(e - \frac{1}{e}\right)\sin 1$.

Statement II $e^{i\theta} = \cos\theta + i\sin\theta$

24. **Statement I** If $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2$, then $\frac{z_1}{z_2}$ is purely imaginary.

Statement II If z is purely imaginary, then $z + \bar{z} = 0$.

25. **Statement I** If $\arg(z_1z_2) = 2\pi$, then both z_1 and z_2 are purely real (z_1 and z_2 have principal arguments).

Statement II Principal argument of complex number and between $-\pi$ and π.

26. **Statement I** $|z_1 - a| < a$, $|z_2 - b| < b$, $|z_3 - c| < c$, where a, b and c are positive real numbers, then $|z_1 + z_2 + z_3|$ is greater than $2|a + b + c|$.

Statement II $|z_1 \pm z_2| \le |z_1| + |z_2|$

27. **Statement I** If the equation $ax^2 + bx + c = 0$, $0 < a < b < c$, has non-real complex roots z_1 and z_2, then $|z_1| > 1$, $|z_2| > 1$.

Statement II Complex roots always occur in conjugate pairs.

28. **Statement I** The product of all values of $(\cos\alpha + i\sin\alpha)^{3/5}$ is $\cos 3a + i\sin 3a$.

Statement II The product of fifth roots of unity is 1.

Previous Years' Questions

29. If z is a complex number of unit modulus and argument θ, then $\arg\left(\frac{1+z}{1+\bar{z}}\right)$ is equal to **[JEE Main 2013]**

(a) $-\theta$ (b) $\frac{\pi}{2} - \theta$
(c) θ (d) $\pi - \theta$

30. If $z \neq 1$ and $\frac{z^2}{z-1}$ is real, then the point represented by the complex number z lies **[AIEEE 2012]**

(a) either on the real axis or on a circle passing through the origin
(b) on a circle with centre at the origin
(c) either on the real axis or on a circle not passing through the origin
(d) on the imaginary axis

31. If $\omega(\neq 1)$ is a cube root of unity and $(1 + \omega)^7 = A + B\omega$. Then, (A, B) is equal to **[AIEEE 2011]**

(a) (1, 1) (b) (1, 0)
(c) (−1, 1) (d) (0, 1)

32. The number of complex numbers z such that $|z - 1| = |z + 1| = |z - i|$ is equal to **[AIEEE 2010]**

(a) 0 (b) 1
(c) 2 (d) ∞

33. If $\left|z - \frac{4}{z}\right| = 2$, then the maximum value of $|z|$ is equal to **[AIEEE 2009]**

(a) $\sqrt{3} + 1$ (b) $\sqrt{5} + 1$
(c) 2 (d) $2 + \sqrt{2}$

34. The conjugate of a complex number is $\frac{1}{i-1}$. Then, that complex number is [AIEEE 2008]

(a) $\frac{1}{i-1}$ (b) $-\frac{1}{i-1}$

(c) $\frac{1}{i+1}$ (d) $-\frac{1}{i+1}$

35. If $|z+4| \le 3$, then the maximum value of $|z+1|$ is [AIEEE 2007]

(a) 4 (b) 10

(c) 6 (d) 0

36. If $z^2 + z + 1 = 0$, where z is complex number, then the value of $\left(z+\frac{1}{z}\right)^2 + \left(z^2+\frac{1}{z^2}\right)^2 + \left(z^3+\frac{1}{z^3}\right)^2 + \ldots + \left(z^6+\frac{1}{z^6}\right)^2$ is [AIEEE 2006]

(a) 54 (b) 6

(c) 12 (d) 18

37. If the cube roots of unity are 1, ω and ω^2, then the roots of the equation $(x-1)^3 + 8 = 0$, are [AIEEE 2005]

(a) $-1, 1+2\omega, 1+2\omega^2$ (b) $-1, 1-2\omega, 1-2\omega^2$

(c) $-1, -1, -1$ (d) $-1, -1+2\omega, -1-2\omega^2$

38. If z_1 and z_2 are two non-zero complex numbers such that $|z_1 + z_2| = |z_1| + |z_2|$, then $\arg(z_1) - \arg(z_2)$ is equal to [AIEEE 2005]

(a) $-\frac{\pi}{2}$ (b) 0

(c) $-\pi$ (d) $\frac{\pi}{2}$

39. If $w = \frac{z}{z - \frac{i}{3}}$ and $|w| = 1$, then z lies on [AIEEE 2005]

(a) a parabola (b) a straight line

(c) a circle (d) an ellipse

40. Let z and w be complex numbers such that $\bar{z} + i\bar{w} = 0$ and $\arg(zw) = \pi$. Then, $\arg(z)$ is equal to [AIEEE 2004]

(a) $\pi/4$ (b) $\pi/2$

(c) $3\pi/4$ (d) $5\pi/2$

41. If $z = x - iy$ and $z^{1/3} = p + iq$, then $\left(\frac{x}{p} + \frac{y}{q}\right) \Big/ (p^2 + q^2)$ is equal to [AIEEE 2004]

(a) 1 (b) -1

(c) 2 (d) -2

42. If $|z^2 - 1| = |z|^2 + 1$, then z lies on [AIEEE 2004]

(a) the real axis

(b) the imaginary axis

(c) a circle

(d) an ellipse

43. Let z_1 and z_2 be two roots of the equation $z^2 + az + b = 0$, z being complex. Further, assume that the origin z_1 and z_2 form an equilateral triangle. Then, [AIEEE 2003]

(a) $a^2 = b$ (b) $a^2 = 2b$

(c) $a^2 = 3b$ (d) $a^2 = 4b$

44. If z and w are two non-zero complex numbers such that $|zw| = 1$ and $\arg(z) - \arg(w) = \frac{\pi}{2}$, then $\bar{z}w$ is equal to [AIEEE 2003]

(a) 1 (b) -1

(c) i (d) $-i$

45. If $\left(\frac{1+i}{1-i}\right)^x = 1$, then [AIEEE 2003]

(a) $x = 4n$, where n is any positive integer

(b) $x = 2n$, where n is any positive integer

(c) $x = 4n + 1$, where n is any positive integer

(d) $x = 2n + 1$, where n is any positive integer

46. If ω is an imaginary cube root of unity, then $(1 + \omega - \omega^2)^7$ is equal to [AIEEE 2002]

(a) $128\,\omega$ (b) $-128\,\omega$

(c) $128\,\omega^2$ (d) $-128\,\omega^2$

47. If $\begin{vmatrix} 6i & -3i & 1 \\ 4 & 3i & -1 \\ 20 & 3 & i \end{vmatrix} = x + iy$, then [AIEEE 2002]

(a) $x = 3, y = 1$

(b) $x = 1, y = 3$

(c) $x = 0, y = 3$

(d) $x = 0, y = 0$

the **Guidance**

Round I

1. Let $z = \sqrt{5} + 3i$, then its multiplicative inverse is

$$\frac{1}{z} = \frac{1}{\sqrt{5}+3i} = \frac{1}{\sqrt{5}+3i} \times \frac{\sqrt{5}-3i}{\sqrt{5}-3i}$$

$$= \frac{\sqrt{5}-3i}{5-9i^2} \qquad [\because (a+b)(a-b) = a^2 - b^2]$$

$$= \frac{\sqrt{5}-3i}{5+9} = \frac{\sqrt{5}-3i}{14} \qquad (\because i^2 = -1)$$

$$= \frac{\sqrt{5}}{14} - \frac{3i}{14}$$

2. Given, $$\left(\frac{1+i}{1-i}\right)^3 - \left(\frac{1-i}{1+i}\right)^3 = x + iy \qquad \text{...(i)}$$

Now, $$\frac{1+i}{1-i} = \frac{1+i}{1-i} \times \frac{1+i}{1+i}$$

$$= \frac{(1+i)^2}{1^2-(i)^2} = \frac{1^2+(i)^2+2i}{1-(-1)}$$

$$= \frac{1-1+2i}{1+1} = \frac{2i}{2} = i$$

$$\therefore \quad \left(\frac{1+i}{1-i}\right)^3 - \left(\frac{1-i}{1+i}\right)^3 = (i)^3 - \left(\frac{1}{i}\right)^3 = -i - \frac{1}{(-i)}$$

$$= -i + \frac{1}{i} \times \frac{i}{i} = -i + \frac{i}{-1} = -2i$$

$$\therefore \quad -2i = x + iy \qquad [\because \text{from Eq. (i)}]$$

On comparing the real and imaginary part both sides, we get

$$x = 0, y = -2$$

3. Given, $$\frac{(1+i)^2}{2-i} = x + iy$$

$$\therefore \quad \frac{1^2+(i)^2+2i}{2-i} \times \frac{2+i}{2+i} = x + iy$$

$$\Rightarrow \quad \frac{(1-1+2i)(2+i)}{2^2-(i)^2} = x + iy$$

$\Rightarrow \quad \dfrac{4i-2}{4+1} = x + iy$

$\Rightarrow \quad \dfrac{4i}{5} - \dfrac{2}{5} = x + iy$

On comparing real and imaginary parts, we get

$$x = -\frac{2}{5}, y = \frac{4}{5}$$

$\therefore \quad x + y = -\dfrac{2}{5} + \dfrac{4}{5} = \dfrac{2}{5}$

4. Let $\quad z = \dfrac{1 - i\sin\alpha}{1 + 2i\sin\alpha} \times \dfrac{(1 - 2i\sin\alpha)}{(1 - 2i\sin\alpha)}$

$$= \frac{1 - 2i\sin\alpha - i\sin\alpha + (-1)\,2\sin^2\alpha}{1^2 - (2i\sin\alpha)^2}$$

$$= \frac{1 - 2\sin^2\alpha - 3i\sin\alpha}{1 + 4\sin^2\alpha}$$

Since, z is purely real, therefore

$$\text{Im}(z) = 0$$

$$\frac{-3\sin\alpha}{1 + 4\sin^2\alpha} = 0$$

$\Rightarrow \quad \sin\alpha = 0 \Rightarrow \quad \alpha = n\pi$

5. Let $\quad z = x + iy$

$\Rightarrow \quad z^2 = (x + iy)^2$

$\Rightarrow \quad z^2 = x^2 + i^2y^2 + 2ixy$

$\Rightarrow \quad z^2 = (x^2 - y^2) + i(2xy)$

$\Rightarrow \quad \text{Re}(z^2) = x^2 - y^2$

Given, $\quad \text{Re}(z^2) = 0$

$\Rightarrow \quad x^2 - y^2 = 0$

$\Rightarrow \quad x = \pm y$

$\Rightarrow \quad x = y \quad$ ...(i)

and $\quad x = -y \quad$ ...(ii)

Again, $\quad |z| = 2$

$\Rightarrow \quad |z|^2 = 4$

$\Rightarrow \quad x^2 + y^2 = 4 \quad$ ...(iii)

From Eqs. (i) and (iii), we get

$$y^2 + y^2 = 4 \Rightarrow 2y^2 = 4$$

$\Rightarrow \quad y^2 = 2 \Rightarrow y = \pm\sqrt{2}$

Therefore, from Eq. (i), we get

$$x = \pm\sqrt{2}$$

$\therefore \quad z = \pm\sqrt{2} \pm i\sqrt{2}$

On putting the value of x from Eq. (ii) in Eq. (iii), we get

$$(-y)^2 + y^2 = 4 \Rightarrow 2y^2 = 4$$

$\Rightarrow \quad y^2 = 2 \Rightarrow y = \pm\sqrt{2}$

From Eq. (ii), $\quad x = \mp\sqrt{2}$

$\therefore \quad z = x + iy, z = \mp\sqrt{2} \pm i\sqrt{2}$

6. Let $S = 1 + i^2 + i^4 + i^6 + \ldots + i^{2n}$

$$= 1 - 1 + 1 - 1 + 1 - \ldots + (-1)^n$$

The value of S depends on n.

$\therefore$ The value cannot be determined.

7. As sum of any four consecutive powers of iota is zero.

$$\therefore \quad \sum_{n=1}^{13} (i^n + i^{n+1}) = (i + i^2 + \ldots + i^{13}) + (i^2 + i^3 + \ldots + i^{14})$$

$$= i + i^2 = i - 1$$

8. $\left(\dfrac{1+i}{1-i}\right)^x = \left[\dfrac{(1+i)}{(1-i)} \times \dfrac{1+i}{1+i}\right]^x$

$$= \left[\frac{(1+i)^2}{1^2 - i^2}\right]^x = \left[\frac{1^2 + i^2 + 2i}{1+1}\right]^x$$

$$= \left(\frac{1 - 1 + 2i}{2}\right)^x = i^x$$

But it is given $i^x = 1$

$\Rightarrow \quad x = 4n$, where $n \in N$

9. **Hints** $\dfrac{1 + i\cos\theta}{1 - 2i\cos\theta} = \dfrac{1 + i\cos\theta}{1 - 2i\cos\theta} \times \dfrac{1 + 2i\cos\theta}{1 + 2i\cos\theta}$

$$= \frac{1 + 3i\cos\theta + 2i^2\cos^2\theta}{1^2 - (2i\cos\theta)^2}$$

$$= \frac{1 - 2\cos^2\theta}{1 + 4\cos^2\theta} + \frac{i3\cos\theta}{1 + 4\cos^2\theta}$$

10. We have, $z = \dfrac{q + ir}{1 + p} \quad \therefore \; iz = \dfrac{-r + iq}{1 + p}$

By componendo and dividendo,

$$\frac{1 + iz}{1 - iz} = \frac{1 + p - r + iq}{1 + p + r - iq}$$

$\therefore \quad \dfrac{p + iq}{1 + r} = \dfrac{1 + iz}{1 - iz}$, if $\dfrac{p + iq}{1 + r} = \dfrac{1 + p - r + iq}{1 + p + r - iq}$

$\Rightarrow \quad p(1 + p + r) + q^2 + i\{q(1 + p + r) - pq\}$

$$= (1 + r)(1 + p - r) + iq(1 + r)$$

$\Rightarrow \quad p(1 + p + r) + q^2 = (1 + r)(1 + p - r)$

and $\quad q(1 + p + r) - pq = q(1 + r)$

(this is obviously true)

$\therefore$ The condition is

$$p(1 + p + r) + q^2 = (1 + r)(1 + p - r)$$

$\Rightarrow \quad p + p^2 + pr + q^2 = 1 + p - r + r + pr - r^2$

$\Rightarrow \quad p^2 + q^2 + r^2 = 1$

11. **Hints** $\quad \dfrac{\bar{z}}{z} = \dfrac{\overline{(x + iy)}}{x + iy} = \dfrac{x - iy}{x + iy} \times \dfrac{x - iy}{x - iy}$

$$= \frac{x^2 - y^2 - 2ixy}{x^2 - i^2y^2} = \frac{x^2 - y^2 - 2ixy}{x^2 + y^2}$$

$$= \frac{x^2 - y^2}{x^2 + y^2} + \frac{i(-2xy)}{x^2 + y^2}$$

Since, $\frac{\bar{z}}{z}$ lies in third quadrant, therefore its real and imaginary parts should be negative.

12. Let $z = \frac{2 - i}{(1 - 2i)^2}$

$\therefore$ Conjugate of $z = \bar{z} = \frac{2 + i}{(1 + 2i)^2}$ ($\because$ replacing i by $-i$)

$$\therefore \quad \bar{z} = \frac{2 + i}{1^2 - 4 + 4i} = \frac{2 + i}{4i - 3} \times \frac{4i + 3}{4i + 3}$$

$$= \frac{11i + 2}{(4i)^2 - (3)^2} = \frac{11i + 2}{-16 - 9} = \frac{-2}{25} - i\,\frac{11}{25}$$

13. Let $z = \sin x + i \cos 2x$

According to the given condition,

$$\bar{z} = \cos x - i \sin 2x$$

$$\therefore \quad \sin x - i \cos 2x = \cos x - i \sin 2x$$

$$\Rightarrow \quad (\sin x - \cos x) + i(\sin 2x - \cos 2x) = 0$$

On equating real and imaginary parts, we get

$$\sin x - \cos x = 0, \sin 2x - \cos 2x = 0$$

$$\Rightarrow \quad \tan x = 0 \text{ and } \tan 2x = 0$$

$$\Rightarrow \quad x = n\pi \text{ and } 2x = n\pi$$

$$\Rightarrow \quad x = n\pi \text{ and } x = \frac{n\pi}{2}$$

which is not possible.

14. $(z + 3)(\bar{z} + 3) = z\bar{z} + 3z + 3\bar{z} + (3)^2$

$$= |z|^2 + 3\left(\frac{z + \bar{z}}{2}\right) \times 2 + 3^2 \qquad (\because |z|^2 = z\bar{z})$$

$$= |z|^2 + 2 \times 3 \times |z| + 3^2 = |z + 3|^2$$

15. Let $z = x + iy$

$$\frac{z - 1}{z + 1} = \frac{x + iy - 1}{x + iy + 1} = \frac{(x - 1) + iy}{(x + 1) + iy} \times \frac{(x + 1) - iy}{(x + 1) - iy}$$

$$= \frac{(x - 1)(x + 1) - iy(x - 1) + iy(x + 1) - i^2 y^2}{(x + 1)^2 - i^2 y^2}$$

$$= \frac{x^2 - 1 + iy(x + 1 - x + 1) + y^2}{(x + 1)^2 + y^2}$$

$$\Rightarrow \quad \frac{z - 1}{z + 1} = \frac{(x^2 + y^2 - 1)}{(x + 1)^2 + y^2} + \frac{i(2y)}{(x + 1)^2 + y^2}$$

$\because \frac{z - 1}{z + 1}$ is purely imaginary.

$$\therefore \quad \text{Re}\left(\frac{z - 1}{z + 1}\right) = 0$$

$$\Rightarrow \quad \frac{x^2 + y^2 - 1}{(x + 1)^2 + y^2} = 0$$

$$\Rightarrow \quad x^2 + y^2 - 1 = 0$$

$$\Rightarrow \quad x^2 + y^2 = 1$$

$$\Rightarrow \quad |z^2| = 1 \Rightarrow |z| = 1$$

16. We have, $|z_k| = 1, k = 1, 2, \ldots, n$

$$\Rightarrow \quad |z_k|^2 = 1 \Rightarrow z_k \bar{z}_k = 1 \Rightarrow \bar{z}_k = \frac{1}{z_k}$$

$$\therefore |z_1 + z_2 + \ldots + z_n| = |\overline{z_1 + z_2 + \ldots + z_n}| \qquad (\because |z| = |\bar{z}|)$$

$$= |\bar{z}_1 + \bar{z}_2 + \ldots + \bar{z}_n|$$

$$= \left|\frac{1}{z_1} + \frac{1}{z_2} + \ldots + \frac{1}{z_n}\right|$$

17. Given that, $|\beta| = 1$

$$\therefore \quad \left|\frac{\beta - \alpha}{1 - \bar{\alpha}\beta}\right| = \left|\frac{\beta - \alpha}{\beta\bar{\beta} - \bar{\alpha}\beta}\right|$$

$$= \left|\frac{\beta - \alpha}{\beta(\bar{\beta} - \bar{\alpha})}\right| = \frac{1}{|\beta|}\left|\frac{\beta - \alpha}{(\bar{\beta} - \bar{\alpha})}\right|$$

$$= \frac{1}{|\beta|} = 1 \qquad (\because |z| = |\bar{z}|)$$

18. Given, $|z + 1| = z + 2(1 + i)$ ...(i)

By taking option (a),

Put $z = \frac{1}{2} - 2i$ in Eq. (i), we get

$$\text{LHS} = \left|\frac{1}{2} - 2i + 1\right| = \left|\frac{3}{2} - 2i\right| = \sqrt{\frac{9}{4} + 4} = \frac{\sqrt{25}}{2} = \frac{5}{2}$$

$$\text{RHS} = \left(\frac{1}{2} - 2i\right) + 2 + 2i = \frac{5}{2}$$

$\therefore$ LHS = RHS

Hence, option (a) is correct.

19. Let $z = x + iy$

$$\Rightarrow \quad \bar{z} = x - iy$$

and $$(\bar{z}^{-1}) = \frac{1}{x - iy} = \frac{x + iy}{x^2 + y^2}$$

$$\therefore \quad (\bar{z}^{-1})\,\bar{z} = \frac{x + iy}{x^2 + y^2} \times (x - iy) = 1$$

20. Given, $\left|\frac{i + z}{i - z}\right| = 1$

Let $z = x + iy$

$$\therefore \quad \left|\frac{i + x + iy}{i - (x + iy)}\right| = 1$$

$$\Rightarrow \quad \frac{|x + i(1 + y)|}{|-x + i(1 - y)|} = 1$$

$$\Rightarrow \quad \sqrt{x^2 + (1 + y)^2} = \sqrt{(-x)^2 + (1 - y)^2}$$

$$\Rightarrow \quad x^2 + 1^2 + y^2 + 2y = x^2 + 1^2 + y^2 - 2y$$

$$\Rightarrow \quad 4y = 0 \Rightarrow y = 0$$

Hence, the given condition lies on x-axis.

21. Let $z_1 = r_1(\cos\theta_1 + i\sin\theta_1)$, $z_2 = r_2(\cos\theta_2 + i\sin\theta_2)$

$\because \quad |z_1 + z_2| = |z_1| + |z_2|$

$|(r_1\cos\theta_1 + r_2\cos\theta_2) + i(r_1\sin\theta_1 + r_2\sin\theta_2)|$

$= |r_1\cos\theta_1 + ir_1\sin\theta_1| + |r_2\cos\theta_2 + ir_2\sin\theta_2|$

$\Rightarrow \sqrt{r_1^2 + r_2^2 + 2r_1r_2\cos(\theta_1 - \theta_2)} = \sqrt{r_1^2\cos^2\theta_1 + r_1^2\sin^2\theta_1} + \sqrt{r_2^2\cos^2\theta_2 + r_2^2\sin^2\theta_2}$

$\Rightarrow \sqrt{r_1^2 + r_2^2 + 2r_1r_2\cos(\theta_1 - \theta_2)} = r_1 + r_2$

$\Rightarrow r_1^2 + r_2^2 + 2r_1r_2\cos(\theta_1 - \theta_2) = r_1^2 + r_2^2 + 2r_1r_2$

$\Rightarrow \cos(\theta_1 - \theta_2) = 1$

$\Rightarrow \theta_1 - \theta_2 = 0$

$\Rightarrow \theta_1 = \theta_2$

$\Rightarrow \arg(z_1) = \arg(z_2)$

22. $|z - 2| = \min\{|z - 1|, |z - 5|\}$

i.e., $|z - 2| = |z - 1|$, where $|z - 1| < |z - 5|$

$\Rightarrow \text{Re}(z) = \frac{3}{2}$, which satisfy $|z - 1| < |z - 5|$

Also, $|z - 2| = |z - 5|$, where $|z - 5| < |z - 1|$

$\Rightarrow \text{Re}(z) = \frac{7}{2}$, which satisfy $|z - 5| < |z - 1|$

23. $|3z - 1| = 3|z - 2|$

$\Rightarrow \left|z - \frac{1}{3}\right| = |z - 2|$

$\Rightarrow z$ is perpendicular bisector of $\left(\frac{1}{3}, 0\right)$ and $(2, 0)$.

$\Rightarrow x = \frac{7}{6}$

24. We have, $\left|\frac{z - a}{z + \bar{a}}\right| = 1$

$\Rightarrow |z - a| = |z + \bar{a}| \Rightarrow |z - a|^2 = |z + \bar{a}|^2$

$\Rightarrow (z - a)\overline{(z - a)} = (z + \bar{a})\overline{(z + \bar{a})}$

$\Rightarrow (z - a)(\bar{z} - \bar{a}) = (z + \bar{a})(\bar{z} + a) \quad [\because (\bar{\bar{a}}) = a]$

$\Rightarrow z\bar{z} - z\bar{a} - a\bar{z} + a\bar{a} = z\bar{z} + za + \bar{a}\bar{z} + \bar{a}a$

$\Rightarrow za + z\bar{a} + \bar{a}\bar{z} + a\bar{z} = 0$

$\Rightarrow (a + \bar{a})(z + \bar{z}) = 0$

$\Rightarrow z + \bar{z} = 0 \quad [\because a + \bar{a} = 2\,\text{Re}(a) \neq 0]$

$\Rightarrow 2\,\text{Re}(z) = 0 \Rightarrow 2x = 0$

$\Rightarrow x = 0 \Rightarrow y$-axis

25. We have, $|\lambda_1a_1 + \lambda_2a_2 + \ldots + \lambda_na_n|$

$\leq |\lambda_1a_1| + |\lambda_2a_2| + \ldots + |\lambda_na_n|$

$= |\lambda_1||a_1| + \ldots + |\lambda_n||a_n|$

$= \lambda_1|a_1| + \ldots + \lambda_n|a_n| < \lambda_1 + \ldots + \lambda_n \quad (\because \text{each } \lambda_k \geq 0)$

$(\because |a_k| < 1$ and so $\lambda_k|a_k| < \lambda_k$ for all $k = 1, 2, \ldots, n)$

Hence, $|\lambda_1a_1 + \lambda_2a_2 + \ldots + \lambda_na_n| < 1$

26. Let $z = x + iy$

$\therefore \arg(z) = \tan^{-1}\left(\frac{y}{x}\right)$

Then, $\arg(\bar{z}) = \tan^{-1}\left(-\frac{y}{x}\right) = 2\pi - \tan^{-1}\frac{y}{x}$

$= 2\pi - \arg(z)$

Since, in argument of a conjugate of a complex, the real axis is unaltered but imaginary axis be changed, hence it is given by $2\pi - \arg(z)$.

27. We have, $\arg(z - 1) = \arg(z + 3i)$

On putting $z = x + iy$,

$\Rightarrow \arg(x + iy - 1) = \arg(x + iy + 3i)$

$\Rightarrow \arg[(x - 1) + iy] = \arg[x + i(y + 3)]$

$\Rightarrow \tan^{-1}\frac{y}{x - 1} = \tan^{-1}\frac{y + 3}{x}$

$\Rightarrow \frac{y}{x - 1} = \frac{y + 3}{x} \Rightarrow xy = (x - 1)(y + 3)$

$\Rightarrow xy = xy + 3x - y - 3$

$\Rightarrow 0 = 3(x - 1) - y$

$\Rightarrow y = 3(x - 1) \Rightarrow \frac{x - 1}{y} = \frac{1}{3}$

$\Rightarrow (x - 1) : y = 1 : 3$

28. Let $z_1 = r(\cos\theta_1 + i\sin\theta_1)$

and $z_2 = r(\cos\theta_2 + i\sin\theta_2)$

Since, $|z_2| = |z_1|$

$\therefore r_2 = r_1$

Also, $\arg(z_1) + \arg(z_2) = \pi$

$\therefore \arg(z_2) = \pi - \arg(z_1)$

$\Rightarrow \arg(z_2) = \pi - \theta_1$

$\therefore z_2 = r_1\{\cos(\pi - \theta_1) + i\sin(\pi - \theta_1)\}$

$= r_1(-\cos\theta_1 + i\sin\theta_1)$

$= -r_1(\cos\theta_1 - i\sin\theta_1) = -\bar{z}_1$

$\Rightarrow z_1 = -\bar{z}_2$

29. Given, $f(z) = \frac{7 - z}{1 - z^2}$ and $z = 1 + 2i$

$\therefore f(z) = \frac{7 - (1 + 2i)}{1 - (1 + 2i)^2}$

$= \frac{6 - 2i}{1 - (1 - 4 + 4i)} = \frac{6 - 2i}{4 - 4i}$

$= \frac{6 - 2i}{4(1 - i)} \times \frac{1 + i}{(1 + i)} = \frac{6 + 4i + 2}{4(1^2 - i^2)}$

$= \frac{8 + 4i}{4(2)} = \frac{1}{2}(2 + i)$

$|f(z)| = \frac{\sqrt{4 + 1}}{2} = \frac{\sqrt{5}}{2}$

$= \frac{|z|}{2} \quad (\because z = 1 + 2i$, given $\Rightarrow |z| = \sqrt{5})$

30. We have, $\tan^{-1}(\alpha + i\beta) = x + iy$

$\Rightarrow \quad \alpha + i\beta = \tan(x + iy)$ ...(i)

Taking conjugate, we get

$(\alpha - i\beta) = \tan(x - iy)$ ...(ii)

$\therefore \quad \tan 2x = \tan[(x + iy) + (x - iy)]$

$\Rightarrow \quad \tan 2x = \dfrac{(\alpha + i\beta) + (\alpha - i\beta)}{1 - (\alpha + i\beta)(\alpha - i\beta)}$

$= \dfrac{2\alpha}{1 - (\alpha^2 + \beta^2)}$

$\therefore \quad x = \dfrac{1}{2}\tan^{-1}\left(\dfrac{2\alpha}{1 - \alpha^2 - \beta^2}\right)$

31. Let $z = x + iy \Rightarrow \bar{z} = x - iy$

Since, $\arg(z) = \tan^{-1}\dfrac{y}{x}$

and $\arg(\bar{z}) = \tan^{-1}\left(\dfrac{-y}{x}\right)$

$\Rightarrow \quad \arg(z) \neq \arg(\bar{z})$

32. We know that principal argument of a complex number lie between $-\pi$ and π, but $\alpha + \beta > \pi$.

Therefore, principal

$\arg(z_1 z_2) = \arg(z_1) + \arg(z_2) = \alpha + \beta$ is given by $\alpha + \beta - \pi$.

33. We have, $z_2 = \bar{z}_1$ and $z_4 = \bar{z}_3$

Therefore, $z_1 z_2 = |z_1|^2$ and $z_3 z_4 = |z_3|^2$

Now, $\arg\left(\dfrac{z_1}{z_4}\right) + \arg\left(\dfrac{z_2}{z_3}\right) = \arg\left(\dfrac{z_1 z_2}{z_4 z_3}\right)$

$= \arg\left(\dfrac{|z_1|^2}{|z_3|^2}\right) = \arg\left(\left|\dfrac{z_1}{z_3}\right|^2\right) = 0$

($\because$ argument of positive real number is zero)

34. Let $z = \dfrac{1 - i\sqrt{3}}{1 + i\sqrt{3}}$

$= \dfrac{1 - i\sqrt{3}}{1 + i\sqrt{3}} \times \dfrac{1 - i\sqrt{3}}{1 - i\sqrt{3}} = \dfrac{-1 - i\sqrt{3}}{2}$

$\therefore \quad \arg(z) = \theta = \tan^{-1}\left|\dfrac{\frac{\sqrt{3}}{2}}{\frac{1}{2}}\right| = \tan^{-1}(\sqrt{3}) = 60°$

35. Since, $\arg(z) - \arg(w) = \dfrac{\pi}{2}$

$\Rightarrow \quad -\arg(z) + \arg(w) = -\dfrac{\pi}{2}$

$\Rightarrow \quad \arg(\bar{z}) + \arg(w) = -\dfrac{\pi}{2}$

$\Rightarrow \quad \arg(\bar{z}w) = -\dfrac{\pi}{2}$ ...(i)

Also given, $|zw| = i = |\bar{z}w|$ ...(ii)

$\therefore$ From Eqs. (i) and (ii), we get

$\bar{z}w = |\bar{z}w|\, e^{i\arg(zw)}$

$= 1\, e^{-i\frac{\pi}{2}} = \cos\left(-\dfrac{\pi}{2}\right) + i\sin\left(-\dfrac{\pi}{2}\right)$

$= 0 - i\sin\dfrac{\pi}{2} = -i$

36. We have, $|z + 4| \le 3 \Rightarrow -3 \le z + 4 \le 3$

$\Rightarrow \quad -6 \le z + 1 \le 0 \Rightarrow 0 \le -(z + 1) \le 6$

$\Rightarrow \quad 0 \le |z + 1| \le 6$

Hence, greatest and least values of $|z + 1|$ are 6 and 0, respectively.

37. We know that, $|-z| = |z|$

and $|z_1 + z_2| \le |z_1| + |z_2|$

Now, $|z| + |z - 1| = |z| + |1 - z| \ge |z + (1 - z)| = |1| = 1$

Hence, minimum value of $|z| + |z - 1|$ is 1.

38. Since, $|z + a| \le a$ implies z lies on or inside a circle with centre $(-a, 0)$ and radius a, we have

$|z_1| + |z_2| + |z_3| \le 14$

39. $\left|z + \dfrac{2}{z}\right| = 2 \Rightarrow |z| - \dfrac{2}{|z|} \le 2$

$\Rightarrow \quad |z|^2 - 2|z| - 2 \le 0$

This is a quadratic equation in $|z|$.

$\therefore \quad |z| \le \dfrac{2 \pm \sqrt{4 + 8}}{2} \le 1 \pm \sqrt{3}$

Hence, maximum value of $|z|$ is $1 + \sqrt{3}$.

40. Since, $|z_1 - 1| < 4$

$\Rightarrow \quad |z_1| - |1| < 1$ ($\because$ by triangle inequality)

$\Rightarrow \quad |z_1| < 2$ ...(i)

Similarly, $|z_3 - 2| < 2$

$\Rightarrow \quad |z_2| < 4$ ...(ii)

and $|z_3 - 3| < 3$

$\Rightarrow \quad |z_3| < 6$ ...(iii)

On adding Eqs. (i), (ii) and (iii), we get

$|z_1| + |z_2| + |z_3| < 2 + 4 + 6$

$\Rightarrow \quad |z_1| + |z_2| + |z_3| < 12$ ...(iv)

By using triangular inequality

$|z_1 + z_2 + z_3| \le |z_1| + |z_2 + |z_3|$

$\Rightarrow \quad |z_1 + z_2 + z_3| < 12$ [$\because$ from Eq. (iv)]

41. We have, $OC = 5$ and $CA = 1$

Clearly, the point z is such that amplitude of z is minimum to the point of contact of the circle and the tangent drawn from the origin O.

Let $\theta = \angle AOC$. Then, $\angle AOC = 90° - \theta$

From figure,

$$\sin \angle AOC = \frac{1}{5}$$

$$\Rightarrow \quad \sin(90° - \theta) = \frac{1}{5}$$

$$\Rightarrow \quad \cos\theta = \frac{1}{5}$$

and $$\sin\theta = \frac{\sqrt{24}}{5}$$

Now, $$OA = \sqrt{OC^2 - CA^2} = \sqrt{5^2 - 1^2} = \sqrt{24}$$

Now, the coordinates of A are $(\sqrt{24}\cos\theta, \sqrt{24}\sin\theta)$

i.e., $$\left(\frac{\sqrt{24}}{5}, \frac{24}{5}\right)$$

Hence, $$z = \frac{2\sqrt{6}}{5} + i\,\frac{24}{5}$$

42. $$\frac{4(\cos 75° + i\sin 75°)}{0.4(\cos 30° + i\sin 30°)}$$

$$= 10(\cos 75° + i\sin 75°)(\cos 30° - i\sin 30°)$$

$$= 10\,e^{75i}\cdot e^{-30i} = 10\,e^{45i}$$

$$= 10(\cos 45° + i\sin 45°) = \frac{10}{\sqrt{2}}(1+i)$$

43. $(\cos\theta + i\sin\theta)(\cos 2\theta + i\sin 2\theta)\ldots(\cos n\theta + i\sin n\theta) = 1$

$$\Rightarrow \quad \cos(\theta + 2\theta + 3\theta + \ldots + n\theta) + i\sin(\theta + 2\theta + 3\theta + \ldots + n\theta) = 1$$

$$\Rightarrow \quad \cos\left\{\frac{n(n+1)}{2}\theta\right\} + i\sin\left\{\frac{n(n+1)}{2}\theta\right\} = 1$$

On comparing the coefficients of real and imaginary parts on both sides, we get

$$\cos\left\{\frac{n(n+1)}{2}\theta\right\} = 1 \text{ and } \sin\left\{\frac{n(n+1)}{2}\theta\right\} = 0$$

$$\Rightarrow \quad \frac{n(n+1)}{2}\theta = 2m\pi$$

$$\Rightarrow \quad \theta = \frac{4m\pi}{n(n+1)}, \text{ where } m \in I$$

44. Here, $$\sqrt{1-c^2} = nc - 1$$

$$\Rightarrow \quad 1 - c^2 = n^2c^2 - 2nc + 1$$

$$\therefore \quad \frac{c}{2n} = \frac{1}{1+n^2} \quad \ldots(\text{i})$$

or $$\frac{c}{2n}(1+nz)\left(1+\frac{n}{z}\right) = \frac{1}{1+n^2}\left\{1 + n^2 + n\left(z + \frac{1}{z}\right)\right\}$$

$$= \frac{1}{1+n^2}\{1 + n^2 + n(2\cos\theta)\}$$

$$= \frac{(1+n^2) + 2n\cos\theta}{1+n^2}$$

$$= 1 + \left(\frac{2n}{1+n^2}\right)\cos\theta \quad \text{[using Eq. (i)]}$$

$$= 1 + c\cos\theta$$

45. We have, $\{(1-\cos\theta) + i\cdot 2\sin\theta\}^{-1}$

$$= \left(2\sin^2\frac{\theta}{2} + i\cdot 4\sin\frac{\theta}{2}\cos\frac{\theta}{2}\right)^{-1}$$

$$= \left(2\sin\frac{\theta}{2}\right)^{-1}\left(\sin\frac{\theta}{2} + i\cdot 2\cos\frac{\theta}{2}\right)^{-1}$$

$$= \left(2\sin\frac{\theta}{2}\right)^{-1}\cdot\frac{1}{\sin\frac{\theta}{2} + i\cdot 2\cos\frac{\theta}{2}} \times \frac{\sin\frac{\theta}{2} - i\cdot 2\cos\frac{\theta}{2}}{\sin\frac{\theta}{2} - i\cdot 2\cos\frac{\theta}{2}}$$

$$= \frac{\sin\frac{\theta}{2} - i\cdot 2\cos\frac{\theta}{2}}{2\sin\frac{\theta}{2}\left(\sin^2\frac{\theta}{2} + 4\cos^2\frac{\theta}{2}\right)}$$

$$= \frac{\sin\frac{\theta}{2} - i\cdot 2\cos\frac{\theta}{2}}{2\sin\frac{\theta}{2}\left(1 + 3\cos^2\frac{\theta}{2}\right)}$$

It's real part

$$= \frac{\sin\frac{\theta}{2}}{2\sin\frac{\theta}{2}\left(1 + 3\cos^2\frac{\theta}{2}\right)} = \frac{1}{2\left(1 + 3\cos^2\frac{\theta}{2}\right)}$$

$$= \frac{1}{2 + 3(\cos\theta + 1)} = \frac{1}{5 + 3\cos\theta}$$

46. $$\frac{1+a}{1-a} = \frac{e^{\frac{-i\theta}{2}}(1+e^{i\theta})}{e^{\frac{-i\theta}{2}}(1-e^{i\theta})} = \frac{e^{-i\left(\frac{\theta}{2}\right)} + e^{i\frac{\theta}{2}}}{e^{-i\left(\frac{\theta}{2}\right)} - e^{-i\frac{\theta}{2}}} = \frac{2\cos\frac{\theta}{2}}{-2i\sin\frac{\theta}{2}} = i\cot\frac{\theta}{2}$$

47. $$x + iy = \frac{3}{2 + \cos\theta + i\sin\theta} = \frac{3(2 + \cos\theta - i\sin\theta)}{(2+\cos\theta)^2 + \sin^2\theta}$$

$$= \frac{6 + 3\cos\theta - 3i\sin\theta}{4 + \cos^2\theta + 4\cos\theta + \sin^2\theta}$$

$$= \left[\frac{6 + 3\cos\theta}{5 + 4\cos\theta}\right] + i\left[\frac{-3\sin\theta}{5 + 4\cos\theta}\right]$$

On equating the real and imaginary parts on both sides, we get

$$x = \frac{3(2+\cos\theta)}{5 + 4\cos\theta}, \quad y = \frac{-3\sin\theta}{5 + 4\cos\theta}$$

$$\therefore \quad x^2 + y^2 = \frac{9}{(5 + 4\cos\theta)^2}(4 + \cos^2\theta + 4\cos\theta + \sin^2\theta)$$

$$= \frac{9}{5 + 4\cos\theta} = 4\left(\frac{6 + 3\cos\theta}{5 + 4\cos\theta}\right) - 3$$

$$= 4x - 3$$

48. We have, $z_r = \cos\frac{r\alpha}{n^2} + i\sin\frac{r\alpha}{n^2}$

where $r = 1, 2, 3, \ldots, n$

$$\therefore \quad z_1 = \cos\frac{\alpha}{n^2} + i\sin\frac{\alpha}{n^2};$$

$$z_2 = \cos\frac{2\alpha}{n^2} + i\sin\frac{2\alpha}{n^2}$$

$$\vdots \qquad \vdots \qquad \vdots$$

$$z_n = \cos\frac{n\alpha}{n^2} + i\sin\frac{n\alpha}{n^2}$$

$$\therefore \lim_{n\to\infty}(z_1 z_2 z_3 \ldots z_n)$$

$$= \lim_{n\to\infty}\left(\cos\frac{\alpha}{n^2} + i\sin\frac{\alpha}{n^2}\right)\left(\cos\frac{2\alpha}{n^2} + i\sin\frac{2\alpha}{n^2}\right)\ldots\left(\cos\frac{n\alpha}{n^2} + i\sin\frac{n\alpha}{n^2}\right)$$

$$= \lim_{n\to\infty}\left[\cos\left\{\frac{\alpha}{n^2}(1+2+3+\ldots+n)\right\} + i\sin\left\{\frac{\alpha}{n^2}(1+2+3+\ldots+n)\right\}\right]$$

$$= \lim_{n\to\infty}\left[\cos\frac{\alpha n(n+1)}{2n^2} + i\sin\frac{\alpha n(n+1)}{2n^2}\right]$$

$$= \cos\frac{\alpha}{2} + i\sin\frac{\alpha}{2} = e^{\frac{i\alpha}{2}}$$

49. Let $z = \cos\frac{2\pi}{7} + i\sin\frac{2\pi}{7}$, then by using de-Moivre's theorem

$$\therefore \quad z^k = \cos\frac{2\pi k}{7} + i\sin\frac{2\pi k}{7} \qquad \ldots(\text{i})$$

Let
$$S = \sum_{k=1}^{6}\left(\sin\frac{2\pi k}{7} - i\cos\frac{2\pi k}{7}\right)$$

$$= \sum_{k=1}^{6}\left[(-i)\left(\cos\frac{2\pi k}{7} + i\sin\frac{2\pi k}{7}\right)\right]$$

$$= (-i)\sum_{k=1}^{6}\left(\cos\frac{2\pi k}{7} + i\sin\frac{2\pi k}{7}\right)$$

$$= (-i)\sum_{k=1}^{6} z^k \qquad \text{[from Eq. (i)]}$$

$$= (-i)(z + z^2 + z^3 + \ldots + z^6)$$

It is a GP of which the first term is z, number of terms is 6 and the common ratio is

$$z = \cos\frac{2\pi}{7} + i\sin\frac{2\pi}{7} \neq 1$$

$$\therefore \quad S = (-i)\frac{z(1-z^6)}{1-z} = (-i)\frac{z - z^7}{1-z}$$

$$= (-i)\frac{z-1}{1-z} = i \qquad \left[\because z^7 = \left(\cos\frac{2\pi}{7} + i\sin\frac{2\pi}{7}\right)^7 = \cos 2\pi + i\sin 2\pi = 1\right]$$

50. Let $z - 1 = r(\cos\theta + i\sin\theta) = re^{i\theta}$

$$\therefore \text{Given expression} = re^{i\theta}\cdot e^{-i\alpha} + \frac{1}{re^{i\theta}}\cdot e^{i\alpha}$$

$$= re^{i(\theta-\alpha)} + \frac{1}{r}e^{-i(\theta-\alpha)}$$

Since, imaginary part of given expression is zero, we have

$$r\sin(\theta-\alpha) - \frac{1}{r}\sin(\theta-\alpha) = 0$$

$$r^2 - 1 = 0 \quad \Rightarrow \quad r^2 = 1$$

$$\Rightarrow \quad r = 1$$

$$\Rightarrow \quad |z-1| = 1$$

or $\quad \sin(\theta-\alpha) = 0 \quad \Rightarrow \quad \theta - \alpha = 0$

$$\Rightarrow \quad \theta = \alpha$$

$$\Rightarrow \quad \arg(z-1) = \alpha$$

51. We have, $\quad a = \cos\alpha + i\sin\alpha,$

$$b = \cos\beta + i\sin\beta$$

and $\quad c = \cos\gamma + i\sin\gamma$

Now, $\quad \frac{b}{c} = \frac{\cos\beta + i\sin\beta}{\cos\gamma + i\sin\gamma} \times \frac{\cos\gamma - i\sin\gamma}{\cos\gamma - i\sin\gamma}$

$$= \cos\beta\cos\gamma + \sin\beta\sin\gamma + i[\sin\beta\cos\gamma - \sin\gamma\cos\beta]$$

$$\Rightarrow \quad \frac{b}{c} = \cos(\beta-\gamma) + i\sin(\beta-\gamma) \qquad \ldots(\text{i})$$

Similarly, $\quad \frac{c}{a} = \cos(\gamma-\alpha) + i\sin(\gamma-\alpha) \qquad \ldots(\text{ii})$

and $\quad \frac{a}{b} = \cos(\alpha-\beta) + i\sin(\alpha-\beta) \qquad \ldots(\text{iii})$

On adding Eqs. (i), (ii) and (iii), we get

$$\cos(\beta-\gamma) + \cos(\gamma-\alpha) + \cos(\alpha-\beta) + i[\sin(\beta-\gamma) + \sin(\gamma-\alpha) + \sin(\alpha-\beta)] = 1$$

On equating real parts to on both sides, we get

$$\cos(\beta-\gamma) + \cos(\gamma-\alpha) + \cos(\alpha-\beta) = 1$$

52. We have, $\quad \cos\alpha + \cos\beta + \cos\gamma = 0 \qquad \ldots(\text{i})$

and $\quad \sin\alpha + \sin\beta + \sin\gamma = 0 \qquad \ldots(\text{ii})$

Let $\quad a = \cos\alpha + i\sin\alpha,$

$$b = \cos\beta + i\sin\beta$$

and $\quad c = \cos\gamma + i\sin\gamma$

Therefore, $\quad a + b + c = (\cos\alpha + \cos\beta + \cos\gamma) + i(\sin\alpha + \sin\beta + \sin\gamma)$

$$= 0 + i0 = 0 \qquad \text{[from Eqs. (i) and (ii)]}$$

If $a + b + c = 0$, then $a^3 + b^3 + c^3 = 3abc$

$$\Rightarrow (\cos\alpha + i\sin\alpha)^3 + (\cos\beta + i\sin\beta)^3 + (\cos\gamma + i\sin\gamma)^3$$

$$= 3(\cos\alpha + i\sin\alpha)(\cos\beta + i\sin\beta)(\cos\gamma + i\sin\gamma)$$

$$\Rightarrow (\cos 3\alpha + i\sin 3\alpha) + (\cos 3\beta + i\sin 3\beta) + (\cos 3\gamma + i\sin 3\gamma)$$

$$= 3[\cos(\alpha+\beta+\gamma) + i\sin(\alpha+\beta+\gamma)]$$

$$\Rightarrow \quad \cos 3\alpha + \cos 3\beta + \cos 3\gamma = 3\cos(\alpha+\beta+\gamma)$$

53. We have,

$$(16)^{1/4} = (2^4)^{1/4} = 2(1)^{1/4} = 2(\cos 0 + i \sin 0)^{1/4}$$

$$= 2\{\cos \frac{1}{4}(2k\pi + 0) + i \sin \frac{1}{4}(2k\pi + 0)\}$$

$$k = 0, 1, 2, 3$$

$$= 2 \times 1, 2 \times i, 2 \times -1, 2 \times -i = \pm 2, \pm 2i$$

54. We have, $\omega_n = \cos\left(\frac{2\pi}{n}\right) + i \sin\left(\frac{2\pi}{n}\right)$

$$\Rightarrow \quad \omega_3 = \cos\frac{2\pi}{3} + i \sin\frac{2\pi}{3}$$

$$= -\frac{1}{2} + \frac{i\sqrt{3}}{2} = \omega \text{ and } \omega_3^2 = \left(\cos\frac{2\pi}{3} + i \sin\frac{2\pi}{3}\right)^2$$

$$= \cos\frac{4\pi}{3} + i \sin\frac{4\pi}{3} = -\frac{1}{2} - \frac{i\sqrt{3}}{2} = \omega^2$$

$$\therefore (x + y\omega_3 + z\omega_3^2)(x + y\omega_3^2 + z\omega_3)$$

$$= (x + y\omega + z\omega^2)(x + y\omega^2 + z\omega)$$

$$= x^2 + y^2 + z^2 - xy - yz - zx$$

55. Given expression

$$= \frac{\omega(a + b\omega + c\omega^2)}{b\omega + c\omega^2 + a} + \frac{\omega^2(a + b\omega + c\omega^2)}{c\omega^2 + a + b\omega}$$

$$= \omega + \omega^2 = -1 \qquad (\because 1 + \omega + \omega^2 = 0)$$

56. Since, α, β and γ be the cube roots of a positive number p.

$$\therefore \quad \alpha = p^{1/3}, \quad \beta = \omega p^{1/3}, \quad \gamma = \omega^2 p^{1/3}$$

Hence, $\frac{\alpha x + \beta y + \gamma z}{\beta x + \gamma y + \alpha z} = \frac{x + \omega y + \omega^2 z}{\omega x + \omega^2 y + z} = \frac{1}{\omega} = \omega^2$

$$= \frac{-1 - i\sqrt{3}}{2}$$

57. $(1 + \omega^2 + 2\omega)^{3n} - (1 + \omega + 2\omega^2)^{3n}$

$$= \omega^{3n} - (\omega^2)^{3n}$$

$$= (\omega^3)^n - (\omega^3)^{2n}$$

$$= 1 - 1 = 0$$

58. Let $x = \sqrt{-1 - \sqrt{-1 - \sqrt{-1 - \ldots \infty}}}$

Then, $x = \sqrt{-1 - x}$ or $x^2 = -1 - x$

or $x^2 + x + 1 = 0$

$$\therefore \quad x = \frac{-1 \pm \sqrt{1 - 4 \cdot 1 \cdot 1}}{2 \cdot 1} = \frac{-1 \pm \sqrt{-3}}{2}$$

$$= \frac{-1 \pm \sqrt{3}\, i}{2} = \omega \text{ or } \omega^2$$

59. $x = a + b, y = a\alpha + b\beta$ and $z = a\beta + b\alpha$

Now, $xyz = (a + b)(a\omega + b\omega^2)(a\omega^2 + b\omega)$,

where $\alpha = \omega$ and $\beta = \omega^2$

$$\therefore \quad xyz = (a + b)(a^2 + ab\omega^2 + ab\omega + b^2)$$

$$= (a + b)(a^2 - ab + b^2) = a^3 + b^3$$

60. $(1 + \omega)^7 = (1 + \omega)(1 + \omega)^6 = (1 + \omega)(-\omega^2)^6 = (1 + \omega)$

$$\Rightarrow \quad A + B\omega = 1 + \omega$$

$$\Rightarrow \quad A = 1, \ B = 1$$

61. We have, $\omega^1 \cdot \omega^2 \cdot \omega^3 \cdot \ldots \cdot \omega^n$

$$= \omega^{1+2+3+\ldots+n} = \omega^{\frac{n(n+1)}{2}} = S_n \qquad \text{(say)}$$

On putting $n = 1, 2, 3, \ldots, n$, we get

$$S_1 = \omega^1 = \omega, \quad S_2 = \omega^3 = 1,$$

$$S_3 = \omega^6 = 1, \ldots, \quad S_7 = \omega^{28} = \omega$$

$\therefore$ We always get 1 and ω.

62. $\Delta = \begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^n & \omega^{2n} & 1 \\ \omega^{2n} & 1 & \omega^n \end{vmatrix}$

$$= 1(\omega^{3n} - 1) - \omega^n(\omega^{2n} - \omega^{2n}) + \omega^{2n}(\omega^n - \omega^{4n})$$

$$= (1 - 1) - 0 + \omega^{2n}[\omega^n - (\omega^3)^n \omega^n] \qquad (\because \omega^{3n} = 1)$$

$$= 0 + 0 + 0 = 0$$

63. $S = 1 + 3\alpha + 5\alpha^2 + \ldots + (2n - 1)\alpha^{n-1}$ ...(i)

$\Rightarrow \quad \alpha S = \alpha + 3\alpha^2 + 5\alpha^3 + \ldots + (2n - 1)\alpha^n$ ...(ii)

On subtracting Eq. (ii) from Eq. (i), we get

$$(1 - \alpha) S = 1 + 2\alpha + 2\alpha^2 + \ldots + 2\alpha^{n-1} - (2n - 1)\alpha^n$$

$$= 2(1 + \alpha + \alpha^2 + \ldots + \alpha^{n-1}) - 1 - (2n - 1)\alpha^n$$

$$= \frac{2(1 - \alpha^n)}{1 - \alpha} - 2n = -2n \qquad (\because \alpha^n = 1)$$

$$\Rightarrow \quad S = \frac{-2n}{(1 - \alpha)}$$

64. The given equation $z^3 + 2z^2 + 2z + 1 = 0$ can be rewritten as $(z + 1)(z^2 + z + 1) = 0$. Its roots are -1, ω and ω^2.

Let $f(z) = z^{1985} + z^{100} + 1$

Put $z = -1$, ω and ω^2 respectively, we have

$$f(-1) = (-1)^{1985} + (-1)^{100} + 1 \neq 0$$

Therefore, -1 is not a root of the equation $f(z) = 0$.

Again, $f(\omega) = \omega^{1985} + \omega^{100} + 1$

$$= (\omega^3)^{661}\omega^2 + (\omega^3)^{33}\omega + 1 = \omega^2 + \omega + 1 = 0$$

Therefore, ω is a root of the equation $f(z) = 0$.

Similarly, $f(\omega^2) = 0$

Hence, ω and ω^2 are the common roots.

65. r th term of the given series

$$= r[(r + 1) - \omega][(r + 1) - \omega^2]$$

$$= r[(r + 1)^2 - (\omega + \omega^2)(r + 1) + \omega^3]$$

$$= r[(r + 1)^2 - (-1)(r + 1) + 1]$$

$$= r(r^2 + 3r + 3) = r^3 + 3r^2 + 3r$$

Thus, sum of the given series

$$= \sum_{r=1}^{(n-1)} (r^3 + 3r^2 + 3r)$$

$$= \frac{1}{4}(n-1)^2 n^2 + 3 \cdot \frac{1}{6}(n-1)(n)(2n-1) + 3 \cdot \frac{1}{2}(n-1)n$$

$$= \frac{1}{4}(n-1)\,n\,(n^2 + 3n + 4)$$

66. $\begin{vmatrix} 1 & 1 & 1 \\ 1 & -1-\omega^2 & \omega^2 \\ 1 & \omega^2 & \omega^4 \end{vmatrix} = \begin{vmatrix} 3 & 1 & 1 \\ 0 & -1-\omega^2 & \omega^2 \\ 0 & \omega^2 & \omega^4 \end{vmatrix}$ $(\because C_1 \to C_1 + C_2 + C_3)$

$$= 3(\omega^2 - \omega) = 3\omega(\omega - 1)$$

67. $\because$ $1, a_1, a_2, \ldots, a_{n-1}$ are n roots of unity.

$\therefore$ $$\frac{x^n - 1}{x - 1} = (x - a_1)(x - a_2)\ldots(x - a_{n-1})$$

$\Rightarrow$ $$x^{n-1} + x^{n-2} + \ldots + x^2 + x + 1$$
$$= (x - a_1)(x - a_2)\ldots(x - a_{n-1})$$

Put $x = 1$

$\therefore$ $(1 - a_1)(1 - a_2)\ldots(1 - a_{n-1}) = 1 + 1 + \ldots n$ times $= n$

68. Since, $x^2 - x + 1 = 0$ (given)

Solving for x, we have $x = -\omega$ and $x = -\omega^2$

Case I $x = -\omega$

$$S = \sum_{n=1}^{5} \left\{(-\omega)^n + \frac{1}{(-\omega)^n}\right\}^2$$

$\Rightarrow$ $$S = \sum_{r=1}^{5} (\omega^n + \omega^{2n})^2$$

$\Rightarrow$ $$S = (-1)^2 + (-1)^2 + 2^2 + (-1)^2 + (-1)^2$$
$$S = 8$$

Case II $x = -\omega^2$

$$S = \sum_{n=1}^{6} \left\{(-\omega^2)^n + \left(\frac{1}{-\omega^2}\right)^n\right\}^2$$

$\Rightarrow$ $$S = \sum_{n=1}^{5} (\omega^{2n} + \omega^n)^2 = 8$$

69. Let $z = x + iy$

$\therefore$ $$\frac{z-1}{2z+1} = \frac{x + iy - 1}{2x + 2iy + 1} = \frac{\{(x-1)(2x+1) + 2y^2)\} + iy(3)}{(2x+1)^2 + 4y^2}$$

According to the question,

$$\text{Im}\left(\frac{z-1}{2z+1}\right) = -4$$

$\therefore$ $$\frac{3y}{(2x+1)^2 + 4y^2} = -4$$

$\Rightarrow$ $$3y = -4\{(4x^2 + 4x + 1) + 4y^2\}$$

$\Rightarrow$ $$16x^2 + 16y^2 + 16x + 3y + 4 = 0$$

This equation represents a circle.

Hence, locus of z is a circle.

70. We have, $z = 4 - 3i$

$\therefore$ $$|z| = \sqrt{4^2 + (-3)^2} = 5$$

Let z_1 be the new complex number obtained by rotating z in the clockwise sense through $180°$, therefore

$$z_1 = -4 + 3i$$

Therefore, required complex number is

$$3(-4 + 3i) = -12 + 9i$$

71. Let OA and OB be the sides of an equilateral ΔOAB and let OA and OB represent the complex numbers z_1 and z_2, respectively.

From the equilateral ΔOAB,

$$\mathbf{AB} = z_2 - z_1$$

$\therefore$ $$\arg\left(\frac{z_2 - z_1}{z_2}\right) = \arg(z_2 - z_1) - \arg z_2 = \frac{\pi}{3}$$

and $$\arg\left(\frac{z_2}{z_1}\right) = \arg(z_2) - \arg(z_1) = \frac{\pi}{3}$$

Also, $\left|\frac{z_2 - z_1}{z_2}\right| = 1 = \left|\frac{z_2}{z_1}\right|$, since triangle is equilateral. Thus, the complex numbers $\frac{z_2 - z_1}{z_2}$ and $\frac{z_2}{z_1}$ have same modulus and same argument, which implies that the numbers are equal, that is

$$\frac{z_2 - z_1}{z_2} = \frac{z_2}{z_1} \Rightarrow z_1 z_2 - z_1^2 = z_2^2$$

$\Rightarrow$ $$z_1^2 + z_2^2 = z_1 z_2$$

72. In a parallelogram $OP_1P_2P_3$, the mid-point of P_1P_2 and OP_3 are the same. But mid-point of P_1P_2 is $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$.

So, that the coordinates of P_3 are $(x_1 + x_2, y_1 + y_2)$.

Thus, the point P_3 corresponds to sum of the complex numbers z_1 and z_2.

$\therefore$ $$\mathbf{OP_3} = \mathbf{OP_1} + \mathbf{OP_2} = z_1 + z_2$$

73. $z_1 + z_2 = -1$ and $z_1 z_2 = \frac{b}{3}$

As z_1 and z_2 origin form an equilateral triangle, we have

$$z_1^2 + z_2^2 + z_3^2 = z_1 z_2 + z_2 z_3 + z_3 z_1$$

$\Rightarrow$ $$z_1^2 + z_2^2 + 0 = z_1 z_2 + 0 + 0$$

$\Rightarrow$ $$(z_1 + z_2)^2 = 3 z_1 z_2 \Rightarrow 1 = b$$

74. We have, $\arg(z-1) - \arg(z+1) = \frac{\pi}{2}$

It is clear from the figure that it a semi-circle.

75. Let $z = x + iy$

$$\therefore \quad \frac{z-1}{z+1} = \frac{x+iy-1}{x+iy+1}$$

$$= \frac{(x^2+y^2-1)+2iy}{(x+1)^2+y^2}$$

$$\therefore \quad \arg\left(\frac{z-1}{z+1}\right) = \tan^{-1}\frac{2y}{x^2+y^2-1}$$

$$\Rightarrow \quad \tan^{-1}\frac{2y}{x^2+y^2-1} = \frac{\pi}{3} \qquad \text{(given)}$$

$$\Rightarrow \quad \frac{2y}{x^2+y^2-1} = \tan\frac{\pi}{3} = \sqrt{3}$$

$$\Rightarrow \quad x^2+y^2-1 = \frac{2}{\sqrt{3}}y$$

$$\Rightarrow \quad x^2+y^2-\frac{2}{\sqrt{3}}y-1=0$$

which is an equation of a circle.

76. $z^2 + ax + a^2 = 0 \Rightarrow z = a\omega, a\omega^2$

(where ω is a non-real root of unity)

$\Rightarrow$ Locus of z is a pair of straight lines

and $\arg(z) = \arg(a) + \arg(\omega)$

or $\arg(z) = \arg(a) + \arg(\omega^2)$

$$\Rightarrow \quad \arg(z) = \pm\frac{2\pi}{3}$$

Also, $|z| = |a||\omega|$ or $|z| = |a||\omega^2|$

$\Rightarrow \quad |z| = |a|$

77. We have, $|z - z_1| = |z - z_2| = |z - z_3| = |z - z_4|$

Therefore, the point having affix z is equidistant from the four points having affixes z_1, z_2, z_3 and z_4. Thus, z is the affix of either the centre of a circle or the point of intersection of diagonals of a square (or rectangle). Therefore, z_1, z_2, z_3 and z_4 are either concyclic or vertices of a square (or rectangle). Hence, z_1, z_2, z_3 and z_4 are concyclic.

78. Let $z_1 = 1 + i$, $z_2 = -2 + 3i$ and $z_3 = 0 + \frac{5}{3}i$.

$$\text{Then,} \quad \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 1 & 1 \\ -2 & 3 & 1 \\ 0 & \frac{5}{3} & 1 \end{vmatrix}$$

$$= 1\left(3 - \frac{5}{3}\right) + 1(2) + 1\left(\frac{-10}{3}\right)$$

$$= \frac{4}{3} + 2 - \frac{10}{3}$$

$$= \frac{4+6-10}{3} = 0$$

Hence, area of triangle is zero, therefore points are collinear.

79. Let $z = x + iy$

Then, $z + iz = (x + iy) + i(x + iy) = (x - y) + i(x + y)$

and $iz = i(x + iy) = -y + ix$

If triangle be the area of the triangle formed by z, $z + iz$ and iz, then

$$\Delta = \frac{1}{2}\left|\begin{vmatrix} x & y & 1 \\ x-y & x+y & 1 \\ -y & x & 1 \end{vmatrix}\right|$$

Applying $R_2 \to R_2 - (R_1 + R_3)$,

$$\text{then} \quad \Delta = \frac{1}{2}\left\|\begin{matrix} x & y & 1 \\ 0 & 0 & -1 \\ -y & x & 1 \end{matrix}\right\| = \frac{1}{2}(x^2+y^2)$$

$$= \frac{1}{2}|z|^2 = 200 \qquad \text{(given)}$$

$\Rightarrow \quad |z|^2 = 400 \Rightarrow |z| = 20$

$\therefore \quad |3z| = 3|z| = 60$

80. Let $z = x + iy$

$\Rightarrow \quad z^2 = x^2 - y^2 + 2ixy$

$\Rightarrow \quad \text{Re}(z^2) = \text{Re}(x^2 - y^2 + 2ixy)$

$\Rightarrow \quad 1 = x^2 - y^2 \qquad [\because \text{Re}(z^2) = 1 \text{ (given)}]$

81.

$$\therefore \quad \overline{AC} = \overline{AB}\, e^{i\pi/3}$$

By rotating $\frac{\pi}{3}$ in clockwise sense

$\Rightarrow \quad (z_3 - z_1) = (z_2 - z_1)\, e^{i\pi/3} \qquad \ldots\text{(i)}$

Also, $(z_1 - z_2) = (z_3 - z_2)\, e^{i\pi/3} \qquad \ldots\text{(ii)}$

On dividing Eq. (i) by Eq. (ii), we get

$$\frac{z_3 - z_1}{z_1 - z_2} = \frac{z_2 - z_1}{z_3 - z_2}$$

$$\Rightarrow \quad z_1^2 + z_2^2 + z_3^2 = z_1z_2 + z_2z_3 + z_3z_1$$

82. Given z, iz and $z + iz$ be the vertices of a triangle, then

let $z = x + iy$

$\therefore \quad iz = -y + ix, z + iz = (x - y) + i(x + y)$

Hence, required area $= \frac{1}{2}\begin{vmatrix} x & y & 1 \\ -y & x & 1 \\ x-y & x+y & 1 \end{vmatrix}$

$= \frac{1}{2}\begin{vmatrix} x & y & 1 \\ -y & x & 1 \\ 0 & 0 & -1 \end{vmatrix}$

$= \left[-\frac{1}{2}(x^2 + y^2)\right]$

$= \frac{1}{2}|z|^2$

83. Vertices of the triangle are $0 = 0 + i0, z = x + iy$

and $ze^{i\alpha} = (x + iy)(\cos\alpha + i\sin\alpha)$

$= (x\cos\alpha - y\sin\alpha) + i(y\cos\alpha + x\sin\alpha)$

$\therefore$ Area of triangle

$= \frac{1}{2}\begin{vmatrix} 0 & 0 & 1 \\ x & y & 1 \\ (x\cos\alpha - y\sin\alpha) & (y\cos\alpha + x\sin\alpha) & 1 \end{vmatrix}$

$= \frac{1}{2}[xy\cos\alpha + x^2\sin\alpha - xy\cos\alpha + y^2\sin\alpha]$

$= \frac{1}{2}(x^2 + y^2)\sin\alpha = \frac{1}{2}|z|^2\sin\alpha \qquad (\because |z| = \sqrt{x^2 + y^2})$

84. As we know, the equation of the form $\left|\frac{z-2}{z+2}\right| = n$ is a circle, if $n \neq 1$.

85. Let $z = x + iy$

$\therefore \quad \text{Re}\left(\frac{x - iy + 2}{x - iy - 1}\right) = 4 \qquad$ (given)

$\therefore \quad \text{Re}\left[\frac{(x+2) - iy}{(x-1) - iy} \times \frac{(x-1) + iy}{(x-1) + iy}\right] = 4$

$\Rightarrow \quad (x + 2)(x - 1) + y^2 = 4[(x-1)^2 + y^2]$

$\Rightarrow \quad x^2 + y^2 - 3x + 2 = 0$, which represents a circle.

86. Let $z = x + iy$, therefore given equation becomes

$(x + iy)(x - iy) + (2 - 3i)(x + iy) + (2 + 3i)(x - iy) + 4 = 0$

$\Rightarrow x^2 + y^2 + 2x + 3y - 3ix + 2iy + 2x - 2iy$

$+ 3ix + 3y + 4 = 0$

$\Rightarrow \quad x^2 + y^2 + 4x + 6y + 4 = 0$

Therefore, given equation represents a circle with radius

$= \sqrt{2^2 + 3^2 - 4} = \sqrt{4 + 9 - 4} = \sqrt{9} = 3$

87. Let $z = x + iy$

$\therefore \quad \frac{z+i}{z+2} = \frac{x + iy + i}{x + iy + 2} = \frac{x + i(y+1)}{(x+2) + iy}$

$= \frac{[x + i(y+1)] \times [(x+2) - iy]}{[(x+2) + iy] \times [(x+2) - iy]}$

$= \left[\frac{x^2 + 2x + y^2 + y}{(x+2)^2 + y^2}\right] + i\left[\frac{(y+1)(x+2) - xy}{(x+2)^2 + y^2}\right]$

Since, it is purely imaginary, therefore real part must be equal to zero.

$\therefore \quad \frac{x^2 + y^2 + 2x + y}{(x+2)^2 + y^2} = 0$

$\Rightarrow \quad x^2 + y^2 + 2x + y = 0$

It represents the equation of circle and its radius

$= \sqrt{1 + \frac{1}{4} - 0} = \frac{\sqrt{5}}{2}$

Therefore, locus of z in argand diagram is a circle of radius $\frac{\sqrt{5}}{2}$.

88. Equation of circle whose centre is z_0 and radius is r, is $|z - z_0|^2 = r^2$

$\Rightarrow \quad (z - z_0)\overline{(z - z_0)} = r^2$

$\Rightarrow \quad (z - z_0)(\bar{z} - \bar{z}_0) = r^2$

$\Rightarrow \quad z\bar{z} - z\bar{z}_0 - \bar{z}z_0 + z_0\bar{z}_0 = r^2$

89. $z^3 + \frac{1}{i}z^2 - \frac{z}{i} + 1 = 0$

$\Rightarrow \quad z^3 - iz^2 + iz + 1 = 0$

$\Rightarrow \quad z^2(z - i) + i(z - i) = 0$

$\Rightarrow \quad (z - i)(z^2 + i) = 0 \quad \Rightarrow \quad |z| = 1$

90. Centre of the circle $z\bar{z} + \bar{a}z + a\bar{z} + b = 0$ is $-a$.

Therefore, centre of the given circle

$z\bar{z} - (2 + 3i)z - (2 - 3i)\bar{z} + 9 = 0$

is $2 - 3i$ i.e., $(2, -3)$.

91. $\because \quad \sqrt{3} + i = (a + ib)(c + id)$

$= (ac - bd) + i(ad + bc)$

Here, $\quad ac - bd = \sqrt{3}$ and $ad + bc = 1$

Now, $\tan^{-1}\left(\frac{b}{a}\right) + \tan^{-1}\left(\frac{d}{c}\right) = \tan^{-1}\left(\frac{bc + ad}{ac - bd}\right)$

$= \tan^{-1}\left(\frac{1}{\sqrt{3}}\right)$

$= n\pi + \frac{\pi}{6}, n \in I$

92. We have, $|1 - i|^x = 2^x \quad \Rightarrow \quad (\sqrt{2})^x = 2^x \Rightarrow 2^{x/2} = 2^x$

$\Rightarrow \quad \frac{x}{2} = x \quad \Rightarrow \quad x = 0$

Therefore, the number of non-zero integral solution is one.

93. Given, $z_1 = (1, \alpha) = \cos\alpha + i\sin\alpha = e^{i\alpha}$

$z_2 = (1, \beta) = \cos\beta + i\sin\beta = e^{i\beta}$

and $z_3 = (1, \gamma) = \cos\gamma + i\sin\gamma = e^{i\gamma}$

Also, $z_1 + z_2 + z_3 = 0$

$\therefore (\cos\alpha + \cos\beta + \cos\gamma) + i(\sin\alpha + \sin\beta + \sin\gamma) = 0$

$\Rightarrow \cos\alpha + \cos\beta + \cos\gamma = 0$

and $\sin\alpha + \sin\beta + \sin\gamma = 0$ ...(i)

Let $E = \frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3} = e^{-i\alpha} + e^{-i\beta} + e^{-i\gamma}$

$= (\cos\alpha + \cos\beta + \cos\gamma) - i(\sin\alpha + \sin\beta + \sin\gamma)$

$= 0 - i0 = 0$ [$\because$ from Eq. (i)]

94. Since, $x = -5 + 4i$

$\Rightarrow x + 5 = 4i$

On squaring both sides, we get

$x^2 + 10x + 25 = -16$

$\Rightarrow x^2 + 10x + 41 = 0$ ...(i)

Let $E = x^4 + 9x^3 + 35x^2 - x + 4$

$= x^2[(x^2 + 10x + 41) - x - 6] - x + 4$

$= x^2(0) - x^3 - 6x^2 - x + 4$ [$\because$ from Eq. (i)]

$= -x^3 - 6x^2 - x + 4$

$= -x(x^2 + 6x + 1) + 4$

$= -x(x^2 + 10x + 41 - 4x - 40) + 4$

$= 4x^2 + 40x + 4$ [$\because$ from Eq. (i)]

$= 4(x^2 + 10x + 41 - 40)$

$= 4(0) - 160$ [$\because$ from Eq. (i)]

$= -160$

95. We have, $a = \cos\left(\frac{2\pi}{7}\right) + i\sin\left(\frac{2\pi}{7}\right)$

$\Rightarrow a^7 = \left[\cos\left(\frac{2\pi}{7}\right) + i\sin\left(\frac{2\pi}{7}\right)\right]^7$

$= \cos 2\pi + i\sin 2\pi = 1$ ...(i)

Let $S = \alpha + \beta = (a + a^2 + a^4) + (a^3 + a^5 + a^6)$

$(\because \alpha = a + a^2 + a^4, \beta = a^3 + a^5 + a^6)$

$\Rightarrow S = a + a^2 + a^3 + a^4 + a^5 + a^6 = \frac{a(1 - a^6)}{1 - a}$

$\Rightarrow S = \frac{a - a^7}{1 - a} = \frac{a - 1}{1 - a} = -1$ ...(ii)

Let $P = \alpha\beta = (a + a^2 + a^4)(a^3 + a^5 + a^6)$

$= a^4 + a^6 + a^7 + a^5 + a^7 + a^8 + a^7 + a^9 + a^{10}$

$= a^4 + a^6 + 1 + a^5 + 1 + a + 1 + a^2 + a^3$

[from Eq. (i)]

$= 3 + (a + a^2 + a^3 + a^4 + a^5 + a^6) = 3 + S$

$= 3 - 1 = 2$ [from Eq. (ii)]

Required equation is, $x^2 - Sx + P = 0$

$\Rightarrow x^2 + x + 2 = 0$

96. Let $z = r(\cos\theta + i\sin\theta)$

Given that, $\left|z + \frac{1}{z}\right| = a \Rightarrow \left|z + \frac{1}{z}\right|^2 = a^2$

$\Rightarrow r^2 + \frac{1}{r^2} + 2\cos 2\theta = a^2$ ...(i)

On differentiating w.r.t. θ, we get

$2r\frac{dr}{d\theta} - \frac{2}{r^3}\frac{dr}{d\theta} - 4\sin 2\theta = 0$

$\Rightarrow \frac{dr}{d\theta}\left(2r - \frac{2}{r^3}\right) = 4\sin 2\theta$

For maximum or minimum, put $\frac{dr}{d\theta} = 0$, we get $\Rightarrow \theta = 0, \frac{\pi}{2}$

$\therefore$ r is maximum for $\theta = \frac{\pi}{2}$, therefore from Eq. (i), we get

$r^2 + \frac{1}{r^2} - 2 = a^2 \Rightarrow r - \frac{1}{r} = a$

$\Rightarrow r^2 - ar - 1 = 0 \Rightarrow r = \frac{a + \sqrt{a^2 + 4}}{2}$

97. $d = \frac{a \cdot 0 + 0 \cdot \bar{a} + |a|^2}{2|a|} = \frac{|a|}{2}$

98. Let O is orthocentre, G is centroid and C is circumcentre, then

$\frac{z_1 + z_2 + z_3}{3} = \frac{2 \times 0 + 1(z)}{3} \Rightarrow z = z_1 + z_2 + z_3$

99. $\log_{\sqrt{3}}\left(\frac{|z|^2 - |z| + 1}{2 + |z|}\right) < 2$

$\Rightarrow \frac{|z|^2 - |z| + 1}{2 + |z|} < (\sqrt{3})^2$

$\Rightarrow |z|^2 - |z| + 1 < 3(2 + |z|)$

$\Rightarrow |z|^2 - 4|z| - 5 < 0$

$\Rightarrow (|z| + 1)(|z| - 5) < 0$

$\Rightarrow -1 < |z| < 5 \Rightarrow |z| < 5$ as $|z| > 0$

$\therefore$ Locus of z is $|z| < 5$.

100. Given that, $z^2 + (p + iq)z + r + is = 0$ ...(i)

Let $z = \alpha$ (where α is real) be a root of Eq. (i), then

$\alpha^2 + (p + iq)\alpha + r + is = 0$

$\Rightarrow \alpha^2 + p\alpha + r + i(q\alpha + s) = 0$

On equating real and imaginary parts, we get

$\alpha^2 + p\alpha + r = 0$ ...(ii)

and $q\alpha + s = 0 \Rightarrow \alpha = \frac{-s}{q}$

On putting the value of α in Eq. (ii), we get

$\left(\frac{-s}{q}\right)^2 + p\left(\frac{-s}{q}\right) + r = 0$

$\Rightarrow s^2 - pqs + q^2r = 0 \Rightarrow pqs = s^2 + q^2r$

Round II

1. $|z - i\text{Re}(z)| = |z - \text{Im}(z)|$

If $z = x + iy$,

then $|x + iy - ix| = |x + iy - y|$

$$\sqrt{x^2 + (y-x)^2} = \sqrt{(x-y)^2 + y^2}$$

$\Rightarrow$ $x^2 = y^2$

$\therefore$ $x = \pm y$

$\Rightarrow$ $\text{Re}(z) = \pm \text{Im}(z)$

$\Rightarrow$ $\text{Re}(z) + \text{Im}(z) = 0$

and $\text{Re}(z) - \text{Im}(z) = 0$

2. $a_0 z^n + a_1 z^{n-1} + a_2 z^{n-2} + \ldots + a_{n-1} z + a_n = 3$

$\Rightarrow$ $|3| = |a_0 z^n + a_1 z^{n-1} + \ldots + a_{n-1} z + a_n|$

$\Rightarrow$ $3 \le |a_0||z|^n + |a_1||z|^{n-1} + \ldots + |a_{n-1}||z| + |a_n|$

$\Rightarrow$ $3 < 2(|z|^n + |z|^{n-1} + \ldots + |z| + 1)$

$\Rightarrow$ $1 + |z| + |z|^2 + \ldots + |z|^n > \frac{3}{2}$

If $|z| \ge 1$, the inequality is clearly satisfied. For $|z| < 1$, we must have.

$$\frac{1 - |z|^{n+1}}{1 - |z|} > \frac{3}{2}$$

$\Rightarrow$ $2 - 2|z|^{n+1} > 3 - 3|z| \Rightarrow 2|z|^{n+1} < 3|z| - 1$

$\Rightarrow$ $3|z| - 1 > 0 \Rightarrow |z| > \frac{1}{3}$

Since, z_1 is a root of given equation,

$\therefore$ $|z_1| > \frac{1}{3}$

3. $\because \arg(z - 3i) = \arg(x + iy - 3i) = \frac{3\pi}{4}$

$\Rightarrow$ $x < 0, y - 3 > 0$ $\left(\because \frac{3\pi}{4} \text{ is in IInd quadrant}\right)$

$$\frac{y-3}{x} = \tan\frac{3\pi}{4} = -1$$

$\Rightarrow$ $y = -x + 3$ ...(i)

$\forall x < 0$ and $y > 3$

and $\arg(2z + 1 - 2i) = \arg[(2x+1) + i(2y-2)] = \frac{\pi}{4}$

$\Rightarrow$ $2x + 1 > 0, 2y - 2 > 0$ $\left(\because \frac{\pi}{4} \text{ is in Ist quadrant}\right)$

$\therefore$ $\frac{2y-2}{2x+1} = \tan\frac{\pi}{4} = 1$

$\Rightarrow$ $2y - 2 = 2x + 1$

$\Rightarrow$ $y = x + \frac{3}{2}, \ \forall x > \frac{-1}{2}, y > 1$ ...(ii)

From Eqs. (i) and (ii), we get

It is clear from the graph that there is no point of intersection.

4. $\left|z - \frac{25}{z}\right| \ge \left||z| - \frac{25}{|z|}\right| \Rightarrow 24 \ge \left||z| - \frac{25}{|z|}\right|$

$\Rightarrow$ $-24 \le |z| - \frac{25}{|z|} \le 24$

$\Rightarrow$ $-24|z| \le |z|^2 - 25 \le 24|z|$

$\therefore$ $|z|^2 + 24|z| - 25 \ge 0$ and $|z|^2 - 24|z| - 25 \le 0$

$\Rightarrow$ $(|z| + 25)(|z| - 1) \ge 0$ and $(|z| - 25)(|z| + 1) \le 0$

$\therefore$ $|z| - 1 \ge 0$ and $|z| - 25 \le 0$

Hence, $1 \le |z| \le 25$

$\Rightarrow$ $1 \le |z - 0| \le 25$

5. $z = (1 - i\cot 8)^3$

$= \text{cosec}^3 8 (\sin 8 - i\cos 8)^3$

$= \text{cosec}^3 8 \left\{\cos\left(\frac{\pi}{2} - 8\right) - i\sin\left(\frac{\pi}{2} - 8\right)\right\}^3$

$= \text{cosec}^3 8 \left\{\cos\left(\frac{3\pi}{2} - 24\right) - i\sin\left(\frac{3\pi}{2} - 24\right)\right\}$

$= \text{cosec}^3 8 \cdot e^{-i\left(\frac{3\pi}{2} - 24\right)} = \text{cosec}^3 8 \cdot e^{i\left(24 - \frac{3\pi}{2}\right)}$

6. $\begin{vmatrix} x+1 & \omega & \omega^2 \\ \omega & x+\omega^2 & 1 \\ \omega^2 & 1 & x+\omega \end{vmatrix}$

$= \begin{vmatrix} x+1+\omega+\omega^2 & \omega & \omega^2 \\ \omega+x+\omega^2+1 & x+\omega^2 & 1 \\ \omega^2+1+x+\omega & 1 & x+\omega \end{vmatrix}$

$(C_1 \to C_1 + C_2 + C_3)$

$= x\begin{vmatrix} 1 & \omega & \omega^2 \\ 1 & x+\omega^2 & 1 \\ 1 & 1 & x+\omega \end{vmatrix}$ $(\because 1 + \omega + \omega^2 = 0)$

$= x\begin{vmatrix} 1 & \omega & \omega^2 \\ 0 & x+\omega^2-\omega & 1-\omega^2 \\ 0 & 1-\omega & x+\omega-\omega^2 \end{vmatrix}$

$(R_2 \to R_2 - R_1, R_3 \to R_3 - R_1)$

$= x[(x+\omega^2-\omega)(x+\omega-\omega^2) - (1-\omega)(1-\omega^2)]$

$= x[x + 3 - 3]$

$= x^2$

7. $x = 9^{\frac{1}{3}+\frac{1}{9}+\frac{1}{27},+\dots} = 9^{\frac{1/3}{1-1/3}} = 9^{1/2} = 3$

$y = 4^{\frac{1}{3}-\frac{1}{9}+\frac{1}{27}+\dots} = 4^{\frac{1/3}{1+1/3}} = 4^{1/4} = \sqrt{2}$

$$z = \sum_{r=1}^{\infty} (1+i)^{-r} = \frac{1}{1+i} + \frac{1}{(1+i)^2} + \frac{1}{(1+i)^3} + \dots$$

$$= \frac{\frac{1}{1+i}}{1-\frac{1}{1+i}} = \frac{1}{i} = -i$$

Let $a = x + yz = 3 - \sqrt{2}i$ (fourth quadrant). Then,

$$\arg \alpha = -\tan^{-1}\left(\frac{\sqrt{2}}{3}\right)$$

8. Let $z_1 = a + ib$ and $z_2 = c - id$, where $a > 0$ and $d > 0$. Then,

$|z_1| = |z_2| \Rightarrow a^2 + b^2 = c^2 + d^2$ ...(i)

Now, $\frac{z_1 + z_2}{z_1 - z_2} = \frac{(a+ib)+(c-id)}{(a+ib)-(c-id)}$

$$= \frac{[(a+c)+i(b-d)][(a-c)-i(b+d)]}{[(a-c)+i(b+d)][(a-c)-i(b+d)]}$$

$$= \frac{(a^2+b^2)-(c^2+d^2)-2(ad+bc)i}{a^2+c^2-2ac+b^2+d^2+2bd}$$

$$= \frac{-(ad+bc)i}{a^2+b^2-ac+bd} \quad \text{[using Eq. (i)]}$$

Hence, $(z_1 + z_2)/(z_1 - z_2)$ is purely imaginary. However, if $ad + bc = 0$, then $(z_1 + z_2)/(z_1 - z_2)$ will be equal to zero. According to the conditions of the equation, we can have $ad + bc = 0$.

9. We have,

$$\arg\left(\frac{z_1}{z_2}\right) = \pi$$

$\Rightarrow \quad \arg(z_1) - \arg(z_2) = \pi$

$\Rightarrow \quad \arg(z_1) = \arg(z_2) + \pi$

Let $\arg(z_2) = \theta$. Then, $\arg(z_1) = \pi + \theta$

$\therefore \quad z_1 = |z_1|[\cos(\pi+\theta) + i\sin(\pi+\theta)]$

$= |z_1|(-\cos\theta - i\sin\theta)$

and $\quad z_2 = |z_2|(\cos\theta + i\sin\theta)$

$= |z_1|(\cos\theta + i\sin\theta) \quad (\because |z_1| = |z_2|)$

$= -z_1$

$\Rightarrow \quad z_1 + z_2 = 0$

10. $|z^2 + 2z\cos\alpha| \le |z^2| + |2z\cos\alpha|$

$= |z|^2 + 2|z||\cos\alpha| \le |z|^2 + 2|z|$

$< (\sqrt{2}-1)^2 + 2(\sqrt{2}-1) = 1$

11.

$$\frac{z_1 - z_2}{z_3 - z_2} = \frac{1}{\sqrt{2}} - \frac{i}{\sqrt{2}} = e^{i\pi/4}$$

$$\angle CBA = \frac{\pi}{4}$$

Also, $\quad |z_1 - z_2| = |z_3 - z_2|$

Hence, ΔABC is isosceles.

12. Given that,

$$|z_1 - i| = |z_2 - i| = |z_3 - i|$$

Hence, z_1, z_2 and z_3 lie on the circle whose centre is i. Also, given that the triangle is equilateral. Hence, centroid and cirucmcentre coincides.

$\therefore \quad \frac{z_1 + z_2 + z_3}{3} = i$

$\Rightarrow \quad |z_1 + z_2 + z_3| = 3$

13. We have, $z_1 = a + ib$ and $z_2 = c + id$

$\therefore \quad |z_1|^2 = a^2 + b^2 = 1$

and $\quad |z_2|^2 = c^2 + d^2 = 1$ ...(i)

Also, $\quad \text{Re}(z_1 \bar{z}_2) = 0$

$\Rightarrow \quad ac + bd = 0$

$\Rightarrow \quad \frac{a}{b} = -\frac{d}{c} = \lambda$ ...(ii)

From Eqs. (i) and (ii), we get

$$b^2\lambda^2 + b^2 = c^2 + \lambda^2 c^2$$

$\Rightarrow \quad b^2 = c^2$ and $a^2 = d^2$

Now, $\quad |w_1| = \sqrt{a^2 + c^2} = \sqrt{a^2 + b^2} = 1$

and $\quad |w_2| = \sqrt{b^2 + d^2} = \sqrt{a^2 + b^2} = 1$

$\text{Re}|w_1 \overline{w_2}| = (ab + cd)$

$= (b\lambda)\, b + c(-\lambda c) = \lambda(b^2 - c^2) = 0$

Hence, (a), (b) and (c) are correct answers.

14. We have, $\frac{1 + i\cos\theta}{1 - 2i\cos\theta} = \frac{(1+i\cos\theta)(1+2i\cos\theta)}{(1-2i\cos\theta)(1+2i\cos\theta)}$

$$= \frac{(1 - 2\cos^2\theta) + i\,3\cos\theta}{1 + 4\cos^2\theta}$$

Thus, $\frac{(1+i\cos\theta)}{(1-2i\cos\theta)}$ is a real number, if $\cos\theta = 0$

$\Rightarrow \quad \theta = 2n\pi \pm \frac{\pi}{2}$

where, n is an integer.

15. Let $z_2 = r_2(\cos\theta_2 + i\sin\theta_2)$

$\Rightarrow \quad |z_2| = r_2$

Also, $\quad \arg(z_1) + \arg(z_2) = 0$

$\Rightarrow \quad \arg(z_1) = -\arg(z_2) = -\theta_2$

$\therefore \quad z_1 = r_2[\cos(-\theta_2) + i\sin(-\theta_2)]$

$= r_2[\cos\theta_2 - i\sin\theta_2]$

$\Rightarrow \quad z_1 = \bar{z}_2$

$\Rightarrow \quad z_1 = \dfrac{1}{z_2}$

$\Rightarrow \quad z_1 z_2 = 1$

16.

We have,

$$|z_1| = 15, |z_2 - 3 - 4i| = 5$$

Minimum value of $|z_1 - z_2|$ is $AB = OB - OA = 15 - 10 = 5$

Maximum value of $|z_1 - z_2|$ is

$$CA = OA + OC = 10 + 15 = 25$$

Solutions (Q. Nos. 17-19)

Given that,

$$|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2$$

$\Rightarrow \quad |z_1|^2 + |z_2|^2 + z_1\bar{z}_2 + \bar{z}_1 z_2 = |z_1|^2 + |z_2|^2$

$\Rightarrow \quad z_1\bar{z}_2 + \bar{z}_1 z_2 = 0 \quad$ ...(i)

$\Rightarrow \quad \dfrac{z_1}{z_2} + \dfrac{\bar{z}_1}{\bar{z}_2} = 0 \quad$ (dividing by $z_2\bar{z}_2$)

$\Rightarrow \quad \dfrac{z_1}{z_2} + \overline{\left(\dfrac{z_1}{z_2}\right)} = 0 \quad$ ...(ii)

17. From Eq. (i), $z_2\bar{z}_2$ is purely imaginary.

18. From Eq. (ii), z_1/z_2 is purely imaginary.

19. Also, $i(z_1/z_2)$ is purely real. Hence, its possible arguments are 0 and π.

20. We have, $\arg(z) = 0 \Rightarrow z$ is purely real.

$\therefore$ Statement II is true.

Also, $\quad |z_1| = |z_2| + |z_1 - z_2|$

$\Rightarrow \quad |z_1 - z_2|^2 = (|z_1| - |z_2|)^2$

$\Rightarrow \quad |z_1|^2 + |z_2|^2 - 2|z_1||z_2|\cos(\theta_1 - \theta_2)$

$= |z_1|^2 + |z_2|^2 - 2|z_1||z_2|$

$\Rightarrow \quad \cos(\theta_1 - \theta_2) = 1$

$\Rightarrow \quad \theta_1 - \theta_2 = 0$

$\Rightarrow \quad \arg(z_1) - \arg(z_2) = 0$

$\Rightarrow \quad \arg\left(\dfrac{z_1}{z_2}\right) = 0$

$\Rightarrow \quad \dfrac{z_1}{z_2}$ is purely real.

$\Rightarrow \quad \operatorname{Im}\left(\dfrac{z_1}{z_2}\right) = 0$

Statement I and statement II are true and statement II is a correct explanation of statement I.

21. $\left|\dfrac{z_1 z - z_2}{z_1 z + z_2}\right| = k \Rightarrow \left|\dfrac{z - \dfrac{z_2}{z_1}}{z + \dfrac{z_2}{z_1}}\right| = k$

Clearly, if $k \neq 0, 1$, then z would lie on a circle.

If $k = 1$, z would lie on a perpendicular bisector of line segment joining $\dfrac{z_2}{z_1}$ and $-\dfrac{z_2}{z_1}$ and represents a point, if $k = 0$.

$\therefore$ Statement I is false and statement II is true.

22. $|z_2 z_3 + 8z_3 z_1 + 27 z_1 z_2| = \left|z_1 z_2 z_3\left(\dfrac{1}{z_1} + \dfrac{8}{z_2} + \dfrac{27}{z_3}\right)\right|$

$= |z_1||z_2||z_3|\left|\dfrac{1}{z_1} + \dfrac{8}{z_2} + \dfrac{27}{z_3}\right|$

$= |z_1||z_2||z_3|\left|\dfrac{\bar{z}_1}{|z_1|^2} + \dfrac{8\bar{z}_2}{|z_2|^2} + \dfrac{27\bar{z}_3}{|z_3|^2}\right|$

$= |z_1||z_2||z_3|\left|\dfrac{\bar{z}_1}{1} + \dfrac{8\bar{z}_2}{4} + \dfrac{27\bar{z}_3}{9}\right|$

$= |z_1||z_2||z_3||\overline{z_1 + 2z_2 + 3z_3}|$

$= |z_1||z_2||z_3||z_1 + 2z_2 + 3z_3| = 1 \cdot 2 \cdot 3 \cdot 6 = 36$

23. $\because \; e^{i\theta} = \cos\theta + i\sin\theta$

$\Rightarrow \quad e^{-i\theta} = \cos\theta - i\sin\theta$

$\therefore \quad \cos\theta = \dfrac{e^{i\theta} + e^{-i\theta}}{2}$

Now, $\cos(1 - i) = \dfrac{e^{i(1-i)} + e^{-i(1-i)}}{2} = \dfrac{e^{(i+1)} + e^{-(1+i)}}{2}$

$= \dfrac{e(e^i) + e^{-1}(e^{-i})}{2}$

$= \dfrac{e(\cos 1 + i\sin 1) + e^{-1}(\cos 1 - i\sin 1)}{2}$

$= \dfrac{1}{2}\left(e + \dfrac{1}{e}\right)\cos 1 + \dfrac{i}{2}\left(e - \dfrac{1}{e}\right)\sin 1$

$\therefore \quad a = \dfrac{1}{2}\left(e + \dfrac{1}{e}\right)\cos 1, \quad b = \dfrac{1}{2}\left(e - \dfrac{1}{e}\right)\sin 1$

24. We have, $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2$

$\Rightarrow \quad |z_1|^2 + |z_2|^2 + 2|z_1||z_2|\cos(\theta_1 - \theta_2) = |z_1|^2 + |z_2|^2$

where, $\quad \theta_1 = \arg(z_1), \quad \theta_2 = \arg(z_2)$

$\Rightarrow \quad \cos(\theta_1 - \theta_2) = 0 \Rightarrow \theta_1 - \theta_2 = \frac{\pi}{2}$

$\Rightarrow \quad \arg\left(\frac{z_1}{z_2}\right) = \frac{\pi}{2}$

$\Rightarrow \quad \text{Re}\left(\frac{z_1}{z_2}\right) = \frac{|z_1|}{|z_2|}\cos\frac{\pi}{2} = 0$

$\therefore \frac{z_1}{z_2}$ is purely imaginary.

$\therefore$ Statement I is true.

If z is purely imaginary, then $z - \bar{z} = 0$.

25. $\arg(z_1 z_2) = 2\pi \Rightarrow \arg(z_1) + \arg(z_2) = 2\pi$

$\Rightarrow \arg(z_1) = \arg(z_2) = \pi$, as principal arguments are from $-\pi$ to π.

Hence, both the complex numbers are purely real. Hence, both the statements are true and statement II is correct explanation of statement I.

26. $|z_1 + z_2 + z_3| = |z_1 - a + z_2 - b + z_3 - c + (a + b + c)|$

$\le |z_1 - a| + |z_2 - b| + |z_3 - c| + |a + b + c|$

$\le 2|a + b + c|$

Hence, $|z_1 + z_2 + z_3|$ is less than $2|a + b + c|$.

27. If roots of $ax^2 + bx + c = 0, 0 < a < b < c$, are non-real, then they will be the conjugate of each other. Hence,

$$z_2 = \bar{z}_1 \Rightarrow |z_1| = |z_2|$$

Now, $\quad z_1 z_2 = \frac{c}{a} > 1 \Rightarrow |z_1|^2 > 1$

$\Rightarrow \quad |z_1| > 1$

$\Rightarrow \quad |z_2| > 1$

28. We have,

$$(\cos\theta + i\sin\theta)^{3/5} = (\cos 3\theta + i\sin 3\theta)^{1/5}$$

$= [\cos(2r\pi + 3\theta) + i\sin(2r\pi + 3\theta)]^{1/5}$, where $r = 0, 1, 2, 3, 4$

$= e^{i\left(\frac{2r\pi + 3\theta}{5}\right)}, r = 0, 1, 2, 3, 4$

Hence, product of all values of $(\cos\theta + i\sin\theta)^{3/5}$ is

$$e^{i\frac{3\theta}{5}} e^{i\left(\frac{2\pi + 3\theta}{5}\right)} e^{i\left(\frac{4\pi + 3\theta}{2}\right)} e^{i\left(\frac{6\pi + 3\theta}{5}\right)} e^{i\left(\frac{8\pi + 3\theta}{5}\right)}$$

$$= e^{i3\theta + 4\pi i}$$

$$= e^{4i\pi} e^{i3\theta}$$

$$= \cos 3\theta + i\sin 3\theta$$

Also, product of roots of the equation $x^5 - 1 = 0$ is 1. Hence, statement II is true, but it is not a correct explanation of statement I.

29. Given, $|z| = 1, \arg z = \theta \therefore z = e^{i\theta}$

But $\quad \bar{z} = \frac{1}{z}$

$\therefore \quad \arg\left(\frac{1 + z}{1 + \frac{1}{z}}\right) = \arg(z) = \theta$

30. Since, $\frac{z^2}{z - 1}$ $(z \ne 1)$ is purely real.

Hence, $\quad \frac{z^2}{z - 1} = \frac{\bar{z}^2}{\bar{z} - 1}$

$\Rightarrow \quad z^2(\bar{z} - 1) = \bar{z}^2(z - 1)$

$\Rightarrow \quad z^2\bar{z} - z^2 = z^2 z - \bar{z}^2$

$\Rightarrow \quad zz\bar{z} - z^2 = \bar{z}^2 z z - \bar{z}^2$

$z|z|^2 - z^2 = \bar{z}|z|^2 - \bar{z}^2$

$\Rightarrow \quad z|z|^2 - \bar{z}|z|^2 = \bar{z}^2 - z^2$

$\Rightarrow \quad |z|^2(z - \bar{z}) = (\bar{z} - z)(\bar{z} + z)$

$\Rightarrow \quad |z|^2(z - \bar{z}) - (z - \bar{z})(\bar{z} + z) = 0$

$\Rightarrow \quad (z - \bar{z})\{|z|^2 - (\bar{z} + z)\} = 0$

Either $\quad (z - \bar{z}) = 0$ or $\{|z|^2 - (\bar{z} + z)\} = 0$

Now, $\quad z = \bar{z} \Rightarrow$ Locus of z is real axis

and $\quad \{|z|^2 - (\bar{z} + z)\} = 0$

$\Rightarrow \quad z\bar{z} - (\bar{z} + z) = 0$

Locus of z is a circle passing through origin.

Alternate Method

Put $z = x + iy$, then

$$\frac{z^2}{z - 1} = \frac{(x + iy)^2}{(x + iy) - 1} = \frac{(x^2 - y^2) + i(2xy)}{(x - 1) + iy}$$

$$= \frac{(x^2 - y^2) + i(2xy)}{(x - 1) + iy} \times \frac{(x - 1) - iy}{(x - 1) - iy}$$

Since, $\frac{z^2}{z - 1}$ $(z \ne 1)$ is purely real, hence its imaginary part should be equal to zero.

$\Rightarrow \quad (x^2 - y^2)(-y) + (2xy)(x - 1) = 0$

$\Rightarrow \quad y(x^2 - y^2 + 2x - 2x^2) = 0$

$\Rightarrow \quad y(x^2 + y^2 - 2x) = 0$

$\Rightarrow$ Either $\quad y = 0$

$\Rightarrow \quad x^2 + y^2 - 2x = 0$

Now, $y = 0 \Rightarrow$ Locus of z is real axis and $x^2 + y^2 - 2x = 0$.

Locus of z is a circle pasing through origin.

Locus of z is either real axis or a circle passing through origin.

31. $(1 + \omega)^7 = A + B\omega$, we know $1 + \omega + \omega^2 = 0$

$\therefore \quad 1 + \omega = -\omega^2$

$\Rightarrow \quad (-\omega^2)^7 = A + B\omega$

$\Rightarrow \quad -\omega^{14} = A + B\omega \qquad (\omega^{14} = \omega^{12} \cdot \omega^2 = \omega^2)$

$\Rightarrow \quad -\omega^2 = A + B\omega$

$\Rightarrow \quad 1 + \omega = A + B\omega$

On comparing, we get

$$A = 1, B = 1$$

32. We have, $|z-1| = |z+1| = |z-i|$

Clearly, z is the circumcentre of the triangle formed by the vertices (1, 0) and (0, 1) and (–1, 0), which is unique.

Hence, the number of complex numbers z is one.

33. $|z| = \left|\left(z - \frac{4}{z}\right) + \frac{4}{z}\right| \Rightarrow |z| < \left|z - \frac{4}{z}\right| + \frac{4}{|z|} \Rightarrow |z| \le 2 + \frac{4}{|z|}$

$$\Rightarrow \quad \frac{|z|^2 - 2|z| - 4}{|z|} \le 0$$

Since, $|z| > 0$

$$|z|^2 - 2|z| - 4 \le 0$$

$$\Rightarrow \quad [|z| - (\sqrt{5}+1)][|z| - (1-\sqrt{5})] \le 0$$

$$\Rightarrow \quad 1 - \sqrt{5} \le |z| \le \sqrt{5} + 1$$

34. Let $z = \frac{1}{i-1}$

$$\therefore \quad \bar{z} = \overline{\left(\frac{1}{i-1}\right)} = \frac{1}{-i-1} = \frac{-1}{i+1}$$

35. $|z+4| \le 3$ represents the interior and boundary of the circle with centre at $(-4, 0)$ and radius $= 3$. As -1 is an end point of a diameter of the circle, maximum possible value of $|z+1|$ is 6.

36. Given equation is

$$z^2 + z + 1 = 0$$

$$\Rightarrow \quad z = \frac{-1 \pm \sqrt{1 - 4 \times 1 \times 1}}{2 \times 1}$$

$$\Rightarrow \quad z = \frac{-1 \pm \sqrt{-3}}{2}$$

$$\Rightarrow \quad z = \omega, \omega^2$$

Now, $\left(z + \frac{1}{z}\right)^2 + \left(z^2 + \frac{1}{z^2}\right)^2 + \left(z^3 + \frac{1}{z^3}\right)^2$

$$+ \left(z^4 + \frac{1}{z^4}\right)^2 + \left(z^5 + \frac{1}{z^5}\right)^2 + \left(z^6 + \frac{1}{z^6}\right)^2$$

$$= (-1)^2 + (-1)^2 + (1+1)^2 + (-1)^2 + (-1)^2 + (1+1)^2$$

when, we put either $z = \omega$ or $z = \omega^2$, we get the same result

$$= 1 + 1 + 4 + 1 + 1 + 4 = 12$$

37. Given that, $(x-1)^3 + 8 = 0$

$$\Rightarrow \quad (x-1)^3 = (-2)^3$$

$$\Rightarrow \quad \left(\frac{x-1}{-2}\right)^3 = 1$$

$$\Rightarrow \quad \left(\frac{x-1}{-2}\right) = (1)^{1/3}$$

$\therefore$ Cube roots of $\left(\frac{x-1}{-2}\right)$ are 1, ω and ω^2.

$\Rightarrow$ Cube roots of $(x-1)$ are -2, -2ω and $-2\omega^2$

$\Rightarrow$ Cube roots of x are -1, $1-2\omega$ and $1-2\omega^2$.

38. Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$

Given that,

$$|z_1 + z_2| = |z_1| + |z_2|$$

$$\therefore \quad \sqrt{(x_1+x_2)^2 + (y_1+y_2)^2} = \sqrt{x_1^2 + y_1^2} + \sqrt{x_2^2 + y_2^2}$$

On squaring both sides, we get

$$x_1^2 + x_2^2 + 2x_1x_2 + y_1^2 + y_2^2 + 2y_1y_2$$

$$= x_1^2 + y_1^2 + x_2^2 + y_2^2 + 2\sqrt{(x_1^2 + y_1^2)(x_2^2 + y_2^2)}$$

$$\Rightarrow \quad x_1x_2 + y_1y_2 = \sqrt{(x_1^2 + y_1^2)(x_2^2 + y_2^2)}$$

Again, squaring on both sides, we get

$$x_1^2x_2^2 + y_1^2y_2^2 + 2x_1x_2y_1y_2$$

$$= x_1^2x_2^2 + y_1^2y_2^2 + x_1^2y_2^2 + y_1^2x_2^2$$

$$\Rightarrow \quad (x_1y_2 - y_1x_2)^2 = 0$$

$$\Rightarrow \quad \frac{y_1}{x_1} = \frac{y_2}{x_2}$$

$$\Rightarrow \quad \tan^{-1}\left(\frac{y_1}{x_1}\right) = \tan^{-1}\left(\frac{y_2}{x_2}\right)$$

$$\Rightarrow \quad \arg(z_1) = \arg(z_2)$$

$$\Rightarrow \quad \arg(z_1) - \arg(z_2) = 0$$

39. Given that, $w = \frac{z}{z - \frac{i}{3}}$ and $|w| = 1$

$$\Rightarrow \quad \left|\frac{z}{z - \frac{i}{3}}\right| = 1$$

$\Rightarrow \quad |z| = \left|z - \frac{i}{3}\right|$

$\Rightarrow z$ lies on perpendicular bisector of $(0, 0)$ and $\left(0, \frac{1}{3}\right)$.

Hence, z lies on a straight line.

40. Given that, $\bar{z} + i\bar{w} = 0 \Rightarrow \bar{z} = -i\bar{w}$

$\Rightarrow \quad z = iw \Rightarrow w = -iz$

and $\quad \arg(zw) = \pi$

$\Rightarrow \quad \arg(-iz^2) = \pi$

$\Rightarrow \quad \arg(-i) + 2\arg(z) = \pi$

$\Rightarrow \quad -\frac{\pi}{2} + 2\arg(z) = \pi \qquad \left[\because \arg(-i) = -\frac{\pi}{2}\right]$

$\Rightarrow \quad \arg(z) = \frac{3\pi}{4}$

41. Since, $\quad z^{1/3} = p + iq$

$\therefore \quad z = (p + iq)^3$

$= p^3 - iq^3 + 3ip^2q - 3pq^2$

Given that, $\quad z = x - iy$

$\therefore \quad x - iy = p^3 - 3pq^2 + i(3p^2q - q^3)$

$\Rightarrow \quad x = p^3 - 3pq^2$ and $-y = 3p^2q - q^3$

$\Rightarrow \quad \frac{x}{p} = p^2 - 3q^2$

and $\quad \frac{y}{q} = -3p^2 + q^2$

$\therefore \quad \frac{x}{p} + \frac{y}{q} = -2p^2 - 2q^2$

$\Rightarrow \quad \frac{1}{(p^2 + q^2)}\left(\frac{x}{p} + \frac{y}{q}\right) = -2$

42. Using the relation, if

$|z_1 + z_2| = |z_1| + |z_2|$

Then, $\quad \arg(z_1) = \arg(z_2)$

Since, $\quad |z^2 + (-1)| = |z^2| + |-1|$

Then, $\quad \arg(z^2) = \arg(-1)$

$\Rightarrow \quad 2\arg(z) = \pi \qquad [\because \arg(-1) = \pi]$

$\Rightarrow \quad \arg(z) = \frac{\pi}{2}$

$\Rightarrow z$ lies on y-axis (imaginary axis).

43. Since, origin z_1 and z_2 are the vertices of an equilateral triangle, then

$z_1^2 + z_2^2 = z_1z_2$

$\Rightarrow \quad (z_1 + z_2)^2 = 3z_1z_2 \qquad \ldots(i)$

Again, z_1 and z_2 are the roots of the equation

$z^2 + az + b = 0$

Then, $\quad z_1 + z_2 = -a$

and $\quad z_1z_2 = b$

On putting these values in Eq. (i), we get

$(-a)^2 = 3b$

$\Rightarrow \quad a^2 = 3b$

44. Let $\quad z = r_1e^{i\theta}$ and $w = r_2e^{i\phi}$

$\Rightarrow \quad \bar{z} = r_1e^{-i\theta}$

Given, $\quad |zw| = 1$

$\Rightarrow \quad |r_1e^{i\theta} \cdot r_2e^{i\phi}| = 1$

$\Rightarrow \quad r_1r_2 = 1 \qquad \ldots(i)$

and $\quad \arg(z) - \arg(w) = \frac{\pi}{2}$

$\Rightarrow \quad \theta - \phi = \frac{\pi}{2} \qquad \ldots(ii)$

Now, $\quad \bar{z}w = r_1e^{-i\theta} \cdot r_2e^{i\phi}$

$= r_1r_2e^{-i(\theta - \phi)}$

$= 1 \cdot e^{i\pi/2} \qquad$ [from Eqs. (i) and (ii)]

$= \cos\frac{\pi}{2} - i\sin\frac{\pi}{2}$

$\Rightarrow \quad \bar{z}w = -i$

45. Now, $\left(\frac{1+i}{1-i}\right)^x = \left[\frac{(1+i)(1+i)}{(1-i)(1+i)}\right]^x$

$= \left[\frac{(1+i)^2}{1-i^2}\right]^x = \left[\frac{1-1+2i}{2}\right]^x$

$\Rightarrow \quad \left(\frac{1+i}{1-i}\right)^x = (i)^x = 1$ (given)

$\Rightarrow \quad (i)^x = (i)^{4n},$

where n is any positive integer.

$\therefore \quad x = 4n$

46. Now, $(1 + \omega - \omega^2)^7 = (-\omega^2 - \omega^2)^7 \qquad (\because 1 + \omega + \omega^2 = 0)$

$= (-2\omega^2)^7$

$= -2^7 \cdot \omega^{14} = -128(\omega^3)^4\omega^2$

$= -128\omega^2 \qquad (\because \omega^3 = 1)$

47. Given that,

$$\begin{vmatrix} 6i & -3i & 1 \\ 4 & 3i & -1 \\ 20 & 3 & i \end{vmatrix} = x + iy$$

Applying $R_1 \to R_1 + R_2$

$$\Rightarrow \quad \begin{vmatrix} 6i+4 & 0 & 0 \\ 4 & 3i & -1 \\ 20 & 3 & i \end{vmatrix} = x + iy$$

$$\Rightarrow \quad (6i + 4)\begin{vmatrix} 3i & -1 \\ 3 & i \end{vmatrix} = x + iy$$

$\Rightarrow \quad (6i + 4)(3i^2 + 3) = x + iy$

$\Rightarrow \quad 0 + 0i = x + iy$

$\Rightarrow \quad x = 0, y = 0$

Quadratic Equations and Inequalities introduces students to the graphs of quadratics, teaches them to find the vertex, intercepts, discriminant, domain and range and interpret the graph in relation to these qualities. It also introduces students to the focus and directrix of parabolas, how to use a sign on number line to find the shape of a graph.

5.1 Real and Complex Polynomial

If $a_0, a_1, a_2, \ldots, a_n$ are real numbers and x is a real variable, then $f(x) = a_0 + a_1x + a_2x^2 + \ldots + a_nx^n$ is known as a real polynomial with real coefficients while if $a_0, a_1, a_2, \ldots, a_n$ are complex numbers and x is a varying complex number, then $f(x) = a_0 + a_1x + a_2x^2 + \ldots + a_nx^n$ is called a complex polynomial with complex coefficients.

e.g., $x^2 + 3x + 7$ is a real polynomial whereas $x^2 + (3 + 2i)x + (7 + 3i)$ is a complex polynomial.

5.2 Degree of a Polynomial

A polynomial $f(x) = a_0 + a_1x + a_2x^2 + \ldots + a_nx^n$ which is real or complex, is a polynomial of degree n, if $a_n \neq 0$.

e.g., $x^2 + 7x + 2$ and $x^2 + (7 + 2i) + (3 + 2i)$ are two polynomials of degree 2.

Note Polynomials of degree 2, 3 and 4 are known as quadratic, cubic and biquadratic polynomials, respectively.

5.3 Polynomial Equation

If $f(x)$ is a real or complex polynomial, then $f(x) = 0$ is known as a polynomial equation.

e.g., If $x^2 + 3x + 2$ is a real polynomial, then

$x^2 + 3x + 2 = 0$ is a polynomial equation.

5.4 Identity and Equation

A statement of equality of two expressions which is satisfied for each value of variable is called an identity.

e.g., $(x - 4)^2 + 8x = x^2 + 16$ is an identity.

A statement of equality between two expressions which is satisfied for definite values of variable, is known as an equation.

e.g., $x^2 - 5x + 6 = 0$ is an equation, which is not satisfied for any value of x except 2 and 3.

5.5 Roots of an Equation

The values of a variable in an equation which satisfied the given equation are known as roots of an equation *i.e.,* if $f(x) = 0$ is a polynomial equation and $f(a) = 0$, then a is a root of $f(x) = 0$.

e.g., If $f(x) = x^2 + 3x + 2 = 0$

and $f(-1) = (-1) + 3(-1) + 2 = 1 + 2 - 3 = 0 \Rightarrow f(-1) = 0$

$\therefore$ -1 is a root of $f(x) = 0$.

Note

- There are n real or imaginary roots of an equation of order n.
- An odd degree equation has atleast one real root, whose sign is opposite to that of its last term, provided that the coefficient of highest degree term is positive.
- Every equation of an even degree, whose constant term is negative and the coefficient of highest degree term is positive, has atleast two real roots, one positive and one negative.

Geometrical Interpretation of Roots of Equation

In geometrical interpretation, the real roots of the equation $f(x) = 0$ are the coordinates of the points, where the curve $y = f(x)$ crosses the x-axis.

e.g., Let $f(x) = x^4 + x^3 - 4x^2 + 2x - 12$ be a polynomial equation of 4 degree. The graph of $f(x)$ is shown below.

$\therefore$ $f(x) = (x - 2)(x + 3)(x^2 + 2)$

$\therefore$ The roots of $f(x)$ are

$x - 2 = 0, x + 3 = 0$ and $x^2 + 2 = 0$

$\Rightarrow$ $x = 2, x = -3$ and $x^2 = -2$ (complex root)

The given polynomial equation of four degree in $f(x)$ have $-3, 2$ as two real roots.

Since, we have seen in the above graph that $f(x)$ is intersecting the x-axis at the points $(-3, 0)$ and $(2, 0)$.

Sample Problem 1 *Two non-integer roots of*

$$\left(\frac{3x-1}{2x+3}\right)^4 - 5\left(\frac{3x-1}{2x+3}\right)^2 + 4 = 0 \text{ are}$$

(a) $-5/7, -2/5$ (b) $-2/5, 7/5$

(c) $5/7, 7/5$ (d) $-2/5, 3/5$

Interpret (a) Let $\left(\frac{3x-1}{2x+3}\right)^2 = t$

Then, given equation becomes

$t^2 - 5t + 4 = 0 \Rightarrow (t - 1)(t - 4) = 0 \Rightarrow t = 1$ or 4

When, $t = 1$

$$\frac{3x-1}{2x+3} = \pm 1$$

$\Rightarrow$ $x = 4, \frac{-2}{5}$

and when, $t = 4$ $\frac{3x-1}{2x+3} = \pm 2$

$\Rightarrow$ $x = -7, -5/7$

Thus, two non-integer roots of given equation are $-2/5, -5/7$.

Descartes Rule of Sign

Descartes rule of sign gives the maximum number of positive or negative real roots in the given polynomial equation.

(i) Maximum Number of Positive Real Roots

The maximum number of positive real roots of a polynomial equation $f(x) = 0$ are the number of changes of sign from positive to negative and *vice-versa* in $f(x)$.

(ii) Maximum Number of Negative Real Roots

The maximum number of negative real roots of a polynomial equation $f(x) = 0$ are the number of changes of sign from positive to negative and *vice-versa* in $f(x)$.

Note

(a) Descartes rule only gives the maximum number of positive or negative real roots in $f(x)$ or $f(-x)$, respectively.

(b) Descartes rule does not tell the exact number of positive or negative real roots of the polynomial equation $f(x) = 0$.

Sample Problem 2 *The maximum number of positive and negative roots in the equation*

$$x^4 - x^3 + 3x^2 - 14x + 5 = 0 \text{ are}$$

(a) 4, 0 (b) 4, 1
(c) 4, 2 (d) 2,2

Interpret (a) Let $f(x) = x^4 - x^3 + 3x^2 - 14x + 5$. Here, we see that there are four changes of sign from $\oplus \to \ominus$ or $\ominus \to \oplus$. Hence, the maximum number of positive real roots in $f(x) = 0$ are 4.

Now, $f(-x) = (-x)^4 - (-x)^3 + 3(-x)^2 - 14(-x) + 5.$

Here, we see that, there in no change of sign. Hence, no negative roots of equation exist.

5.6 Remainder and Factor Theorem

Remainder theorem states that, if a polynomial $f(x)$ is divided by a linear function $x - a$, then remainder is $f(a)$.

And factor theorem is a special case of remainder theorem, which states that, if a polynomial $f(x)$ is divisible by a linear function $x - a$, then remainder is zero, *i.e.*, if on dividing a polynomial $f(x)$ by $x - a$, the remainder is zero, then $f(x)$ is divisible by $x - a$ or $x - a$ is a factor of $f(x)$.

Note In remainder theorem, the degree of remainder is always one less than the degree of divisor.

Sample Problem 3 *On dividing the expression $2x^3 + 3px^2 - 4x + p$ by $x + 2$, the remainder is 5, then the value of p is*

(a) 0 (b) 1
(c) 2 (d) 3

Interpret (b) Let $f(x) = 2x^3 + 3px^2 - 4x + p$

$$\therefore \quad f(-2) = 5$$
$$\Rightarrow \quad 2(-2)^3 + 3p(-2)^2 - 4(-2) + p = 5$$
$$\Rightarrow \quad -16 + 12p + 8 + p = 5$$
$$\Rightarrow \quad 13p = 5 + 8 \Rightarrow p = 1$$

5.7 Quadratic Equation

If $f(x)$ is a quadratic polynomial. Then, $f(x) = 0$ is known as quadratic equation. The general form of a quadratic equation is $ax^2 + bx + c = 0, \forall\, a, b, c \in R$ or C and $a \neq 0$.

Roots of a Quadratic Equation

Roots of the quadratic equation $ax^2 + bx + c = 0$ are $\dfrac{-b + \sqrt{b^2 - 4ac}}{2a}$ and $\dfrac{-b - \sqrt{b^2 - 4ac}}{2a}$, where $b^2 - 4ac$ is known as discriminant and it is denoted by D.

If in a quadratic equation $ax^2 + bx + c = 0$, a, b, c are complex numbers, then we cannot assign positive or negative sign to the discriminant.

Note If one root of an equation is $a + \sqrt{b}$ or $a + ib$, then another root of an equation will be $a - \sqrt{b}$ or $a - ib$, respectively.

Sample Problem 4 *The roots of equation $27x^2 - 10x + 1 = 0$ are* [NCERT]

(a) $\dfrac{5}{23} \pm \dfrac{\sqrt{2}i}{23}$ (b) $\dfrac{5}{27} \pm \dfrac{\sqrt{2}i}{27}$
(c) $\dfrac{5}{27} \pm \dfrac{\sqrt{3}i}{27}$ (d) *None of these*

Interpret (b) Given, $27x^2 - 10x + 1 = 0$

On comparing the given equation with $ax^2 + bx + c = 0$, we get

$$a = 27, b = -10, c = 1$$
$$\therefore \quad D = b^2 - 4ac = (-10)^2 - 4 \times 27 \times 1$$
$$= 100 - 108 = -8 < 0$$
$$\Rightarrow \quad x = \frac{-(-10) \pm \sqrt{-8}}{2 \times 27} = \frac{(10) \pm 2\sqrt{2}i}{2 \times 27}$$
$$= \frac{2(5 \pm \sqrt{2}i)}{2 \times 27} = \frac{5}{27} \pm \frac{\sqrt{2}i}{27}$$

Sample Problem 5 *The roots of the quadratic equation $x^2 - 2\sqrt{3}x - 22 = 0$ are*

(a) *imaginary* (b) *real*
(c) *real and imaginary* (d) *None of these*

Interpret (b) Given equation is $x^2 - 2\sqrt{3}x - 22 = 0$

On comparing the given equation of $ax^2 + bx + c = 0$, we get

$$a = 1, b = -2\sqrt{3}, c = -22$$
$$\therefore \quad D = b^2 - 4ac$$
$$= (-2\sqrt{3})^2 - 4 \times 1 \times (-22)$$
$$= 12 + 88 = 100 \quad = (10)^2 > 0$$

Hence, roots are real.

5.8 Nature of Roots

(i) The roots are real and distinct, iff $D > 0$.
(ii) The roots are real and equal, iff $D = 0$.
(iii) The roots are complex with non-zero imaginary part, iff $D < 0$.
(iv) The roots are rational, iff a, b, c are rational and D is perfect square.
(v) The roots are of the form $p + \sqrt{q}\,(p, q \in Q)$, iff a, b, c are rational and D is not a perfect square.

(vi) If $a = 1, b, c \in I$ and the roots are rational numbers, then these roots must be integers.

(vii) If a quadratic equation in x has more than two roots, then it is an identity in x that is $a = b = c = 0$.

Sample Problem 6 *If a, b and c are distinct positive real numbers in AP, then the roots of the equation $ax^2 + 2bx + c = 0$ are*

(a) *imaginary* (b) *rational and equal*
(c) *rational and distinct* (d) *irrational*

Interpret (c) Since, a, b and c are in AP.

$$\therefore \quad b = \frac{a+c}{2} \quad \ldots(i)$$

Now, discriminant, $D = B^2 - AC$

$$= 4b^2 - 4ac$$

$$= 4\left(\frac{a+c}{2}\right)^2 - 4ac \quad \text{[from Eq.(i)]}$$

$$= (a+c)^2 - 4ac$$

$$= (a-c)^2 \geq 0$$

Hence, the roots of the given equation are rational and distinct.

5.9 Relation between Coefficients and Roots of an Equation

(i) **Quadratic Equation** If α and β are the roots of the quadratic equation $ax^2 + bx + c = 0$, then

Sum of roots $\alpha + \beta = -\frac{b}{a}$ and

Product of roots $\alpha\beta = \frac{c}{a}$

Also, $ax^2 + bx + c = a(x - \alpha)(x - \beta)$

(ii) **Cubic Equation** If α, β and γ are the roots of a cubic equation $ax^3 + bx^2 + cx + d = 0$, then

Sum of roots $\alpha + \beta + \gamma = -\frac{b}{a}$,

Product of two roots $\alpha\beta + \beta\gamma + \gamma\alpha = \frac{c}{a}$ and

Product of three roots $\alpha\beta\gamma = -\frac{d}{a}$

Sample Problem 7 *If the roots of the equation $x^2 + px + q = 0$ are in the same ratio as those of the equation $x^2 + lx + m = 0$, then p^2m is equal to*

(a) lq (b) l^2q
(c) lq^2 (d) *None of these*

Interpret (b) Let the roots of each equation be in the ratio $k:1$.

Let $k\alpha$ and α be the roots of $x^2 + px + q = 0$.

Then, $k\alpha + \alpha = -p$ and $k\alpha \cdot \alpha = q$

$$\Rightarrow \quad \alpha = \frac{-p}{k+1} \quad \text{and} \quad \alpha^2 = \frac{q}{k}$$

$$\Rightarrow \quad \left(\frac{-p}{k+1}\right)^2 = \frac{q}{k}$$

$$\Rightarrow \quad \frac{k}{(k+1)^2} = \frac{q}{p^2} \quad \ldots(i)$$

Again, let $k\beta$ and β be the roots of $x^2 + lx + m = 0$.

Then, $k\beta + \beta = -l$ and $k\beta \cdot \beta = m$

$$\Rightarrow \quad \beta = -\frac{l}{k+1} \quad \text{and} \quad \beta^2 = \frac{m}{k}$$

$$\Rightarrow \quad \left(\frac{-l}{k+1}\right)^2 = \frac{m}{k}$$

$$\Rightarrow \quad \frac{k}{(k+1)^2} = \frac{m}{l^2} \quad \ldots(ii)$$

Thus, from Eqs. (i) and (ii), we get

$$\frac{q}{p^2} = \frac{m}{l^2}$$

$$\Rightarrow \quad p^2m = l^2q$$

5.10 Formation of an Equation with Given Roots

(i) **Quadratic Equation** If α and β are the roots of a quadratic equation, then the equation will be $x^2 - (\alpha + \beta)x + \alpha\beta = 0$.

e.g., 2 and –5 be the roots of a quadratic equation, then the equation will be

$$x^2 - (2 - 5)x + 2 \times (-5) = 0$$

i.e., $$x^2 + 3x - 10 = 0$$

(ii) **Cubic Equation** If α, β and γ are the roots of a cubic equation, then the equation will be

$$x^3 - (\alpha + \beta + \gamma)x^2 + (\alpha\beta + \beta\gamma + \gamma\alpha)x - \alpha\beta\gamma = 0.$$

Sample Problem 8 *If α and β are the roots of equation $2x^2 - 5x + 7 = 0$, then the equation whose roots are $2\alpha + 3\beta$ and $3\alpha + 2\beta$, is*

(a) $2x^2 - 25x + 82 = 0$ (b) $2x^2 + 25x + 82 = 0$
(c) $x^2 - 25x + 82 = 0$ (d) *None of these*

Interpret (a) Since, α and β be the roots of the equation $2x^2 - 5x + 7 = 0$, then

$$\alpha + \beta = \frac{5}{2} \quad \text{and} \quad \alpha\beta = \frac{7}{2}$$

Now, sum of roots $= (2\alpha + 3\beta) + (3\alpha + 2\beta) = 5(\alpha + \beta) = \left(\frac{25}{2}\right)$

and product of roots $= (2\alpha + 3\beta)(3\alpha + 2\beta)$

$$= 6(\alpha^2 + \beta^2) + 13\alpha\beta$$
$$= 6[(\alpha+\beta)^2 - 2\alpha\beta] + 13\alpha\beta$$
$$= \left[6 \times \left(\frac{25}{4} - 7\right) + \frac{91}{2}\right] = 41$$

The required equation is

$$x^2 - \frac{25}{2}x + 41 = 0$$
$$\Rightarrow \quad 2x^2 - 25x + 82 = 0$$

5.11 Symmetric Function

A function of α and β is said to be a symmetric function, if it remains unchanged when α and β are interchanged.

Let α and β be the roots of the equation $ax^2 + bx + c = 0$,

then $\quad \alpha + \beta = -\dfrac{b}{a}$ and $\alpha\beta = \dfrac{c}{a}$

The following results may be useful.

(i) $\alpha^2 + \beta^2 = (\alpha+\beta)^2 - 2\alpha\beta$

(ii) $\alpha^3 + \beta^3 = (\alpha+\beta)^3 - 3\alpha\beta(\alpha+\beta)$

(iii) $\alpha^4 + \beta^4 = [(\alpha+\beta)^2 - 2\alpha\beta]^2 - 2(\alpha\beta)^2$

(iv) $(\alpha - \beta) = \sqrt{(\alpha+\beta)^2 - 4\alpha\beta}$

(v) $\alpha^2 - \beta^2 = (\alpha+\beta)\sqrt{(\alpha+\beta)^2 - 4\alpha\beta}$

(vi) $\alpha^3 - \beta^3 = (\alpha-\beta)[(\alpha+\beta)^2 - \alpha\beta]$

$$= [\sqrt{(\alpha+\beta)^2 - 4\alpha\beta}]\,[(\alpha+\beta)^2 - \alpha\beta]$$

(vii) $\alpha^4 - \beta^4 = (\alpha+\beta)(\alpha-\beta)(\alpha^2+\beta^2)$

$$= (\alpha+\beta)\,[\sqrt{(\alpha+\beta)^2 - 4\alpha\beta}]\,[(\alpha+\beta)^2 - 2\alpha\beta]$$

Sample Problem 9 *If α and β be the roots of the equation $px^2 + qx + r = 0$, then the value of $\alpha^3\beta + \beta^3\alpha$ is*

(a) $\dfrac{r}{p^3}$ (b) $\dfrac{r(q^2 - 2pr)}{p^3}$

(c) $\dfrac{r(q^2 + 2pr)}{p^3}$ (d) $\dfrac{(q^2 - 2pr)}{p^3}$

Interpret (*b*) Since, α and β be the roots of the equation $px^2 + qx + r = 0$, therefore $\alpha + \beta = -\dfrac{q}{p}$ and $\alpha\beta = \dfrac{r}{p}$.

$$\therefore \quad \alpha^3\beta + \beta^3\alpha = \alpha\beta(\alpha^2 + \beta^2)$$
$$= (\alpha\beta)[(\alpha+\beta)^2 - 2\alpha\beta]$$
$$= \left(\frac{r}{p}\right)\left(\frac{q^2}{p^2} - \frac{2r}{p}\right)$$
$$= \frac{r(q^2 - 2pr)}{p^3}$$

5.12 Condition for Common Roots (s)

Consider two equations

$$ax^2 + bx + c = 0$$

and $\quad a'x^2 + b'x + c' = 0$

(a) **When one common root** Let a be the common roots of two equations, then

$$a\alpha^2 + b\alpha + c = 0$$

and $\quad a'\alpha^2 + b'\alpha + c' = 0$

On solving the two equations, we get

$$\frac{\alpha^2}{bc' - b'c} = \frac{\alpha}{a'c - ac'} = \frac{1}{ab' - a'b}$$

$$\Rightarrow \quad \alpha = \frac{a'c - ac'}{ab' - a'b},\ \alpha^2 = \frac{bc' - b'c}{ab' - a'b}$$

$$\Rightarrow \quad (bc' - b'c)(ab' - a'b) = (a'c - ac')^2$$

This is the condition for roots of two quadratic equations to be common.

(b) **When two common roots** In such a case, two equations should be identical. The ratio of coefficients of x^2, x^1 and x^0 must be same

i.e., $\quad \dfrac{a}{a'} = \dfrac{b}{b'} = \dfrac{c}{c'}$

Sample Problem 10 *If the equations $3x^2 - 2x + p = 0$ and $6x^2 - 17x + 12 = 0$ have a common root, then the value of p is*

(a) $\dfrac{15}{3}, \dfrac{8}{3}$ (b) $-\dfrac{15}{4}, -\dfrac{8}{3}$

(c) $\dfrac{15}{7}, \dfrac{8}{3}$ (d) $-\dfrac{15}{4}, \dfrac{8}{3}$

Interpret (*b*) Let α be a common root, then

$$3\alpha^2 - 2\alpha + p = 0 \quad \text{...(i)}$$

and $\quad 6\alpha^2 - 17\alpha + 12 = 0 \quad$ ...(ii)

From Eqs. (i) and (ii), we get

$$\frac{\alpha^2}{-24 + 17p} = \frac{\alpha}{6p - 36} = \frac{-1}{39}$$

$$\Rightarrow \quad \alpha^2 = \frac{24 - 17p}{39} \text{ and } \alpha = \frac{36 - 6p}{39}$$

$$\Rightarrow \quad \left(\frac{36 - 6p}{39}\right)^2 = \frac{24 - 17p}{39}$$

$$\Rightarrow \quad 12p^2 + 77p + 120 = 0$$

$$\Rightarrow \quad (4p + 15)(3p + 8) = 0$$

$$\Rightarrow \quad p = \frac{-15}{4}, \frac{-8}{3}$$

5.13 Different Conditions for Roots

(i) If b is of opposite sign as compared to a and c, then both roots of $ax^2 + bx + c = 0$ are positive.

(ii) If a, b and c are all of same sign, then both roots of $ax^2 + bx + c = 0$ are negative.

(iii) If there is no term containing coefficient of x, then both the roots of the equation $ax^2 + bx + c = 0$ are equal in magnitude but opposite in sign.

(iv) If a and c are of opposite signs, then both the roots of the equation are of opposite sign.

(v) If the roots of $ax^2 + bx + c$ are reciprocal to each other, then $c = a$.

Sample Problem 11 *If $a \neq b$, then the roots of the equation $2(a^2 + b^2)x^2 + 2(a + b)x + 1 = 0$ are*

(a) *real and distinct*
(b) *real and equal*
(c) *imaginary*
(d) *None of the above*

Interpret (c) The given equation is

$$2(a^2 + b^2)x^2 + 2(a + b)x + 1 = 0$$

Now,
$$D = 4(a + b)^2 - 8(a^2 + b^2)$$
$$= -4(a^2 + b^2 - 2ab)$$
$$= -4(a - b)^2 < 0 \qquad (\because a - b \neq 0)$$

Hence, the roots of the given equation are imaginary.

Hot Spot

Roots of Quadratic Equation

In these types of problems, a quadratic equation is given and we have to find its root/solutions. These types of problems are directly or indirectly asked in every year in AIEEE (JEE Main) from 2008. *To solve such types of problem following steps are given below.*

Step I Firstly, assume the roots of a quadratic equation α and β

Step II Determine sum and product of roots.

Step III If it is required, use symmetric function.

Step IV Apply the suitable formula carefully and get the required result.

Sample Problem 12 *If the quadratic equation is $x^2 + 9x + 20 = 0$, then the roots of an equation are*

(a) $-4, -5$
(b) $+4, -5$
(c) $5, 4$
(d) *None of these*

Interpret (a)

Step I Firstly assume the roots of a quadratic equation be α and β.

Step II Sum of a roots, $\alpha + \beta = -9$ and product of a roots, $\alpha\beta = 20$.

Step III Use symmetric function

$$\alpha - \beta = \sqrt{(\alpha + \beta)^2 - 4\alpha\beta}$$
$$= \sqrt{81 - 4(20)} = \sqrt{9} = 3$$

Step IV Simplify it,

On solving, we get $\alpha = -4, -5$

Check Point 1

1. If one root of the equation $x^2 + px + 12 = 0$ is 4, while the equation $x^2 + px + q = 0$ has equal roots, then the value of q is
   (a) 49/4 (b) 4/49
   (c) 4 (d) None of these
2. If the roots of the equation $x^2 + 2ax + b = 0$ are real and distinct and they differ by atmost 2m, then b lies in the interval
   (a) $(a^2 - m^2, a^2)$
   (b) $[a^2 - m^2, a^2)$
   (c) $(a^2, m^2 + a^2)$
   (d) None of the above
3. The value of α, for which the equation $x^2 - (\sin\alpha - 2)x - (1 + \sin\alpha) = 0$ has roots, whose sum of square is least, is
   (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{3}$ (c) $\frac{\pi}{2}$ (d) $\frac{\pi}{6}$
4. The number of values of the triplet (a, b, c) for which, $a\cos^2 x + b\sin^2 x + c = 0$ is satisfied by all real x, is
   (a) 0 (b) 2 (c) 3 (d) infinite
5. If a and b are rational and b is not a perfect square, then the quadratic equation with rational coefficients whose one root is $\frac{1}{a + \sqrt{b}}$, is
   (a) $x^2 - 2ax + (a^2 - b) = 0$
   (b) $(a^2 - b)x^2 - 2ax + 1 = 0$
   (c) $(a^2 - b)x^2 - 2bx + 1 = 0$
   (d) None of the above
6. If tan A and tan B are the roots of the quadratic equation $x^2 - px + q = 0$, then the value of $\sin^2(A + B)$ is
   (a) $\frac{p^2}{p^2 + q^2}$ (b) $\frac{p^2}{(p + q)^2}$
   (c) $1 - \frac{p}{(1 - q)^2}$ (d) None of these
7. If the roots of $a_1x^2 + b_1x + c_1 = 0$ are α_1, β_1 and those of $a_2x^2 + b_2x + c_2 = 0$ are α_2, β_2 such that $\alpha_1\alpha_2 = \beta_1\beta_2 = 1$, then
   (a) $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$ (b) $\frac{a_1}{c_2} = \frac{b_1}{b_2} = \frac{c_1}{a_2}$
   (c) $a_1 a_2 = b_1 b_2 = c_1 c_2$ (d) None of these
8. If $(2x^2 - 3x + 1)(2x^2 + 5x + 1) = 9x^2$, then equation has
   (a) four real roots
   (b) two real and two imaginary roots
   (c) four imaginary roots
   (d) None of the above
9. If $|x^2| + |x| - 2 = 0$, then the value of x is equal to
   (a) 2
   (b) – 2
   (c) 1
   (d) None of the above

5.14 Quadratic Expression

An expression of the form $ax^2 + bx + c$, where $a, b, c \in R$ and $a \neq 0$ is called a quadratic expression in x. So, in general quadratic expression is represented as

$$f(x) = ax^2 + bx + c \text{ or } y = ax^2 + bx + c$$

Graph of a Quadratic Expression

We have, $y = ax^2 + bx + c = f(x)$ $(a \neq 0)$

$$\Rightarrow \quad y = a\left[\left(x + \frac{b}{2a}\right)^2 - \frac{D}{4a^2}\right] \quad \text{or} \left(y + \frac{D}{4a}\right) = a\left(x + \frac{b}{2a}\right)^2$$

Now, let $y + \frac{D}{4a} = Y$ and $x + \frac{b}{2a} = X$

$$\therefore \quad Y = aX^2 \quad \Rightarrow X^2 = \frac{Y}{a}$$

(i) The shape of the curve $y = f(x)$ is parabolic.

(ii) The axis of parabola is $X = 0$ or $x + \frac{b}{2a} = 0$, *i.e.*, parallel to y-axis.

(iii) (a) If $a > 0$, then the parabola opens upwards.

(b) If $a < 0$, then the parabola opens downwards.

Sample Problem 13 *The linear factors of* $2x^2 - y^2 - x + xy + 2y - 1$ *are*

(a) $(2x + y + 1)$ *and* $(x + y - 1)$
(b) $(2x - y + 1)$ *and* $(x + y - 1)$
(c) $(2x - y + 1)$ *and* $(x + y + 1)$
(d) *None of the above*

Interpret (*b*) The corresponding equation to given expression can be rewritten as

$$2x^2 - (1 - y)x - (y^2 - 2y + 1) = 0$$

$$\therefore \quad \text{Roots } x = \frac{1 - y \pm \sqrt{(1 - y)^2 + 8(y - 1)^2}}{4}$$

$$= \frac{(1 - y) \pm 3(1 - y)}{4} = 1 - y, \frac{y - 1}{2}$$

Thus, required linear factors are $(x + y - 1)$ and $(2x - y + 1)$.

5.15 Possible Graph of Quadratic Expression

Let a quadratic expression is $f(x) = ax^2 + bx + c$.

Here, two cases arise.

***Case* I** When $a > 0$

- $D = 0$
- $f(x) = 0$ has real and equal roots.
- $f(x) \geq 0$ for all $x \in R$

(a)

- $D < 0$
- $f(x) = 0$ does not have real roots.
- $f(x) > 0$ for all $x \in R$

(b)

- $D > 0$
- Roots of $f(x) = 0$ are real and distinct.
- $f(x) > 0$, if $x < \alpha$ or $x > \beta$ and $f(x) < 0$, if $\alpha < x < \beta$

(c)

***Case* II** When $a < 0$

- $D < 0$
- $f(x) = 0$ does not have real roots.
- $f(x) < 0$ for all $x \in R$

(d)

- $D = 0$
- $f(x) = 0$ has real and equal roots.
- $f(x) \leq 0$ for all $x \in R$

(e)

- $D > 0$
- Roots of $f(x) = 0$ are real and distinct.
- $f(x) < 0$, if $x < \alpha$ or $x > \beta$ and $f(x) > 0$, if $\alpha < x < \beta$

(f)

5.16 Position of Roots of a Quadratic Equation

Let $f(x) = ax^2 + bx + c$; $a, b, c \in R$, $a \neq 0$ and α, β be the roots of $f(x) = 0$. Suppose $k, k_1, k_2 \in R$ and $k_1 < k_2$. Then, the following hold good

(i) **Conditions for a number k**

[If both the roots of $f(x) = 0$ are less than k]

(a) $D \geq 0$ (roots may be equal) (b) $af(k) > 0$

(c) $k > -\dfrac{b}{2a}$, where $\alpha \leq \beta$

(ii) **Conditions for a number k**

[If both the roots of $f(x) = 0$ are greater than k]

(a) $D \geq 0$ (b) $f(2) > 0$ (c) $\dfrac{-b}{2a} > 2$

(iii) **Conditions for a number k**

[If k lies between the roots of $f(x) = 0$]

(a) $D > 0$ (b) $af(k) < 0$ where, $\alpha < \beta$

(iv) **Conditions for numbers k_1 and k_2**

[If exactly one root of $f(x) = 0$ lies in the interval (k_1, k_2)]

(a) $D > 0$

(b) $f(k_1)f(k_2) < 0$, where $\alpha < \beta$

(v) **Conditions for numbers k_1 and k_2**

[If both roots of $f(x) = 0$ lies between k_1 and k_2]

(a) $D \geq 0$ (roots may be equal) (b) $af(k_1) > 0$

(c) $af(k_2) > 0$ (d) $k_1 < -\dfrac{b}{2a} < k_2$, where $\alpha \leq \beta$ and $k_1 < k_2$.

(vi) **Conditions for numbers k_1 and k_2**

[If k_1 and k_2 lie between the roots of $f(x) = 0$]

(a) $D > 0$ (b) $af(k_1) < 0$ (c) $af(k_2) < 0$, where $\alpha < \beta$.

Sample Problem 14 *For what values of $m \in R$, both roots of the equation $x^2 - 6mx + 9m^2 - 2m + 2 = 0$ exceed 3?*

(a) $\left(\dfrac{11}{7}, \infty\right)$ (b) $\left(\dfrac{11}{9}, \infty\right)$

(c) $\left(\dfrac{11}{5}, \infty\right)$ (d) $\left(-\dfrac{11}{9}, \infty\right)$

Interpret *(b)* Let $f(x) = x^2 - 6mx + 9m^2 - 2m + 2$ as both roots of $f(x) = 0$ are greater than 3, we can take $D \geq 0$, $af(3) > 0$ and $-\dfrac{b}{2a} > 3$.

(1) For $D \geq 0$: $(-6m)^2 - 4.1(9m^2 - 2m + 2) \geq 0$

$\Rightarrow \quad 8m - 8 \geq 0 \therefore m \geq 1$

or $\quad m \in [1, \infty)$ ...(i)

(2) For $af(3) > 0$: $1.(9 - 18m + 9m^2 - 2m + 2) > 0$

$\Rightarrow \quad 9m^2 - 20m + 11 > 0$

$\Rightarrow \quad (9m - 11)(m - 1) > 0$

$\Rightarrow \quad \left(m - \dfrac{11}{9}\right)(m - 1) > 0$

$\Rightarrow \quad m \in (-\infty, 1) \cup \left(\dfrac{11}{9}, \infty\right)$ ...(ii)

For $-\dfrac{b}{2a} > 3$: $\dfrac{6m}{2} > 3 \Rightarrow m > 1 \Rightarrow m \in (1, \infty)$ ...(iii)

Hence, the values of m satisfying Eqs. (i), (ii) and (iii) at the same time are $m \in \left(\dfrac{11}{9}, \infty\right)$.

Sample Problem 15 *The value of a for which the quadratic equation $3x^2 + 2(a^2 + 1)x + (a^2 - 3a + 2) = 0$ possesses roots of opposite sign, lies in*

(a) $(-\infty, 1)$ (b) $(-\infty, 0)$

(c) $(1, 2)$ (d) $\left(\dfrac{3}{2}, 2\right)$

Interpret (c) The quadratic equation

$$3x^2 + 2(a^2 + 1)x + (a^2 - 3a + 2) = 0$$

will have two roots of opposite sign, if it has real roots and the product of roots is negative *i.e.*, if $D > 0$ and $\alpha\beta < 0$.

$\Rightarrow \quad 4(a^2 + 1)^2 - 12(a^2 - 3a + 2) > 0$

and $\quad \dfrac{a^2 - 3a + 2}{3} < 0$

Both of these conditions are satisfied, if $a^2 - 3a + 2 < 0$ *i.e.*, if $(a - 1)(a - 2) < 0$ or $1 < a < 2$.

5.17 Maximum and Minimum Value of $ax^2 + bx + c$

$\because \quad ax^2 + bx + c = a\left(x + \dfrac{b}{2a}\right)^2 + \left(\dfrac{4ac - b^2}{4a}\right)$

***Case* I** When $a > 0$

$\because \quad ax^2 + bx + c \geq \dfrac{4ac - b^2}{4a}$

$\therefore$ Minimum value of $ax^2 + bx + c$ is $\dfrac{4ac - b^2}{4a}$ at $x = -\dfrac{b}{2a}$.

***Case* II** When $a < 0$

$\because \quad ax^2 + bx + c \leq \dfrac{4ac - b^2}{4a}$

$\therefore$ Maximum value of $ax^2 + bx + c$ is $\dfrac{4ac - b^2}{4a}$ at $x = -\dfrac{b}{2a}$.

Check Point **2**

1. The roots of $ax^2 + bx + c = 0$, where $a \neq 0$ and coefficients are real, non-real complex and $a + c < b$, then
   (a) $4a + c > 2b$ (b) $4a + c < 2b$
   (c) $4a + c = 2b$ (d) None of the above
2. If X denotes the set of real number p for which the equation $x^2 = p(x + p)$ has its roots greater than p, then X is equal to
   (a) $\left(-2, -\frac{1}{2}\right)$ (b) $\left(\frac{-1}{2}, \frac{1}{4}\right)$
   (c) ϕ (d) $(-\infty, 0)$
3. Conditions on a and b for which $x^2 - ax - b^2$ is less than zero for atleast one positive x, are
   (a) $a > 3, b < 0$ (b) $a > 3, b > 0$
   (c) $a, b \in R$ (d) None of these
4. If $ax^2 + bx + 6 = 0$ does not have two distinct real roots, then the least value of $3a + b$ is
   (a) 2 (b) – 2 (c) 1 (d) – 1
5. If $(\lambda^2 + \lambda - 2)x^2 + (\lambda + 2)x < 1$ for all $x \in R$, then λ belongs to the interval
   (a) $(-2, 1)$ (b) $\left(-2, \frac{2}{5}\right)$ (c) $\left(\frac{2}{5}, 1\right)$ (d) $\left(-2, \frac{1}{2}\right)$
6. The value of a for which $2x^2 - 2(2a + 1)x + a(a + 1) = 0$ may have one root less than a and other root greater than a, is
   (a) $-1 < a < 0$ (b) $a > 0$ or $a < -1$
   (c) $a \geq 0$ (d) $-\frac{1}{2} < a < 0$
7. Find all values of p, so that 6 lies between the roots of the equation $x^2 + 2(p - 3)x + 9 = 0$.
   (a) $\left(-\infty, \frac{3}{4}\right)$ (b) $\left(-\infty, -\frac{3}{4}\right)$
   (c) $\left(\frac{3}{4}, \infty\right)$ (d) None of these

5.18 Inequality

An equation having signs $>, <, \geq$ or $\leq$ at the place of sign of equality (=) is known as inequality or inequation.

OR

Let a and b are two real numbers. If $a - b$ is negative, we say that a is less than $b (a < b)$ and if $a - b$ is positive, then a is greater than $b (a > b)$.

Properties of Inequalities

(i) If $a > b$ and $b > c$, then $a > c$. Generally, if $a_1 > a_2, a_2 > a_3, \ldots, a_{n-1} > a_n$, then $a_1 > a_n$.

(ii) If $a > b$, then $a \pm c > b \pm c, \forall c \in R$

(iii) If $a > b$, then for $m > 0$, $am > bm$, $\frac{a}{m} > \frac{b}{m}$ and for $m < 0$, $bm > am$, $\frac{b}{m} < \frac{a}{m}$

(iv) If $a > b > 0$, then
   (a) $a^2 > b^2$ (b) $|a| > |b|$ (c) $\frac{1}{a} < \frac{1}{b}$
   and if $a < b < 0$, then
   (a) $a^2 > b^2$ (b) $|a| > |b|$ (c) $\frac{1}{a} > \frac{1}{b}$

(v) If $a < 0 < b$, then
   (a) $a^2 > b^2$, if $|a| > |b|$ (b) $a^2 < b^2$, if $|a| < |b|$

(vi) If $a < x < b$ and a, b are positive real numbers, then
$$a^2 < x^2 < b^2$$

(vii) If $a < x < b$ and a is negative number and b is positive number, then
   (a) $0 \leq x^2 < b^2$, if $|b| > |a|$
   (b) $0 \leq x^2 \leq a^2$, if $|a > |b|$

(viii) If $\frac{a}{b} > 0$, then
   (a) $a > 0$, if $b > 0$ (b) $a < 0$, if $b < 0$

(ix) If $a_i > b_i > 0$, where $i = 1, 2, 3, \ldots, n$, then
$$a_1 a_2 a_3 \ldots a_n > b_1 b_2 b_3 \ldots b_n$$

(x) If $|x| < a$, then
   (a) If a is positive, then $-a < x < a$
   (b) If a is negative, then $x \in \phi$

(xi) If $a_1 > b_i$, where $i = 1, 2, 3, \ldots, n$, then
$$a_1 + a_2 + a_3 + \ldots + a_n > b_1 + b_2 + \ldots + b_n$$

(xii) If $a > b > 0$, then $\frac{1}{a} < \frac{1}{b}$

(xiii) If $0 < a < 1$ and n is a positive rational number, then
   (a) $0 < a^n < 1$ (b) $a^{-n} > 1$

Algorithm of Modulus Function

The equation of the form
$$|f_1(x)| + |f_2(x)| + |f_3(x)| + \ldots + |f_n(x)| = g(x) \quad \ldots(i)$$
when $f_1(x) f_2(x) \ldots f_3(x), g(x)$ are function of x and $g(x)$ may be constant.

Equations of this form solved by the method of intervals. We first find all critical points of $f_1(x), f_2(x), \ldots f_n(x)$, if coefficient of x is +ve then graph start with +ve sign and if coefficient of x is negative the graph start with negative sign.

Then, using the definition of the absolute value, we pass from Eq. (i) to a collection of systems which do not contain the absolute value symbols.

Sample Problem 16 *The solution set of* $|3-4x| \geq 9$ *is*

[NCERT Exemplar]

(a) $\left(-\infty, \frac{3}{2}\right) \cup [3, \infty)$ (b) $\left(-\infty, -\frac{3}{2}\right] \cup [3, \infty)$

(c) $(-\infty, 2) \cup [2, \infty)$ (d) *None of these*

Interpret (b) We have, $|3-4x| \geq 9$.

$\Rightarrow$ $3-4x \leq -9$ or $3-4x \geq 9$ (since, $|x| \geq a \Rightarrow x \leq -a$ or $x \geq a$)

$\Rightarrow$ $-4x \leq -12$ or $-4x \geq 6$

$\Rightarrow$ $x \geq 3$ or $x \leq \frac{-3}{2}$ (dividing both sides by –4)

$\Rightarrow$ $x \in \left(-\infty, \frac{-3}{2}\right] \cup [3, \infty)$

Sample Problem 17 *The solution set of* $\frac{|x+3|+x}{x+2} > 1$ *is*

[NCERT Exemplar]

(a) $[-5, -2] \cup [-1, \infty)$ (b) $[-5, -2] \cup [-1, \infty)$

(c) $(-5, -2) \cup (-1, \infty)$ (d) *None of these*

Interpret (c) We have, $\frac{|x+3|+x}{x+2} > 1$

$\Rightarrow$ $\frac{|x+3|+x}{x+2} - 1 > 0 \Rightarrow \frac{|x+3|-2}{x+2} > 0$

Case I When $x+3 \geq 0$, *i.e.*, $x \geq -3$

$\therefore$ $\frac{|x+3|-2}{x+2} > 0 \Rightarrow \frac{x+3-2}{x+2} > 0 \Rightarrow \frac{x+1}{x+2} > 0$

$\Rightarrow$ $\{(x+1) > 0$ and $x+2 > 0\}$ or $\{x+1 < 0$ and $x+2 < 0\}$

$\Rightarrow$ $\{x > -1$ and $x > -2\}$ or $\{x < -1$ and $x < -2\}$

$\Rightarrow$ $x > -1$ or $x < -2$

$\Rightarrow$ $x \in (-1, \infty)$ or $x \in (-\infty, -2)$

$\Rightarrow$ $x \in (-3, -2) \cup (-1, \infty)$ (since, $x \geq -3$) ...(i)

Case II When $x+3 < 0$ *i.e.*, $x < -3$

$\therefore$ $\frac{|x+3|-2}{x+2} > 0 \Rightarrow \frac{-x-3-2}{x+2} > 0$

$\Rightarrow$ $\frac{-(x+5)}{x+2} > 0 \Rightarrow \frac{x+5}{x+2} < 0$

$\Rightarrow$ $(x+5 < 0$ and $x+2 > 0)$ or $(x+5 > 0$ and $x+2 < 0)$

$\Rightarrow$ $(x < -5$ and $x > -2)$

or $(x > -5$ and $x < -2)$ it is not possible.

$\Rightarrow$ $x \in (-5, -2)$ ...(ii)

$\therefore$ From Eqs. (i) and (ii), we get $x \in (-5, -2) \cup (-1, \infty)$

5.19 Arithmetico-Geometric Mean Inequality

(i) If $a, b > 0$ and $a \neq b$, then $\frac{a+b}{2} > \sqrt{ab} > \frac{2}{\frac{1}{a}+\frac{1}{b}}$

(ii) If $a_i > 0$, where $i = 1, 2, 3, \ldots, n$, then

$$\frac{a_1 + a_2 + \ldots + a_n}{n} \geq (a_1 \cdot a_2 \cdot \ldots \cdot a_n)^{1/n} \geq \frac{n}{\frac{1}{a_1}+\frac{1}{a_2}+\ldots+\frac{1}{a_n}}$$

Sample Problem 18 *If* a, b and c *be positive number, then* $a^2 + b^2 + c^2$ *is greater than*

(a) $ab + bc + ca$ (b) $\frac{ab+bc+ca}{2}$

(c) $2(ab + bc + ca)$ (d) *None of these*

Interpret (a) $\because$ AM > GM

$\therefore$ $\frac{a^2+b^2}{2} > \sqrt{a^2b^2} \Rightarrow \frac{a^2+b^2}{2} > ab$ ...(i)

Similarly, $\frac{b^2+c^2}{2} > bc$ ...(ii)

and $\frac{c^2+a^2}{2} > ca$ ...(iii)

On adding Eqs. (i), (ii) and (iii), we get

$$a^2 + b^2 + c^2 > ab + bc + ca$$

5.20 Logarithm

If a is a positive real number other than 1 and $a^x = m$, then x is called the logarithm of m to the base a, written as $\log_a m$. ln $\log_a m$, m should be always positive.

Note

- If $m < 0$, then $\log_a m$ will be imaginary and if $m = 0$, then $\log_a m$ will be meaningless.
- $\log_a m$ exists, if $m, a > 0$ and $a \neq 1$.

Important Results on Logarithm

(a) $a^{\log_a x} = x$; $a \neq 0, \neq 1, x > 0$ (b) $a^{\log_b x} = x^{\log_b a}$; $a, b > 0, \neq 1, x > 0$

(c) $\log_a a = 1, a > 0, \neq 1$ (d) $\log_a x = \frac{1}{\log_x a}$; $x, a > 0, \neq 1$

(e) $\log_a x = \log_a b \log_b x = \frac{\log_b x}{\log_b a}$; $a, b > 0, \neq 1, x > 0$

(f) For $m, n > 0$ and $a > 0, \neq 1$, then

(i) $\log_a (m \cdot n) = \log_a m + \log_a n$ (ii) $\log_a \left(\frac{m}{n}\right) = \log_a m - \log_a n$

(iii) $\log_a (m^n) = n \log_a (m)$

(g) For $x > 0, a > 0, \neq 1$

(i) $\log_{a^n} (x) = \frac{1}{n} \log_a x$ (ii) $\log_{a^n} x^m = \left(\frac{m}{n}\right) \log_a x$

(h) For $x > y > 0$

(i) $\log_a x > \log_a y$, if $a > 1$ (ii) $\log_a x < \log_a y$, if $0 < a < 1$

(i) If $a > 1$ and $x > 0$, then

(i) $\log_a x > p \Rightarrow x > a^p$ (ii) $0 < \log_a x < p \Rightarrow 1 < x < a^p$

(j) If $0 < a < 1$, then

(i) $\log_a x > p \Rightarrow 0 < x < a^p$ (ii) $0 < \log_a x < p \Rightarrow a^p < x < 1$

Sample **Problem 19** *If $a^x = b^y = c^z = d^w$, then the value of $x\left(\frac{1}{y}+\frac{1}{z}+\frac{1}{w}\right)$ is*

(a) $\log_a (abc)$ (b) $\log_a (bcd)$ (c) $\log_b (cda)$ (d) $\log_c (dab)$

Interpret (b) Given, $a^x = b^y = c^z = d^w$

$\Rightarrow$ $x = y \log_a b = z \log_a c = w \log_a d$

$\Rightarrow$ $y = \frac{x}{\log_a b}, z = \frac{x}{\log_a c}, w = \frac{x}{\log_a d}$

Now, $x\left(\frac{1}{y}+\frac{1}{z}+\frac{1}{w}\right) = x\left(\frac{\log_a b}{x}+\frac{\log_a c}{x}+\frac{\log_a d}{x}\right)$

$= \frac{x}{x}(\log_a bcd)$ $(\because \log_x y + \log_x z = \log_x yz)$

$= \log_a (bcd)$

Check Point **3**

1. The solution set of $\frac{1}{|x|-3} \le \frac{1}{2}$ is
   (a) $(-\infty, -5) \cup (-3, 3) \cup [5, \infty)$
   (b) $(-\infty, -5] \cup [-3, 3] \cup [5, \infty)$
   (c) $(-\infty, -5) \cup (-3, 3) \cup (5, \infty)$
   (d) None of the above
2. The solution set of $|x+1| + |x| > 3$ is
   (a) $(-\infty, -2) \cup [1, \infty)$ (b) $(-\infty, -2) \cup (1, \infty)$
   (c) $(-\infty, 2) \cup [3, \infty)$ (d) None of these
3. If $c < d$, $x^2 + (c+d)x + cd < 0$, then $x \in$
   (a) $(-d, -c]$ (b) $(-d, -c)$
   (c) R (d) S
4. If $x^2 + x + |x| + 1 \le 0$, then x lies in
   (a) $(0, \infty)$
   (b) $(-\infty, 0)$
   (c) R
   (d) ϕ
5. Solution set of the inequality $\frac{1}{2^x - 1} > \frac{1}{1 - 2^{x-1}}$, is
   (a) $(1, \infty)$ (b) $\left(0, \log_2\left(\frac{4}{3}\right)\right)$
   (c) $(-1, \infty)$ (d) $\left(0, \log_2\left(\frac{4}{3}\right)\right) \cup (1, \infty)$
6. If $a_i > 0, \forall i = 1, 2, \ldots, n$ and $a_1 a_2 \ldots a_n = 1$, then the minimum value of $(1+a_1)(1+a_2)\ldots(1+a_n)$ is
   (a) $2^{n/2}$ (b) 2^n (c) 2^{2n} (d) 1
7. If $\frac{2x}{2x^2+5x+2} > \frac{1}{x+1}$, then
   (a) $-2 > x > -1$ (b) $-2 \ge x \ge -1$
   (c) $-2 < x < -1$ (d) $-2 < x \le -1$
8. If $\log_{0.3}(x-1) < \log_{0.09}(x-1)$, then x lies in the interval
   (a) $(2, \infty)$ (b) $(1, 2)$
   (c) $(-2, -1)$ (d) None of these

WORKED OUT
Examples

Example 1 *If α and β be the roots of equation $ax^2 + bx + c = 0$, then the value of $\left(\frac{1}{a\alpha + b} + \frac{1}{a\beta + b}\right)$ is*

(a) $\frac{ac}{b}$ (b) $\frac{b}{ac}$

(c) $\frac{b}{c}$ (d) *None of these*

Solution (b) Since, α and β are the roots of $ax^2 + bx + c = 0$.

$$\therefore \quad \alpha + \beta = -\frac{b}{a} \quad \text{and} \quad \alpha\beta = \frac{c}{a}$$

Now, $$\frac{1}{a\alpha + b} + \frac{1}{a\beta + b} = \frac{a\beta + b + a\alpha + b}{(a\alpha + b)(a\beta + b)}$$

$$= \frac{a(\alpha + \beta) + 2b}{a^2\alpha\beta + ab(\alpha + \beta) + b^2}$$

$$= \frac{a\left(-\frac{b}{a}\right) + 2b}{a^2\left(\frac{c}{a}\right) + ab\left(-\frac{b}{a}\right) + b^2}$$

$$= \frac{-b + 2b}{ac - b^2 + b^2} = \frac{b}{ac}$$

Example 2 *If equations $2x^2 + kx - 5 = 0$ and $x^2 - 3x - 4 = 0$ have a common root, then the values of k are*

(a) -3 *or* $-\frac{27}{4}$ (b) 3 *or* $\frac{27}{4}$

(c) -3 *or* $\frac{27}{4}$ (d) 3 *or* $-\frac{27}{4}$

Solution (a) Let α be a root common to both of the given equations.

$$\therefore \quad 2\alpha^2 + k\alpha - 5 = 0 \quad \ldots(i)$$

$$\text{and} \quad \alpha^2 - 3\alpha - 4 = 0 \quad \ldots(ii)$$

On solving Eqs. (i) and (ii), we get

$$\frac{\alpha^2}{(-4k - 15)} = \frac{\alpha}{-5 + 8} = \frac{1}{-6 - k}$$

$$\Rightarrow \quad \alpha^2 = \frac{4k + 15}{k + 6} \quad \text{and} \quad \alpha = \frac{-3}{k + 6}$$

$$\Rightarrow \quad \left(\frac{-3}{k + 6}\right)^2 = \frac{4k + 15}{k + 6}$$

$$\Rightarrow \quad (4k + 15)(k + 6) = 9$$

$$\Rightarrow \quad 4k^2 + 39k + 81 = 0$$

$$\Rightarrow \quad k = -3 \quad \text{or} \quad k = -\frac{27}{4}$$

Example 3 *If the roots of equation $ax^2 + bx + c = 0$ are $\frac{k+1}{k}$ and $\frac{k+2}{k+1}$, then the value of $(a + b + c)^2$ is*

(a) $b^2 + 4ac$ (b) $-b^2 + 4ac$

(c) $b^2 - 4ac$ (d) *None of these*

Solution (c) $\because$ Sum of roots,

$$\frac{k+1}{k} + \frac{k+2}{k+1} = -\frac{b}{a} \quad \ldots(i)$$

and product of roots,

$$\frac{k+1}{k} \times \frac{k+2}{k+1} = \frac{c}{a}$$

$$\Rightarrow \quad \frac{k+2}{k} = \frac{c}{a}$$

$$\Rightarrow \quad \frac{2}{k} = \frac{c}{a} - 1 = \frac{c - a}{a}$$

$$\Rightarrow \quad k = \frac{2a}{c - a}$$

On putting the value of k in Eq. (i), we get

$$\frac{c + a}{2a} + \frac{2c}{c + a} = -\frac{b}{a}$$

$$\Rightarrow \quad (c + a)^2 + 4ac = -2b(a + c)$$

$$\Rightarrow \quad (a + c)^2 + 2b(a + c) = -4ac$$

$$\Rightarrow \quad (a + c)^2 + 2b(a + c) + b^2 = b^2 - 4ac$$

$$\Rightarrow \quad (a + b + c)^2 = b^2 - 4ac$$

Example 4 *Two students tried to solve a quadratic equation $x^2 + px + q = 0$. First student took a wrong value of p and then found the roots of equation as 2 and 6. Another student took a wrong value of q and then found the roots of equation as 2 and -9. The exact roots of equation are*

(a) $3, 4$ (b) $-3, -4$

(c) $-3, 4$ (d) $3, -4$

Solution (*b*) Let equation of exact roots is

$$x^2 + ax + b = 0 \quad \ldots(i)$$

According to first student,

sum of roots $= 2 + 6 = 8$

and product of roots $= 2 \times 6 = 12$

Since, first student took a wrong value of p.

$\therefore \quad q = 12$

and according to second student,

sum of roots $= 2 + (-9) = -7$

and product of roots $= 2 \times (-9) = -18$

Since, second student took a wrong value of q.

$\therefore \quad p = 7$

$\therefore$ From Eq. (i),

$$x^2 + 7x + 12 = 0$$

$$x^2 + 3x + 4x + 12 = 0$$

$$\Rightarrow \quad (x + 4)(x + 3) = 0$$

$$\Rightarrow \quad x = -3, -4$$

Example 5 *If* $x = 2 + 2^{2/3} + 2^{1/3}$, *then the value of* $x^3 - 6x^2 + 6x$ *is*

(*a*) 2 (*b*) 3 (*c*) -6 (*d*) 8

Solution (*a*) $\because \quad x = 2 + 2^{2/3} + 2^{1/3}$

$$\Rightarrow \quad (x - 2) = 2^{2/3} + 2^{1/3}$$

$$\Rightarrow \quad x^3 - 8 - 6x^2 + 12x = 2^2 + 2 + 3 \cdot 2(x - 2)$$

$$\Rightarrow \quad x^3 - 8 - 6x^2 + 12x = 4 + 2 + 6x - 12$$

$$\Rightarrow \quad x^3 - 6x^2 + 6x = 8 + 6 - 12$$

$$\Rightarrow \quad x^3 - 6x^2 + 6x = 2$$

Example 6 *If the product of roots of equation* $x^2 - 3kx + 2e^{2\log k} - 1 = 0$ *is 7, then the value of k is*

(*a*) -2 (*b*) 2

(*c*) 4 (*d*) *None of these*

Solution (*b*) Since, product of roots of $x^2 - 3kx + 2e^{2\log_e k} - 1 = 0$ is 7.

$$\therefore \quad 2e^{2\log k} - 1 = 7$$

$$\Rightarrow \quad 2e^{2\log k} = 8 \Rightarrow e^{2\log_e k} = 4$$

$$\Rightarrow \quad k^2 = 4 \Rightarrow k = \pm 2$$

$$\Rightarrow \quad k = 2 \quad (\because k \neq -2)$$

Example 7 *The number of solutions of equation*

$$\frac{(x + 2)(x - 5)}{(x - 3)(x + 6)} = \frac{x - 2}{x + 4} \text{ is}$$

(*a*) 1 (*b*) 2 (*c*) 3 (*d*) *infinite*

Solution (*a*) We have, $\dfrac{(x + 2)(x - 5)}{(x - 3)(x + 6)} = \dfrac{x - 2}{x + 4}$

$$\Rightarrow \quad (x + 2)(x - 5)(x + 4) = (x - 2)(x - 3)(x + 6)$$

$$\Rightarrow \quad (x^2 - 3x - 10)(x + 4) = (x^2 - 5x + 6)(x + 6)$$

$$\Rightarrow \quad x^3 - 3x^2 - 10x + 4x^2 - 12x - 40$$

$$= x^3 - 5x^2 + 6x + 6x^2 - 30x + 36$$

$$\Rightarrow \quad x^2 - 22x - 40 = x^2 - 24x + 36$$

$$\Rightarrow \quad 2x = 40 + 36$$

$$\Rightarrow \quad x = \frac{76}{2} = 38$$

Number of solutions of given equation is 1.

Example 8 *If* $x > 0$, *then solution of* $\left|x + \dfrac{1}{x}\right| < 4$ *is*

(*a*) $-2 - \sqrt{3} < x < -2 + \sqrt{3}$ (*b*) $2 - \sqrt{3} < x < 7 + \sqrt{3}$

(*c*) $2 - \sqrt{3} < x < 2 + \sqrt{3}$ (*d*) *None of these*

Solution (*a*) $\because \left|x + \dfrac{1}{x}\right| < 4 \Rightarrow \dfrac{x^2 + 1}{|x|} < 4$

$$\Rightarrow \quad |x|^2 - 4|x| + 1 < 0$$

$$\Rightarrow \quad (|x| - 2)^2 < 3$$

$$\Rightarrow \quad (|x| - 2)^2 < (\sqrt{3})^2$$

$$\Rightarrow \quad ||x| - 2| < \sqrt{3}$$

$$\Rightarrow \quad -\sqrt{3} < (|x| - 2) < \sqrt{3}$$

$$\Rightarrow \quad 2 - \sqrt{3} < |x| < 2 + \sqrt{3}$$

when $x > 0$, $\quad 2 - \sqrt{3} < x < 2 + \sqrt{3}$

and when $x < 0$, $\quad -2 - \sqrt{3} < x < -2 + \sqrt{3}$

Example 9 *For positive real numbers a, b and c, the minimum value of* $\dfrac{b + c}{a} + \dfrac{c + a}{b} + \dfrac{a + b}{c}$ *is*

(*a*) 5 (*b*) 6

(*c*) 9 (*d*) *None of these*

Solution (*b*) Since,

$$\frac{1}{6}\left(\frac{a}{b} + \frac{b}{a} + \frac{b}{c} + \frac{c}{b} + \frac{c}{a} + \frac{a}{c}\right) \geq \left(\frac{a}{b} \cdot \frac{b}{a} \cdot \frac{b}{c} \cdot \frac{c}{b} \cdot \frac{c}{a} \cdot \frac{a}{c}\right)^{1/6}$$

$$\Rightarrow \quad \left(\frac{a}{b} + \frac{b}{a} + \frac{b}{c} + \frac{c}{b} + \frac{c}{a} + \frac{a}{c}\right) \geq 6$$

$\therefore$ Minimum value of $\left(\dfrac{a + b}{c} + \dfrac{c + a}{b} + \dfrac{b + c}{a}\right) = 6$

Example 10 *The equation*

$$\sqrt{x + 3 - 4\sqrt{x - 1}} + \sqrt{x + 8 - 6\sqrt{x - 1}} = 1 \text{ has}$$

(*a*) *no solution* (*b*) *only one solution*

(*c*) *only two solutions* (*d*) *more than two solutions*

Solution (*d*) Put $\sqrt{x - 1} = t$ or $x = t^2 + 1$, so that given equation becomes

$$\sqrt{t^2 + 4 - 4t} + \sqrt{t^2 + 9 - 6t} = 1$$

$$\Rightarrow \quad \sqrt{(t - 2)^2} + \sqrt{(t - 3)^2} = 1$$

$$\Rightarrow \quad |t - 2| + |t - 3| = 1$$

This equation is satisfied for all values of t lying between 2 and 3 *i.e.*, $2 \le t \le 3$.

Thus, the given equation is satisfied for all values of x lying between 5 and 10.

Example 11 *If the roots of equation $ax^2 + bx + c = 0$ are in the ratio $1:r$, then $\left\{\frac{(r+1)^2}{r}\right\}$ is equal to*

(a) $\frac{b^2}{ac}$ (b) $\frac{ac}{b^2}$ (c) $\frac{b^2}{a}$ (d) $\frac{b^2}{c}$

Solution (a) Let roots of equation $ax^2 + bx + c = 0$ are α and $r\alpha$, then

$$\alpha + \alpha r = -\frac{b}{a} \quad \text{...(i)}$$

and $$\alpha \cdot r\alpha = \frac{c}{a} \Rightarrow r\alpha^2 = \frac{c}{a} \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\left\{-\frac{b}{a}\left(\frac{1}{1+r}\right)\right\}^2 = \frac{c}{ar}$$

$$\Rightarrow \quad \frac{b^2}{a^2}\left(\frac{1}{1+r}\right)^2 = \frac{c}{ar} \Rightarrow \frac{b^2}{ac} = \frac{(1+r)^2}{r}$$

Example 12 *If one root of equation $(l - m)x^2 + lx + 1 = 0$ is twice of another and l is real, then m is*

(a) $< \frac{9}{8}$ (b) $\le \frac{9}{8}$ (c) $\ge \frac{9}{8}$ (d) $> \frac{9}{8}$

Solution (b) Let roots of equation $(l - m)x^2 + lx + 1 = 0$ are α and 2α.

Then, $$2\alpha + \alpha = -\frac{l}{l-m} \Rightarrow \alpha = -\frac{1}{3(l-m)} \quad \text{...(i)}$$

and $$(2\alpha)(\alpha) = \frac{1}{l-m} \Rightarrow \alpha^2 = \frac{1}{2(l-m)} \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\left(-\frac{l}{3(l-m)}\right)^2 = \frac{1}{2(l-m)}$$

$$\Rightarrow \quad \frac{2l^2}{9} = (l-m)$$

$$\Rightarrow \quad 2l^2 - 9l + 9m = 0 \quad (\because l \text{ is real})$$

$$\therefore \quad 9^2 - 72m \ge 0$$

$$\Rightarrow \quad m \le \frac{81}{72} \Rightarrow m \le \frac{9}{8}$$

Example 13 *If a, b and c are real positive numbers such that $a < b < c$, then $\frac{a^2+b^2+c^2}{a+b+c}$ lies between*

(a) $\frac{a}{c}, \frac{c}{a}$ (b) $\frac{a^2}{c}, \frac{c^2}{a}$

(c) $\frac{c}{a^2}, \frac{a}{c^2}$ (d) *None of these*

Solution (b) Since, $c > b > a$

$$\Rightarrow \quad c^2 > b^2 > a^2$$

$$\Rightarrow \quad 3a^2 < a^2 + b^2 + c^2 < 3c^2 \quad \text{...(i)}$$

and $$3a < a + b + c < 3c$$

$$\Rightarrow \quad \frac{1}{3c} < \frac{1}{a+b+c} < \frac{1}{3a} \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{3a^2}{3c} < \frac{a^2+b^2+c^2}{a+b+c} < \frac{3c^2}{3a}$$

$$\Rightarrow \quad \frac{a^2}{c} < \frac{a^2+b^2+c^2}{a+b+c} < \frac{c^2}{a}$$

Example 14 *If a, b and c are distinct three positive real numbers, then $(a + b + c)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right)$ is*

(a) > 1 (b) > 9

(c) < 9 (d) *None of these*

Solution (b) We know that,

$$\text{AM} > \text{GM}$$

$$\Rightarrow \quad \frac{a+b+c}{3} > (abc)^{1/3} \quad \text{...(i)}$$

and $$\frac{\frac{1}{a}+\frac{1}{b}+\frac{1}{c}}{3} > \left(\frac{1}{abc}\right)^{1/3}$$

$$\Rightarrow \quad \left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) > \frac{3}{(abc)^{1/3}} \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\left(\frac{a+b+c}{3}\right)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) > \frac{3}{(abc)^{1/3}} \cdot (abc)^{1/3}$$

$$\Rightarrow \quad (a+b+c)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) > 9$$

Example 15 *The maximum value of function $f(x) = (1-x)^3$, $(1+3x)$, $\frac{-1}{3} < x < 1$ is*

(a) 1 (b) 0

(c) 3 (d) *None of these*

Solution (a) $\because f(x) = (1-x)^3 (1 + 3x)$

$$= (1-x)(1-x)(1-x)(1+3x)$$

$$\therefore \quad (1-x) > 0 \text{ and } 1 + 3x > 0 \quad \left(\because -\frac{1}{3} < x < 1\right)$$

and $(1-x) + (1-x) + (1-x) + (1+3x) = 4$

$\therefore$ For maximum value of $f(x)$

$$1 - x = 1 + 3x \Rightarrow x = 0$$

$\therefore$ Maximum value of $f(x)$ at $x = 0$ is

$$f(0) = (1-0)^3 (1 + 0) = 1$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Remainder and Factor Theorem

1. If $(x-2)$ is a common factor of the expressions x^2+ax+b and x^2+cx+d, then $\frac{b-d}{c-a}$ is equal to

(a) -2 (b) -1 (c) 1 (d) 2

2. If x^2+ax+1 is a factor of ax^3+bx+c, then

(a) $b+a+a^2=0, a=c$ (b) $b-a+a^2=0, a=c$

(c) $b+a-a^2=0, a=0$ (d) None of these

3. If x^2-3x+2 be a factor of x^4-px^2+q, then (p, q) is equal to

(a) (3, 4) (b) (4, 5) (c) (4, 3) (d) (5, 4)

4. If x^2+px+1 is a factor of the expression ax^3+bx+c, then

(a) $a^2+c^2=-ab$ (b) $a^2-c^2=-ab$

(c) $a^2-c^2=ab$ (d) None of these

Roots of Equation

5. The roots of a equation $2x^2+x+1=0$ are [NCERT]

(a) $\frac{-1+i\sqrt{7}}{4}, \frac{-1-i\sqrt{7}}{4}$ (b) $\frac{1+i\sqrt{7}}{4}, \frac{1-i\sqrt{7}}{4}$

(c) $\frac{-1+i\sqrt{7}}{2}, \frac{-1-i\sqrt{7}}{2}$ (d) None of these

6. If one root of the equation $x^2+(1-3i)x-2(1+i)=0$ is $-1+i$, then the other root is

(a) $-1-i$ (b) $\frac{-1-i}{2}$

(c) i (d) $2i$

7. If the difference of the roots of the equation $x^2-Px+8=0$ is 2, then the value of P is [NCERT Exemplar]

(a) ± 4 (b) ± 6

(c) ± 5 (d) None of these

8. If the sum of the squares of the roots of the equation $x^2-(a-2)x-(a+1)=0$ is least, then the value of a is [NCERT Exemplar]

(a) -1 (b) 1 (c) 2 (d) -2

9. If $x=\sqrt{1+\sqrt{1+\sqrt{1+\ldots\infty}}}$, then x is equal to

(a) $\frac{1+\sqrt{5}}{2}$ (b) $\frac{1-\sqrt{5}}{2}$

(c) $\frac{1\pm\sqrt{5}}{2}$ (d) None of these

10. If $\sqrt{3x^2-7x-30}+\sqrt{2x^2-7x-5}=x+5$, then x is equal to

(a) 2 (b) 3 (c) 6 (d) 5

11. The value of $2+\cfrac{1}{2+\cfrac{1}{2+\ldots\infty}}$ is

(a) $1-\sqrt{2}$ (b) $1+\sqrt{2}$

(c) $1\pm\sqrt{2}$ (d) None of these

12. The roots of the equation $|2x-1|^2-3|2x-1|+2=0$ are

(a) $\left\{-\frac{1}{2}, 0, \frac{1}{2}\right\}$ (b) $\left\{-\frac{1}{2}, 0, \frac{3}{2}\right\}$

(c) $\left\{-\frac{3}{2}, \frac{1}{2}, 0, 1\right\}$ (d) $\left\{-\frac{1}{2}, 0, 1, \frac{3}{2}\right\}$

13. The number of real roots of the equation $e^{\sin x}-e^{-\sin x}-4=0$ are

(a) 1 (b) 2

(c) infinite (d) None of these

14. How many roots of the equation $x-\frac{2}{x-1}=1-\frac{2}{x-1}$ have ?

(a) One (b) Two

(c) Infinite (d) None of these

15. The number of real solutions of the equation $|x^2 + 4x + 3| + 2x + 5 = 0$ are
(a) 1 (b) 2
(c) 3 (d) 4

16. The roots of the equation $x^4 - 8x^2 - 9 = 0$ are
(a) $\pm 1, \pm i$ (b) $\pm 3, \pm i$
(c) $\pm 2, \pm i$ (d) None of these

17. If the roots of the equation $8x^3 - 14x^2 + 7x - 1 = 0$ are in GP, then the roots are
(a) $1, \frac{1}{2}, \frac{1}{4}$ (b) 2, 4, 8
(c) 3, 6, 12 (d) None of these

18. If $2 + i\sqrt{3}$ is a root of the equation $x^2 + px + q = 0$, where p and q are real, then (p, q) is equal to
(a) $(-4, 7)$ (b) $(4, -7)$
(c) $(4, 7)$ (d) $(-4, -7)$

19. The number of real roots of $3^{2x^2 - 7x + 7} = 9$ is
(a) 0 (b) 2
(c) 1 (d) 4

20. Rational roots of the equation

$$2x^4 + x^3 - 11x^2 + x + 2 = 0 \text{ are}$$

(a) $\frac{1}{2}$ and 2 (b) $\frac{1}{2}, 2, \frac{1}{4}, -2$
(c) $\frac{1}{2}, 2, 3, 4$ (d) $\frac{1}{2}, 2, \frac{3}{4}, -2$

21. The roots of the given equation

$$(p - q)x^2 + (q - r)x + (r - p) = 0 \text{ are}$$

(a) $\frac{p-q}{r-p}, 1$ (b) $\frac{q-r}{p-q}, 1$
(c) $\frac{r-p}{p-q}, 1$ (d) $1, \frac{q-r}{p-q}$

22. If $2\sin^2 \frac{\pi}{8}$ is a root of the equation $x^2 + ax + b = 0$, where a and b are rational numbers, then $a - b$ is equal to
(a) $-\frac{5}{2}$ (b) $-\frac{3}{2}$ (c) $-\frac{1}{2}$ (d) $\frac{1}{2}$

23. $\tan\alpha$ and $\tan\beta$ are the roots of the equation $x^2 + ax + b = 0$, then the value of

$\sin^2(\alpha + \beta) + a\sin(\alpha + \beta)\cos(\alpha + \beta) + b\cos^2(\alpha + \beta)$ is equal to
(a) ab (b) b
(c) $\frac{a}{b}$ (d) a

24. The coefficient of x in the equation $x^2 + px + q = 0$ was taken as 17 in place of 13 its roots were found to be -2 and -15. The roots of the original equation are
(a) 3, 10 (b) $-3, -10$
(c) $-5, -8$ (d) None of these

25. Two students while solving a quadratic equation in x, one copied the constant term incorrectly and got the roots 3 and 2. The other copied the constant term coefficient of x^2 correctly as -6 and 1 respectively the correct roots are
(a) $3, -2$ (b) $-3, 2$
(c) $-6, -1$ (d) $6, -1$

26. If α, β, γ are the roots of $x^3 + 2x^2 - 3x - 1 = 0$, then $\alpha^{-2} + \beta^{-2} + \gamma^{-2}$ is equal to
(a) 12 (b) 13
(c) 14 (d) 15

27. If the roots of the given equation
$(\cos p - 1)x^2 + (\cos p)x + \sin p = 0$ are real, then
(a) $p \in (-\pi, 0)$ (b) $p \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$
(c) $p \in (0, \pi)$ (d) $p \in (0, 2\pi)$

Nature of Roots

28. If $P(x) = ax^2 + bx + c$ and $Q(x) = -ax^2 + dx + c$, where $ac \neq 0$, then $P(x)\,Q(x) = 0$ has atleast
(a) four real roots (b) two real roots
(c) four imaginary roots (d) None of these

29. If the roots of $(a^2 + b^2)x^2 - 2(bc + ad)x + c^2 + d^2 = 0$ are equal, then
(a) $\frac{a}{b} = \frac{c}{d}$ (b) $\frac{a}{c} + \frac{b}{d} = 0$
(c) $\frac{a}{d} = \frac{b}{c}$ (d) $a + b = c + d$

30. Let $f(x) = x^2 + ax + b; a, b \in R$. If $f(1) + f(2) + f(3) = 0$, then the roots of the equation $f(x) = 0$
(a) are imaginary
(b) are real and equal
(c) are from the set $\{1, 2, 3\}$
(d) real and distinct

31. If $\sin\alpha, \sin\beta$ and $\cos\alpha$ are in GP, then roots of $x^2 + 2x\cot\beta + 1 = 0$ are always
(a) real (b) real and negative
(c) greater than one (d) non-real

32. If one root of equation $x^2 + ax + 12 = 0$ is 4 while the equation $x^2 + ax + b = 0$ has equal roots, then the value of b is
(a) $\frac{4}{49}$ (b) $\frac{49}{4}$ (c) $\frac{7}{4}$ (d) $\frac{4}{7}$

33. The solution set of the equation

$$pqx^2 - (p + q)^2 x + (p + q)^2 = 0 \text{ is}$$

(a) $\left\{\frac{p}{q}, \frac{q}{p}\right\}$ (b) $\left\{pq, \frac{p}{q}\right\}$
(c) $\left\{\frac{q}{p}, pq\right\}$ (d) $\left\{\frac{p+q}{p}, \frac{p+q}{q}\right\}$

34. If $\sin\alpha$ and $\cos\alpha$ are the roots of the equation $ax^2 + bx + c = 0$, then
(a) $a^2 - b^2 + 2ac = 0$ (b) $(a - c)^2 = b^2 + c^2$
(c) $a^2 + b^2 - 2ac = 0$ (d) $a^2 + b^2 + 2ac = 0$

35. If the roots of the equation $ax^2 + bx + c = 0$ of the form $\frac{k+1}{k}$ and $\frac{k+2}{k+1}$, then $(a + b + c)^2$ is equal to
(a) $2b^2 - ac$ (b) Σa^2 (c) $b^2 - 4ac$ (d) $b^2 - 2ac$

36. If a root of the equation $ax^2 + bx + c = 0$ be reciprocal of a root of the equation $a'x^2 + b'x + c' = 0$, then
(a) $(cc' - aa')^2 = (ba' - cb')(ab' - bc')$
(b) $(bb' - aa')^2 = (ca' - bc')(ab' - bc')$
(c) $(cc' - aa')^2 = (ba' + cb')(ab' + bc')$
(d) None of the above

37. If the product of the roots of the equation $(a + 1)x^2 + (2a + 3)x + (3a + 4) = 0$ is 2, then the sum of roots is
(a) 1 (b) -1 (c) 2 (d) -2

38. The system $y^{(x^2 + 7x + 12)} = 1$ and $x + y = 6, y > 0$ has
(a) no solution (b) one solution
(c) two solutions (d) more than 2 solutions

39. If $[x]^2 = [x + 2]$, where $[x]$ = the greatest integer less than or equal to x, then x must be such that
(a) $x = 2, -1$ (b) $[-1, 0) \cup [2, 3)$
(c) $x \in [-1, 0)$ (d) None of these

40. If α, β and γ are the roots of the equation $x^3 - 7x + 7 = 0$, then $\frac{1}{\alpha^4} + \frac{1}{\beta^4} + \frac{1}{\gamma^4}$ is
(a) 7/3 (b) 3/7
(c) 4/7 (d) 7/4

41. If the roots of the equation $\frac{\alpha}{x - \alpha} + \frac{\beta}{x - \beta} = 1$ be equal in magnitude but opposite in sign, then $\alpha + \beta$ is equal to
(a) 0 (b) 1
(c) 2 (d) None of these

42. If the roots of the equation $\frac{1}{x + p} + \frac{1}{x + q} = \frac{1}{r}$ are equal in magnitude but opposite in sign, then the product of the roots will be
(a) $\frac{p^2 + q^2}{2}$ (b) $-\frac{(p^2 + q^2)}{2}$
(c) $\frac{p^2 - q^2}{2}$ (d) $-\frac{(p^2 - q^2)}{2}$

43. The least value of $|a|$ for which $\tan\theta$ and $\cot\theta$ are roots of the equation $x^2 + ax + 1 = 0$, is
(a) 2 (b) 1 (c) 1/2 (d) 0

44. The harmonic mean of the roots of the equation $(5 + \sqrt{2})x^2 - (4 + \sqrt{5})x + 8 + 2\sqrt{5} = 0$ is
(a) 2 (b) 4
(c) 6 (d) 8

45. If $a + b + c = 0$, then the roots of the equation $4ax^2 + 3bx + 2c = 0$ are
(a) equal (b) imaginary
(c) real (d) None of these

46. If x_1, x_2 and x_3 are distinct roots of the equation $ax^2 + bx + c = 0$, then
(a) $a = b = 0, c \in R$ (b) $a = c = 0, b \in R$
(c) $b^2 - 4ac \geq 0$ (d) $a = b = c = 0$

47. If $x^2 + 2x + 2xy + my - 3 = 0$ has two rational factors, then the values of m will be
(a) $-6, -2$ (b) $-6, 2$
(c) $6, -2$ (d) $6, 2$

48. If the roots of the equation $qx^2 + px + q = 0$ are complex, where p and q are real, then the roots of the equation $x^2 - 4qx + p^2 = 0$ are
(a) real and unequal (b) real and equal
(c) imaginary (d) None of these

49. If $a < b < c < d$, then the roots of the equation $(x - a)(x - c) + 2(x - b)(x - d) = 0$ are
(a) real and distinct (b) real and equal
(c) imaginary (d) None of these

50. If the roots of the equation $x^2 + px + q = 0$ are α and β and roots of the equation $x^2 - xr + s = 0$ are α^4 and β^4, then the roots of the equation $x^2 - 4qx + 2q^2 - r = 0$ are
(a) both negative
(b) both positive
(c) both real
(d) one negative and one positive

51. If $a > 0, b > 0, c > 0$, then both the roots of the equation $ax^2 + bx + c = 0$
(a) are real and negative (b) have negative real part
(c) are rational numbers (d) None of these

52. If $(ax^2 + c)y + (a'x^2 + c') = 0$ and x is a rational function of y and ac is negative, then
(a) $ac' + a'c = 0$
(b) $\frac{a}{a'} = \frac{c}{c'}$
(c) $a^2 + c^2 = a'^2 + c'^2$
(d) $aa' + cc' = 1$

53. If roots of the equation $(a - b)x^2 + (c - a)x + (b - c) = 0$ are equal, then a, b and c are in
(a) AP (b) HP
(c) GP (d) None of these

54. If the roots of the equation $(p^2 + q^2)x^2 - 2q(p + r)x + (q^2 + r^2) = 0$ be real and equal, then p, q and r will be in

(a) AP (b) GP
(c) HP (d) None of these

55. Let α and β be the roots of the equation $x^2 - px + r = 0$ and $\frac{\alpha}{2}, 2\beta$ be the roots of the equation $x^2 - qx + r = 0$. Then, the value of r is

(a) $\frac{2}{9}(p - q)(2q - p)$ (b) $\frac{2}{9}(q - p)(2p - q)$
(c) $\frac{2}{9}(q - 2p)(2q - p)$ (d) $\frac{2}{9}(2p - q)(2q - p)$

56. If roots of the equation $ax^2 + bx + c = 0; (a, b, c \in N)$ are rational numbers, then which of the following cannot be true ?

(a) All a, b and c are even
(b) All a, b and c are odd
(c) b is even while a and c are odd
(d) None of the above

Formation of Quadratic Equation

57. Let α, β be the roots of $x^2 - 2x\cos\phi + 1 = 0$, then the equation whose roots are α^n and β^n, is

(a) $x^2 - 2x\cos n\phi - 1 = 0$
(b) $x^2 - 2x\cos n\phi + 1 = 0$
(c) $x^2 - 2x\sin n\phi + 1 = 0$
(d) $x^2 + 2x\sin n\phi - 1 = 0$

58. If α and β be the roots of the equation $2x^2 + 2(a + b)x + a^2 + b^2 = 0$, then the equation whose roots are $(\alpha + \beta)^2$ and $(\alpha - \beta)^2$, is

(a) $x^2 - 2ab\,x - (a^2 - b^2)^2 = 0$
(b) $x^2 - 4abx - (a^2 - b^2)^2 = 0$
(c) $x^2 - 4abx + (a^2 - b^2)^2 = 0$
(d) None of the above

59. Let α and α^2 be the roots of $x^2 + x + 1 = 0$, then the equation whose roots are α^{31} and α^{62}, is

(a) $x^2 - x + 1 = 0$ (b) $x^2 + x - 1 = 0$
(c) $x^2 + x + 1 = 0$ (d) $x^{60} + x^{30} + 1 = 0$

60. If α and β are the roots of the equation $ax^2 + bx + c = 0$, then the equation whose roots are $\alpha + \frac{1}{\beta}$ and $\beta + \frac{1}{\alpha}$, is

(a) $ac\,x^2 + (a + c)\,bx + (a + c)^2 = 0$
(b) $ab\,x^2 + (a + c)\,bx + (a + c)^2 = 0$
(c) $ac\,x^2 + (a + b)cx + (a + c)^2 = 0$
(d) None of the above

Condition for Common Roots

61. If atleast one root of the equation $x^3 + ax^2 + bx + c = 0$ remains unchanged, when a, b and c are decreased by one, then which one of the following is always a root of the given equation ?

(a) 1
(b) -1
(c) ω, an imaginary cube root of unity
(d) i

62. If the equation $2x^2 + 3x + 5\lambda = 0$ and $x^2 + 2x + 3\lambda = 0$ have a common root, then λ is equal to

(a) 0 (b) -1
(c) 0, -1 (d) 2, -1

63. If each pair of the equation $x^2 + ax + b = 0$, $x^2 + bx + c = 0$ and $x^2 + cx + a = 0$ has a common root, then product of all common roots is

(a) $\sqrt{abc}$ (b) $2\sqrt{abc}$
(c) $\sqrt{ab + bc + ca}$ (d) $2\sqrt{ab + bc + ca}$

64. If atleast one root of $2x^2 + 3x + 5 = 0$ and $ax^2 + bx + c = 0$, $a, b, c \in N$ is common, then the maximum value of $a + b + c$ is

(a) 10 (b) 0
(c) does not exist (d) None of these

Quadratic Expression and Position of Roots

65. If $x^2 + 2ax + b \geq c, \forall x \in R$, then

(a) $b - c \geq a^2$ (b) $c - a \geq b^2$
(c) $a - b \geq c^2$ (d) None of these

66. For all x, $x^2 + 2ax + (10 - 3a) > 0$, then the interval in which a lies, is

(a) $a < -5$ (b) $-5 < a < 2$
(c) $a > 5$ (d) $2 < a < 5$

67. The values of 'a' for which $(a^2 - 1)x^2 + 2(a - 1)x + 2$ is positive for any x, are

(a) $a \geq 1$ (b) $a \leq 1$
(c) $a > -3$ (d) $a < -3$ or $a > 1$

68. If the roots of the equation $x^2 - 2ax + a^2 + a - 3 = 0$ are real and less than 3, then

(a) $a < 2$ (b) $2 \leq a \leq 3$
(c) $3 < a \leq 4$ (d) $a > 4$

69. If α and β be the roots of the quadratic equation $ax^2 + bx + c = 0$ and k be a real number, then the condition, so that $\alpha < k < \beta$ is given by

(a) $ac > 0$ (b) $ak^2 + bk + c = 0$
(c) $ac < 0$ (d) $a^2k^2 + abk + ac < 0$

70. The values of a for which $2x^2 - 2(2a+1)x + a(a+1) = 0$ may have one root less than a and other root greater than a are given by
(a) $1 > a > 0$ (b) $-1 < a < 0$
(c) $a \geq 0$ (d) $a > 0$ or $a < -1$

71. One lies between the roots of the equation $-x^2 + ax + a = 0$, $a \in R$ if and only if a lies in the interval
(a) $\left(\frac{1}{2}, \infty\right)$ (b) $\left[-\frac{1}{2}, \infty\right)$
(c) $\left(-\infty, \frac{1}{2}\right)$ (d) $\left(-\infty, \frac{1}{2}\right]$

72. If α and β $(\alpha < \beta)$ are the roots of the equation $x^2 + bx + c = 0$, where $c < 0 < b$, then
(a) $0 < \alpha < \beta$ (b) $\alpha < 0 < \beta < |\alpha|$
(c) $\alpha < \beta < 0$ (d) $\alpha < 0 < |\alpha| < \beta|$

Inequality

73. The solution set of $1 \leq |x-2| \leq 3$ is [NCERT Exemplar]
(a) $(-1, 1) \cup (3, 5]$ (b) $[-1, 1] \cup [3, 5]$
(c) $[-1, 1] \cup [3, 5)$ (d) None of these

74. If $|x+2| \leq 9$, then
(a) $x \in (-7, 11)$ (b) $x \in [-11, 7]$
(c) $x \in (-\infty, -7) \cup (11, \infty)$ (d) $x \in (-\infty, -7) \cup [11, \infty)$

75. If the expression $\left(mx - 1 + \frac{1}{x}\right)$ is always non-negative, then the minimum value of m must be
(a) $-\frac{1}{2}$ (b) 0 (c) $\frac{1}{4}$ (d) $\frac{1}{2}$

76. The solution set of $\frac{2x-1}{3} \geq \left(\frac{3x-2}{4}\right) - \left(\frac{2-x}{5}\right)$ is [NCERT]
(a) $(4, \infty)$ (b) $[4, \infty)$
(c) $[-4, 4]$ (d) $(-\infty, 2]$

77. The solution set of $\frac{|x-2|-1}{|x-2|-2} \leq 0$ is [NCERT Exemplar]
(a) $[0, 1] \cup (3, 4)$ (b) $[0, 1] \cup [3, 4]$
(c) $[0, 1] \cup (3, 4)$ (d) None of these

78. The solution set of $1 \leq |x-2| \leq 3$ is [NCERT Exemplar]
(a) $[-1, 1] \cup (3, 5)$ (b) $(-1, 1) \cup [3, 5]$
(c) $[-1, 1] \cup [3, 5]$ (d) $[-1, 2] \cup [3, 5]$

79. $|2x-3| < |x+5|$, then x belongs to
(a) $(-3, 5)$ (b) $(5, 9)$ (c) $\left(-\frac{2}{3}, 8\right)$ (d) $\left(-8, \frac{2}{3}\right)$

80. $(x-1)(x^2 - 5x + 7) < (x-1)$, then x belongs to
(a) $(1, 2) \cup (3, \infty)$ (b) $(2, 3)$
(c) $(-\infty, 1) \cup (2, 3)$ (d) None of these

81. $x^2 - 3|x| + 2 < 0$, then x belongs to
(a) $(1, 2)$ (b) $(-2, -1)$
(c) $(-2, -1) \cup (1, 2)$ (d) $(-3, 5)$

82. $\left|x + \frac{2}{x}\right| < 3$, then x belongs to
(a) $(-2, -1) \cup (1, 2)$
(b) $(-\infty, -2) \cup (-1, 1) \cup (2, \infty)$
(c) $(-2, 2)$
(d) $(-3, 3)$

83. If $x^2 + 6x - 27 > 0$ and $x^2 - 3x - 4 < 0$, then
(a) $x > 3$ (b) $x < 4$
(c) $3 < x < 4$ (d) $x = \frac{7}{2}$

84. If $a + b = 8$, then ab is greatest when
(a) $a = 4, b = 4$ (b) $a = 3, b = 5$
(c) $a = 6, b = 2$ (d) None of these

85. If $ab = 4 (a, b \in R^+)$, then
(a) $a + b \leq 4$ (b) $a + b = 4$
(c) $a + b \geq 4$ (d) None of these

86. The minimum value of $P = bcx + cay + abz$, when $xyz = abc$, is
(a) $3abc$ (b) $6abc$
(c) abc (d) $4abc$

87. $\log_2(x^2 - 3x + 18) < 4$, then x belongs to
(a) $(1, 2)$ (b) $(2, 16)$
(c) $(1, 16)$ (d) None of these

88. If $a_i > 0$ for $i = 1, 2, \ldots, n$ and $a_1 a_2 \ldots a_n = 1$, then minimum value of $(1 + a_1)(1 + a_2) \ldots (1 + a_n)$ is
(a) $2^{n/2}$ (b) 2^n
(c) 2^{2n} (d) 1

Miscellaneous

89. $(a^2 - 3a + 2)x^2 + (a^2 - 5a + 6)x + a - 2 = r$ for three distinct values of x for some $r \in R$, if $a + r$ is equal to
(a) 1 (b) 2
(c) 3 (d) does not exist

90. If the equation $x^2 + 9y^2 - 4x + 3 = 0$ is satisfied values of x and y, then
(a) $1 \leq x \leq 3$ (b) $2 \leq x \leq 3$
(c) $-\frac{1}{3} < y < 1$ (d) $0 < y < \frac{2}{3}$

91. If x is real, then the maximum and minimum values of the expression $\frac{x^2 - 3x + 4}{x^2 + 3x + 4}$ will be
(a) 2, 1 (b) 5, $\frac{1}{5}$
(c) 7, $\frac{1}{7}$ (d) None of these

92. If x is real, then expression $\frac{x+2}{2x^2+3x+6}$ takes all values in the interval

(a) $\left(\frac{1}{13}, \frac{1}{3}\right)$ (b) $\left[-\frac{1}{13}, \frac{1}{3}\right]$

(c) $\left(-\frac{1}{3}, \frac{1}{13}\right)$ (d) None of these

93. If x is real, then function $\frac{(x-a)(x-b)}{(x-c)}$ will assume all real values, provided

(a) $a > b > c$ (b) $a \le b \le c$

(c) $a > c > b$ (d) $a \le c \le b$

94. For what value of λ the sum of the squares of the roots of $x^2 + (2+\lambda)x - \frac{1}{2}(1+\lambda) = 0$ is minimum ?

(a) $\frac{3}{2}$ (b) 1 (c) $\frac{1}{2}$ (d) $\frac{11}{4}$

95. Let $p, q \in \{1, 2, 3, 4\}$. The number of equations of the form $px^2 + qx + 1 = 0$ having real roots, is

(a) 15 (b) 9 (c) 7 (d) 8

96. Let α and β be the roots of the equation $ax^2 + 2bx + c = 0$ and γ, δ be the roots of the equation $px^2 + 2qx + r = 0$. If α, β, γ and δ are in GP, then

(a) $q^2ac = b^2pr$ (b) $qac = bpr$

(c) $c^2pq = r^2ab$ (d) $p^2ab = a^2qr$

97. If the roots of $ax^2 + bx + c = 0$ are α, β and the roots of $Ax^2 + Bx + C = 0$ are $\alpha - k, \beta - k$, then $\frac{B^2 - 4AC}{b^2 - 4ac}$ is equal to

(a) 0 (b) 1

(c) $\left(\frac{A}{a}\right)^2$ (d) $\left(\frac{a}{A}\right)^2$

98. Let a, b and c be real numbers $a \ne 0$. If α is a root of $a^2x^2 + bx + c = 0$, β is a root of $a^2x^2 - bx - c = 0$ and $0 < \alpha < \beta$, then the equation $a^2x^2 + 2bx + 2c = 0$ has a root of γ that always satisfies

(a) $\gamma = \frac{\alpha+\beta}{2}$ (b) $\gamma = \alpha + \frac{\beta}{2}$

(c) $\gamma = \alpha$ (d) $\alpha < \gamma < \beta$

99. $\sin x + \cos x = y^2 - y + a$ has no value of x for any y, if a belongs to

(a) $(0, \sqrt{3})$ (b) $(-\sqrt{3}, 0)$

(c) $(-\infty, -\sqrt{3})$ (d) $(\sqrt{3}, \infty)$

100. If roots of $x^2 - ax + b = 0$ are prime numbers, then

(a) b is a prime number

(b) a is a composite number

(c) $1 + a + b$ is a prime number

(d) None of the above

Round II (Mixed Bag)

Only One Correct Option

1. The root of the equation $2(1+i)x^2 - 4(2-i)x - 5 - 3i = 0$, where $i = \sqrt{-1}$, which has greater modulus, is

(a) $\frac{3-5i}{2}$ (b) $\frac{5-3i}{2}$

(c) $\frac{3+i}{2}$ (d) $\frac{3i+1}{2}$

2. If the equation $ax^2 + 2bx - 3c = 0$ has non-real roots and $(3c/4) < (a+b)$, then c is

(a) < 0 (b) > 0 (c) ≥ 0 (d) $= 0$

3. If α and β are the roots of $ax^2 + bx + c = 0$, then the equation $ax^2 - bx(x-1) + c(x-1)^2 = 0$ has roots

(a) $\frac{\alpha}{1-\alpha}, \frac{\beta}{1-\beta}$ (b) $\frac{1-\alpha}{\alpha}, \frac{1-\beta}{\beta}$

(c) $\frac{\alpha}{\alpha+1}, \frac{\beta}{\beta+1}$ (d) $\frac{\alpha+1}{\alpha}, \frac{\beta+1}{\beta}$

4. If α and β are the roots of the equation $ax^2 + bx + c = 0$ such that $\beta < \alpha < 0$, then the quadratic equation whose roots are $|\alpha|, |\beta|$, is given by

(a) $|a|x^2 + |b|x + |c| = 0$ (b) $ax^2 - |b|x + c = 0$

(c) $|a|x^2 - |b|x + |c| = 0$ (d) $a|x|^2 + b|x| + c = 0$

5. The value of a for which the equations $x^3 + ax + 1 = 0$ and $x^4 + ax^2 + 1 = 0$ have a common root, is

(a) -2 (b) -1

(c) 1 (d) 2

6. The number of real solutions of the equation

$$\left(\frac{9}{10}\right)^x = -3 + x - x^2 \text{ is}$$

(a) none (b) one

(c) two (d) more than two

7. Suppose the quadratic equations $x^2 + px + q = 0$ and $x^2 + rx + s = 0$ are such that p, q, r and s are real and $pr = 2(q+s)$. Then,

(a) both the equations always have real roots

(b) atleast one equation always has real roots

(c) both the equations always have non-real roots

(d) atleast one equation always has real and equal roots

8. If α and β be the roots of $x^2 + px + q = 0$, then $\dfrac{(\omega\alpha + \omega^2\beta)(\omega^2\alpha + \omega\beta)}{\dfrac{\alpha^2}{\beta} + \dfrac{\beta^2}{\alpha}}$ is equal to

(a) $-\dfrac{q}{p}$ (b) $\alpha\beta$ (c) $-\dfrac{p}{q}$ (d) ω

(ω and ω^2 are complex cube roots of unity)

9. In writing an equation of the form $ax^2 + bx + c = 0$; the coefficient of x is written incorrectly and roots are found to be equal. Again, in writing the same equation the constant term is written incorrectly and it is found that one root is equal to those of the previous wrong equation while the other is double of it. If α and β be the roots of correct equation, then $(\alpha - \beta)^2$ is equal to

(a) 5 (b) $5\alpha\beta$
(c) $-4\alpha\beta$ (d) -4

10. If the equation $ax^2 + 2bx + 3c = 0$ and $3x^2 + 8x + 15 = 0$ have a common root, where a, b and c are the lengths of the sides of a ΔABC, then $\sin^2 A + \sin^2 B + \sin^2 C$ is equal to

(a) 1 (b) $\dfrac{3}{2}$ (c) $\sqrt{2}$ (d) 2

11. If $x = 2 + 2^{2/3} + 2^{1/3}$, then the value of $x^3 - 6x^2 + 6x$ is

(a) 3 (b) 2 (c) 1 (d) -2

12. Let $a \neq 0$ and $p(x)$ be a polynomial of degree greater than 2. If $p(x)$ leaves remainders a and $-a$ when divided, respectively, by $x + a$ and $x - a$, the remainder when $p(x)$ is divided by $x^2 - a^2$ is

(a) $2x$ (b) $-2x$
(c) x (d) $-x$

13. If the roots of the equation $ax^2 - bx + c = 0$ are α and β, then the roots of the equation $b^2cx^2 - ab^2x + a^3 = 0$ are

(a) $\dfrac{1}{\alpha^3 + \alpha\beta}, \dfrac{1}{\beta^3 + \alpha\beta}$ (b) $\dfrac{1}{\alpha^2 + \alpha\beta}, \dfrac{1}{\beta^2 + \alpha\beta}$

(c) $\dfrac{1}{\alpha^4 + \alpha\beta}, \dfrac{1}{\beta^4 + \alpha\beta}$ (d) None of these

14. If $a, b \in R$, $a \neq 0$ and the quadratic equation $ax^2 - bx + 1 = 0$ has imaginary roots, then $(a + b + 1)$ is

(a) positive
(b) negative
(c) zero
(d) dependent on the sign of b

15. If roots of $x^2 - (a - 3)x + a = 0$ are such that atleast one of them is greater than 2, then

(a) $a \in [7, 9]$ (b) $a \in [7, \infty)$
(c) $a \in [9, \infty)$ (d) $a \in [7, 9)$

16. All the values of m for which both the roots of the equation $x^2 - 2mx + m^2 - 1 = 0$ are greater than -2 but less than 4, lie in the interval

(a) $-2 < m < 0$ (b) $m > 3$
(c) $-1 < m < 3$ (d) $1 < m < 4$

17. If the roots of the quadratic equation $(4p - p^2 - 5)x^2 - (2p - 1)x + 3p = 0$ lie on either side of unity, then the number of integral values of p is

(a) 1 (b) 2
(c) 3 (d) 4

18. The range of a for which the equation $x^2 + ax - 4 = 0$ has its smaller root in the interval $(-1, 2)$ is

(a) $(-\infty, -3)$ (b) $(0, 3)$
(c) $(0, \infty)$ (d) $(-\infty, -3) \cup (0, \infty)$

19. For $x^2 - (a + 3)|x| + 4 = 0$ to have real solutions, then the range of a is

(a) $(-\infty, -7] \cup [1, \infty)$ (b) $(-3, \infty)$
(c) $(-\infty, -7]$ (d) $[1, \infty)$

20. Let α and β be the roots of the equation $x^2 - x + p = 0$ and γ, δ be the roots of $x^2 - 4x + q = 0$. If α, β, γ and δ are in GP, then integral values of p and q are respectively

(a) $-2, -32$ (b) $-2, 3$
(c) $-6, 3$ (d) $-6, -32$

More Than One Correct Option

21. The equation $x^2 + a^2x + b^2 = 0$ has two roots each of which exceeds a number c, then

(a) $a^4 > 4b^2$ (b) $c^2 + a^2c + b^2 > 0$

(c) $-\dfrac{a^2}{2} > c$ (d) None of these

22. If $c \neq 0$ and the equation $\dfrac{p}{2x} = \dfrac{a}{x + c} + \dfrac{b}{x - c}$ has two equal roots, then p can be

(a) $(\sqrt{a} - \sqrt{b})^2$ (b) $(\sqrt{a} + \sqrt{b})^2$

(c) $a + b$ (d) $a - b$

23. If α and β are the roots of $ax^2 + bx + c = 0$ and $\alpha + h, \beta + h$ are the roots of $px^2 + qx + r = 0$, then

(a) $h = \dfrac{1}{2}\left(\dfrac{b}{a} - \dfrac{q}{p}\right)$

(b) $\dfrac{b^2 - 4ac}{a^2} = \dfrac{q^2 - 4pr}{p^2}$

(c) $\dfrac{a}{p} = \dfrac{b}{q} = \dfrac{c}{r}$

(d) None of the above

Comprehension Based Questions

Passage

Directions (Q. Nos. 24-26) *Consider the quadratic equation* $ax^2 - bx + c = 0$, $a, b, c \in N$, *which has two distinct real roots belonging to the interval* (1, 2).

24. The least value of a is
(a) 4 (b) 6 (c) 7 (d) 5

25. The least value of b is
(a) 10 (b) 11 (c) 13 (d) 15

26. The least value of c is
(a) 4 (b) 6 (c) 7 (d) 5

Assertion and Reason

Directions (Q. Nos. 27-34) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*), (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I
(c) Statement I is true; Statement II is false
(d) Statement I is false; Statement II is true

27. Let $a + b + c = 0$ and a, b, c are rational.

Statement I Then, the roots of the equation $(b + c - a)x^2 + (c + a - b)x + (a + b - c) = 0$ are rational.

Statement II Discriminant of equation $(b + c - a)x^2 + (c + a - b)x + (a + b - c) = 0$ is a perfect square.

28. **Statement I** If both roots of the equation $4x^2 - 2x + a = 0, a \in R$ lie in the interval $(-1, 1)$, then $-2 < a \le \frac{1}{4}$.

Statement II If $f(x) = 4x^2 - 2x + a$, then $D \ge 0$, $f(-1) > 0$ and $f(1) > 0 \Rightarrow -2 < a \le \frac{1}{4}$.

29. **Statement I** The greatest integral value of λ for which $(2\lambda - 1)x^2 - 4x + (2\lambda - 1) = 0$ has real roots, is 2.

Statement II For real roots of $ax^2 + bx + c = 0, D \ge 0$.

30. **Statement I** Let $f(x)$ be quadratic expression such that $f(0) + f(1) = 0$. If -2 is one of the root of $f(x) = 0$, then other root is 3/5.

Statement II If α and β are the zero's of $f(x) = ax^2 + bx + c$, then sum of zero's $= -b/a$, product of zero's $= c/a$.

31. **Statement I** If equations $ax^2 + bx + c = 0$, $(a, b, c \in R)$ and $2x^2 + 3x + 4 = 0$ have a common root, then $a : b : c = 2 : 3 : 4$.

Statement II Roots of $2x^2 + 3x + 4 = 0$ are imaginary.

32. **Statement I** If the equations $ax^2 + bx + c = 0$ and $x^2 - 3x + 4 = 0$ have exactly one root common, then atleast one of a, b and c is imaginary.

Statement II If a, b and c are not all real, then $ax^2 + bx + c = 0$ can have one root real and one root imaginary.

33. **Statement I** Equation $ix^2 + (i - 1)x - (1/2) - i = 0$ has imaginary roots.

Statement II If $a = i, b = i - 1$ and $c = -(1/5) - i$, then $b^2 - 4ac < 0$.

34. Let $f(x) = -x^2 + (a + 1)x + 5$.

Statement I $f(x)$ is positive for some $\alpha < x < \beta$ and for all $a \in R$.

Statement II $f(x)$ is always positive for all $x \in R$ and for same real a.

Previous Years' Questions

35. If the equations $x^2 + 2x + 3 = 0$ and $ax^2 + bx + c = 0$, $a, b, c \in R$, have a common root, then $a : b : c$ is **[JEE Main 2013]**
(a) 1 : 2 : 3 (b) 3 : 2 : 1
(c) 1 : 3 : 2 (d) 3 : 1 : 2

36. Let α and β be real and z be a complex number. If $z^2 + az + \beta = 0$ has two distinct roots on the line $\text{Re}(z) = 1$, then it is necessary that **[AIEEE 2011]**
(a) $\beta \in (-1, 0)$ (b) $|\beta| = 1$
(c) $\beta \in [1, \infty)$ (d) $\beta \in (0, 1)$

37. If α and β are the roots of the equation $x^2 - x + 1 = 0$, then $\alpha^{2009} + \beta^{2009}$ is equal to **[AIEEE 2010]**
(a) -2 (b) -1 (c) 1 (d) 2

38. If the roots of the equation $bx^2 + cx + a = 0$ be imaginary, then for all real values of x, the expression $3b^2x^2 + 6bcx + 2c^2$ **[AIEEE 2009]**
(a) greater than $4ab$
(b) less than $4ab$
(c) greater than $-4ab$
(d) less than $-4ab$

39. The quadratic equations $x^2 - 6x + a = 0$ and $x^2 - cx + 6 = 0$ have one root in common. The other roots of the first and second equations are integers in the ratio 4 : 3. Then, the common root is [AIEEE 2008]
(a) 2 (b) 1 (c) 4 (d) 3

40. If the difference between the roots of the equation $x^2 + ax + 1 = 0$ is less than $\sqrt{5}$, then the set of possible values of a is [AIEEE 2007]
(a) $(-3, 3)$ (b) $(-3, \infty)$ (c) $(3, \infty)$ (d) $(-\infty, -3)$

41. If the roots of the quadratic equation $x^2 + px + q = 0$ are $\tan 30°$ and $\tan 15°$, then the value of $2 + q - p$ is [AIEEE 2006]
(a) 3 (b) 0 (c) 1 (d) 2

42. All the values of m for which both roots of the equation $x^2 - 2mx + m^2 - 1 = 0$ are greater than -2 but less than 4 lie in the interval [AIEEE 2005]
(a) $m > 3$ (b) $-1 < m < 3$
(c) $1 < m < 4$ (d) $-2 < m < 0$

43. If the cube roots of unity are 1, ω and ω^2, then the roots of the equation $(x - 1)^3 + 8 = 0$, are [AIEEE 2005]
(a) $-1, 1 + 2\omega, 1 + 2\omega^2$ (b) $-1, 1 - 2\omega, 1 - 2\omega^2$
(c) $-1, -1, -1$ (d) $-1, -1 + 2\omega, -1 - 2\omega^2$

44. The value of a for which the sum of the squares of the roots of the equation $x^2 - (a - 2)x - a - 1 = 0$ assume the least value is [AIEEE 2005]
(a) 2 (b) 3 (c) 0 (d) 1

45. If the roots of the equation $x^2 - bx + c = 0$ be two consecutive integers, then $b^2 - 4c$ equals [AIEEE 2005]
(a) 1 (b) 2 (c) 3 (d) -2

46. If both the roots of the quadratic equation $x^2 - 2kx + k^2 - 5 = 0$ are less than 5, than k lies in the interval [AIEEE 2005]
(a) $[4, 5]$ (b) $(-\infty, 4)$ (c) $(6, \infty)$ (d) $(5, 6]$

47. If the equation $a_n x^n + a_{n-1}x^{n-1} + \ldots + a_1 x = 0$, $a_1 \neq 0$, $n \geq 2$, has a positive root $x = \alpha$, then the equation $na_n x^{n-1} + (n-1)a_{n-1}x^{n-2} + \ldots + a_1 = 0$ has a positive root, which is [AIEEE 2004]
(a) equal to α (b) greater than or equal to α
(c) smaller than α (d) greater than α

48. If $(1 - p)$ is a root of quadratic equation $x^2 + px + (1 - p) = 0$, then its roots are [AIEEE 2004]
(a) 0, 1 (b) $-1, 1$
(c) $0, -1$ (d) $-1, 2$

49. If one root of the equation $x^2 + px + 12 = 0$ is 4, while the equation $x^2 + px + q = 0$ has equal roots, then the value of q is [AIEEE 2004]
(a) $\frac{49}{4}$ (b) 12
(c) 3 (d) 4

50. Let two numbers have arithmetic mean 9 and geometric mean 4. Then, these numbers are the roots of the quadratic equation [AIEEE 2004]
(a) $x^2 + 18x + 16 = 0$ (b) $x^2 - 18x + 16 = 0$
(c) $x^2 + 18x - 16 = 0$ (d) $x^2 - 18x - 16 = 0$

51. If the sum of the roots of the quadratic equation $ax^2 + bx + c = 0$ is equal to the sum of the squares of their reciprocals, then $\frac{a}{c}, \frac{b}{a}$ and $\frac{c}{b}$ are in [AIEEE 2003]
(a) arithmetic progression
(b) geometric progression
(c) harmonic progression
(d) arithmetico-geometric progression

52. The number of the real solutions of the equation $x^2 - 3|x| + 2 = 0$ is [AIEEE 2003]
(a) 2 (b) 4
(c) 1 (d) 3

53. The value of a for which one root of the quadratic equation $(a^2 - 5a + 3)x^2 + (3a - 1)x + 2 = 0$ is twice as large as the other, is [AIEEE 2003]
(a) 2/3 (b) $-2/3$
(c) 1/3 (d) $-1/3$

54. If $\alpha \neq \beta$ and $\alpha^2 = 5\alpha - 3, \beta^2 = 5\beta - 3$, then the equation having α/β and β/α as its roots, is [AIEEE 2002]
(a) $3x^2 + 19x + 3 = 0$ (b) $3x^2 - 19x + 3 = 0$
(c) $3x^2 - 19x - 3 = 0$ (d) $x^2 - 16x + 1 = 0$

the Guidance

Round I

1. Since, $(x-2)$ is a common factor of the expressions $x^2 + ax + b$ and $x^2 + cx + d$

$\Rightarrow \quad 4 + 2a + b = 0 \quad \ldots(i)$

and $\quad 4 + 2c + d = 0 \quad \ldots(ii)$

$\Rightarrow \quad 2a + b = 2c + d$

$\Rightarrow \quad b - d = 2(c - a)$

$\Rightarrow \quad \dfrac{b-d}{c-a} = 2$

2. $x^2 + ax + 1$ must divide $ax^3 + bx + c$.

Now, $\dfrac{ax^3 + bx + c}{x^2 + ax + 1} = \dfrac{a(x-a) + (b - a + a^3)x + c + a^2}{x^2 + ax + 1}$

Remainder must be zero

$\Rightarrow \quad b - a + a^3 = 0, \quad a^2 + c = 0$

3. Given that, $x^2 - 3x + 2$ be a factor of $x^4 - px^2 + q = 0 \quad \ldots(i)$

$\Rightarrow \quad (x^2 - 3x + 2) = 0$

$\Rightarrow \quad (x-2)(x-1) = 0 \Rightarrow x = 2, 1$

On putting these values in Eq. (i), we get

$4p - q - 16 = 0 \quad \ldots(ii)$

and $\quad p - q - 1 = 0 \quad \ldots(iii)$

On solving Eqs. (ii) and (iii), we get

$p = 5$ and $q = 4$

$\Rightarrow \quad (p, q) = (5, 4)$

4. Given that, $x^2 + px + 1$ is a factor of $ax^3 + bx + c = 0$, then let $ax^3 + bx + c \equiv (x^2 + px + 1)(ax + \lambda)$, where λ is a constant. Then, equating the coefficients of like powers of x on both sides, we get

$0 = ap + \lambda, b = p\lambda + a, c = \lambda$

$\Rightarrow \quad p = -\frac{\lambda}{a} = -\frac{c}{a}$

Hence, $\quad b = \left(-\frac{c}{a}\right)c + a$

$\Rightarrow \quad ab = a^2 - c^2$

5. Given equation is $2x^2 + x + 1 = 0$.

On comparing the given equation with $ax^2 + bx + c = 0$, we get

$a = 2, b = 1, c = 1$

Now, $\quad D = b^2 - 4ac$

$= (1)^2 - 4 \times 2 \times 1$

$= 1 - 8 = -7 < 0$

$\because \quad x = \frac{-b \pm \sqrt{D}}{2a}$

$\therefore \quad x = \frac{-1 \pm \sqrt{-7}}{2(2)} = \frac{-1 \pm \sqrt{7}i}{4}$

6. Let another root of equation

$x^2 + (1 - 3i)x - 2(1 + i) = 0$. is α

$\therefore \quad \alpha + (-1 + i) = -(1 - 3i)$

$\Rightarrow \quad \alpha = 2i$

7. Let α and β be the roots of the equation $x^2 - Px + 8 = 0$

$\therefore \quad \alpha + \beta = P$ and $\alpha \cdot \beta = 8$

Now, $\quad \alpha - \beta = \pm\sqrt{(\alpha + \beta)^2 - 4\alpha\beta}$

$\therefore \quad 2 = \pm\sqrt{P^2 - 32} \qquad (\because \alpha - \beta = 2$ given)

$\Rightarrow \quad P^2 - 32 = 4 \Rightarrow P^2 = 6$

$\Rightarrow \quad P = \pm 6$

8. Let α and β be the roots of the given equation

$x^2 - (a - 2)x - (a + 1) = 0$

$\therefore \quad \alpha + \beta = a - 2$ and $\alpha\beta = -(a + 1)$

Now, $\quad \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$

$= (a - 2)^2 + 2(a + 1)$

$= a^2 + 4 - 4a + 2a + 2$

$= a^2 - 2a + 6$

$= (a - 1)^2 + 5$

$\therefore \alpha^2 + \beta^2$ will be minimum, if $(a - 1)^2 = 0$ *i.e.*, $a = 1$.

9. We have, $\quad x = \sqrt{1 + \sqrt{1 + \sqrt{1 + \ldots \infty}}}$

$\Rightarrow \quad x = \sqrt{1 + x}$

$\Rightarrow \quad x^2 = 1 + x$

$\Rightarrow \quad x^2 - x - 1 = 0$

$\Rightarrow \quad x = \frac{1 \pm \sqrt{1 + 4}}{2} = \frac{1 \pm \sqrt{5}}{2}$

As $x > 0$, we take only $x = \frac{1 + \sqrt{5}}{2}$.

10. We have,

$\sqrt{3x^2 - 7x - 30} + \sqrt{2x^2 - 7x - 5} = x + 5$

$\Rightarrow \quad \sqrt{3x^2 - 7x - 30} = (x + 5) - \sqrt{2x^2 - 7x - 5}$

On squaring both sides, we get

$3x^2 - 7x - 30 = x^2 + 25 + 10x + (2x^2 - 7x - 5)$

$- 2(x + 5)\sqrt{2x^2 - 7x - 5}$

$\Rightarrow \quad \sqrt{2x^2 - 7x - 5} = 5$

Again on squaring both sides, we get

$2x^2 - 7x - 30 = 0$

$\Rightarrow \quad x = 6$

11. Let $\quad x = 2 + \cfrac{1}{2 + \cfrac{1}{2 + \ldots \infty}}$

$\Rightarrow \quad x = 2 + \frac{1}{x}$

$\Rightarrow \quad x^2 - 2x - 1 = 0$

$\Rightarrow \quad x = \frac{2 \pm \sqrt{4 + 4}}{2}$

$\Rightarrow \quad x = 1 \pm \sqrt{2}$

But the value of the given expression cannot be negative or less than 2, therefore $1 + \sqrt{2}$ is required answer.

12. Given equation is

$|2x - 1|^2 - 3|2x - 1| + 2 = 0$

Let $\quad |2x - 1| = t$

$\therefore \quad t^2 - 3t + 2 = 0$

$\Rightarrow \quad (t - 1)(t - 2) = 0 \quad \Rightarrow \quad t = 1, 2$

$\Rightarrow \quad |2x - 1| = 1$ and $|2x - 1| = 2$

$\Rightarrow \quad 2x - 1 = \pm 1$ and $2x - 1 = \pm 2$

$\Rightarrow \quad x = 1, 0$ and $x = \frac{3}{2}, -\frac{1}{2}$

13. Given equation is $e^{\sin x} - e^{-\sin x} - 4 = 0$

Let $e^{\sin x} = y$, then given equation can be written as

$y^2 - 4y - 1 = 0 \quad \Rightarrow \quad y = 2 \pm \sqrt{5}$

But the value of $y = e^{\sin x}$ is always positive, so we take only $y = 2 + \sqrt{5}$

$\Rightarrow \quad \log_e y = \log_e(2 + \sqrt{5})$

$\Rightarrow \quad \sin x = \log_e(2 + \sqrt{5}) > 1$

Which is impossible since $\sin x$ cannot be greater than 1.

Hence, we cannot find any real value of x which satisfies the given equation.

14. We have, $x - \frac{2}{x - 1} = 1 - \frac{2}{x - 1}$. If $x \neq 1$ multiplying each term by $(x - 1)$, the given equation reduces to $x(x - 1) = (x - 1)$ or $(x - 1)^2 = 0$ or $x = 1$ which is not possible as considering $x \neq 1$.

Thus, given equation has no root.

15. We have,

$$|x^2 + 4x + 3| + 2x + 5 = 0$$

Here, two cases arise.

Case I When $x^2 + 4x + 3 > 0$

$\Rightarrow \quad x^2 + 4x + 3 + 2x + 5 = 0$

$\Rightarrow \quad x^2 + 6x + 8 = 0$

$\Rightarrow \quad (x + 2)(x + 4) = 0$

$\Rightarrow \quad x = -2, -4$

$x = -2$ is not satisfying the condition $x^2 + 4x + 3 > 0$. So, $x = -4$ is the only solution of the given equation.

Case II When $x^2 + 4x + 3 < 0$

$\Rightarrow \quad -(x^2 + 4x + 3) + 2x + 5 = 0$

$\Rightarrow \quad -x^2 - 2x + 2 = 0$

$\Rightarrow \quad x^2 + 2x - 2 = 0$

$\Rightarrow \quad (x + 1 + \sqrt{3})(x + 1 - \sqrt{3}) = 0$

$\Rightarrow \quad x = -1 + \sqrt{3}, -1 - \sqrt{3}$

Hence, $x = -(1 + \sqrt{3})$ satisfy the given condition.

Since, $x^2 + 4x + 3 < 0$ while $x = -1 + \sqrt{3}$ is not satisfying the condition. Thus, number of real solutions are two.

16. $\because x^4 - 8x^2 - 9 = 0$

$\Rightarrow \quad x^4 - 9x^2 + x^2 - 9 = 0$

$\Rightarrow \quad x^2(x^2 - 9) + 1(x^2 - 9) = 0$

$\Rightarrow \quad (x^2 + 1)(x^2 - 9) = 0$

$\Rightarrow \quad x = \pm i, \pm 3$

17. Since, the roots of the equation $8x^3 - 14x^2 + 7x - 1 = 0$ are in GP. Let the roots be $\frac{\alpha}{\beta}, \alpha, \alpha\beta, \beta \neq 0$. Then, the product of roots is $\alpha^3 = \frac{1}{8} \Rightarrow \alpha = \frac{1}{2}$ and hence, $\beta = \frac{1}{2}$.

So, roots are $1, \frac{1}{2}, \frac{1}{4}$.

18. Since, $2 + i\sqrt{3}$ is a root of equation $x^2 + px + q = 0$. Therefore, $2 - i\sqrt{3}$ will be other root.

Now, sum of the roots $= (2 + i\sqrt{3}) + (2 - i\sqrt{3}) = -p$

$\Rightarrow \quad 4 = -p$

Product of roots $= (2 + i\sqrt{3})(2 - i\sqrt{3}) = q$

$\Rightarrow \quad 7 = q$

Hence, $\quad (p, q) = (-4, 7)$

19. Given that, $3^{2x^2 - 7x + 7} = 3^2 \Rightarrow 2x^2 - 7x + 7 = 2$

$\Rightarrow \quad 2x^2 - 7x + 5 = 0$

Now, $\quad D = b^2 - 4ac$

$= (-7)^2 - 4 \times 2 \times 5$

$= 49 - 40 = 9 > 0$

Hence, it has two real roots.

20. Given equation can be reduced to a quadratic equation.

$\therefore \quad 2x^2 + x - 11 + \frac{1}{x} + \frac{2}{x^2} = 0$

$\Rightarrow \quad 2\left(x^2 + \frac{1}{x^2}\right) + \left(x + \frac{1}{x}\right) - 11 = 0$

Put $x + \frac{1}{x} = y$

$2(y^2 - 2) + y - 11 = 0$

$\Rightarrow \quad 2y^2 + y - 15 = 0$

$\Rightarrow \quad y = -3$ and $\frac{5}{2}$

$\Rightarrow \quad x + \frac{1}{x} = -3, \; x + \frac{1}{x} = \frac{5}{2}$

$\Rightarrow \quad x^2 + 3x + 1 = 0, 2x^2 - 5x + 2 = 0$

Only 2nd equation has rational roots as $D = 9$ and roots are $\frac{1}{2}$ and 2.

21. Given equation is

$(p - q)x^2 + (q - r)x + (r - p) = 0$

$\Rightarrow \quad x = \frac{(r - q) \pm \sqrt{(q - r)^2 - 4(r - p)(p - q)}}{2(p - q)}$

$= \frac{(r - q) \pm \sqrt{q^2 + r^2 - 2qr - 4(rp - rq - p^2 + pq)}}{2(p - q)}$

$\Rightarrow \quad x = \frac{(r - q) \pm (q + r - 2p)}{2(p - q)}$

$\Rightarrow \quad x = \frac{r - p}{p - q}, 1$

22. $\because 2\sin^2\frac{\pi}{8} = 1 - \cos\frac{\pi}{4} = 1 - \frac{1}{\sqrt{2}} = \frac{\sqrt{2} - 1}{\sqrt{2}}$ (irrational root)

So, other root is $\frac{\sqrt{2} + 1}{\sqrt{2}}$.

Sum of roots $= -a = 1 - \frac{1}{\sqrt{2}} + 1 + \frac{1}{\sqrt{2}} = 2 \Rightarrow a = -2$

Product of roots $= 1 - \frac{1}{2} = \frac{1}{2} = b$

So, $\quad a - b = -2 - \frac{1}{2} = -\frac{5}{2}$

23. Since, $\tan\alpha$ and $\tan\beta$ are the roots of the equation $x^2 + ax + b = 0$, then

$$\tan\alpha + \tan\beta = -\frac{a}{1}$$

and $\quad \tan\alpha \cdot \tan\beta = b$

$\Rightarrow \quad \frac{\sin\alpha}{\cos\alpha} + \frac{\sin\beta}{\cos\beta} = -\frac{a}{1}$

and $$\frac{\sin\alpha\sin\beta}{\cos\alpha\cos\beta} = b$$

$\therefore\ \sin^2(\alpha+\beta) + a\sin(\alpha+\beta)\cos(\alpha+\beta) + b\cos^2(\alpha+\beta)$

$$= \cos^2(\alpha+\beta)\,[\tan^2(\alpha+\beta) + b + a\tan(\alpha+\beta)]$$

$$= \frac{\tan^2(\alpha+\beta) + b + a\tan(\alpha+\beta)}{1+\tan^2(\alpha+\beta)}$$

$$= \frac{\frac{a}{b-1}\left(a + \frac{a}{b-1}\right) + b}{1 + \frac{a^2}{(b-1)^2}} = b$$

24. Let the equation (incorrectly written form) be

$$x^2 + 17x + q = 0$$

Since, roots are $-2, -15$.

$\therefore\quad q = 30$

So, correct equation is $x^2 + 13x + 30 = 0$

$\Rightarrow\quad x^2 + 10x + 3x + 30 = 0$

$\Rightarrow\quad (x+3)(x+10) = 0$

$\Rightarrow\quad x = -3, -10$

25. Let the correct equation be $ax^2 + bx + c = 0$ and the correct roots are α and β. Taking c wrong, the roots are 3 and 2.

$\therefore\quad \alpha + \beta = 3 + 2 = 5$ ...(i)

Also, $a = 1$ and $c = -6$

$\therefore\quad \alpha\beta = \frac{c}{a} = -6$ ...(ii)

On solving Eqs. (i) and (ii), the correct roots are 6 and -1.

26. Here, $\alpha + \beta + \gamma = -2$ ...(i)

$\alpha\beta + \beta\gamma + \gamma\alpha = -3$ ...(ii)

and $\alpha\beta\gamma = 1$ ...(iii)

On squaring Eq. (ii), we get

$$\alpha^2\beta^2 + \beta^2\gamma^2 + \gamma^2\alpha^2 + 2\alpha\beta\gamma(\alpha+\beta+\gamma) = 9$$

$\Rightarrow\quad \alpha^2\beta^2 + \beta^2\gamma^2 + \gamma^2\alpha^2 = 9 - 2(1)(-2) = 13$

Now, $\alpha^{-2} + \beta^{-2} + r^{-2} = \frac{\beta^2\gamma^2 + \gamma^2\alpha^2 + \alpha^2\beta^2}{(\alpha\beta\gamma)^2} = \frac{13}{1} = 13$

27. Given equation is $(\cos p - 1)x^2 + (\cos p)x + \sin p = 0$

Since, roots are real, its discriminant, $D \ge 0$

$\therefore\quad \cos^2 p - 4(\cos p - 1)\sin p \ge 0$

$\Rightarrow\quad \cos^2 p - 4\cos p\sin p + 4\sin p \ge 0$

$\Rightarrow\quad (\cos p - 2\sin p)^2 - 4\sin^2 p + 4\sin p \ge 0$

$\Rightarrow\quad (\cos p - 2\sin p)^2 + 4\sin p(1 - \sin p) \ge 0$ ...(i)

Now, $(1 - \sin p) \ge 0$ for all real p and $\sin p > 0$ for $0 < p < \pi$.

Therefore, $4\sin p(1 - \sin p) \ge 0$ when $0 < p < \pi$ or $p \in (0, \pi)$.

28. Let all four roots are imaginary. Then, roots of both equation $P(x) = 0$ and $Q(x) = 0$ are imaginary.

Thus, $b^2 - 4ac < 0$; $d^2 - 4ac < 0$, so $b^2 + d^2 < 0$ which is impossible unless $b = 0, d = 0$.

So, if $b \ne 0$ or $d \ne 0$ atleast two roots must be real, if $b = 0$, $d = 0$, we have the equations

$$P(x) = ax^2 + c = 0$$

and $$Q(x) = -ax^2 + c = 0$$

or $x^2 = -\frac{c}{a}$; $x^2 = \frac{c}{a}$ as one of $\frac{c}{a}$ and $-\frac{c}{a}$ must be positive, so two roots must be real.

29. Since, roots are real.

$\therefore\ \{2(bc + ad)\}^2 = 4(a^2 + b^2)(c^2 + d^2)$

$\Rightarrow 4b^2c^2 + 4a^2d^2 + 8abcd = 4a^2c^2 + 4a^2d^2 + 4b^2c^2 + 4b^2d^2$

$\Rightarrow\quad 4a^2d^2 + 4b^2c^2 - 8abcd = 0$

$\Rightarrow\quad 4(ad - bc)^2 = 0$

$\Rightarrow\quad ad = bc$

$\Rightarrow\quad \frac{a}{b} = \frac{c}{d}$

30. Since, $f(1) + f(2) + f(3) = 0$

$f(1), f(2), f(3)$ all cannot be of same sign.

$\Rightarrow$ Roots are real and distinct.

31. Since, $\sin\alpha$, $\sin\beta$ and $\cos\alpha$ are in GP, then

$\sin^2\beta = \sin\alpha\cos\alpha$ ...(i)

Given equation is $x^2 + 2x\cot\beta + 1 = 0$.

$\therefore$ Discriminant, $D = b^2 - 4ac$

$= (2\cot\beta)^2 - 4 = 4(\text{cosec}^2\beta - 2)$

$= 4(\text{cosec}\,\alpha\sec\alpha - 2)$ [from Eq. (i)]

$= 4(2\,\text{cosec}\,2\alpha - 2) \ge 0$

$\therefore$ Roots are real.

32. Since, 4 is a root of $x^2 + ax + 12 = 0$

$\therefore\quad 16 + 4a + 12 = 0$

$\Rightarrow\quad a = -7$

Let the roots of the equation $x^2 + ax + b = 0$ be α and α.

$\therefore\quad 2\alpha = -a$

$\Rightarrow\quad \alpha = \frac{7}{2}$

and $\alpha\cdot\alpha = b \Rightarrow \left(\frac{7}{2}\right)^2 = b$

$\Rightarrow\quad b = \frac{49}{4}$

33. The given equation is

$$pqx^2 - (p+q)^2x + (p+q)^2 = 0.$$

$$x = \frac{(p+q)^2 \pm \sqrt{(p+q)^4 - 4pq(p+q)^2}}{2pq}$$

$$x = \frac{(p+q)^2 \pm (p^2 - q^2)}{2pq}$$

Now, taking (+ ve) sign

$$x = \frac{p+q}{q}$$

and taking (– ve) sign

$$x = \frac{p+q}{p}$$

$\therefore$ Solution set is $\left\{\frac{p+q}{p}, \frac{p+q}{q}\right\}$.

34. Since, $\sin\alpha$ and $\cos\alpha$ are the roots of the equation $ax^2 + bx + c = 0$, then

$$\sin\alpha + \cos\alpha = -\frac{b}{a} \quad \text{and} \quad \sin\alpha\cos\alpha = \frac{c}{a}$$

To eliminate α, we have

$$1 = \sin^2\alpha + \cos^2\alpha$$

$$\Rightarrow \quad 1 = (\sin\alpha + \cos\alpha)^2 - 2\sin\alpha\cos\alpha$$

$$\Rightarrow \quad 1 = \frac{b^2}{a^2} - \frac{2c}{a}$$

$$\Rightarrow \quad a^2 - b^2 + 2ac = 0$$

35. $\because$

$$\frac{k+1}{k} + \frac{k+2}{k+1} = -\frac{b}{a} \quad \text{...(i)}$$

and

$$\frac{k+1}{k} \cdot \frac{k+2}{k+1} = \frac{c}{a}$$

$$\Rightarrow \quad \frac{k+2}{k} = \frac{c}{a}$$

$$\Rightarrow \quad \frac{2}{k} = \frac{c}{a} - 1 = \frac{c-a}{a}$$

$$\Rightarrow \quad k = \frac{2a}{c-a}$$

On putting the value of k in the Eq. (i), we get

$$\frac{c+a}{2a} + \frac{2c}{c+a} = -\frac{b}{a}$$

$$\Rightarrow \quad (c+a)^2 + 4ac = -2b(a+c)$$

$$\Rightarrow \quad (a+b+c)^2 = b^2 - 4ac$$

36. Let α be a root of equation $ax^2 + bx + c = 0$, then $\frac{1}{\alpha}$ be a root of second equation, therefore

$$a\alpha^2 + b\alpha + c = 0 \quad \text{...(i)}$$

and

$$a'\frac{1}{\alpha^2} + b'\frac{1}{\alpha} + c' = 0$$

$$\Rightarrow \quad c'\alpha^2 + b'\alpha + a' = 0 \quad \text{...(ii)}$$

On solving Eqs. (i) and (ii), we get

$$\frac{\alpha^2}{ba' - b'c} = \frac{\alpha}{cc' - aa'} = \frac{1}{ab' - bc'}$$

$$\Rightarrow \quad (cc' - aa')^2 = (ba' - cb')(ab' - bc')$$

37. We have,

$$(a+1)x^2 + (2a+3)x + (3a+4) = 0$$

Let α and β be the roots of the equation.

According to the given condition,

$$\alpha\beta = 2$$

$$\Rightarrow \quad \frac{3a+4}{a+1} = 2$$

$$\Rightarrow \quad 3a + 4 = 2a + 2 \Rightarrow a = -2$$

Also,

$$\alpha + \beta = -\frac{2a+3}{a+1} = -\frac{-4+3}{-2+1} = -1$$

38. $y^{x^2+7x+12} = 1$

$$\Rightarrow \quad x^2 + 7x + 12 = 0$$

$$\Rightarrow \quad x = -3, -4$$

$$\Rightarrow \quad y = 9, 10 \quad \text{(when } y \neq 1\text{)}$$

Again when $y = 1, x = 5$.

$\therefore$ Solutions are $(-3, 9)$, $(-4, 10)$, $(5, 1)$.

39. $[x]^2 - [x] - 2 = 0$

$$\Rightarrow \quad ([x] - 2)([x] + 1) = 0$$

$$\Rightarrow \quad [x] = 2, -1$$

$$\Rightarrow \quad x \in [-1, 0) \cup [2, 3)$$

40. Here, $\Sigma\alpha = 0, \Sigma\alpha\beta = -7, \alpha\beta\gamma = -7$

$$\therefore \quad \frac{1}{\alpha^4} + \frac{1}{\beta^4} + \frac{1}{\gamma^4} = \frac{\alpha^4\beta^4 + \beta^4\gamma^4 + \gamma^4\alpha^4}{\alpha^4\beta^4\gamma^4}$$

$$= \frac{\Sigma\alpha^4\beta^4}{\alpha^4\beta^4\gamma^4} \quad \text{...(i)}$$

Now, $\Sigma\alpha\beta\,\Sigma\alpha\beta\,\Sigma\alpha\beta\,\Sigma\alpha\beta = (\Sigma\alpha\beta)^2(\Sigma\alpha\beta)^2$

$$\Rightarrow \quad (-7)^4 = [\alpha^2\beta^2 + \beta^2\gamma^2 + \gamma^2\alpha^2 + 2\alpha\beta\gamma(\alpha + \beta + \gamma)]$$

$$[\alpha^2\beta^2 + \beta^2\gamma^2 + \gamma^2\alpha^2 + 2\alpha\beta\gamma(\alpha + \beta + \gamma)]$$

$$= (\alpha^2\beta^2 + \beta^2\gamma^2 + \gamma^2\alpha^2)(\alpha^2\beta^2 + \beta^2\gamma^2 + \gamma^2\alpha^2)$$

$$(\because \Sigma\alpha = \alpha + \beta + \gamma = 0)$$

$$= \alpha^4\beta^4 + \beta^4\gamma^4 + \gamma^4\alpha^4 + 2\alpha^4\beta^2\gamma^2 + 2\alpha^2\beta^4\gamma^2 + 2\alpha^2\beta^2\gamma^4$$

$$= \Sigma\alpha^4\beta^4 + 2\alpha^2\beta^2\gamma^2(\alpha^2 + \beta^2 + \gamma^2)$$

$$= \Sigma\alpha^4\beta^4 + 2\alpha^2\beta^2\gamma^2[(\Sigma\alpha)^2 - 2\Sigma\alpha\beta]$$

$$= \Sigma\alpha^4\beta^4 + 2\alpha^2\beta^2\gamma^2[0 - 2 \times (-7)]$$

$$= \Sigma\alpha^4\beta^4 + 2(-7)^2(2 \times 7)$$

$$\Rightarrow \quad \Sigma\alpha^4\beta^4 = (-7)^4 + 4(-7)^3$$

$$\Rightarrow \quad \Sigma\alpha^4\beta^4 = (-7)^3(-7 + 4) = -3(-7)^3$$

On putting this value in Eq. (i), we get

$$\frac{1}{\alpha^4} + \frac{1}{\beta^4} + \frac{1}{\gamma^4} = \frac{-3(-7)^3}{(-7)^4} = \frac{-3}{-7} = \frac{3}{7}$$

41. Given equation $\frac{\alpha}{x-\alpha} + \frac{\beta}{x-\beta} = 1$ can be rewritten as

$$x^2 - 2(\alpha + \beta)x + 3\alpha\beta = 0$$

Let its roots be α' and $-\alpha'$.

$$\Rightarrow \quad \alpha' + (-\alpha') = 2(\alpha + \beta)$$

$$\Rightarrow \quad 0 = 2(\alpha + \beta)$$

$$\Rightarrow \quad \alpha + \beta = 0$$

42. Given equation $\frac{1}{x+p}+\frac{1}{x+q}=\frac{1}{r}$ can be rewritten as

$$x^2+x(p+q-2r)+pq-pr-qr=0 \quad \text{...(i)}$$

Let roots are α and $-\alpha$, then the product of roots

$$-\alpha^2=pq-pr-qr=pq-r(p+q) \quad \text{...(ii)}$$

and sum of roots, $0=-(p+q-2r)$

$$\Rightarrow \quad r=\frac{p+q}{2} \quad \text{...(iii)}$$

On solving Eqs. (ii) and (iii), we get

$$-\alpha^2=pq-\frac{p+q}{2}(p+q)$$

$$=-\frac{1}{2}\{(p+q)^2-2pq\}$$

$$\Rightarrow \quad \alpha^2=-\frac{(p^2+q^2)}{2}$$

43. Given equation is $x^2+ax+1=0$.

Since, roots are $\tan\theta$ and $\cot\theta$.

$\therefore$ Product of roots, $\tan\theta\cdot\cot\theta=a\Rightarrow a=1$

Again, since roots are real.

$$\therefore \quad a^2-4\geq 0 \quad \Rightarrow \quad |a|\geq 2$$

Thus, the least value of $|a|$ is 2.

44. Given equation is $(5+\sqrt{2})x^2-(4+\sqrt{5})x+8+2\sqrt{5}=0$.

Let x_1 and x_2 are the roots of the equation.

$$\Rightarrow \quad x_1+x_2=\frac{4+\sqrt{5}}{5+\sqrt{2}} \quad \text{...(i)}$$

and $x_1x_2=\frac{8+2\sqrt{5}}{5+\sqrt{2}}=\frac{2(4+\sqrt{5})}{5+\sqrt{2}}=2(x_1+x_2)$ ...(ii)

$\therefore$ Harmonic mean $=\frac{2x_1x_2}{x_1+x_2}=\frac{4(x_1+x_2)}{(x_1+x_2)}=4$ [from Eq. (ii)]

45. Given, $a+b+c=0$ ...(i)

and $4ax^2+3bx+2c=0$

$\because \quad D=b^2-4ac$

$\therefore \quad D=(3b)^2-4(4a)(2c)$

$=9b^2-32ac$

$=9(a+c)^2-32ac$ [$\because$ from Eq. (i)]

$=9(a-c)^2+4ac>0$

Hence, roots are real.

46. Since, quadratic equation $ax^2+bx+c=0$ has three distinct roots. So, it must be an identity. So, $a=b=c=0$.

47. Given expression $x^2+2x+2xy+my-3=0$ can be rewritten as $x^2+2x(1+y)+(my-3)=0$.

But factors are rational so discriminant b^2-4ac is a perfect square.

Now, $b^2-4ac=4\{(1+y)^2-(my-3)\}\geq 0$

$\Rightarrow \quad 4\{y^2+1+2y-my+3\}\geq 0$

$\Rightarrow \quad y^2+2y-my+4\geq 0$

Hence, $2y-my=\pm 4y$ (as it is perfect square).

$\Rightarrow \quad 2y-my=4y$

$\Rightarrow \quad m=-2$

Now, taking (–)ve sign, we get $m=6$

48. The given equations are

$$qx^2+px+q=0 \quad \text{...(i)}$$

and $x^2-4qx+p^2=0$ ...(ii)

Since, root of the Eq. (i) are complex, therefore

$$p^2-4q^2<0$$

Now, discriminant of Eq. (ii) is

$$16q^2-4p^2=-4(p^2-4q^2)>0$$

Hence, roots are real and unequal.

49. Given equation can be rewritten as

$$3x^2-(a+c+2b+2d)x+ac+2bd=0$$

$\therefore$ Discriminant, D

$=(a+c+2b+2d)^2-4\cdot 3\,(ac+2bd)$

$=\{(a+2d)+(c+2b)\}^2-12(ac+2bd)$

$=\{(a+2d)-(c+2b)\}^2+4(a+2d)(c+2b)-12\,(ac+2bd)$

$=\{(a+2d)-(c+2b)\}^2-8ac+8ab+8dc-8bd$

$=\{(a+2d)-(c+2b)\}^2+8\,(c-b)(d-a)$

Which is +ve, since $a<b<c<d$.

Hence, roots are real and distinct.

50. Since, α,β are the roots of the equation $x^2+px+q=0$, then

$$\alpha+\beta=p, \quad \alpha\beta=q \quad \text{...(i)}$$

and α^4,β^4 are the roots of $x^2-xr+s=0$.

Then, $\alpha^4+\beta^4=r$ ...(ii)

and $\alpha^4\beta^4=s$

If D is discriminant of the equation $x^2-4qx+2q^2-r=0$,

then $D=16q^2-4\,(2q^2-r)=8q^2+4r$

$=8\alpha^2\beta^2+4(\alpha^4+\beta^4)$ [from Eqs. (i) and (ii)]

$=4\,(\alpha^2+\beta^2)^2\geq 0$

Hence, the equation $x^2-4qx+2q^2-r=0$ has always two real roots.

51. The roots of the equation $ax^2+bx+c=0$ are given by

$$x=\frac{-b\pm\sqrt{b^2-4ac}}{2a}$$

(i) Let $b^2-4ac>0$, $b>0$

Now, if $a>0$, $c>0$, $b^2-4ac<b^2$

$\Rightarrow$ The roots are negative.

(ii) Let $b^2 - 4ac < 0$, then the roots are given by

$$x = \frac{-b \pm i\sqrt{(4ac - b^2)}}{2a} \qquad (i = \sqrt{-1})$$

Which are imaginary and have negative part. $(\because b > 0)$

$\therefore$ In each case the root have negative real part.

52. Given, $(ax^2 + c)\,y + (a'x^2 + c') = 0$

or $x^2(ay + a') + (cy + c') = 0$

Since, x is rational, then the discriminant of the above equation must be a perfect square.

$\therefore \quad 0 - 4(ay + a')(cy + c') = 0$

$\Rightarrow -acy^2 - (ac' + a'c)\,y - a'c'$ must be a perfect square

$\Rightarrow \quad (ac' - a'c)^2 - 4aca'c' = 0$

$\Rightarrow \quad (ac' - a'c)^2 = 0$

$\Rightarrow \quad ac' = a'c$

$\Rightarrow \quad \dfrac{a}{a'} = \dfrac{c}{c'}$

53. Since, roots of the equation

$(a - b)x^2 + (c - a)x + (b - c) = 0$ are equal.

$\therefore$ Discriminant, $B^2 - 4AC = 0$

$\Rightarrow \quad (c - a)^2 - 4(a - b)(b - c) = 0$

$\Rightarrow \quad a^2 + 4b^2 + c^2 + 2ac - 4ab - 4bc = 0$

$\Rightarrow \quad (a + c - 2b)^2 = 0$

$\Rightarrow \quad a + c = 2b$

Hence, a, b, c are in AP.

54. Given equation is

$$(p^2 + q^2)x^2 - 2q(p + r)x + (q^2 + r^2) = 0.$$

Since, roots are real and equal, then

$$b^2 - 4ac = 0$$

$\Rightarrow \quad 4q^2(p + r)^2 - 4(p^2 + q^2)(q^2 + r^2) = 0$

$\Rightarrow \quad q^2(p^2 + r^2 + 2pr) - (p^2q^2 + p^2r^2 + q^4 + q^2r^2) = 0$

$\Rightarrow \quad q^2p^2 + q^2r^2 + 2pq^2r - p^2q^2 - p^2r^2 - q^4 - q^2r^2 = 0$

$\Rightarrow \quad 2pq^2r - p^2r^2 - q^4 = 0$

$\Rightarrow \quad (q^2 - pr)^2 = 0$

$\Rightarrow \quad q^2 = pr$

$\therefore$ p, q and r will be in GP.

55. The equation $x^2 - px + r = 0$ has roots α, β and the equation $x^2 - qx + r = 0$ has roots $\dfrac{\alpha}{2}, 2\beta$.

$\Rightarrow \quad r = \alpha\beta$

and $\alpha + \beta = p$

and $\dfrac{\alpha}{2} + 2\beta = q$

$\Rightarrow \quad \beta = \dfrac{2q - p}{3}$ and $\alpha = \dfrac{2(2p - q)}{3}$

$\Rightarrow \quad \alpha\beta = r = \dfrac{2}{9}(2q - p)(2p - q)$

56. For rational roots $b^2 - 4ac$ must be a perfect square of a rational number and as a, b and c are natural numbers $b^2 - 4ac$ must be a perfect square of an integer.

$$b^2 - 4ac = I^2 \Rightarrow b^2 - I^2 = 4ac$$

$\Rightarrow \quad 4ac = (b - I)(b + I)$

$\Rightarrow \quad ac = \dfrac{b - I}{2} \cdot \dfrac{b + I}{2}$

$b - I, b + I$ are both odd integers or both even integers but ac is an odd integer. So, $b - I$ and $b + I$ must be even integers. b is odd I must be odd. Now, let

$b - I = 2m$, (m is an odd integer)

$b + I = 2n$, (n is an odd integer)

$I = (n - m)$, ($n - m$ is an even integer)

So, contradiction $\Rightarrow b^2 - 4ac$ is not a perfect square. So, all a, b and c cannot be odd integers.

57. The given equation is $x^2 - 2x\cos\phi + 1 = 0$.

$$\therefore \quad x = \frac{2\cos\phi \pm \sqrt{4\cos^2\phi - 4}}{2} = \cos\phi \pm i\sin\phi$$

Let $\alpha = \cos\phi + i\sin\phi$, then $\beta = \cos\phi - i\sin\phi$

$\therefore \quad \alpha^n + \beta^n = (\cos\phi + i\sin\phi)^n + (\cos\phi - i\sin\phi)^n$

$= 2\cos n\phi$

and $\alpha^n\beta^n = (\cos n\phi + i\sin n\phi)(\cos n\phi - i\sin n\phi)$

$= \cos^2 n\phi + \sin^2 n\phi = 1$

$\therefore$ Required equation is $x^2 - 2x\cos n\phi + 1 = 0$

58. Since, α and β are the roots of the equation

$2x^2 + 2(a + b)x + a^2 + b^2 = 0$.

$\therefore \quad (\alpha + \beta)^2 = (a + b)^2$ and $\alpha\beta = \dfrac{a^2 + b^2}{2}$

Now, $(\alpha - \beta)^2 = (\alpha + \beta)^2 - 4\alpha\beta$

$= (a + b)^2 - 4\left(\dfrac{a^2 + b^2}{2}\right)$

$= -(a - b)^2$

Now, the required equation whose roots are $(\alpha + \beta)^2$ and $(\alpha - \beta)^2$ is

$$x^2 - \{(\alpha + \beta)^2 + (\alpha - \beta)^2\}x + (\alpha + \beta)^2(\alpha - \beta)^2 = 0$$

$\Rightarrow \quad x^2 - \{(a + b)^2 - (a - b)^2\}\,x - (a + b)^2(a - b)^2 = 0$

$\Rightarrow \quad x^2 - 4abx - (a^2 - b^2)^2 = 0$

59. Since, α, α^2 be the roots of the equation $x^2 + x + 1 = 0$.

$\therefore \quad \alpha + \alpha^2 = -1 \qquad$ ...(i)

and $\alpha^3 = 1 \qquad$ ...(ii)

Now, $\alpha^{31} + \alpha^{62} = \alpha^{31}(1 + \alpha^{31})$

$\Rightarrow$ $\alpha^{31} + \alpha^{62} = \alpha^{30} \cdot \alpha(1 + \alpha^{30} \cdot \alpha)$

$\Rightarrow$ $\alpha^{31} + \alpha^{62} = (\alpha^3)^{10} \cdot \alpha\{1 + (\alpha^3)^{10} \cdot \alpha\}$

$\Rightarrow$ $\alpha^{31} + \alpha^{62} = \alpha(1 + \alpha)$ [from Eq. (ii)]

$\Rightarrow$ $\alpha^{31} + \alpha^{62} = -1$ [from Eq. (i)]

Again, $\alpha^{31} \cdot \alpha^{62} = \alpha^{93}$

$\Rightarrow$ $\alpha^{31} \cdot \alpha^{62} = [\alpha^3]^{31} = 1$

$\therefore$ Required equation is

$$x^2 - (\alpha^{31} + \alpha^{62})x + \alpha^{31} \cdot \alpha^{62} = 0$$

$\Rightarrow$ $x^2 + x + 1 = 0$

60. Since, α and β are the roots of $ax^2 + bx + c = 0$.

$\Rightarrow$ $\alpha + \beta = -\dfrac{b}{a}$ and $\alpha\beta = \dfrac{c}{a}$ ...(i)

If roots are $\alpha + \dfrac{1}{\beta}, \beta + \dfrac{1}{\alpha}$, then

sum of roots $= \left(\alpha + \dfrac{1}{\beta}\right) + \left(\beta + \dfrac{1}{\alpha}\right) = (\alpha + \beta) + \dfrac{\alpha + \beta}{\alpha\beta}$

$= \dfrac{-b}{ac}(a + c)$ [from Eq. (i)]

and product of roots $= \left(\alpha + \dfrac{1}{\beta}\right)\left(\beta + \dfrac{1}{\alpha}\right)$

$= \alpha\beta + 1 + 1 + \dfrac{1}{\alpha\beta} = 2 + \dfrac{c}{a} + \dfrac{a}{c}$ [from Eq. (i)]

$= \dfrac{2ac + c^2 + a^2}{ac} = \dfrac{(a + c)^2}{ac}$

Hence, required equation is given by

$x^2 -$ (sum of roots) $x +$ (product of roots) $= 0$

$\Rightarrow$ $x^2 + \dfrac{b}{ac}(a + c)x + \dfrac{(a + c)^2}{ac} = 0$

$\Rightarrow$ $acx^2 + (a + c)bx + (a + c)^2 = 0$

61. Equations $x^3 + ax^2 + bx + c = 0$

and $x^3 + (a - 1)x^2 + (b - 1)x + (c - 1) = 0$ have atleast one common root, let common root be α.

$\therefore$ $\alpha^3 + a\alpha^2 + b\alpha + c = 0$

and $\alpha^3 + a\alpha^2 + b\alpha + c - \alpha^2 - \alpha - 1 = 0$

$\Rightarrow$ $\alpha^2 + \alpha + 1 = 0$

$\Rightarrow \alpha = \omega, \omega^2$ (where, ω and ω^2 are the cube roots of unity)

62. Given equations are $2x^2 + 3x + 5\lambda = 0$ and $x^2 + 2x + 3\lambda = 0$ have a common root, if

$$\frac{x^2}{(9 - 10)\lambda} = \frac{x}{(5 - 6)\lambda} = \frac{1}{(4 - 3)}$$

$\Rightarrow$ $\dfrac{x^2}{-\lambda} = \dfrac{x}{-\lambda} = \dfrac{1}{1}$

$\Rightarrow$ $x^2 = -\lambda$, $x = -\lambda$ or $\lambda = -1, 0$

63. Let the roots be $\alpha, \beta, \beta, \gamma$ and γ, α, then

$$\alpha\beta = b, \quad \beta\gamma = c \quad \text{and} \quad \gamma\alpha = a$$

$\Rightarrow$ $\alpha\beta\gamma = \sqrt{abc}$

64. Roots of the equation $2x^2 + 3x + 5 = 0$ are

$$x = \frac{-3 \pm \sqrt{9 - 40}}{6} \quad \text{(imaginary roots)}$$

Hence, both roots coincide, so on comparing

$$\frac{a}{2} = \frac{b}{3} = \frac{c}{5} = k$$

$\Rightarrow$ $a = 2k, b = 3k, c = 5k$

$\Rightarrow$ $a + b + c = 10k$

So, maximum value does not exist.

65. Let $f(x) = x^2 + 2ax + b$

$= (x + a)^2 + b - a^2$

So, minimum value of $f(x)$ is $b - a^2$.

Since, $f(x) \geq c, \forall x \in R$, hence $b - a^2 \geq c$

i.e., $b - c \geq a^2$

66. As we know, $ax^2 + bx + c > 0$ for all $x \in R$, iff $a > 0$ and $D < 0$.

$\therefore$ $x^2 + 2ax + (10 - 3a) > 0, \forall x \in R$

$\Rightarrow$ $D < 0$

$\Rightarrow$ $4a^2 - 4(10 - 3a) < 0$

$\Rightarrow$ $4(a^2 + 3a - 10) < 0$

$\Rightarrow$ $(a + 5)(a - 2) < 0$

Using number line rule

$a \in (-5, 2)$

67. We know that, the expression $ax^2 + bx + c > 0$ for all x, if $a > 0$ and $b^2 < 4ac$.

$\therefore$ $(a^2 - 1)x^2 + 2(a - 1)x + 2$ is positive for all x, if

$a^2 - 1 > 0$ and $4(a - 1)^2 - 8(a^2 - 1) < 0$

$\Rightarrow$ $a^2 - 1 > 0$ and $-4(a - 1)(a + 3) < 0$

$\Rightarrow$ $a^2 - 1 > 0$ and $(a - 1)(a + 3) > 0$

$\Rightarrow$ $a^2 > 1$ and $a < -3$ or $a > 1$

$\Rightarrow$ $a < -3$ or $a > 1$

68. Given equation is $x^2 - 2ax + a^2 + a - 3 = 0$.

If roots are real, then $D \geq 0$

$\Rightarrow$ $4a^2 - 4(a^2 + a - 3) \geq 0$

$\Rightarrow$ $-a + 3 \geq 0$

$\Rightarrow$ $a - 3 \leq 0 \Rightarrow a \leq 3$

As roots are less than 3, hence $f(3) > 0$

$$9 - 6a + a^2 + a - 3 > 0$$

$\Rightarrow \quad a^2 - 5a + 6 > 0$

$\Rightarrow \quad (a-2)(a-3) > 0$

$\Rightarrow$ Either $a < 2$ or $a > 3$.

Hence, only $a < 2$ satisfy.

69. Since, α, β are the roots of the equation $ax^2 + bx + c = 0$.

$\therefore \quad ax^2 + bx + c = a(x-\alpha)(x-\beta)$

$\Rightarrow \alpha, \beta$ be the roots of $ax^2 + bx + c = 0$. Also, $\alpha < k < \beta$

So, $\quad a(k-\alpha)(k-\beta) < 0$

Also, $\quad a^2k^2 + abk + ac = a(ak^2 + bk + c)$

$= a^2(k-\alpha)(k-\beta) < 0$

$\Rightarrow \quad a^2k^2 + abk + ac < 0$

70. The given condition suggest that a lies between the roots.

Let $\quad f(x) = 2x^2 - 2(2a+1)x + a(a+1)$

For a to lie between the roots we must have discriminant ≥ 0 and $f(a) < 0$.

Now, $\quad$ discriminant ≥ 0

$\Rightarrow \quad 4(2a+1)^2 - 8a(a+1) \geq 0$

$\Rightarrow 8\left(a^2 + a + \frac{1}{2}\right) \geq 0$, which is always true.

Also, $\quad f(a) < 0$

$\Rightarrow \quad 2a^2 - 2a(2a+1) + a(a+1) < 0$

$\Rightarrow \quad -a^2 - a < 0 \quad \Rightarrow \quad a^2 + a > 0 \quad \Rightarrow \quad a(1+a) > 0$

$\Rightarrow \quad a > 0 \quad$ or $\quad a < -1$

71. $-x^2 + ax + a = 0$

$\Rightarrow \quad x^2 - ax - a = 0$

Let $\quad f(x) = x^2 - ax - a$

$f(1) < 0$

$\Rightarrow \quad 1 - a - a < 0$

$\Rightarrow \quad 1 < 2a$

$\Rightarrow \quad a > \frac{1}{2}$

72. Since, α, β are the roots of the equation $x^2 + bx + c = 0$.

Here, $D = b^2 - 4c > 0$ because $c < 0 < b$. So, roots are real and unequal.

Now, $\quad \alpha + \beta = -b < 0 \quad$ and $\quad \alpha\beta = c < 0$

$\therefore$ One root is positive and the other is negative, then the negative root being numerically bigger. As $\alpha < \beta$, α is the negative root while β is the positive root. So, $|\alpha| > \beta$ and $\alpha < 0 < \beta$.

73. Given, $\quad 1 \leq |x-2| \leq 3$

Case I When $1 \leq |x-2|$

$\therefore \quad x - 2 \geq 1$ and $(x-2) \leq -1$

$\Rightarrow \quad x \geq 3$ and $x \leq 1$

$\Rightarrow \quad x \in (-\infty, 1] \cup [3, \infty) \quad$ ...(i)

Case II When $|x-2| \leq 3$

$\Rightarrow \quad -3 \leq x - 2 \leq 3$

$\Rightarrow \quad -1 \leq x \leq 5$

$\Rightarrow \quad x \in [-1, 5] \quad$ ...(ii)

$\therefore$ From Eqs.(i) and (ii), we get

$x \in [-1, 1] \cup [3, 5]$

74. Given, $\quad |x+2| \leq 9$

$\Rightarrow \quad -9 \leq x + 2 \leq 9$

$\Rightarrow \quad -11 \leq x \leq 7$

75. We know that, $ax^2 + bx + c \geq 0$, if $a > 0$ and $b^2 - 4ac \leq 0$

Now, $\quad mx - 1 + \frac{1}{x} \geq 0$

$\Rightarrow \quad \frac{mx^2 - x + 1}{x} \geq 0$

$\Rightarrow \quad mx^2 - x + 1 \geq 0 \quad$ and $\quad x > 0$

Now, $mx^2 - x + 1 \geq 0$, if $m > 0$ and $1 - 4m \leq 0$ or if $m > 0$ and $m \geq \frac{1}{4}$.

Thus, the minimum value of m is $\frac{1}{4}$.

76. Given, $\quad \frac{2x-1}{3} \geq \left(\frac{3x-2}{4}\right) - \left(\frac{2-x}{5}\right)$

$\therefore \quad \frac{2x-1}{3} \geq \frac{15x - 10 - 8 + 4x}{20}$

$\Rightarrow \quad \frac{2x-1}{3} \geq \frac{19x - 18}{20}$

$\Rightarrow \quad 20(2x-1) \geq 3(19x - 18)$

$\Rightarrow \quad 40x - 20 \geq 57x - 54$

$\Rightarrow \quad -17x \geq -34$

$\Rightarrow \quad 17x \leq 34 \quad (\because -a \geq -b \Rightarrow a \leq b)$

$\Rightarrow \quad x \leq 2$

$\therefore \quad x \in (-\infty, 2]$

77. Given, $\quad \frac{|x-2| - 1}{|x-2| - 2} \leq 0$

Let $\quad |x-2| = k$

$\therefore$ Given equation becomes

$\frac{k-1}{k-2} \leq 0$

$\Rightarrow \quad \frac{(k-1)(k-2)}{(k-2)^2} \leq 0$

$\Rightarrow \quad (k-1)(k-2) \leq 0$

$\Rightarrow \quad 1 \leq k \leq 2$

$\Rightarrow \quad 1 \leq |x-2| \leq 2$

Case I When $1 \leq |x-2|$

$\Rightarrow \quad |x-2| \geq 1$

$\Rightarrow \quad x - 2 \geq 1$ or $x - 2 \leq -1$

$\Rightarrow \quad x \geq 3$ and $x \leq 1 \quad$ ...(i)

Case II When $|x-2| \le 2$

$\Rightarrow \quad -2 \le x-2 \le 2$

$\Rightarrow \quad -2+2 \le x \le 2+2$

$\Rightarrow \quad 0 \le x \le 4 \quad$ ...(ii)

$\therefore$ From Eqs.(i) and (ii), we get

$$x \in [0, 1] \cup [3, 4]$$

78. We have, $1 \le |x-2| \le 3$

$\Rightarrow \quad |x-2| \ge 1$ and $|x-2| \le 3$

$\Rightarrow \quad (x-2 \le -1$ or $x-2 \ge 1)$

and $\quad (-3 \le x-2 \le 3)$

$\Rightarrow \quad (x \le 1$ or $x \ge 3)$ and $(-1 \le x \le 5)$

$\Rightarrow \quad x \in (-\infty, 1] \cup [3, \infty)$ and $x \in [-1, 5]$

Combining the solutions of two inequalities, we have

$x \in [-1, 1] \cup [3, 5]$

79. We have, $\quad |2x-3| < |x+5|$

$\Rightarrow \quad |2x-3| - |x+5| < 0$

$$\Rightarrow \quad \begin{cases} 3-2x+x+5<0, x \le -5 \\ 3-2x-x-5<0, -5<x \le \frac{3}{2} \\ 2x-3-x-5<0, x>\frac{3}{2} \end{cases}$$

$$\Rightarrow \quad \begin{cases} x>8, x \le -5 \\ x>-\frac{2}{3}, -5<x \le \frac{3}{2} \\ x<8, x>\frac{3}{2} \end{cases}$$

$$\Rightarrow \quad x \in \left(-\frac{2}{3}, \frac{3}{2}\right] \cup \left(\frac{3}{2}, 8\right)$$

$$\Rightarrow \quad x \in \left(-\frac{2}{3}, 8\right)$$

80. $(x-1)(x^2-5x+7) < (x-1)$

$\Rightarrow \quad (x-1)(x^2-5x+6) < 0$

$\Rightarrow \quad (x-1)(x-2)(x-3) < 0$

$\therefore \quad x \in (-\infty, 1) \cup (2, 3)$

81. $x^2 - 3|x| + 2 < 0$

$\Rightarrow \quad |x|^2 - 3|x| + 2 < 0$

$\Rightarrow \quad (|x|-1)(|x|-2) < 0$

$\Rightarrow \quad 1 < |x| < 2$

$\Rightarrow \quad -2 < x < -1$ or $1 < x < 2$

$\therefore \quad x \in (-2, -1) \cup (1, 2)$

82. Since, $-3 < x + \frac{2}{x} < 3$

$\Rightarrow \quad -3 < \frac{(x^2+2)x}{x^2} < 3$

$\Rightarrow \quad -3x^2 < (x^2+2)x < 3x^2 \quad (x \ne 0)$

$\Rightarrow \quad x(x^2+3x+2) > 0$

and $\quad x(x^2-3x+2) < 0 \quad (x \ne 0)$

$\Rightarrow \quad x(x+1)(x+2) > 0$ and $x(x-1)(x-2) < 0$

$\Rightarrow \quad x \in (-2, -1) \cup (0, \infty) \quad$ ...(i)

and $\quad x \in (-\infty, 0) \cup (1, 2) \quad$ ...(ii)

From Eqs. (i) and (ii), we get

$$x \in (-2, -1) \cup (1, 2)$$

83. We have, $x^2 + 6x - 27 > 0$

$\Rightarrow \quad (x+9)(x-3) > 0 \Rightarrow x < -9$ or $x > 3$

$\Rightarrow \quad x \in (-\infty, -9) \cup (3, \infty) \quad$ ...(i)

and $\quad x^2 - 3x - 4 < 0$

$\Rightarrow \quad (x-4)(x+1) < 0$

$\Rightarrow \quad -1 < x < 4 \quad$ ...(ii)

From Eqs. (i) and (ii), we get

$$3 < x < 4$$

84. We know that, $\quad$ A M $\ge$ GM

$\Rightarrow \quad \frac{a+b}{2} \ge \sqrt{ab}$

$\Rightarrow \quad 4 \ge \sqrt{ab} \quad (\because a + b = 8$ given)

$\Rightarrow \quad ab \le 16$

Equality holds when numbers are equal. So, ab is equal to 16 when $a = 4$, $b = 4$.

85. Since, $\quad$ AM $\ge$ GM

$\Rightarrow \quad \frac{a+b}{2} \ge \sqrt{ab}$

$\Rightarrow \quad \frac{a+b}{2} \ge \sqrt{4} \quad (\because ab = 4$, given)

$\Rightarrow \quad a + b \ge 4$

86. Since, $\quad$ AM $\ge$ GM

$\Rightarrow \quad \frac{bcx + cay + abz}{3} \ge (a^2b^2c^2 \cdot xyz)^{1/3}$

$\Rightarrow \quad bcx + cay + abz \ge 3abc \quad (\because xyz = abc)$

87. $\log_2(x^2 - 3x + 18) < 4$

$\Rightarrow \quad x^2 - 3x + 18 < 16 \quad$ (if $\log_a b < c \Rightarrow b < a^c$)

$\Rightarrow \quad x^2 - 3x + 2 < 0$

$\Rightarrow \quad (x-1)(x-2) < 0$

$\Rightarrow \quad x \in (1, 2)$

88. Since, $\quad \frac{(1+a_1)}{2} \ge \sqrt{1 \cdot a_1} = \sqrt{a_1}$

$$\frac{(1+a_2)}{2} \ge \sqrt{1 \cdot a_2} = \sqrt{a_2}$$

$$\vdots \qquad \vdots$$

$$\frac{(1+a_n)}{2} \ge \sqrt{1 \cdot a_n} = \sqrt{a_n}$$

$\Rightarrow \quad \frac{1}{2^n}(1+a_1)(1+a_2)\ldots(1+a_n) \geq \sqrt{a_1a_2\ldots a_n} = 1$

$\Rightarrow \quad (1+a_1)(1+a_2)\ldots(1+a_n) \geq 2^n$

89. Now, $a^2 - 3a + 2 = 0$

$\Rightarrow \quad a = 1, 2 \quad \ldots(i)$

and $a^2 - 5a + 6 = 0$

$\Rightarrow \quad a = 2, 3 \quad \ldots(ii)$

$\Rightarrow \quad a - 2 - r = 0$

At $a = 2$ [common value from Eqs. (i) and (ii)]

$r = 0$

So, $a + r = 2$

90. Given equation is $x^2 + 9y^2 - 4x + 3 = 0 \quad \ldots(i)$

or $x^2 - 4x + 9y^2 + 3 = 0$

Since, x is real.

$\therefore \quad (-4)^2 - 4(9y^2 + 3) \geq 0$

$\Rightarrow \quad 16 - 4(9y^2 + 3) \geq 0$

$\Rightarrow \quad 4 - 9y^2 - 3 \geq 0$

$\Rightarrow \quad 9y^2 - 1 \leq 0$

$\Rightarrow \quad (3y - 1)(3y + 1) \leq 0$

$\Rightarrow \quad \frac{-1}{3} \leq y \leq \frac{1}{3}$

From Eq. (i) can also be written as

$$9y^2 + 0y + x^2 - 4x + 3 = 0$$

Since, y is real.

$\therefore \quad 0^2 - 4 \cdot 9(x^2 - 4x + 3) \geq 0$

$\Rightarrow \quad x^2 - 4x + 3 \leq 0$

$\Rightarrow \quad (x - 1)(x - 3) \leq 0$

$\Rightarrow \quad 1 \leq x \leq 3$

91. Let $y = \frac{x^2 - 3x + 4}{x^2 + 3x + 4}$

$\Rightarrow \quad (y - 1)x^2 + 3(y + 1)x + 4(y - 1) = 0$

$\because x$ is real.

$\therefore \quad D \geq 0$

$\Rightarrow \quad 9(y + 1)^2 - 16(y - 1)^2 \geq 0$

$\Rightarrow \quad -7y^2 + 50y - 7 \geq 0$

$\Rightarrow \quad 7y^2 - 50y + 7 \leq 0$

$\Rightarrow \quad (y - 7)(7y - 1) \leq 0 \quad \ldots(i)$

$\Rightarrow \quad y \leq 7$ and $y \geq \frac{1}{7}$

$\Rightarrow \quad \frac{1}{7} \leq y \leq 7$

Hence, maximum value is 7 and minimum value is $\frac{1}{7}$.

92. Let the given expression be y.

$\therefore \quad y = \frac{x + 2}{2x^2 + 3x + 6} \Rightarrow 2x^2y + (3y - 1)x + (6y - 2) = 0$

If $y \neq 0$, then $\Delta \geq 0$ for real x.

i.e., $b^2 - 4ac \geq 0$

$\therefore \quad (3y - 1)^2 - 8y(6y - 2) \geq 0$

$\Rightarrow \quad -39y^2 + 10y + 1 \geq 0$

$\Rightarrow \quad 39y^2 - 10y - 1 \leq 0$

$\Rightarrow \quad (13y + 1)(3y - 1) \leq 0$

$\Rightarrow \quad -\frac{1}{13} \leq y \leq \frac{1}{3}$

If $y = 0$, then $x = -2$ which is real and this value of y is included in the above range.

93. Let $y = \frac{(x - a)(x - b)}{(x - c)}$

$\Rightarrow \quad y(x - c) = x^2 - (a + b)x + ab$

$\Rightarrow \quad x^2 - (a + b + y)x + ab + cy = 0$

Now, discriminant

$$D = (a + b + y)^2 - 4(ab + cy)$$
$$= y^2 + 2y(a + b - 2c) + (a - b)^2$$

Since, x is real and y assumes all real values, we must have $D \geq 0$ for all real values of y.

$\Rightarrow \quad 4(a + b - 2c)^2 - 4(a - b)^2 \leq 0$

$\Rightarrow \quad 4(a + b - 2c + a - b)(a + b - 2c - a + b) \leq 0$

$\Rightarrow \quad 16(a - c)(b - c) \leq 0$

$\Rightarrow \quad (c - a)(c - b) \leq 0$

$\Rightarrow \quad a \leq c \leq b$ or $b \leq c \leq a$

94. Given equation is $x^2 + (2 + \lambda)x - \frac{1}{2}(1 + \lambda) = 0$.

Let α and β are the roots of the given equation.

$\Rightarrow \quad \alpha + \beta = -(2 + \lambda)$ and $\alpha\beta = -\left(\frac{1 + \lambda}{2}\right)$

Now, $\alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$

$\Rightarrow \quad \alpha^2 + \beta^2 = [-(2 + \lambda)]^2 + 2\frac{(1 + \lambda)}{2}$

$\Rightarrow \quad \alpha^2 + \beta^2 = \lambda^2 + 4 + 4\lambda + 1 + \lambda = \lambda^2 + 5\lambda + 5$

Now, we take the option simultaneously.

It is minimum for $\lambda = \frac{1}{2}$.

95. We have, $px^2 + qx + 1 = 0$, for real roots discriminant ≥ 0

$\Rightarrow \quad q^2 - 4p \geq 0 \Rightarrow q^2 \geq 4p$

For $p = 1, q^2 \geq 4 \Rightarrow q = 2, 3, 4$

$p = 2, q^2 \geq 8 \Rightarrow q = 3, 4$

$p = 3, q^2 \geq 12 \Rightarrow q = 4$

$p = 4, q^2 \geq 16 \Rightarrow q = 4$

Total seven solutions are possible.

96. Since, α, β and γ, δ are the roots of the equation $ax^2 + 2bx + c = 0$ and $px^2 + 2qx + r = 0$ respectively, then

$$\alpha + \beta = -\frac{2b}{a}, \quad \alpha\beta = \frac{c}{a}, \quad \gamma + \delta = -\frac{2q}{p}, \quad \gamma\delta = \frac{r}{p}$$

As given α, β, γ and δ are in GP, therefore

$$\frac{\alpha}{\gamma} = \frac{\beta}{\delta} \quad \text{...(i)}$$

But $\quad \dfrac{\alpha\beta}{\gamma\delta} = \dfrac{pc}{ar} \Rightarrow \left(\dfrac{\beta}{\delta}\right)^2 = \dfrac{pc}{ar}$ [from Eq. (i)]

Also, $\dfrac{\alpha}{\beta} = \dfrac{\gamma}{\delta} \Rightarrow \dfrac{\alpha+\beta}{\beta} = \dfrac{\gamma+\delta}{\delta} \Rightarrow \dfrac{\alpha+\beta}{\gamma+\delta} = \dfrac{\beta}{\delta}$

$$\Rightarrow \frac{bp}{aq} = \sqrt{\frac{pc}{ar}} \Rightarrow \frac{b^2p^2}{a^2q^2} = \frac{pc}{ar} \Rightarrow q^2ac = b^2pr$$

97. Since, α, β and $\alpha - k, \beta - k$ are the roots of the equations $ax^2 + bx + c = 0$ and $Ax^2 + Bx + C = 0$, respectively.

$$\Rightarrow \quad \alpha + \beta = -\frac{b}{a}, \quad \alpha\beta = \frac{c}{a}$$

and $\quad \alpha + \beta - 2k = -\dfrac{B}{A}, \quad (\alpha - k)(\beta - k) = \dfrac{C}{A}$

Now, $\quad (\alpha - \beta)^2 = (\alpha + \beta)^2 - 4\alpha\beta = \dfrac{(b^2 - 4ac)}{a^2} \quad$ ...(i)

Also, $\quad \{(\alpha - k) - (\beta - k)\}^2$

$$= \{(\alpha - k) + (\beta - k)\}^2 - 4(\alpha - k)(\beta - k)$$

$$= \left(-\frac{B}{A}\right)^2 - 4\left(\frac{C}{A}\right) = \frac{B^2 - 4AC}{A^2} \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{(b^2 - 4ac)}{a^2} = \frac{B^2 - 4AC}{A^2}$$

$$\therefore \quad \frac{B^2 - 4AC}{b^2 - 4ac} = \left(\frac{A}{a}\right)^2$$

98. Since, α and β are the roots of given equation.

Let $\quad f(x) = a^2x^2 + 2bx + 2c = 0$

Then, $\quad f(\alpha) = a^2\alpha^2 + 2b\alpha + 2c = 0$

$$= a^2\alpha^2 + 2(b\alpha + c) = a^2\alpha^2 - 2a^2\alpha^2$$

$$= -a^2\alpha^2 = -\text{ve}$$

and $\quad f(\beta) = a^2\beta^2 + 2(b\beta + c) = a^2\beta^2 + 2a^2\beta^2$

$$= 3a^2\beta^2 = +\text{ve}$$

Since, $f(\alpha)$ and $f(\beta)$ are of opposite signs, therefore by theory of equations there lies a root γ of the equation $f(x) = 0$ between α and β, *i.e.*, $\alpha < \gamma < \beta$.

99. Since, $y^2 - y + a = \left(y - \dfrac{1}{2}\right)^2 + a - \dfrac{1}{4}$

and $-\sqrt{2} \le \sin x + \cos x \le \sqrt{2}$, given equation will have no real values of x for any y, if $a - \dfrac{1}{4} > \sqrt{2}$

i.e., $\quad a \in \left(\sqrt{2} + \dfrac{1}{4}, \infty\right)$

$\Rightarrow \quad a \in (\sqrt{3}, \infty) \quad$ (as $\sqrt{2} + \dfrac{1}{4} < \sqrt{3}$)

100. Let α, β are the roots of the equation $x^2 - ax + b = 0$.

$\therefore \quad \alpha + \beta = a \quad$ ...(i)

and $\quad \alpha\beta = b \quad$ ...(ii)

Roots are prime numbers, so clearly b cannot be a prime number as it is product of two prime numbers [from Eq.(ii)]. Sum of two prime numbers is always an even number except in one situation when one prime number is 2. 'a' can be a prime number and can be composite number.

Now, $\quad 1 + a + b = 1 + \alpha\beta + \alpha + \beta = (1 + \alpha)(1 + \beta)$

$(1 + \alpha), (1 + \beta)$ can be prime numbers, can be composite numbers, so $1 + a + b$ is not certain.

So, option (d) is correct.

Round II

1. The given equation is

$$2(1 + i)x^2 - 4(2 - i)x - 5 - 3i = 0$$

$$\Rightarrow \quad x = \frac{4(2 - i) \pm \sqrt{16(2 - i)^2 + 8(1 + i)(5 + 3i)}}{4(1 + i)}$$

$$= -\frac{i}{1 + i} \text{ or } \frac{4 - i}{1 + i} = \frac{-1 - i}{2} \text{ or } \frac{3 - 5i}{2}$$

Now, $\quad \left|\dfrac{-1 - i}{2}\right| = \sqrt{\dfrac{1}{4} + \dfrac{1}{4}} = \sqrt{\dfrac{1}{2}}$

and $\quad \left|\dfrac{3 - 5i}{2}\right| = \sqrt{\dfrac{9}{4} + \dfrac{25}{4}} = \sqrt{\dfrac{17}{2}}$

Also, $\quad \sqrt{\dfrac{17}{2}} > \sqrt{\dfrac{1}{2}}$

Hence, required root is $\dfrac{3 - 5i}{2}$.

2. Let $f(x) = ax^2 + 2bx - 3c$ and $f(x) = 0$ has non-real roots, $f(x)$ will have the same sign for all values of x.

Also, $\quad \dfrac{3c}{4} < (a + b) \Rightarrow 4a + 4b - 3c > 0$

$\Rightarrow \quad f(2) > 0 \Rightarrow f(0) > 0$

$\Rightarrow \quad c < 0$

3. We have, $\quad ax^2 - bx(x - 1) + c(x - 1)^2 = 0 \quad$ ...(i)

$$\Rightarrow \quad a\left(\frac{x}{1 - x}\right)^2 + b\left(\frac{x}{1 - x}\right) + c = 0$$

Also, α and β be the roots of $ax^2 + bx + c = 0$.

$$\therefore \quad \alpha = \frac{x}{1 - x} \text{ and } \beta = \frac{x}{1 - x}$$

$\Rightarrow \quad x = \dfrac{\alpha}{\alpha+1}, x = \dfrac{\beta}{\beta+1}$

Hence, $\dfrac{\alpha}{\alpha+1}$ and $\dfrac{\beta}{\beta+1}$ are the required roots.

4. Since, α and β be the roots of the equation $ax^2 + bx + c = 0$, then

$$\alpha + \beta = -\frac{b}{a} \quad \text{and} \quad \alpha\beta = \frac{c}{a}$$

Now, sum of roots $= |\alpha| + |\beta|$

$= -\alpha - \beta \qquad (\because \beta < \alpha < 0)$

$= -\left(-\dfrac{b}{a}\right) = \left|\dfrac{b}{a}\right| \qquad (\because |\alpha| + |\beta| > 0)$

and product of roots $= |\alpha||\beta| = \left|\dfrac{c}{a}\right|$

Hence, required equation is

$$x^2 - \left|\frac{b}{a}\right|x + \left|\frac{c}{a}\right| = 0$$

$\Rightarrow \quad |a|x^2 - |b|x + |c| = 0$

5. On multiplying first equation by x, we get

$$x^4 + ax^2 + x = 0 \qquad \text{...(i)}$$

and another given equation is

$$x^4 + ax^2 + 1 = 0 \qquad \text{...(ii)}$$

On subtracting Eq. (ii) from Eq. (i), we get

$$x - 1 = 0$$

$\Rightarrow \quad x = 1$

which is a common root.

On putting this value in Eq. (ii), we get

$$1 + a + 1 = 0$$

$\Rightarrow \quad a = -2$

6. $\left(\dfrac{9}{10}\right)^x = -3 + x - x^2$

$\Rightarrow \quad \left(\dfrac{9}{10}\right)^x = -\left\{\left(x - \dfrac{1}{2}\right)^2 + \dfrac{11}{4}\right\}$

LHS is always positive while RHS is always negative.

Hence, the given equation has no solution.

7. Let the discriminant of the equation $x^2 + px + q = 0$ is D_1, then $D_1 = p^2 - 4q$

and the discriminant of the equation $x^2 + rx + s = 0$ is D_2, then $D_2 = r^2 - 4s$

$\therefore \quad D_1 + D_2 = p^2 + r^2 - 4(q + s) = p^2 + r^2 - 2pr$

(from the given relation)

$\Rightarrow \quad D_1 + D_2 = (p - r)^2 \geq 0$

Clearly, atleast one of D_1 and D_2 must be non-negative, consequently atleast one of the equation has real roots.

8. Since, α and β are the roots of the equation $x^2 + px + q = 0$, therefore

$\alpha + \beta = -p$ and $\alpha\beta = q$

Now, $(\omega\alpha + \omega^2\beta)(\omega^2\alpha + \omega\beta)$

$= \alpha^2 + \beta^2 + (\omega^4 + \omega^2)\alpha\beta \qquad (\because \omega^3 = 1)$

$= \alpha^2 + \beta^2 - \alpha\beta \qquad (\because \omega + \omega^2 = -1)$

$= (\alpha + \beta)^2 - 3\alpha\beta = p^2 - 3q$

Also, $\dfrac{\alpha^2}{\beta} + \dfrac{\beta^2}{\alpha} = \dfrac{\alpha^3 + \beta^3}{\alpha\beta}$

$= \dfrac{(\alpha + \beta)^3 - 3\alpha\beta(\alpha + \beta)}{\alpha\beta} = \dfrac{p(3q - p^2)}{q}$

$\therefore$ The given expression $= \dfrac{(p^2 - 3q)}{\dfrac{p(3q - p^2)}{q}} = -\dfrac{q}{p}$

9. Let the correct equation is

$$ax^2 + bx + c = 0,$$

then $\alpha + \beta = -\dfrac{b}{a}$ and $\alpha\beta = \dfrac{c}{a}$

When b is written incorrectly, then the roots are equal. Let these are γ and γ.

$\therefore \quad \gamma \cdot \gamma = \dfrac{c}{a} \Rightarrow \gamma^2 = \alpha\beta \qquad \text{...(i)}$

When c is written incorrectly, then the roots are γ and 2γ.

$\therefore \quad \gamma + 2\gamma = -\dfrac{b}{a} \Rightarrow 3\gamma = \alpha + \beta$

$\Rightarrow \quad 9\gamma^2 = (\alpha + \beta)^2 \Rightarrow 9\alpha\beta = (\alpha - \beta)^2 + 4\alpha\beta$

[from Eq. (i)]

$\therefore \quad (\alpha - \beta)^2 = 5\alpha\beta$

10. Discriminant of the equation $3x^2 + 8x + 15 = 0$ is given by

$$D = 64 - 180 = -116 < 0$$

So, its roots are imaginary and therefore roots are conjugate to each other. Therefore, one common root means both the roots are common.

$\therefore \quad \dfrac{a}{3} = \dfrac{2b}{8} = \dfrac{3c}{15}$

$\Rightarrow \quad \dfrac{a}{3} = \dfrac{b}{4} = \dfrac{c}{5} = k \qquad$ (say), $k \neq 0$

$\Rightarrow \quad a = 3k, \quad b = 4k, \quad c = 5k$

Now, $\quad a^2 + b^2 = c^2$

$\Rightarrow \Delta ABC$ is right angled.

$\therefore \quad \sin^2 A + \sin^2 B = \sin^2 C$

$\Rightarrow \sin^2 A + \sin^2 B + \sin^2 C = 2\sin^2 C = 2\sin^2 90° = 2$

11. Given, $\quad x - 2 = 2^{2/3} + 2^{1/3}$

On cubing both sides, we get

$(x - 2)^3 = 2^2 + 2 + 3 \times 2^{2/3} \times 2^{1/3}(x - 2) = 6 + 6(x - 2)$

$\Rightarrow \quad x^3 - 6x^2 + 12x - 8 = -6 + 6x$

$\therefore \quad x^3 - 6x^2 + 6x = 2$

12. We are given that $p(-a) = q$ and $p(a) = -a$

[since, when a polynomial $f(x)$ is divided by $x - a$, remainder is $f(a)$].

Let the remainder, when $p(x)$ is divided by $x^2 - a^2$, be $Ax + B$. Then,

$$p(x) = Q(x)(x^2 - a^2) + Ax + B \quad \ldots(i)$$

where $Q(x)$ is the quotient.

Putting $x = a$ and $-a$ in Eq. (i), we get

$$p(a) = 0 + Aa + B \Rightarrow -a = aA + B \quad \ldots(ii)$$

and $$p(-a) = 0 - aA + B \Rightarrow a = -aA + B \quad \ldots(iii)$$

On solving Eqs. (ii) and (iii), we get

$$B = 0 \text{ and } A = -1$$

Hence, the required remainder is $-x$.

13. On multiplying the given equation by c/a^3, we get

$$\frac{b^2c^2}{a^3}x^2 - \frac{b^2c}{a^2}x + c = 0$$

$$\Rightarrow \quad a\left(\frac{bc}{a^2}x\right)^2 - b\left(\frac{bc}{a^2}\right)x + c = 0$$

$$\Rightarrow \quad \frac{bc}{a^2}x = \alpha, \beta$$

$$\Rightarrow \quad (\alpha + \beta)\alpha\beta x = a, \beta$$

$$\Rightarrow \quad x = \frac{1}{(\alpha + \beta)\alpha}, \frac{1}{(\alpha + \beta)\beta}$$

14. $D = b^2 - 4a < 0 \Rightarrow a > 0$

Therefore, the graph is concave upwards.

$$f(x) > 0, \forall x \in R$$

$$\Rightarrow \quad f(-1) > 0 \Rightarrow a + b + 1 > 0$$

15. $x^2 - (a - 3)x + a = 0$

Now, $$D = (a - 3)^2 - 4a$$
$$= a^2 - 10a + 9 = (a - 1)(a - 9)$$

Case I Both the roots are greater than 2.

$$D \geq 0, f(2) > 0, -\frac{B}{2A} > 2$$

$$\Rightarrow \quad (a - 1)(a - 9) \geq 0; 4 - (a - 3)2 + a > 0; \frac{a - 3}{2} > 2$$

$$\Rightarrow \quad a \in (-\infty, 1] \cup [9, \infty); a < 10, a > 7$$

$$\Rightarrow \quad a \geq [9, 10] \quad \ldots(i)$$

Case II One root is greater than 2 and the other root is less than or equal to 2. Hence,

$$f(2) \leq 0$$

$$\Rightarrow \quad 4 - (a - 3)2 + a \leq 0$$

$$\Rightarrow \quad a \geq 10 \quad \ldots(ii)$$

From Eqs. (i) and (ii),

$$a \in [9, 10) \cup [10, \infty)$$

$$\Rightarrow \quad a \in [9, \infty)$$

16. The given equation is

$$x^2 - 2mx + m^2 - 1 = 0$$

$$\Rightarrow \quad (x - m)^2 - 1 = 0$$

$$\Rightarrow \quad (x - m + 1)(x - m - 1) = 0$$

$$\Rightarrow \quad x = m - 1, m + 1$$

From given condition,

$m - 1 > -2$ and $m + 1 < 4$

$$\Rightarrow \quad m > -1 \text{ and } m > 3$$

Hence, $$-1 < m < 3$$

17. Note that coefficient of x^2 is $(4p - p^2 - 5) < 0$. Therefore, the graph is concave downward. According to the question, 1 must lie between the roots. Hence,

$f(1) > 0$

$$\Rightarrow \quad 4p - p^2 - 5 - 2p + 1 + 3p > 0$$

$$\Rightarrow \quad -p^2 + 5p - 4 > 0$$

$$\Rightarrow \quad p^2 - 5p + 4 < 0$$

$$\Rightarrow \quad (p - 4)(p - 1) < 0$$

$$\Rightarrow \quad 1 < p < 4$$

$$\Rightarrow \quad p \in \{2, 3\}$$

18. Clearly, $f(-1) > 0$, $f(2) < 0$. Now,

$$f(0) = -4 < 0$$

$$\Rightarrow \quad f(-1) = 1 - a - 4 > 0$$

and $$f(2) = 4 + 2a - 4 < 0$$

$$\Rightarrow \quad a < -3 \text{ and } a < 0$$

$$\Rightarrow \quad a \in (-\infty, -3)$$

19. $$a = \frac{x^2 + 4}{|x|} - 3 = |x| + \frac{4}{|x|} - 3$$

$$\geq 2\sqrt{|x|\frac{4}{|x|}} - 3 \quad (\because \text{AM} \geq \text{GM})$$

$$= 4 - 3 = 1$$

$$\Rightarrow \quad a \geq 1$$

20. Let r be the common ratio of the GP. Since, $\alpha, \beta, \gamma, \delta$ are in GP, then $\beta = \alpha r, \gamma = \alpha r^2$ and $\delta = \alpha r^3$.

For equation, $$x^2 - x + p = 0$$

$$\therefore \quad \alpha + \beta = 1$$

$$\Rightarrow \quad \alpha + \alpha r = 1$$

$$\Rightarrow \quad \alpha(1 + r) = 1 \quad \ldots(i)$$

and $$\alpha\beta = p \Rightarrow \alpha(\alpha r) = p$$

$$\Rightarrow \quad \alpha^2 r = p \quad \ldots(ii)$$

For equation, $$x^2 - 4x + q = 0$$

$$\gamma + \delta = 4$$

$$\Rightarrow \quad \alpha r^2 + \alpha r^3 = 4$$

$$\Rightarrow \quad \alpha r^2(1 + r) = 4 \quad \ldots(iii)$$

and $\gamma\delta = q \Rightarrow \alpha r^3 \cdot \alpha r^2 = q$

$\Rightarrow \alpha^2 r^5 = q$ ...(iv)

On dividing Eq. (iii) by Eq. (i), we get

$$r^2 = 4 \Rightarrow r = \pm 2$$

If we take $r = 2$, then α is not integral, so we take $r = -2$. On substituting $r = -2$ in Eq. (i), we get

$$\alpha = -1$$

Now, from Eq. (ii), we have

$$p = \alpha^2 r = (-1)^2(-2) = -2$$

and from Eq. (iv), we have

$$q = \alpha^2 r^5 = (-1)^2(-2)^5 = -32$$

$$(p, q) = (-2, -32)$$

21. Since, the roots of equation are real.

$\therefore$ $B^2 - 4AC > 0$

$\Rightarrow$ $a^4 > 4b^2$

Hence, option (a) is correct.

If $f(x) = x^2 + a^2x + b^2$ ($\because$ c lies outside the roots)

$\therefore f(c) > 0$, then $c^2 + a^2c + b^2 > 0$

Hence, option (b) is correct.

Also, (x-coordinate of vertex) $> c$

$\Rightarrow$ $-\dfrac{a^2}{2} > c$

Hence, option (c) is correct.

22. The given equation can be written as

$$\frac{p}{2x} = \frac{(a+b)x + c(b-a)}{x^2 - c^2}$$

$\Rightarrow$ $p(x^2 - c^2) = 2(a+b)x^2 - 2c(a-b)x$

$\Rightarrow$ $(2a + 2b - p)x^2 - 2c(a-b)x + pc^2 = 0$

Now, $c^2(a-b)^2 - pc^2(2a + 2b - p) = 0$ ($\because$ equal roots)

$\Rightarrow$ $(a-b)^2 - 2p(a+b) + p^2 = 0$ ($\because c^2 \neq 0$)

$\Rightarrow$ $[p - (a+b)]^2 = (a+b)^2 - (a-b)^2$

$\Rightarrow$ $p = a + b \pm 2\sqrt{ab} = (\sqrt{a} \pm \sqrt{b})^2$

23. $\because$ $\alpha + \beta = -\dfrac{b}{a}$ and $\alpha\beta = \dfrac{c}{a}$

$$\alpha + h + \beta + h = \frac{-q}{p}$$

and $(\alpha + h)(\beta + h) = \dfrac{r}{p}$

$\therefore$ $-\dfrac{q}{p} = \alpha + \beta + 2h = -\dfrac{b}{a} + 2h$

$\Rightarrow$ $h = \dfrac{1}{2}\left(\dfrac{b}{a} - \dfrac{q}{p}\right)$

Now, $(\alpha - \beta)^2 = (\alpha + \beta)^2 - 4\alpha\beta$

$$= \left(-\frac{b}{a}\right)^2 - \frac{4c}{a} = \frac{b^2 - 4ac}{a^2}$$

Also, $(\alpha - \beta)^2 = [(\alpha + h) - (\beta + h)]^2$

$$= \frac{q^2 - 4pr}{p^2} \Rightarrow \frac{b^2 - 4ac}{a^2} = \frac{q^2 - 4pr}{p^2}$$

Solutions (Q. Nos. 24-26)

$$ax^2 - bx + c = 0$$

Let $f(x) = ax^2 - bx + c$ be the corresponding quadratic expression and α, β be the roots of $f(x) = 0$. Then,

$$f(x) = a(x - \alpha)(x - \beta)$$

Now, $af(1) > 0$, $af(2) > 0$, $1 < -\dfrac{b}{2a} < 2$, $b^2 - 4ac > 0$

$\Rightarrow a(1-\alpha)(1-\beta) > 0$, $a(2-\alpha)(2-\beta) > 0$, $2a < b < 4a$, $b^2 - 4ac > 0$

$\Rightarrow$ $a^2(1-\alpha)(1-\beta)(2-\alpha)(2-\beta) > 0$

$\Rightarrow$ $a^2(\alpha - 1)(2-\alpha)(\beta - 1)(2-\beta) > 0$

As $f(1)$ and $f(2)$ both are integers and $f(1) > 0$ and $f(2) > 0$, so $f(1)f(2) > 0$

$\Rightarrow$ $f(1)f(2) \geq 1$

$\Rightarrow$ $1 \leq a^2(\alpha - 1)(2-\alpha)(\beta - 1)(2-\beta)$

Now, $\dfrac{(\alpha - 1) + (2 - \alpha)}{2} \geq \{(\alpha - 1)(2 - \alpha)\}^{1/2}$

$$(\alpha - 1)(2 - \alpha) \leq \frac{1}{4}$$

Similarly,

$$(\beta - 1)(2 - \beta) \leq \frac{1}{4}$$

$\Rightarrow$ $(\alpha - 1)(2-\alpha)(\beta - 1)(2-\beta) < \dfrac{1}{16}$

24. As $\alpha \neq \beta$, so

$$a^2 > 16 \Rightarrow a \geq 5$$

25. $b^2 > 20c$ and $b > 10$

$\Rightarrow$ $b \geq 11$

Also, $b^2 > 100$

26. $c > 5 \Rightarrow c \geq 6$

27. Let $A = b + c - a$, $B = c + a - b$, $C = a + b - c$

$\therefore$ $A + B + C = 0$

And given equation becomes

$$Ax^2 + Bx + C = 0$$

$\therefore$ $D = B^2 - 4AC$

$= (A + C)^2 - 4AC = (A - C)^2$

$= 4(c - a)^2 =$ perfect square

Hence, roots of

$$(b + c - a)x^2 + (c + a - b)x + (a + b - c) = 0$$

are rationals.

Hence option (a) is correct.

28. Let $f(x) = 4x^2 - 2x + a$

Also, both roots of $f(x) = 0$ lie in the interval $(-1, 1)$.

$\therefore D \geq 0$, $f(-1) > 0$ and $f(1) > 0$.

Now, $D \geq 0$

$\Rightarrow (-2)^2 - 4 \cdot 4 \cdot a \geq 0$

$\Rightarrow a \leq \frac{1}{4}$ ...(i)

and $f(-1) > 0$

$\Rightarrow 4(-1)^2 - 2(-1) + a > 0$

$\Rightarrow a > -6$ ...(ii)

Also, $f(1) > 0 \Rightarrow 4(1)^2 - 2(1) + a > 0$

$\Rightarrow a > -2$ ...(iii)

From Eqs. (i), (ii) and (iii), we get

$$-2 < a \leq \frac{1}{4}$$

29. For real roots, $D \geq 0$

$\Rightarrow (-4)^2 - 4(2\lambda - 1)(2\lambda - 1) \geq 0$

$\Rightarrow (2\lambda - 1)^2 \leq 4$

$\Rightarrow -2 \leq 2\lambda - 1 \leq 2$

$\Rightarrow -\frac{1}{2} \leq \lambda \leq \frac{3}{2}$

$\therefore$ Integral values of λ are 0 and 1.

Hence, greatest integral value of $\lambda = 1$

30. Since, $x = -2$ is a root of $f(x)$.

$\therefore f(x) = (x + 2)(ax + b)$

But $f(0) + f(1) = 0$

$\therefore 2b + 3a + 3b = 0 \Rightarrow -\frac{b}{a} = \frac{3}{5}$

Hence, option (a) is correct.

31. $D = (3)^2 - 4 \cdot 2 \cdot 4 = -23 < 0$

$\therefore$ Roots of $2x^2 + 3x + 4 = 0$ are imaginary.

Now, $\because 2, 3, 4 \in R$.

$\therefore$ Roots are conjugate to each other.

$\because$ One root is common in $ax^2 + bx + c = 0$ and $2x^2 + 3x + 4 = 0$ (given), then other roots is also common.

$\because$ Roots are conjugate $(a, b, c \in R)$.

Hence, both equation are identical

$\therefore a : b : c = 2 : 3 : 4$

32. $a^2 + bx + c = 0$ has two complex conjugate roots only, if all the coefficients are real. If all the coefficients are not real, then it is not necessary that both the roots are imaginary. Hence, statement I is true.

Now, equation $x^2 - 3x + 4 = 0$ has two complex conjugate roots. If $ax^2 + bx + c = 0$ has all coefficients real, then there will be two common roots. But if there is only one root common, then atleast one of a, b, c must be non-real.

Thus, both the statements are true and statement II is correct explanation of statement I.

33. $ix^2 + (i - 1)x - \frac{1}{2} - i = 0$

$$\Rightarrow x = \frac{-(i-1) \pm \sqrt{(i-1)^2 - 4(i)\left(-\frac{i}{2} - i\right)}}{2i}$$

$$= \frac{-(i-1) \pm \sqrt{-4}}{2i}$$

Thus, roots are imaginary. Also, we have $b^2 - 4ac = -4 < 0$ but this is not the correct reason for which roots are imaginary as coefficients of the equation are imaginary.

Hence, both the statements are correct but statement II is not correct explanation of statement I.

34. Here, $f(x)$ is a downward parabola.

$$D = (a + 1)^2 + 20 > 0$$

From the graph, clearly statement I is true but statement II is false.

35. Given equation are

$x^2 + 2x + 3 = 0$ ...(i)

and $ax^2 + bx + c = 0$ ...(ii)

Since, Eq. (i) has imaginary roots.

So, Eq. (ii) will also have both roots same as Eq.(i).

Thus, $\frac{a}{1} = \frac{b}{2} = \frac{c}{3}$

Hence, $a : b : c$ is $1 : 2 : 3$.

36. Let $z = x + iy$, given $\text{Re}(z) = 1$

$\therefore x = 1 \Rightarrow z = 1 + iy$

Since, the complex roots are conjugate to each other.

$\therefore z = 1 + iy$ and $1 - iy$ are two roots of $z^2 + \alpha z + \beta = 0$.

$\because$ Product of roots $= \beta$

$\Rightarrow (1 + iy)(1 - iy) = \beta$

$\therefore \beta = 1 + y^2 \geq 1 \Rightarrow \beta \in [1, \infty)$

37. Since, α and β are roots of the equation $x^2 - x + 1 = 0$.

$\Rightarrow \alpha + \beta = 1, \alpha\beta = 1 \Rightarrow x = \frac{1 \pm \sqrt{3}i}{2}$

$\Rightarrow x = \frac{1 + \sqrt{3}i}{2}$ or $\frac{1 - \sqrt{3}i}{2}$

$\Rightarrow x = -\omega$ or $-\omega^2$

Thus, $\alpha = -\omega^2$, then $\beta = -\omega$

$\Rightarrow$ $\alpha = -\omega$, then $\beta = -\omega^2$ (where, $\omega^3 = 1$)

Hence, $\alpha^{2009} + \beta^{2009} = (-\omega)^{2009} + (-\omega^2)^{2009}$

$= -[(\omega^3)^{669} \cdot \omega^2 + (\omega^3)^{1339} \cdot \omega]$

$= -(\omega^2 + \omega) = -(-1) = 1$

38. Given, $bx^2 + cx + a = 0$ has imaginary roots.

$\therefore$ $c^2 - 4ab < 0$

$\Rightarrow$ $c^2 < 4ab$

$\Rightarrow$ $-c^2 > -4ab$ ...(i)

Let $f(x) = 3b^2x^2 + 6bcx + 2c^2$

Here, $3b^2 > 0$

So, the given expression has a minimum value.

$\therefore$ Minimum value $= \dfrac{-D}{4a}$

$= \dfrac{4AC - B^2}{4A}$

$= \dfrac{4(3b^2)(2c^2) - 36b^2c^2}{4(3b^2)}$

$= -\dfrac{12b^2c^2}{12b^2} = -c^2 > -4ab$ [from Eq. (i)]

39. Let the roots of $x^2 - 6x + a = 0$ be $\alpha, 4\beta$ and that of $x^2 - cx + 6 = 0$ be α and 3β.

$\therefore \alpha + 4\beta = 6$ and $4\alpha\beta = a$ and $\alpha + 3\beta = c$ and $3\alpha\beta = 6$

$\Rightarrow$ $\dfrac{a}{6} = \dfrac{4}{3} \Rightarrow a = 8$

$\therefore$ $x^2 - 6x + 8 = 0$

$\Rightarrow$ $(x - 4)(x - 2) = 0 \Rightarrow x = 2, 4$

and $x^2 - cx + 6 = 0$

$\Rightarrow$ $2^2 - 2c + 6 = 0$

$\Rightarrow$ $c = 5$

$\therefore$ $x^2 - 5x + 6 = 0$

$\Rightarrow$ $x = 2, 3$

Hence, common root is 2.

40. Since, $\alpha + \beta = -a$ and $\alpha\beta = 1$

Now, $|\alpha - \beta| = \sqrt{(\alpha + \beta)^2 - 4\alpha\beta} = \sqrt{a^2 - 4}$

Thus, $\sqrt{a^2 - 4} < \sqrt{5}$

$\Rightarrow$ $a^2 < 9$

$\Rightarrow$ $|a| < 3$

41. Here, $\tan 30° + \tan 15° = -p$

and $\tan 30° \tan 15° = q$

Now, $2 + q - p = 2 + \tan 30° \tan 15° + (\tan 30° + \tan 15°)$

$= 2 + \tan 30° \tan 15° + 1 - \tan 30° \tan 15° = 3$

42. Since, both roots of equation $x^2 - 2mx + m^2 - 1 = 0$ are greater than -2 but less than 4.

$\therefore$ $D \geq 0$, $-2 < -\dfrac{b}{2a} < 4$, $f(4) > 0$ and $f(-2) > 0$

Now, $D \geq 0$

$\Rightarrow$ $4m^2 - 4(m^2 - 1) \geq 0$

$\Rightarrow$ $4 > 0, \forall m \in R$ ...(i)

$-2 < -\dfrac{b}{2a} < 4$

$\Rightarrow$ $-2 < \left(\dfrac{2m}{2 \cdot 1}\right) < 4$

$\Rightarrow$ $-2 < m < 4$ ...(ii)

$f(4) > 0$

$\Rightarrow$ $m^2 - 8m + 15 > 0$

$\Rightarrow$ $(m - 3)(m - 5) > 0$

$\Rightarrow$ $-\infty < m < 3$ and $5 < m < \infty$ ...(iii)

and $f(-2) > 0$

$\Rightarrow$ $m^2 + 4m + 3 > 0$

$\Rightarrow$ $(m + 3)(m + 1) > 0$

$\Rightarrow$ $-\infty < m < -3$ and $-1 < m < \infty$ ...(iv)

From Eqs. (i), (ii), (iii) and (iv), we get m lies between -1 and 3.

43. Given that, $(x - 1)^3 + 8 = 0 \Rightarrow (x - 1)^3 = (-2)^3$

$\Rightarrow$ $\left(\dfrac{x - 1}{-2}\right)^3 = 1$

$\Rightarrow$ $\left(\dfrac{x - 1}{-2}\right) = (1)^{1/3}$

$\therefore$ Cube roots of $\left(\dfrac{x - 1}{-2}\right)$ are 1, ω and ω^2.

$\Rightarrow$ Cube roots of $(x - 1)$ are -2, -2ω and $-2\omega^2$.

$\Rightarrow$ Cube roots of x are $-1, 1 - 2\omega$ and $1 - 2\omega^2$.

44. Let α and β be the roots of equation

$x^2 - (a - 2)x - a - 1 = 0$, then

$\alpha + \beta = a - 2$ and $\alpha\beta = -a - 1$

Now, $\alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$

$\Rightarrow$ $\alpha^2 + \beta^2 = (a - 2)^2 + 2(a + 1)$

$\Rightarrow$ $\alpha^2 + \beta^2 = a^2 - 2a + 6$

$\Rightarrow$ $\alpha^2 + \beta^2 = (a - 1)^2 + 5$

The value of $\alpha^2 + \beta^2$ will be least, if $a - 1 = 0$.

$\Rightarrow$ $a = 1$

45. Let n and $(n + 1)$ be the two consecutive roots of $x^2 - bx + c = 0$. Then, $n + (n + 1) = b$ and $n(n + 1) = c$

$\therefore$ $b^2 - 4c = (2n + 1)^2 - 4n(n + 1)$

$= 4n^2 + 4n + 1 - 4n^2 - 4n = 1$

46. Let $f(x) = x^2 - 2kx + k^2 + k - 5$

Since, both roots are less than 5. Then, $D \geq 0$,

$$-\frac{b}{2a} < 5 \quad \text{and} \quad f(5) > 0$$

Now, $D = 4k^2 - 4(k^2 + k - 5)$

$= -4k + 20 \geq 0$

$\Rightarrow \quad k \leq 5 \quad$ ...(i)

$\Rightarrow \quad -\frac{b}{2a} < 5 \Rightarrow k < 5 \quad$ ...(ii)

and $\quad f(5) > 0$

$\Rightarrow \quad 25 - 10k + k^2 + k - 5 > 0$

$\Rightarrow \quad k^2 - 9k + 20 > 0$

$\Rightarrow \quad (k-5)(k-4) > 0$

$\Rightarrow \quad k < 4$ and $k > 5 \quad$ ...(iii)

From Eqs. (i), (ii) and (iii), we get

$$k < 4$$

47. Let $\quad f(x) = a_n x^n + a_{n-1} x^{n-1} + \ldots + a_1 x = 0 \quad$ ...(i)

$f(0) = 0$ and $f(\alpha) = 0$

$\therefore$ According to the Rolle's theorem

$$f'(x) = 0$$

has atleast one root between $(0, \alpha)$.

$\Rightarrow f'(x) = 0$ has a positive root less than α.

48. Since, $(1-p)$ is a root of quadratic equation

$$x^2 + px + (1-p) = 0 \quad \text{...(i)}$$

So, $(1-p)$ satisfied the above equation.

$\therefore \quad (1-p)^2 + p(1-p) + (1-p) = 0$

$\Rightarrow \quad (1-p)[1 - p + p + 1] = 0$

$\Rightarrow \quad (1-p)2 = 0$

$\Rightarrow \quad p = 1$

Then, from Eq. (i), we get

$$x^2 + x = 0$$

$\Rightarrow \quad x(x+1) = 0$

$\Rightarrow \quad x = 0, -1$

49. Since, one of the roots of equation $x^2 + px + 12 = 0$ is 4.

$\therefore \quad 16 + 4p + 12 = 0$

$\Rightarrow \quad 4p = -28$

$\Rightarrow \quad p = -7$

So, the other equation is $x^2 - 7x + q = 0$ whose roots are equal. Let the roots are α and α.

$\therefore \quad$ Sum of roots $= \alpha + \alpha = \frac{7}{1} \Rightarrow \alpha = \frac{7}{2}$

and product of roots $= \alpha \cdot \alpha = q$

$\Rightarrow \quad \left(\frac{7}{2}\right)^2 = q \Rightarrow q = \frac{49}{4}$

50. Let α and β be two numbers whose arithmetic mean is 9 and geometric mean is 4.

$\therefore \quad \alpha + \beta = 18$

and $\quad \alpha\beta = 16$

$\therefore$ Required equation is

$x^2 - (\alpha + \beta)x + (\alpha\beta) = 0$

$\Rightarrow \quad x^2 - 18x + 16 = 0$

51. **Hint** $\quad \alpha + \beta = -\frac{b}{a}$ and $\alpha\beta = \frac{c}{a}$

Also given, $\alpha + \beta = \frac{1}{\alpha^2} + \frac{1}{\beta^2} = \frac{\alpha^2 + \beta^2}{\alpha^2\beta^2}$

$\Rightarrow \quad \alpha + \beta = \left(\frac{\alpha + \beta}{\alpha\beta}\right)^2 - \frac{2}{\alpha\beta}$

$\Rightarrow \quad \left(-\frac{b}{a}\right) = \left(\frac{-b/a}{c/a}\right)^2 - \frac{2}{c/a}$

52. Given equation is $x^2 - 3|x| + 2 = 0$

***Case* I** When $x > 0$, then $|x| = x$

$\therefore \quad x^2 - 3x + 2 = 0 \Rightarrow (x-1)(x-2) = 0$

$\Rightarrow \quad x = 1, 2$

***Case* II** When $x < 0$, then $|x| = -x$

$\therefore \quad x^2 + 3x + 2 = 0 \Rightarrow (x+1)(x+2) = 0$

$\Rightarrow \quad x = -1, -2$

Hence, four solutions are possible.

53. **Hint** Since, one root of the quadratic equation $(a^2 - 5a + 3)x^2 + (3a - 1)x + 2 = 0$ is twice as large as the other, then let their roots be α and 2α.

$\therefore \quad \alpha + 2\alpha = -\frac{(3a-1)}{(a^2 - 5a + 3)} \Rightarrow 3\alpha = -\frac{(3a-1)}{(a^2 - 5a + 3)}$

and $\quad \alpha \cdot 2\alpha = \frac{2}{(a^2 - 5a + 3)} \Rightarrow 2\alpha^2 = \frac{2}{(a^2 - 5a + 3)}$

54. Since, $\quad \alpha^2 = 5\alpha - 3$

$\Rightarrow \quad \alpha^2 - 5\alpha + 3 = 0$

and $\quad \beta^2 = 5\beta - 3$

$\Rightarrow \quad \beta^2 - 5\beta + 3 = 0$

These two equations shows that α and β are the roots of the equation

$$x^2 - 5x + 3 = 0$$

$\therefore \quad \alpha + \beta = 5$ and $\alpha\beta = 3$

Now, $\quad \frac{\alpha}{\beta} + \frac{\beta}{\alpha} = \frac{\alpha^2 + \beta^2}{\alpha\beta} = \frac{(\alpha + \beta)^2 - 2\alpha\beta}{\alpha\beta}$

$= \frac{25 - 6}{3} = \frac{19}{3}$ and $\frac{\alpha}{\beta} \cdot \frac{\beta}{\alpha} = 1$

$\therefore$ Required equation is

$$x^2 - \left(\frac{\alpha}{\beta} + \frac{\beta}{\alpha}\right)x + \frac{\alpha}{\beta} \cdot \frac{\beta}{\alpha} = 0$$

$\Rightarrow \quad x^2 - \frac{19}{3}x + 1 = 0$

$\Rightarrow \quad 3x^2 - 19x + 3 = 0$

6 Permutations and Combinations

JEE Main MILESTONE

- Fundamental Principles of Counting
- Factorial Notation
- Exponent of Prime p in $n!$
- Permutation
- Circular Permutation
- Combination
- Division of Objects into Groups
- Applications of Permutation and Combination
- Number of Divisors
- Dearrangements
- Number of Integral Solution of Linear Equations

6.1 Fundamental Principles of Counting [FPC]

The basis of all the techniques given in this chapter are based on two fundamental principles of counting namely addition and multiplication principles. Using these principles formulae for number of ways of arrangements and selections of different objects are derived.

(i) Fundamental Principle of Multiplication

If an operation can be performed in m different ways, following which a second operation can be performed in n different ways, then the two operations in succession can be performed in $m \times n$ ways. This can be extended to any finite number of operations.

e.g., A hall has 12 gates. After entering into the hall the man come out through a different gate in 11 ways.

Hence, by the fundamental principle of multiplication, the total number of ways of man come out through different gates $= 12 \times 11 = 132$.

(ii) Fundamental Principle of Addition

If an operation can be performed in m different ways and another operation, which is independent of the first operation can be performed in n different ways. Then, either of the two operations can be performed in $(m + n)$ ways. This can be extended to any finite number of mutually exclusive operations.

e.g., There are 25 students in a class in which 15 boys and 10 girls. The class teacher select either a boy or a girl for monitor of the class. Since, there are 15 ways to select a boy and there are 10 ways to select a girl. Hence, by the fundamental principle of addition, the number of ways in which either a boy or a girl can be chosen as a monitor $= 10 + 15 = 25$ ways.

***Sample* Problem 1** *How many 3-digits even numbers can be formed from the digits 1, 2, 3, 4, 5, 6, if the digits can be repeated?* **[NCERT]**

(a) 108 (b) 107
(c) 110 (d) *None of these*

Interpret (a) Even digits = 2, 4, 6

$\therefore$ Number of ways to fill the unit place = 3,
Number of ways to fill the ten place = 6,
Number of ways to fill the hundred place = 6

H	T	U

Hence, by FPC total number of ways $= 3 \times 6 \times 6 = 108$

6.2 Factorial Notation

The product of first n natural numbers is denoted by $n!$ and read as 'factorial n'.

Thus, $n! = n(n-1)(n-2)\ldots 3 \cdot 2 \cdot 1$

e.g., $5! = 5 \times 4 \times 3 \times 2 \times 1 = 120$

and $4! = 4 \times 3! = 4 \times 3 \times 2!$
$= 4 \times 3 \times 2 \times 1 = 24$

Properties of Factorial Notation

(i) $0! = 1! = 1$

(ii) Factorials of negative integers and fractions are not defined.

(iii) $n! = n(n-1)! = n(n-1)(n-2)!$

(iv) $\frac{n!}{r!} = n(n-1)(n-2)\ldots(r+1)$

***Sample* Problem 2** *The units and ten's place digits in* $1! + 2! + 3! + \ldots + 49!$ *are respectively*

(a) 1, 3 (b) 3, 1
(c) 1, 1 (d) *None of these*

Interpret (b) We know that, $n!$ is divisible by 100 for $n \geq 10$ and $1! + 2! + 3! + \ldots + 9! = 409113$

$\therefore$ $1! + 2! + 3! + \ldots + 49! = 409113 +$ a multiple of 100

Hence, one's and ten's digit in $1! + 2! + 3! + \ldots + 49!$ are 3 and 1, respectively.

6.3 Exponent of Prime p in n!

Let n be a positive integer and p be a prime number. Then, last integer amongst $1, 2, 3, \ldots, (n-1), n$ which is divisible by p is $\left[\frac{n}{p}\right]p$, where $\left[\frac{n}{p}\right]$ denotes the greatest integer less than or equal to $\frac{n}{p}$.

e.g., $\left[\frac{12}{5}\right] = 2, \left[\frac{15}{5}\right] = 3$ etc.

Let $E_p(n!)$ denotes the exponent of prime p in $n!$, then

$$E_p(n!) = \left[\frac{n}{p}\right] + \left[\frac{n}{p^2}\right] + \ldots + \left[\frac{n}{p^a}\right]$$

where a is a greatest positive integer such that $p^a \leq n \leq p^{a+1}$.

***Sample* Problem 3** *Let*

$E = \left[\frac{1}{3} + \frac{1}{50}\right] + \left[\frac{1}{3} + \frac{2}{50}\right] + \left[\frac{1}{3} + \frac{3}{50}\right] + \ldots +$ *upto* 50 *terms, then the exponent of 2 in* $E!$ *is*

(a) 17 (b) 25
(c) 15 (d) *None of these*

Interpret (c) Let $E = \left[\frac{1}{3} + \frac{x}{50}\right]$

where, $x = 1, 2, \ldots, 50$

For $1 \leq x \leq 33, \frac{1}{3} < \frac{1}{3} + \frac{x}{50} < 1$

$\therefore$ $\left[\frac{1}{3} + \frac{x}{50}\right] = 0$, for $1 \leq x \leq 33$

For $34 \leq x \leq 50$, $1 < \frac{1}{3} + \frac{x}{50} < \frac{4}{3}$

$\Rightarrow$ $\left[\frac{1}{3} + \frac{x}{50}\right] = 1$, for $34 \leq x \leq 50$

Thus, $E = 17$

and $p = 2$

$\because$ $2^4 < 17 < 2^5$

$\therefore$ $a = 4$

Exponent of 2 in $(17)!$

$$= \left[\frac{17}{2}\right] + \left[\frac{17}{4}\right] + \left[\frac{17}{8}\right] + \left[\frac{17}{16}\right] = 8 + 4 + 2 + 1 = 15$$

6.4 Permutation

Each of different arrangements which can be made by taking some or all of a number of things is called a permutation.

e.g., Arrangements of objects taking 2 at a time from given 3 objects (a, b, c) are ab, bc, ca, cb, ac, ba, then total number of arrangements is 6 each of which is known as permutation.

Meaning of ^nP_r

Number of permutations of n distinct objects taking r at a time is denoted by ^nP_r.

$$^nP_r = \frac{n!}{(n-r)!}, \forall 0 \leq r \leq n$$
$$= n(n-1)(n-2)\ldots(n-r+1), \forall n \in N \text{ and } r \in W.$$

Properties of ^nP_r

(i) The number of permutations of n distinct object taken all at a time is $^nP_n = n!$.

(ii) $^nP_0 = 1$, $^nP_1 = n$ and $^nP_{n-1} = n!$

(iii) $^nP_r = n \cdot {}^{n-1}P_{r-1} = r \cdot {}^{n-1}P_{r-1} + {}^{n-1}P_r$

(iv) $^{n-1}P_r = (n-r)\,{}^{n-1}P_{r-1}$

Important Results on Permutations

(i) The number of permutations of n things taken all at a time p are alike of one kind, q are alike of second kind, r are alike of third kind and remaining are distinct, is $\frac{n!}{p!\,q!\,r!}$.

(ii) The number of permutations of n different things, taken r at a time when each thing may be repeated any number of times is n^r.

(iii) **Number of permutations under certain conditions**

(a) Number of permutations of n different things taken r at a time when a particular thing is to be always included in each arrangement is $r \cdot {}^{n-1}P_{r-1}$.

(b) Number of permutations of n different things taken r at a time, when a particular thing is never taken in each arrangement is $^{n-1}P_r$.

(c) Number of permutations of n different things taken all at a time, when m specified things always come together is $m! \times (n-m+1)!$

(d) Number of permutations of n different things, taken all at a time, when m specified things never come together is $n! - m! \times (n-m+1)!$

(e) Number of permutations of n different things, taken r at a time when p particular things are to be always included in each arrangement is $p!\{r-(p-1)\}\,{}^{n-p}P_{r-p}$.

Hot Spot 1 Arrangement Types Problems

Arrangement types of problems usually have alphabate letters or digits, you are asked to find the words or numbers that can be formed under the conditions given in the question. These types of problems are directly or indirectly asked in various years of AIEEE (JEE Main) 2008, 2005, 2004, 2003. To solve such types of problems, following steps are given below.

Step I Firstly, separate the identical and distinct objects.

Step II Use the properties or results, if require.

Step III Use the formula $^nP_r = \frac{n!}{(n-r)!}$ and simplify it to get the result.

***Sample* Problem 4** *How many numbers of 4-digits can be formed by using the digits 1, 2, 3, 4, 5, 6, 7, if atleast one digit is repeated?*

(a) 1562 (b) 1560
(c) 1561 (d) *None of these*

Interpret (c) **Step I** Separate the identical and different objects. Here, all objects are distinct.

Step II Use the properties or result.

When all digits are repeated, then number of ways $= 7^4$.

Step III Use the formula.

$\therefore$ Required number of ways $= 7^4 - {}^7P_4 = 2401 - 840 = 1561$

***Sample* Problem 5** *Find n, if* $^{n-1}P_3 : {}^nP_4 = 1:9$. [NCERT]

(a) 9 (b) 8 (c) 7 (d) 5

Interpret (a) Given, $^{n-1}P_3 : {}^nP_4 = 1:9$

$$\therefore \quad \frac{(n-1)!}{(n-1-3)!} : \frac{n!}{(n-4)!} = 1:9$$

$$\Rightarrow \quad \frac{(n-1)!}{(n-4)!} : \frac{n(n-1)!}{(n-4)!} = 1:9$$

$$\Rightarrow \quad \frac{(n-1)!}{(n-4)!} \times \frac{(n-4)!}{n(n-1)!} = \frac{1}{9}$$

$$\Rightarrow \quad \frac{1}{n} = \frac{1}{9}$$

$$\Rightarrow \quad n = 9$$

***Sample* Problem 6** *In how many of the distinct permutations of the letters in the 'MISSISSIPPI' do the four I's not come together ?* [NCERT]

(a) 35810 (b) 33810
(c) 33820 (d) *None of these*

Interpret (b) The word MISSISSIPPI has 11 letters in which

M $\rightarrow$ 1 time
I $\rightarrow$ 4 times
S $\rightarrow$ 4 times
P $\rightarrow$ 2 times

The number of permutations of the word 'MISSISSIPPI' in which 4 I's and 4 S's are alike

$$= \frac{11!}{4!\,4!\,2!} \quad \ldots(i)$$

If all the I's are together, then it will be considered as one letter and remaining 7 letters and 1 I's letter (including 4 I's) will be considered as 8 letters. So, the number of permutations is $\frac{8!}{4!\,2!}$.

Hence, total number of arrangements $= \frac{11!}{4!\,4!\,2!} - \frac{8!}{4!\,2!}$

$$= \frac{11 \times 10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4!}{4! \times 4 \times 3 \times 2 \times 1 \times 2 \times 1} - \frac{8 \times 7 \times 6 \times 5 \times 4!}{4! \times 2 \times 1}$$

$$= 34650 - 840 = 33810$$

***Sample* Problem 7** *If the different permutations of all the letters of the word 'EXAMINATION' are listed as in a dictionary, how many words are there in this list before the first word starting with E?* [**NCERT**]

(a) 908300 *ways* (b) 907200 *ways*
(c) 907300 *ways* (d) *None of these*

Interpret (*b*) The letters of given word are A, A, E, I, I, M, N, N, O, T, X *i.e.*, word starting with A are formed with the letters 2I's, 2N's, A, E, X, M, T, O (total 10 letters).

Hence, number of words formed by these letters

$$= \frac{10!}{2!\,2!} = \frac{10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}{2 \times 1 \times 2 \times 1}$$

$$= \frac{10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}{4}$$

$$= 10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 3 \times 2 \times 1 = 907200 \text{ ways}$$

6.5 Circular Permutation

If objects are arranged along a closed curve, then permutation is known as circular permutation.

In other words, the permutation in a row has a beginnings and end but there is no beginning and end in circular permutation. So, we need to consider one object is fixed and the remaining objects are arranged in $(n-1)!$ ways.

e.g., Consider five persons A, B, C, D and E to be seated on the circumference of a circular table in order (which has no head). Now, shifting A, B, C, D and E one position in anti-clockwise direction, we will get arrangements as follows

we see that arrangements in all figures are same.

$\therefore$ The number of circular permutations of n different things taken all at a time is $\frac{{}^nP_n}{n} = (n-1)!$, if clockwise and anti-clockwise orders are taken as different.

Note In a circular permutation, if the position are given by number, then it is treated as a linear arrangement.

Important Results on Circular Permutation

(i) Number of circular permutations of n different things taken all at a time $= (n-1)!$. If clockwise and anti-clockwise orders are taken as different.

(ii) The number of circular permutations of n different things taken all at a time $= \frac{1}{2}(n-1)!$. If clockwise and anti-clockwise orders are taken as not different.

***Sample* Problem 8** *Three boys and three girls are to be seated around a round table, in a circle. Among them the boy X does not want any girl neighbour and the girl Y does not want any boy neighbour, then the number of such arrangements is*

(a) 2 (b) 4
(c) 2^3 (d) *None of these*

Interpret (*b*) As shown in figure 1, 2 and *X* are the three boys and 3, 4 and *Y* are three girls. Boy *X* will have neighbours as boys 1 and 2 and the girl *Y* will have neighbours as girls 3 and 4.

Number of ways in which 1 and 2 can be arranged $= {}^2P_2 = 2! = 2$

Also, number of ways in which 3 and 4 can be arranged $= {}^2P_2$
$= 2! = 2$

Hence, required number of permutations $= 2 \times 2 = 4$.

Check Point 1

1. If ${}^{2n+1}P_{n-1} : {}^{2n-1}P_n = 3:5$, then the value of n is equal to
   (a) 4 (b) 3 (c) 2 (d) 1
2. Seven different lecturers are to deliver lectures in seven periods of a class on a particular day. A, B and C are three of the lecturers. The number of ways in which a routine for the day can be made such that A delivers his lecture before B and B before C, is
   (a) 420 (b) 120 (c) 210 (d) 840
3. A letter lock contains 5 rings each marked with for different letters. The number of all possible unsuccessful attempts to open the lock is
   (a) 625 (b) 1024 (c) 624 (d) 1023
4. The number of ways in which four particular persons A, B, C, D and six more persons can stand in a queue so that A always stands before B, B before C and C before D, is
   (a) 7! 4! (b) 10! – 7! 4!
   (c) $\frac{10!}{4!}$ (d) None of these
5. The number of ways in which 7 pictures can be hung from 5 picture nails on the wall is
   (a) 7^5 (b) 5^7
   (c) 2520 (d) None of these
6. The letters of the word RACHIT are written in all possible manner and words are written as in dictionary. The rank of word RACHIT is
   (a) 365 (b) 702 (c) 481 (d) 480
7. The number of ways in which 10 different diamonds can be arranged to form a necklace, is
   (a) 181440 (b) 161400
   (c) 261960 (d) None of these
8. How many numbers of 4-digits can be formed by using the digits 1, 2, 3, 4, 5, 6, 7 if atleast one digit is repeated ?
   (a) ${}^7P_4$ (b) 7^4
   (c) $7^4 - {}^7P_4$ (d) None of these
9. If a represents the number of permutations of (x + 2) things taken together, b represents the number of permutation of 11 things taken together out of x things, and c represents the number of permutation of (x – 11) things taken together so that a = 182bc, then x is equal to
   (a) 15 (b) 12 (c) 10 (d) 18
10. There are 4 parcels and 5 post offices. In how many ways can 4 parcels be got registered?
   (a) 20 (b) 4^5 (c) 5^4 (d) $5^4 - 4^5$

6.6 Combination

Each of the different groups or selections which can be made by some or all of a number of given things without reference to the order of the things in each group is called a combination.

e.g., The groups made by taking 2 objects at a time from three objects (a, b, c) are ab, bc, ca. Then, the number of groups is 3 each of which is known as combination.

Note In permutation order of objects is important whereas in combination order of objects is not important.

Meaning of ${}^nC_r$

The number of combinations of n different things taken r at a time is denoted by ${}^nC_r$ or $C(n, r)$ or $\binom{n}{r}$.

Then, $${}^nC_r = \frac{n!}{r!\,(n-r)!} = \frac{{}^nP_r}{r!} \qquad (0 \le r \le n)$$

$$= \frac{n\,(n-1)\,(n-2)\ldots(n-r+1)}{r\,(r-1)\,(r-2)\ldots 2\cdot 1}$$

$$n \in N \text{ and } r \in W$$

If $r > n$, then ${}^nC_r = 0$

Properties of ${}^nC_r$

(a) ${}^nC_r$ is a natural number.

(b) ${}^nC_0 = {}^nC_n = 1$, ${}^nC_1 = n$

(c) ${}^nC_r = {}^nC_{n-r}$

(d) ${}^nC_r + {}^nC_{r-1} = {}^{n+1}C_r$

(e) ${}^nC_x = {}^nC_y$

$\Leftrightarrow \quad x = y$

or $\quad x + y = n$

(f) $n \cdot {}^{n-1}C_{r-1} = (n - r + 1)\,{}^nC_{r-1}$

(g) If n is even, then the greatest value of ${}^nC_r$ is ${}^nC_{n/2}$.

(h) If n is odd, then the greatest value of ${}^nC_r$ is ${}^nC_{\frac{n+1}{2}}$

or $\quad {}^nC_{\frac{n-1}{2}}$.

(i) ${}^nC_r = \frac{n}{r} \cdot {}^{n-1}C_{r-1}$

(j) $\frac{{}^nC_r}{{}^nC_{r-1}} = \frac{n-r+1}{r}$

(k) ${}^nC_0 + {}^nC_1 + {}^nC_2 + \ldots + {}^nC_n = 2^n$

(l) ${}^nC_0 + {}^nC_2 + {}^nC_4 + \ldots = {}^nC_1 + {}^nC_3 + {}^nC_5 + \ldots = 2^{n-1}$

(m) ${}^{2n+1}C_0 + {}^{2n+1}C_1 + {}^{2n+1}C_2 + \ldots + {}^{2n+1}C_n = 2^{2n}$

(n) ${}^nC_n + {}^{n+1}C_n + {}^{n+2}C_n + \ldots + {}^{2n-1}C_n = {}^{2n}C_{n+1}$

Important Results on Combinations

(i) The number of combinations of n different things, taken r at a time, where p particular things occur is ${}^{n-p}C_{r-p}$.

(ii) The number of combinations of n different things, taken r at a time, where p particular things never occur is ${}^{n-p}C_r$.

(iii) The total number of combinations of n different things taken one or more at a time or the number of ways of n different things selecting atleast one of them is

$$ {}^nC_1 + {}^nC_2 + \ldots + {}^nC_n = 2^n - 1 $$

(iv) The number of combinations of n identical things taking $r\,(r \le n)$ at a time is 1.

(v) The number of ways of selecting r things out of n alike things is $(n+1)$, (where $r = 0, 1, 2, 3, \ldots, n$).

(vi) If out of $(p+q+r)$ things, p are alike of one kind, q are alike of second kind and rest are alike of third kind, then the total number of combinations is

$$ [(p+1)(q+1)(r+1)] - 1 $$

(vii) If out of $(p+q+r+t)$ things, p are alike of one kind, q are alike of second kind, r are alike of third kind and t are different, then the total number of combinations is $(p+1)(q+1)(r+1)2^t - 1$

***Sample* Problem 9** *If ${}^{2n}C_3 : {}^nC_3 = 11:1$, then the value of n is.* **[NCERT]**

(a) 5
(b) 16
(c) 6
(d) 4

Interpret (c) ${}^{2n}C_3 : {}^nC_3 = 11:1$

$$ \therefore \quad \frac{2n(2n-1)(2n-2)}{6} : \frac{n(n-1)(n-2)}{6} = 11:1 $$

$$ \Rightarrow \quad 2n(2n-1)2(n-1) : n(n-1)(n-2) = 11:1 $$

$$ \Rightarrow \quad 2n(2n-1)2(n-1) \times \frac{1}{n(n-1)(n-2)} = \frac{11}{1} $$

$$ \Rightarrow \quad \frac{4(2n-1)}{n-2} = \frac{11}{1} $$

$$ \Rightarrow \quad 8n - 4 = 11n - 22 $$

$$ \Rightarrow \quad 3n = 18 $$

$$ \Rightarrow \quad n = 6 $$

Hot Spot 2

Selection Types Problems

Selection types of problems usually have a group of different persons or objects out of these objects or persons some are related following the conditions given in the questions. These types of problems are directly or indirectly asked in various years of AIEEE (JEE Main) 2013, 2011, 2010, 2008, 2006, 2004, 2003.

To solve such types of problems, following steps are given below.

Step I Use the properties or result, if require.

Step II Use the formula ${}^nC_r = \dfrac{n!}{(n-r)!\,r!}$ and simplify it to get the result.

***Sample* Problem 10** *Find the number of ways of selecting 9 balls from 6 red balls, 5 white balls and 5 blue balls, if each selection consists of 3 balls of each colour.* **[NCERT]**

(a) 2200 (b) 2000 (c) 2050 (d) 2400

Interpret (b) **Step I** Use the properties or results. Since, 3 red balls out of 6 red balls can be selected in ${}^6C_3$ ways, 3 white balls out of 5 white balls can be selected in ${}^5C_3$ ways and 3 blue balls out of 5 blue balls can be selected in ${}^5C_3$ ways.

Total number of ways selecting 9 balls (3 balls of each colour) is

$$ = {}^6C_3 \times {}^5C_3 \times {}^5C_3 $$

$$ = {}^6C_3 \times {}^5C_2 \times {}^5C_2 \qquad (\because {}^nC_r = {}^nC_{n-r}) $$

Step II Use the formulae,

$$ = \frac{6 \times 5 \times 4}{6} \times \frac{5 \times 4}{2} \times \frac{5 \times 4}{2} $$

$$ \left[\because {}^nC_3 = \frac{n(n-1)(n-2)}{6} \text{ and } {}^nC_2 = \frac{n(n-1)}{2} \right] $$

$$ = 20 \times 10 \times 10 = 2000 $$

6.7 Division of Objects into Groups

Objects are Different

(i) The number of ways of dividing n different objects into 3 groups of p, q and r things

$$(p + q + r = n) \text{ is}$$

(a) $\dfrac{n!}{p!\,q!\,r!}$; p, q and r are unequal.

(b) $\dfrac{n!}{p!\,2!\,(q!)^2}$; $q = r$

(c) $\dfrac{n!}{3!\,(p!)^3}$; $p = q = r$

(ii) The number of ways of dividing n different objects into r groups is

$$\frac{1}{r!}\left[r^n - \binom{r}{1}(r-1)^n + \binom{r}{2}(r-2)^n - \binom{r}{3}(r-3)^n + \ldots\right]$$

(iii) The number of ways of dividing n different objects into r groups taking into account the order of the groups and also the order of objects in each group is

$${}^{(n+r-1)}P_n = r\,(r+1)\,(r+2)\ldots(r+n-1).$$

Objects are Identical

(i) The number of ways of dividing n identical objects among r persons such that each gets 1,2,3,... or k objects is the coefficient of x^{n-r} in the expansion of $(1 + x + x^2 + \ldots + x^{k-1})^r$.

(ii) The number of ways of dividing n identical objects among r persons such that each one may get atmost n objects is $\dbinom{n+r-1}{r-1}$,

OR

The total number of ways of dividing n identical objects into r groups, if blank groups are allowed, is ${}^{n+r-1}C_{r-1}$.

(iii) The total number of ways of dividing n identical objects among r persons, each one of whom, receives atleast one item is ${}^{n-1}C_{r-1}$.

OR

The number of ways in which n identical things can be divided into r groups such that blank groups are not allowed, is ${}^{n-1}C_{r-1}$.

Sample **Problem 11** *The number of ways in which 9 identical balls can be placed in three identical boxes is* **[NCERT]**

(a) 55 (b) $\dfrac{9!}{(3!)^4}$

(c) $\dfrac{9!}{(3!)^3}$ (d) 12

Interpret (*d*) $\therefore$ Required number of ways

$$= ({}^3C_1 \times {}^2C_1 \times {}^1C_1) \times 2$$

$$= 3 \times 2 \times 1 \times 2 = 12$$

Arrangement in Groups

(a) The number of ways in which n different things can be arranged into r different groups is ${}^{n+r-1}P_n$ or $n!\,{}^{n-1}C_{r-1}$.

(b) The number of ways in which n different things can be distributed into r different groups is

$$r^n - {}^rC_1(r-1)^n + {}^rC_2(r-2)^n - \ldots + (-1)^{r-1}\cdot{}^rC_{r-1}$$

or coefficient of x^n in $n!\,(e^x - 1)^r$.

Here, blank groups are not allowed.

(c) The number of ways in which n identical things can be distributed into r different groups is ${}^{n+r-1}C_{r-1}$ or ${}^{n-1}C_{r-1}$, according as blank groups are or are not admissible.

6.8 Applications of Permutation and Combination

Functional Applications

(i) The number of all permutations (arrangements) of n different objects taken r at a time,

(a) when a particular object is to be always included in each arrangement is ${}^{n-1}C_{r-1} \times r!$

(b) when a particular object is never taken in each arrangement is ${}^{n-1}C_r \times r!$

(ii) If the sets A has m elements and B has n elements, then

(a) the number of functions from A to B is n^m.

(b) the number of one-one functions from A to B is ${}^nP_m$, $m \le n$.

(c) the number of onto functions from A to B is

$$n^m - \binom{n}{1}(n-1)^m + \binom{n}{2}(n-2)^m - \ldots,\ m \le n.$$

(d) the number of increasing (decreasing) functions from A to B is $\dbinom{n}{m}$, $m \le n$.

(e) the number of non-decreasing (non-increasing) functions from A to B is

$$\binom{m+n-1}{m}, \quad m \le n.$$

(f) the number of bijections from A to B is $n!$, if $m = n$.

(g) the number of bijections from A to A such that $f(x) \ne x, \forall\ x \in A$, is

$$m!\left[\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \ldots + \frac{(-1)^m}{m!}\right].$$

Sample **Problem 12** *Let* $A = \{x_1, x_2, x_3, x_4, x_5\}$, $B = \{y_1, y_2, y_3, y_4, y_5\}$. *Then, the number of one one mappings, from A to B such that* $f(x_i) \neq y_i$, $i = 1, 2, \ldots, 5$ *is* [**NCERT**]

(a) 40 (b) 44 (c) 6 (d) 24

Interpret (b) Here, we use the formula, the number of bijections from A to A such that $f(x) \neq x, \forall\, x \in A$ is

$$m!\left[\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \ldots + \frac{(-1)^m}{m!}\right]$$

Here, $m = 5$

$\therefore$ Required number of ways $= 5!\left(\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!}\right)$

$$= 120\left(\frac{1}{2} - \frac{1}{6} + \frac{1}{24} - \frac{1}{120}\right)$$

$$= 120\left(\frac{60 - 20 + 5 - 1}{120}\right) = 44$$

Geometrical Applications

(i) Out of n non-concurrent and non-parallel straight lines the number of point of intersection are ${}^nC_2$.

(ii) The number of straight lines passing through n points $= {}^nC_2$.

(iii) The number of straight lines passing through n points out of which m are collinear $= {}^nC_2 - {}^mC_2 + 1$.

(iv) In a polygon, the total number of diagonals out of n points (no three points are collinear) $= {}^nC_2 - n = \frac{n(n-3)}{2}$.

(v) Number of triangles formed by joining n points is ${}^nC_3$.

(vi) Number of triangles formed by joining n points out of which m are collinear are ${}^nC_3 - {}^mC_3$.

(vii) The number of parallelogram in two systems of parallel lines (when Ist set contains m parallel lines and 2nd set contains n parallel lines) $= {}^nC_2 \times {}^mC_2$

(viii) The number of rectangles of any size in a square of $n \times n$ is $\sum_{r=1}^{n} r^3$ and number of squares of any size is $\sum_{r=1}^{n} n^2$.

Sample **Problem 13** *The total number of selections of atmost n things with* 10 *points as vertices, n of them being collinear, is* 110. *Then, n is* [**NCERT**]

(a) 13 (b) 4 (c) 5 (d) 6

Interpret (c) Out of 10 points, let n points be collinear. Then, number of triangles are ${}^{10}C_3 - {}^nC_3 = 110$

$$\therefore \quad \frac{10 \times 9 \times 8}{3 \times 2} - \frac{n(n-1)(n-2)}{3 \times 2} = 110$$

$$\Rightarrow \quad 720 - 660 = n(n-1)(n-2)$$

$$\Rightarrow \quad n(n-1)(n-2) = 60$$

$$\Rightarrow \quad n(n-1)(n-2) = 5 \times 4 \times 3$$

$$\Rightarrow \quad n = 5$$

Sample **Problem 14** *In a polygon the number of diagonals is* 54. *The number of sides of the polygon is*

(a) 10 (b) 12

(c) 9 (d) *None of these*

Interpret (b) Let number of sides of polygon is n. Since, number of sides of polygon is equal to number of vertices of polygon.

$\because$ Number of diagonals of polygon $= 54$

$$\therefore \quad {}^nC_2 - n = 54$$

$$\Rightarrow \quad \frac{n(n-1)}{2} - n = 54$$

$$\Rightarrow \quad n^2 - 3n = 108$$

$$\Rightarrow \quad n^2 - 3n - 108 = 0$$

$$\Rightarrow \quad (n+9)(n-12) = 0$$

$$\Rightarrow \quad n = 12 \qquad (\because n \text{ cannot be negative})$$

6.9 Number of Divisors

Let $N = p_1^{\alpha_1} . p_2^{\alpha_2} . p_3^{\alpha_3} \ldots p_k^{\alpha_k}$, where $p_1, p_2, p_3 \ldots, p_k$ are different primes and $\alpha_1, \alpha_2, \alpha_3, \ldots \alpha_k$ are natural numbers, then

(i) the total number of divisors of N including 1 and N

$$= (\alpha_1 + 1)(\alpha_2 + 1)(\alpha_3 + 1) \ldots (\alpha_k + 1)$$

(ii) the total number of divisors of N excluding 1 and N

$$= (\alpha_1 + 1)(\alpha_2 + 1)(\alpha_3 + 1) \ldots (\alpha_k + 1) - 2$$

(iii) the total number of divisors of N excluding 1 or N

$$= (\alpha_1 + 1)(\alpha_2 + 1)(\alpha_3 + 1) \ldots (\alpha_k + 1) - 1$$

(iv) the sum of these divisors

$$= (p_1^0 + p_1^1 + p_1^2 + \ldots + p_1^{\alpha_1})$$

$$(p_2^0 + p_2^1 + p_2^2 + \ldots + p_2^{\alpha_2}) \ldots (p_k^0 + p_k^1 + p_k^2 + \ldots + p_k^{\alpha_k})$$

(use sum of GP in each bracket)

(v) the number of ways in which N can be resolved as a product of two factors is $\frac{1}{2}(\alpha_1 + 1)(\alpha_2 + 1) \ldots (\alpha_k + 1)$, if N is not a perfect square

and $\frac{1}{2}[(\alpha_1 + 1)(\alpha_2 + 1) \ldots (\alpha_k + 1) + 1]$, if N is a perfect square.

(vi) the number of ways in which a composite number N can be resolved into two factors which are relatively prime (or coprime) to each other is equal 2^{n-1}, where n is the number of different factors in N.

Sample **Problem 15** *The total number of divisors of 5880 is* [**NCERT**]

(a) 48 (b) 24 (c) 96 (d) 16

Interpret (a) $5880 = 2^3 \cdot 3^1 \cdot 5^1 \cdot 7^2$

$\therefore$ Total number of divisors $= (3+1)(1+1)(1+1)(2+1)$

$= 4 \times 2 \times 2 \times 3 = 48$

6.10 Dearrangements

If n distinct objects are arranged in a row, then the number of ways in which they can be dearranged so that none of them occupies its original place is

$$n!\left\{1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \ldots + (-1)^n \frac{1}{n!}\right\}$$

and it is denoted by $D(n)$.

If r $(0 \le r \le n)$ objects occupy the places assigned to them *i.e.*, their original places and none of the remaining $(n-r)$ objects occupies its original places, then the number of such ways is

$$D(n-r) = {}^nC_r \cdot D(n-r)$$

$$= {}^nC_r \cdot (n-r)!\left\{1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + (-1)^{n-r}\frac{1}{(n-r)!}\right\}$$

Sample **Problem 16** *Ajay writes letters to his five friends and addresses the corresponding. The number of ways can the letters be placed in the envelops so that atleast two of them are in the wrong envelopes are*

(a) 120 (b) 125 (c) 119 (d) 124

Interpret (c) Required number of ways $= \sum_{r=2}^{5} {}^5C_{5-r}\, D(r)$

$$= \sum_{r=2}^{5} \frac{5!}{r!(5-r)!} \cdot r!\left\{1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + \frac{(-1)^r}{r!}\right\}$$

$$= \sum_{r=2}^{5} \frac{5!}{(5-r)!}\left\{\frac{1}{2!} - \frac{1}{3!} + \ldots + \frac{(-1)^r}{r!}\right\}$$

$$= \frac{5!}{3!}\left\{\frac{1}{2!}\right\} + \frac{5!}{2!}\left\{\frac{1}{2!} - \frac{1}{3!}\right\} + \frac{5!}{1!}\left\{\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!}\right\} + \frac{5!}{0!}\left\{\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!}\right\}$$

$= 10 + 20 + (60 - 20 + 5) + (60 - 20 + 5 - 1)$

$= 10 + 20 + 45 + 44 = 119$

6.11 Number of Integral Solutions of Linear Equations

Consider the equation

$$x_1 + x_2 + x_3 + x_4 + \ldots + x_r = n \quad \ldots(i)$$

where $x_1, x_2, \ldots, x_r$ and n are non-negative integers objects are to be divided into r groups where a group may contain any number of objects. Therefore, total number of solutions of Eq. (i),

$= \text{Coefficient of } x^n \text{ in } (x^0 + x^1 + \ldots + x^n)^r$

$= {}^{n+r-1}C_r$ or ${}^{n+r-1}C_{n-1}$

Sample **Problem 17** *Total number of non-negative integral solutions of $x_1 + x_2 + x_3 = 10$ is equal to*

(a) ${}^{12}C_3$ (b) ${}^{10}C_3$ (c) ${}^{12}C_2$ (d) ${}^{10}C_2$

Interpret (c) Number of non-negative integral solutions

$= {}^{12}C_{10} = {}^{12}C_2$

Check Point 2

1. The value of $({}^7C_0 + {}^7C_1) + ({}^7C_1 + {}^7C_2) + \ldots + ({}^7C_6 + {}^7C_7)$ is
   (a) $2^7 - 1$ (b) $2^8 - 2$ (c) $2^8 - 1$ (d) 2^8
2. The number of products that can be formed with 10 prime numbers taken two or more at a time is
   (a) 2^{10} (b) $2^{10} - 1$ (c) $2^{10} - 11$ (d) $2^{10} - 10$
3. How many ways can 6 coins be chosen from 20, one rupees coins, 10 fifty paise coins, 7 twenty paise coins ?
   (a) 28 (b) 56 (c) ${}^{37}C_6$ (d) 38
4. A person wishes to make up as many different parties as he can out of 20 friends. Each party consists of the same number of friends. How many should be invited at a time ?
   (a) 8 (b) 9 (c) 10 (d) 11
5. Total number of divisors of 5880 is equal to
   (a) 48 (b) 24 (c) 96 (d) 16
6. There are 6 letters and 6 directed envelopes. Find the number of ways in which all letters are put in the wrong envelopes.
   (a) 260 (b) 265
   (c) 270 (d) 275
7. The number of non-negative integral solutions of $x + y + z \le n$, where $n \in N$ is
   (a) ${}^{n+3}C_3$ (b) ${}^{n+4}C_4$ (c) ${}^{n+5}C_5$ (d) ${}^{n+2}C_2$
8. The number of ways in which a committee of 6 members can be formed from 8 gentlemen and 4 ladies so that the committee contains atleast 3 ladies is
   (a) 252 (b) 672 (c) 444 (d) 420
9. Eight straight lines are drawn in the plane such that no two lines are parallel and no three lines are concurrent. The number of parts into which these lines divide the plane, is
   (a) 29 (b) 32 (c) 36 (d) 37
10. The total number of ways in which 9 different boys can be distributed among three different children, so that the youngest gets 4, the middle gets 3 and the oldest gets 2, is
   (a) 137 (b) 236 (c) 1240 (d) 1260

WORKED OUT
Examples

Example 1 *The value of* ${}^1P_1 + 2 \cdot {}^2P_2 + 3 \cdot {}^3P_3 + \ldots + n \cdot {}^nP_n$ *is*

(*a*) ${}^{n+1}P_{n+1} - 1$ (*b*) ${}^{n+1}P_{n+1}$

(*c*) ${}^{n+1}C_{n+1} - 1$ (*d*) *None of these*

Solution (*a*) ${}^1P_1 + 2 \cdot {}^2P_2 + 3 \cdot {}^3P_3 + \ldots + n \cdot {}^nP_n$

$= (1)! + 2(2)! + 3(3)! + \ldots + n(n)!$ $(\because x! = {}^xP_x, x \in N)$

$= (2-1)1! + (3-1)2! + (4-1)3! + \ldots + [(n+1)-1]n!$

$= (2!-1!) + (3!-2!) + (4!-3!) + \ldots + [(n+1)! - n!]$

$= (n+1)! - 1$ $[\because x(x-1)! = x!, x \in N]$

$= {}^{n+1}P_{n+1} - 1$

Example 2 *How many 3-digits even numbers can be made using the digits 1, 2, 3, 4, 6, 7, if no digit is repeated?* **[NCERT]**

(*a*) 60 (*b*) 61

(*c*) 59 (*d*) 62

Solution (*a*) Even digits = 2, 4, 6

$\therefore$ Number of ways to fill the unit place = 3,

Number of ways to fill the tenth place (in rest of 5-digits) = 5,

H T U

Number of ways of fill the hundred place (in rest of 4 digits) = 4

Hence, by FPC total number of ways $= 3 \times 5 \times 4 = 60$

Example 3 *Find the number of 5 card combinations out of a deck of 52 cards, if there is exactly one ace in each combination.* **[NCERT]**

(*a*) 778315 (*b*) 778325

(*c*) 778320 (*d*) 778328

Solution (*c*) Number of ways selecting one ace from 4 aces $= {}^4C_1$

Number of ways selecting 4 cards out of 48 cards $= {}^{48}C_4$

Hence, by FPC, 5 cards out of 52 cards with exactly one ace can be selected in

${}^4C_1 \times {}^{48}C_4$ ways

$$= 4 \times \frac{48 \times 47 \times 46 \times 45}{24}$$

$$\left[\because {}^nC_1 = n \text{ and } {}^nC_4 = \frac{n(n-1)(n-2)(n-3)}{24}\right]$$

$$= \frac{48 \times 47 \times 46 \times 45}{6}$$

$= 8 \times 47 \times 46 \times 45$

$= 778320$ ways

Example 4 *In how many ways can one select a cricket team of eleven from 17 players in which only 5 players can bowl, if each cricket team of 11 must include exactly 4 bowlers?* **[NCERT]**

(*a*) 3960 (*b*) 3961

(*c*) 3962 (*d*) *None of these*

Solution (*a*)

We are to select 11 players including exactly 4 bowlers.

Hence, 4 bowlers will be selected from 5 bowlers and remaining 7 players will be selected from 12 batsmen.

Now, 4 bowlers out of 5 bowlers can be selected in ${}^5C_4$ ways.

7 players out of 12 players can be selected in ${}^{12}C_7$ ways.

Hence, by FPC, total number of ways selecting the eleven players

$= {}^5C_4 \times {}^{12}C_7 = {}^5C_1 \times {}^{12}C_5$ $(\because {}^nC_r = {}^nC_{n-r})$

$$= \frac{5 \times 12 \times 11 \times 10 \times 9 \times 8}{120}$$

$$\left[\because {}^nC_5 = \frac{n(n-1)(n-2)(n-3)(n-4)}{120}\right]$$

$= 5 \times 11 \times 9 \times 8 = 55 \times 72 = 3960$ ways

Example 5 *In how many different ways can five boys and five girls form a circle such that the boys and girls set alternate ?*

(*a*) 4!

(*b*) 2880

(*c*) 5!

(*d*) *None of the above*

Solution (*b*) After fixing up one boy on the table the remaining can be arranged in 4! ways but boys and girls are to sit alternate.

There will be 5 places, between two boys, these five places can be filled by 5 girls in 5! ways.

The required number of ways $= 4! \times 5! = 2880$.

Example 6 *In a certain test, there are n questions. In the test 2^{n-1} students gave wrong answers to atleast i questions, where $i = 1, 2, 3, \ldots, n$. If the total number of wrong answers given is 2047, then the value of n is*

(a) 11 (b) 2047
(c) 12 (d) *None of these*

Solution (a) The number of students answering exactly $i\ (1 \le i \le n-1)$ questions wrongly is $2^{n-i} - 2^{n-i-1}$. The number of students answering all n questions wrongly is 2047. Thus, the total number of wrong answers is

$$1(2^{n-1} - 2^{n-2}) + 2(2^{n-2} - 2^{n-3}) + \ldots + (n-1)(2^1 - 2^0) + n(2^0)$$
$$= 2^{n-1} + 2^{n-2} + 2^{n-3} + \ldots + 2^0$$
$$= 2^n - 1$$

Thus, $2^n - 1 = 2047$

$\Rightarrow$ $2^n = 2048 = 2^{11}$

$\Rightarrow$ $n = 11$

Example 7 *Four boys picked up 30 mangoes. In how many ways can they divide them, if all mangoes be identical ?*

(a) ${}^{33}C_4$ (b) ${}^{33}C_2$
(c) 5456 (d) *None of these*

Solution (c) Clearly, 30 mangoes can be distributed among 4 boys such that each boy can receive any number of mangoes.

Hence, total number of ways $= {}^{30+4-1}C_{4-1} = {}^{33}C_3$

$$= \frac{33 \cdot 32 \cdot 31}{1 \cdot 2 \cdot 3} = 5456$$

Example 8 *The sum of all five digit numbers that can be formed using the digits 1, 2, 3, 4 and 5 (repetition of digits is not allowed), is*

(a) 11111 (b) 3999960
(c) 399960 (d) 396990

Solution (b) Required sum

$$= (5-1)!(1+2+3+4+5)\left(\frac{10^5 - 1}{9}\right)$$
$$= 24 \cdot 15 \cdot 11111 = 3999960$$

Example 9 *If ${}^nC_{r-1} = 36$, ${}^nC_r = 84$ and ${}^nC_{r+1} = 126$, then find ${}^nC_2$.* **[NCERT]**

(a) 8 (b) 7
(c) 9 (d) 6

Solution (c) Given,

$${}^nC_{r-1} = 36 \quad \ldots(i)$$
$${}^nC_r = 84 \quad \ldots(ii)$$
$${}^nC_{r+1} = 126 \quad \ldots(iii)$$

On dividing Eq. (i) by Eq. (ii), we get

$$\frac{{}^nC_{r-1}}{{}^nC_r} = \frac{36}{84} \qquad \left[\because {}^nC_r = \frac{n!}{(n-r)!\,r!} \text{ and } n! = n(n-1)!\right]$$

$$\Rightarrow \frac{n!}{(r-1)!\{n-(r-1)\}!} \times \frac{r!(n-r)!}{n!} = \frac{3}{7}$$

$$\Rightarrow \frac{1}{(r-1)!(n-r+1)!} \times \frac{r(r-1)!(n-r)!}{1} = \frac{3}{7}$$

$$\Rightarrow \frac{1 \cdot r}{(n-r+1)(n-r)!} \times (n-r)! = \frac{3}{7}$$

$$\Rightarrow \frac{r}{n-r+1} = \frac{3}{7}$$

$$\Rightarrow 7r = 3n - 3r + 3$$

$$\Rightarrow 10r - 3n = 3 \quad \ldots(iv)$$

Now, dividing Eq. (ii) by Eq. (iii),

$$\frac{{}^nC_r}{{}^nC_{r+1}} = \frac{84}{126}$$

$$\Rightarrow \frac{n!}{r!(n-r)!} \times \frac{(r+1)!(n-r-1)!}{n!} = \frac{14}{21}$$

$$\Rightarrow \frac{1}{r!(n-r)(n-r-1)!} \times \frac{(r+1)r!(n-r-1)!}{1} = \frac{2}{3}$$

$$\Rightarrow \frac{r+1}{n-r} = \frac{2}{3}$$

$$\Rightarrow 3r + 3 = 2n - 2r$$

$$\Rightarrow 2n - 5r = 3 \quad \ldots(v)$$

Now, multiplying Eq. (iv) by 2 and Eq. (v) by 3 and adding both the equations, we get

$$20r - 6n = 6 \quad \ldots(vi)$$

and $$6n - 15r = 9 \quad \ldots(vii)$$

Now, adding Eqs. (vi) and (vii), we get

$$5r = 15$$

$$\Rightarrow r = 3$$

Now, from Eq. (v),

$$2n = 3 + 15$$

$$\Rightarrow 2n = 18$$

$$\Rightarrow n = 9$$

Example 10 *Eighteen guests are to be seated, half on each side of a long table. Four particular guests desire to sit on one particular side and three on other side of the table. Find the number of ways in which the seating arrangement can be made.* **[NCERT Exemplar]**

(a) $\frac{11!}{5!6!}(9!)(8!)$ (b) $\frac{11!}{5!6!}(9!)(9!)$

(c) $\frac{11!}{6!6!}(9!)(9!)$ (d) *None of these*

Solution (b) After seating 4 on one side and 3 on the other side, we have to select out of 11; 5 on one side and 6 on the other side.

Now, there are 9 on each side of the long table and each cannot be arranged in 9! ways.

$\therefore$ The number of ways in which the seating arrangements can be made $= \frac{11!}{5!6!}(9!)(9!)$.

Example 11 *A seven digit number divisible by 9 is to be formed by using 7-digit out of numbers* $\{1, 2, 3, \ldots, 9\}$. *The number of ways in which this can be done, is*

(a) 7! (b) 2 (7!) (c) 3 (7!) (d) 4 (7!)

Solution (d) Sum of 7-digit = A multiple of 9

We know that, sum of numbers 1, 2 , 3, ..., 9 is 45. So, two left numbers should also have sum as 9. The pairs to the left are $(1, 8), (2, 7), (3, 6), (4, 5)$ with each part left number of 7-digits numbers is 7!.

So, with all 4 pairs $= 4 \times 7!$

Example 12 *The number of ways of dividing 15 men and 15 women into 15 couples, each consisting of a man and a woman, is*

(a) 1240 (b) 1840 (c) 1820 (d) 2005

Solution (a) The number of ways of choosing first couple

$= (15) \times (15) = 15^2$

The number of ways of choosing second couple $= 14 \times 14 = (14)^2$

and so on

Thus, required number of ways

$$= 15^2 + 14^2 + \ldots + 1^2 = \frac{15 \times (15+1) \times (30+1)}{6} = 1240$$

$$\left[\because \Sigma n^2 = \frac{n(n+1)(2n+1)}{6}\right]$$

Example 13 *The letters of the word MODESTY are written in all possible orders and these words are written out as in a dictionary, then the rank of the word MODESTY is*

(a) 5040 (b) 720 (c) 1681 (d) 2520

Solution (c) The number of words start with $D = 6! = 720$

The number of words start with $E = 6! = 720$

The number of words start with $MD = 5! = 120$

The number of words start with $ME = 5! = 120$

Now, the first word start with MO is MODESTY.

Hence, rank of MODESTY $= 720 + 720 + 120 + 120 = 1681$

Example 14 *A bag contains four one rupee coins, two twenty five-paisa coins and five ten-paisa coins. In how many ways can amount, not les than ₹ 1 be taken out from the bag? (Consider coins of the same denominations to be identical)*

(a) 71 (b) 72 (c) 73 (d) 80

Solution (c) When atleast one one rupee coin is selected we can select any number of twenty-five paisa coins and ten paisa coins. Then, number of ways of such selection is $4(2+1)(5+1) = 72$ as we can select zero or more twenty five paisa and ten paisa coins to ensure that amount selected is ₹ 1 or more.

But when none of the one rupee coins is selected, we have to select all twenty five paisa coins and ten paisa coins to ensure sum of ₹ 1.which can be done only in one way. Then, the total number of ways is 73.

Example 15 *Rajdhani Express going from Bombay to Delhi stops at five intermediate stations, 10 passenger enter the train during the journey with 10 different ticket of two classes. The number of different sets of tickets they may have is*

(a) ${}^{15}C_{10}$ (b) ${}^{20}C_{10}$

(c) ${}^{30}C_{10}$ (d) *None of these*

Solution (c) For a particular class the total number of different tickets from first intermediate station is 5. Similarly, number of different tickets from second intermediate station is 4. So, the total number of different tickets is $5 + 4 + 3 + 2 + 1 = 15$. And same number of tickets for another class is equal to total number of different tickets, which is equal to 30 and number of selection is ${}^{30}C_{10}$.

Example 16 *Five distinct letters are to be transmitted through a communication channel. A total number of 15 blanks is to be inserted between the two letters with atleast three between every two. The number of ways in which this can be done, is*

(a) 20 (b) 2

(c) 6 (d) 2400

Solution (a) For $1 \le (i) \le 4$, let $x_i (\ge 3)$ be the number of blanks between ith and $(i+1)$th letters. Then,

$$x_1 + x_2 + x_3 + x_4 = 15 \quad \ldots(i)$$

The number of solutions of Eq. (i)

$= \text{Coefficient of } t^{15} \text{ in } (t^3 + t^4 + \ldots)^4$

$= \text{Coefficient of } t^3 \text{ in } (1-t)^{-4}$

$= \text{Coefficient of } t^3 \text{ in } [1 + {}^4C_1 + {}^5C_2 t^2 + {}^6C_3 t^3 + \ldots]$

$= {}^6C_3 = 20$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Fundamental Principles of Counting

1. How many 5-digit telephone numbers can be constructed using the digits 0 to 9, if each number starts with 67 and no digit appears more than once? [NCERT]

(a) 336 (b) 337
(c) 335 (d) None of these

2. Given 5 flags of different colours, how many different signals can be generated, if each signal requires the use of 2 flags, one below the other. [NCERT]

(a) 18 (b) 20
(c) 19 (d) 23

3. From a committee of 8 persons, in how many ways can we choose a chairman and a vice-chairman assuming one person cannot hold more than one position? [NCERT]

(a) 54 (b) 55
(c) 52 (d) 56

Factorial Notation

4. If $\frac{1}{6!}+\frac{1}{7!}=\frac{x}{8!}$, then the value of x is [NCERT]

(a) 63 (b) 64
(c) 66 (d) 65

5. The value of $2^n\,[1\cdot 3\cdot 5\ldots(2n-3)(2n-1)]$ is

(a) $\frac{(2n)!}{n!}$ (b) $\frac{(2n)!}{2^n}$
(c) $\frac{n!}{(2n)!}$ (d) None of these

6. The products of any r consecutive natural numbers is always divisible by

(a) $r!$ (b) r^2
(c) r^n (d) None of these

7. The exponent of 3 in 100! is

(a) 47 (b) 48 (c) 49 (d) 50

Permutation

8. If ${}^5P_r = 2\,{}^6P_{r-1}$, then the value of r is [NCERT]

(a) 10 (b) 3
(c) 0 (d) None of these

9. In how many ways can the letters of the word PERMUTATIONS be arranged, if the words start with P and end with S? [NCERT]

(a) 1814400 (b) 1814405
(c) 1824050 (d) None of these

10. How many different non-digit numbers can be formed from the digits of the number 223355888 by rearrangement of the digits so that the odd digits occupy even places?

(a) 16 (b) 36 (c) 60 (d) 180

11. How many even numbers of 3 different digits can be formed from the digits 1, 2, 3, 4, 5, 6, 7, 8, 9 (repetition of digits is not allowed)?

(a) 224 (b) 280
(c) 324 (d) None of these

12. The total number of 9-digit numbers which have all different digits is [NCERT Exemplar]

(a) 10! (b) 9! (c) $9\times 9!$ (d) $10\times 10!$

13. The number of words which can be formed out of the letters of the word ARTICLE, so that vowels occupy the even place is [NCERT Exemplar]

(a) 1440 (b) 144 (c) 7! (d) ${}^4C_4\times{}^3C_3$

14. Eight chairs are numbered 1 to 8. Two women and 3 men wish to occupy one chair each. First the women choose the chairs from amongst the chairs 1 to 4 and then men select from the remaining chairs. Find the total number of possible arrangements. [NCERT Exemplar]

(a) 1440 (b) 1450
(c) 1460 (d) None of these

15. If the letters of the word RACHIT are arranged in all possible ways as listed in dictionary. Then, what is the rank of the word RACHIT? [NCERT Exemplar]
(a) 479 (b) 480 (c) 481 (d) 482

16. Find the number of different words that can be formed from the letters of the word TRIANGLE, so that no vowels are together. [NCERT Exemplar]
(a) 14000 (b) 14500
(c) 14400 (d) 14402

17. The number of different four digit numbers that can be formed with the digits 2, 3, 4, 7 and using each digit only once is [NCERT Exemplar]
(a) 120 (b) 96 (c) 24 (d) 100

18. The sum of the digits in unit place of all the numbers formed with the help of 3, 4, 5 and 6 taken all at a time is [NCERT Exemplar]
(a) 432 (b) 108 (c) 36 (d) 18

19. The number of 5-digits telephone numbers having atleast one of their digits repeated, is [NCERT Exemplar]
(a) 90000 (b) 100000
(c) 30240 (d) 69760

20. We are to form different words with the letters of the word INTEGER. Let m_1 be the number of words in which I and N are never together and m_2 be the number of words which begin with I and end with R, then m_1/m_2 is equal to
(a) 30 (b) 60 (c) 90 (d) 180

21. If the letters of the word KRISNA are arranged in all possible ways and these words are written out as in a dictionary, then the rank of the word KRISNA is
(a) 324 (b) 341
(c) 359 (d) None of these

22. If the letters of the word MOTHER are written in all possible orders and these words are written out as in a dictionary, then the rank of the word MOTHER is
(a) 240 (b) 261
(c) 308 (d) 309

23. Find the number of permutations of n distinct things taken r together, in which 3 particular things must occur together. [NCERT Exemplar]
(a) ${}^{n-3}C_{r-3}(r-2)!\,3!$ (b) ${}^{n-3}C_{r-3}(r-3)!\,3!$
(c) ${}^{n-3}C_{r-3}(r-2)!$ (d) None of these

24. There are 10 persons named $P_1, P_2, P_3, \ldots, P_{10}$. Out of 10 persons, 5 persons are to be arranged in a line such that in each arrangement P_1 must occur whereas P_4 and P_5 do not occur. Find the number of such possible arrangements. [NCERT Exemplar]
(a) 4210 (b) 4200 (c) 4203 (d) 4205

25. If a denotes the number of permutations of $x+2$ things taken all at a time, b the number of permutations of x things taken 11 at a time and c the number of permutations of $x-11$ things taken all at a time such that $a = 182\,bc$, then the value of x is
(a) 15 (b) 12 (c) 10 (d) 18

26. In a circus there are ten cages for accommodating ten animals. Out of these four cages are so small that five out of 10 animals cannot enter into them. In how many ways will it be possible to accommodate ten animals in these ten cages?
(a) 66400 (b) 86400
(c) 96400 (d) None of these

27. The total number of permutations of $n\ (>1)$ different things taken not more than r at a time, when each thing may be repeated any number of times is
(a) $\dfrac{n(n^n-1)}{n-1}$ (b) $\dfrac{n^r-1}{n-1}$
(c) $\dfrac{n(n^r-1)}{n-1}$ (d) None of these

28. The number of ways in which 10 candidates $A_1, A_2, \ldots, A_{10}$ can be ranked such that A_1 is always above A_{10} is
(a) 5! (b) 2(5!)
(c) 10! (d) $\frac{1}{2}(10!)$

Circular Permutation

29. If eleven members of a committee sit at a round table so that the President and Secretary always sit together, then the number of arrangements is
(a) $10! \times 2$ (b) 10!
(c) $9! \times 2$ (d) None of these

30. The number of ways in which seven persons can be arranged at a round table, if two particular persons may not sit together is
(a) 480 (b) 120
(c) 80 (d) None of these

31. In how many ways can 15 members of a council sit along a circular table, when the Secretary is to sit on one side of the Chairman and the Deputy Secretary on the other side?
(a) $2 \times 12!$ (b) 24
(c) $2 \times 15!$ (d) None of these

32. 20 persons are invited for a party. In how many different ways can they and the host be seated at circular table, if the two particular persons are to be seated on either side of the host?
(a) 20 ! (b) 2·18 !
(c) 18 ! (d) None of these

33. In how many ways can 5 boys and 5 girls sit in a circle so that no two boys sit together?
(a) $5! \times 5!$ (b) $4! \times 5!$
(c) $\frac{5! \times 5!}{2}$ (d) None of these

Combination

34. How many numbers lying between 10 and 1000 can be formed from the digits 1, 2, 3, 4, 5, 6, 7, 8, 9 (repetition of digits is allowed) ?
(a) 1024 (b) 810
(c) 2346 (d) None of these

35. Let A be a set containing 10 distinct elements. Then, the total number of distinct functions from A to A is
(a) 10! (b) 10^{10}
(c) 2^{10} (d) $2^{10} - 1$

36. How many 10-digit numbers can be written by using the digits 1 and 2 ?
(a) ${}^{10}C_1 + {}^{9}C_2$ (b) 2^{10}
(c) ${}^{10}C_2$ (d) 10!

37. The number of times the digits 3 will be written when listing the integers from 1 to 1000 is
(a) 269 (b) 300 (c) 271 (d) 302

38. The figures 4, 5, 6, 7, 8 are written in every possible order. The number of numbers greater than 56000 is
(a) 72 (b) 96
(c) 90 (d) 98

39. If ${}^{n}C_{12} = {}^{n}C_8$, then n is equal to [NCERT Exemplar]
(a) 20 (b) 12 (c) 6 (d) 30

40. The value of ${}^{47}C_4 + \sum_{r=1}^{5} {}^{52-r}C_3$ is equal to
(a) ${}^{47}C_6$ (b) ${}^{52}C_5$
(c) ${}^{52}C_4$ (d) None of these

41. ${}^{n}C_r + 2\,{}^{n}C_{r-1} + {}^{n}C_{r-2}$ is equal to [NCERT Exemplar]
(a) ${}^{n+1}C_r$ (b) ${}^{n+1}C_{r+1}$
(c) ${}^{n+2}C_r$ (d) ${}^{n+2}C_{r+1}$

42. If ${}^{n}C_3 + {}^{n}C_4 > {}^{n+1}C_3$, then
(a) $n > 6$ (b) $n > 7$
(c) $n < 6$ (d) None of these

43. In how many ways can a student choose a program of 5 courses, if 9 courses are available and 2 specific courses are compulsory for every student? [NCERT]
(a) 34 (b) 36
(c) 35 (d) 37

44. Every body in a room shakes hands with everybody else. The total number of hand shakes is 66. The total number of persons in the room is [NCERT Exemplar]
(a) 11 (b) 12
(c) 13 (d) 14

45. The number of ways in which a team of eleven players can be selected from 22 players always including 2 of them and excluding 4 of them is [NCERT Exemplar]
(a) ${}^{16}C_{11}$ (b) ${}^{16}C_5$
(c) ${}^{16}C_9$ (d) ${}^{20}C_9$

46. A box contains two white balls, three black balls and four red balls. In how many ways can three balls be drawn from the box, if atleast one black ball is to be included in the draw?
(a) 64 (b) 45
(c) 46 (d) None of these

47. The number of ways in which we can choose a committee from four men and six women so that the committee includes atleast two men and exactly twice as many women as men is [NCERT Exemplar]
(a) 94 (b) 126
(c) 128 (d) None of these

48. A five digit number divisible by 3 is to be formed using the numbers 0, 1, 2, 3, 4 and 5, without repetition. The total number of ways this can be done, is [NCERT Exemplar]
(a) 216 (b) 240
(c) 600 (d) 3125

49. There are 10 lamps in a hall. Each one of them can be switched on independently. Find the number of ways in which hall can be illuminated. [NCERT Exemplar]
(a) $2^{10} - 2$ (b) $2^{10} - 1$
(c) $2^{10} + 1$ (d) None of these

50. Find the number of positive integers greater than 6000 and less than 7000 which are divisible by 5, provided that no digit is to be repeated. [NCERT Exemplar]
(a) 111 (b) 112
(c) 113 (d) None of these

51. In an examination, a student has to answer 4 questions out of 5 questions; questions 1 and 2 are however compulsory. Find the number of ways in which the student can make the choice. [NCERT Exemplar]
(a) 3 (b) 2 (c) 4 (d) 5

52. A sports team of 11 students is to be constituted, choosing atleast 5 from Class XI and atleast 5 from Class XII. If there are 20 students in each of these classes, in how many ways can the team be constituted? [NCERT Exemplar]

(a) ${}^{20}C_5 \times {}^{20}C_6$ (b) $2\,({}^{20}C_5 \times {}^{20}C_6)$
(c) $2\,({}^{20}C_5)^2$ (d) None of these

53. A pack of 52 cards are shuffled together. The number of ways in which a man can be dealt 26 cards so that he does not get two cards of the same suit and same denomination, is

(a) ${}^{52}C_{26} \cdot 2^{26}$ (b) ${}^{104}C_{26}$
(c) $2 \cdot {}^{52}C_{26}$ (d) None of these

54. In how many ways can 21 English and 19 Hindi books be placed in a row so that no two Hindi books are together?

(a) 1540 (b) 1450 (c) 1504 (d) 1405

55. 4 buses runs between Bhopal and Gwalior. If a man goes from Gwalior to Bhopal by a bus and comes back to Gwalior by another bus, then the total possible ways are

(a) 12 (b) 16 (c) 4 (d) 8

56. In a football championship, there were played 153 matches. Every team played one match with each other. The number of teams participating in the championship is

(a) 17 (b) 18 (c) 9 (d) 13

57. A father with 8 children takes them 3 at a time to the zoological gardens, as often as he can without taking the same 3 children together more than once. The number of times he will go the garden, is

(a) 336 (b) 112
(c) 56 (d) None of these

58. A car will hold 2 in the front seat and 1 in the rear seat. If among 6 persons 2 can drive, then number of ways in which the car can be filled, is

(a) 10 (b) 20
(c) 30 (d) None of these

59. Six X's have to be placed in the square of the figure such that each row contains atleast one 'X'. In how many different ways can this be done?

(a) 28 (b) 27
(c) 26 (d) None of these

60. A question paper is divided into two parts A and B and each part contains 5 questions. The number of ways in which a candidate can answer 6 questions selecting atleast two questions from each part is

(a) 80 (b) 100
(c) 200 (d) None of these

61. In an examination there are three multiple choice questions and each question has 4 choices. Number of ways in which a student can fail to get all answers correct, is

(a) 11 (b) 12 (c) 27 (d) 63

62. There were two women participating in a chess tournament. Every participant played two games with the other participants. The number of games that the men played between themselves proved to exceed by 66 the number of games that the men played with the women. The number of participants is

(a) 6 (b) 11
(c) 13 (d) None of these

63. A lady gives a dinner party for six guests. The number of ways in which they may be selected from among ten friends, if two of the friends will not attend the party together, is

(a) 112 (b) 140
(c) 164 (d) None of these

64. A person is permitted to select atleast one and atmost n coins from a collection of $2n + 1$ (distinct) coins. If the total number of ways in which he can select coins is 255, then n is equal to

(a) 4 (b) 8 (c) 16 (d) 32

65. In an steamer, there are stalls for 12 animals and there are horses, cows and calves (not less than 12 each) ready to be shipped in how many ways can the ship load be made?

(a) $3^{12} - 1$ (b) 3^{12}
(c) $(12)^3 - 1$ (d) $(12)^3$

66. In an examination of 9 papers a candidate has to pass in more papers, then the number of papers in which he fails in order to be successful. The number of ways in which he can be unsuccessful, is

(a) 255 (b) 256 (c) 193 (d) 319

Division of Objects into Groups

67. Given 5 different green dyes, four different blue dyes and three different red dyes, the number of combinations of dyes which can be chosen taking atleast one green and one blue dye is [NCERT Exemplar]

(a) 3600 (b) 3720 (c) 3800 (d) 3600

68. There are four balls of different colours and four boxes of colours same as those of the balls. The number of ways in which the balls, one in each box, could be placed such that a ball does not go to box of its own colour, is
(a) 8 (b) 7
(c) 9 (d) None of these

69. Five balls of different colours are to be placed in three boxes of different sizes. Each box can hold all five balls. In how many ways can we place the balls so that no box remains empty?
(a) 50 (b) 100
(c) 150 (d) 200

70. The number of ways of dividing 52 cards amongst four players so that three players have 17 cards each and the fourth players just one card, is
(a) $\frac{52!}{(17!)^3}$ (b) 52!
(c) $\frac{52!}{17!}$ (d) None of these

71. 18 mice were placed in two experimental groups and one control group with all group equally large. In how many ways can the mice be placed into three groups? [NCERT Exemplar]
(a) $\frac{181}{(6!)^2}$ (b) $\frac{181}{(6!)^3}$
(c) $\frac{180}{(6!)^3}$ (d) None of these

72. A candidate is required to answer 7 questions out of 12 questions, which are divided into two groups, each containing 6 questions. He is not permitted to attempt more than 5 questions from either group. Find the number of different ways of doing questions. [NCERT Exemplar]
(a) 779 (b) 781
(c) 780 (d) 782

73. In how many ways can ₹16 be divided into 4 persons when none of them get less than ₹ 3?
(a) 70 (b) 35 (c) 64 (d) 192

74. A library has a copies of one book, b copies of each of two books, c copies of each of three books and single copies of d books. The total number of ways in which these books can be distributed, is
(a) $\frac{(a+b+c+d)!}{a!\,b!\,c!}$ (b) $\frac{(a+2b+3c+d)!}{a!\,(b!)^2(c!)^3}$
(c) $\frac{(a+2b+3c+d)}{a!\,b!\,c!}$ (d) None of these

75. Eleven books consisting of 5 Mathematics, 4 Physics and 2 Chemistry are placed on a shelf. The number of possible ways of arranging them on the assumption that the books of the same subject are all together, is
(a) 4! 2! (b) 11!
(c) 5! 4! 3! 2! (d) None of these

76. Three boys of class X, four boys of class XI and five boys of class XII sit in a row. The total number of ways in which these boys can sit so that all the boys of same class sit together is equal to
(a) $(3!)^2\,(4!)\,(5!)$ (b) $(3!)\,(4!)^2\,(5!)$
(c) $(3!)\,(4!)\,(5!)$ (d) $(3!)\,(4!)\,(5!)^2$

Applications of Permutation and Combination

77. The number of mappings (functions) from the set $A = \{1, 2, 3\}$ into the set $B = \{1, 2, 3, 4, 5, 6, 7\}$ such that $f(i) \le f(j)$, whenever $i < j$, is
(a) 84 (b) 90
(c) 88 (d) None of these

78. Let $f : \{1, 2, 3, 4, 5\} \to \{1, 2, 3, 4, 4, 5\}$ that are onto and $f(x) \ne i$ is equal to
(a) 9 (b) 44
(c) 16 (d) None of these

79. The number of triangles that are formed by choosing the vertices from a set of 12 points, seven of which lie on the same line is [NCERT Exemplar]
(a) 105 (b) 15
(c) 175 (d) 185

80. The number of parallelograms that can be formed from a set of four parallel lines intersecting another set of three parallel lines is [NCERT Exemplar]
(a) 6 (b) 18 (c) 12 (d) 9

81. The maximum number of points of intersection of 6 circles is
(a) 25 (b) 24
(c) 50 (d) 30

82. If a polygon has 44 diagonals, then the number of its sides are [NCERT Exemplar]
(a) 11 (b) 7
(c) 8 (d) None of these

83. The number of diagonals in a polygon of m sides is
(a) $\frac{1}{2!}\,m\,(m-5)$ (b) $\frac{1}{2!}\,m\,(m-1)$
(c) $\frac{1}{2!}\,m\,(m-3)$ (d) $\frac{1}{2!}\,m\,(m-2)$

84. The number of triangles that can be formed by 5 points in a line and 3 points on a parallel line is
(a) ${}^8C_3$ (b) ${}^8C_3 - {}^5C_3$
(c) ${}^8C_3 - {}^5C_3 - 1$ (d) None of these

85. The straight lines I_1, I_2, I_3 are parallel and lie in the same plane. A total numbers of m points are taken on I_1, n points on I_2, k points on I_3. The maximum number of triangles formed with vertices at these points is
(a) ${}^{m+n+k}C_3$
(b) ${}^{m+n+k}C_3 - {}^{m}C_3 - {}^{n}C_3 - {}^{k}C_3$
(c) ${}^{m}C_3 + {}^{n}C_3 + {}^{k}C_3$
(d) None of the above

86. Six points in a plane be joined in all possible ways by indefinite straight lines and if no two of them be coincident or parallel and no three pass through the same point (with the exception of the original 6 points). The number of distinct points or intersection is equal to
(a) 105 (b) 45
(c) 51 (d) None of these

87. The greatest possible number of points of intersection of 8 straight lines and 4 circles is
(a) 32 (b) 64 (c) 76 (d) 104

88. There are n distinct points on the circumference of a circle. The number of pentagons that can be formed with these points as vertices is equal to the number of possible triangles. Then, the value of n is
(a) 7 (b) 8
(c) 15 (d) 30

Number of Divisors

89. The number of divisors of 9600 including 1 and 9600 are
(a) 60 (b) 58 (c) 48 (d) 46

90. Number of divisors of the form $(4n+2)$, $n \geq 0$ of the integer 240 is
(a) 4 (b) 8 (c) 10 (d) 3

91. The number of divisors of the number of 38808 (excluding 1 and the number itself) is
(a) 70 (b) 72
(c) 71 (d) None of these

92. If a, b, c, d, e are prime integers, then the number of divisors of ab^2c^2de excluding 1 as a factor is
(a) 94 (b) 72 (c) 36 (d) 71

Miscellaneous

93. The number of ways can 10 letters be placed in 10 marked envelopes, so that no letter is in the right envelope are
(a) $10!\left(1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + \frac{1}{10!}\right)$
(b) $10!\left(1 + \frac{1}{1!} - \frac{1}{2!} + \frac{1}{3!} - \ldots - \frac{1}{10!}\right)$
(c) $\left\{1 + \frac{1}{1!} - \frac{1}{2!} + \frac{1}{3!} - \ldots - \frac{1}{10!}\right\}$
(d) $9!\left\{1 + \frac{1}{1!} - \frac{1}{2!} + \frac{1}{3!} - \ldots - \frac{1}{10!}\right\}$

94. The number of ordered triplets of positives integers which are solutions of the equation $x + y + z = 100$, is
(a) 6005 (b) 4851
(c) 5081 (d) None of these

95. Total number of words formed by 2 vowels and 3 consonants taken from 4 vowels and 5 consonants is equal to [NCERT Exemplar]
(a) 60 (b) 120 (c) 7200 (d) 720

96. There are 5 historical monuments, 6 gardens and 7 shopping malls in the city. In how many ways a tourist can visit the city, if he visits atleast one shopping mall?
(a) $2^5 \cdot 2^6 \cdot (2^7 - 1)$ (b) $2^4 \cdot 2^6(2^7 - 1)$
(c) $2^5 \cdot 2^6(2^6 - 1)$ (d) None of these

Round II (Mixed Bag)

Only One Correct Option

1. In a city no two persons have identical set of teeth and there is no person without a tooth. Also, no person has more than 32 teeth. If we disregard the shape and size of tooth and consider only the positioning of the teeth, the maximum population of the city is
(a) 2^{32} (b) $(32)^2 - 1$ (c) $2^{32} - 1$ (d) 2^{32-1}

2. A rectangle with sides $2m - 1$ and $2n - 1$ divided into squares of unit length. The number of rectangle which can be formed with sides of odd length is
(a) m^2n^2 (b) $mn\,(m+1)\,(n+1)$
(c) 4^{m+n-1} (d) None of these

3. The lock of a safe consists of five discs each of which features the digits $0, 1, 2, \ldots, 9$. The safe can be opened by dialing a special combination of the digits. The number of days sufficient enough to open the safe. If the work day lasts 13 h and 5 s are needed to dial one combination of digits is
(a) 9 (b) 10
(c) 11 (d) 12

4. The interior angles of a regular polygon measure 160° each. The number of diagonals of the polygon are
(a) 97 (b) 105 (c) 135 (d) 146

5. Let A be the set of 4-digit numbers $a_1\ a_2\ a_3\ a_4$, where $a_1 < a_2 < a_3 < a_4$, then $n(A)$ is equal to
(a) 84 (b) 126
(c) 210 (d) None of these

6. If the total number of m elements subsets of the set $A = \{a_1, a_2, a_3, \ldots, a_n\}$ is λ times the number of 3 elements subsets containing a_4, then n is
(a) $(m-1)\lambda$ (b) $m\lambda$ (c) $(m+1)\lambda$ (d) 0

7. Sixteen men compete with one another in running, swimming and riding. How many prize lists could be made, if there were altogether 6 prizes of different values, one for running, 2 for swimming and 3 for riding?
(a) $16 \times 15 \times 14$ (b) $16^3 \times 15^2 \times 14$
(c) $16^3 \times 15 \times 14^2$ (d) $16^2 \times 15 \times 14$

8. The number of ways in which we can select four numbers from 1 to 30 so as to exclude every selection of four consecutive numbers is
(a) 27378 (b) 27405
(c) 27399 (d) None of these

9. The number of different seven digit numbers that can be written using only the three digits 1, 2 and 3 with the condition that the digit 2 occurs twice in each number is
(a) ${}^7P_2 2$ (b) ${}^7C_2 2^5$
(c) ${}^7C_2 5^2$ (d) None of these

10. If the difference of the number of arrangements of three things from a certain number of dissimilar things and the number of selections of the same number of things from them exceeds 100, then the least number of dissimilar things is
(a) 8 (b) 6 (c) 5 (d) 7

11. A person always prefers to eat 'parantha' and 'vegetable dish' in his meal. How many ways can he make his platter in a marriage party, if there are three types of paranthas, four types of 'vegetable dish', three types of 'salads' and two types of 'sauces'?
(a) 3360 (b) 4096
(c) 3000 (d) None of these

12. There are three coplanar parallel lines. If any p points are taken on each of the lines, the maximum number of triangles with vertices on these points is
(a) $3p^2(p-1)+1$ (b) $3p^2(p-1)$
(c) $p^2(4p-3)$ (d) None of these

13. In how many different ways can the first 12 natural numbers be divided into three different groups such that numbers in each group are in AP?
(a) 1 (b) 5
(c) 6 (d) 4

14. Two packs of 52 cards are shuffled together. The number of ways in which a man can be dealt 20 cards, so that he does not get two cards of the same suit and same denomination is
(a) ${}^{56}C_{20} \times 2^{20}$ (b) ${}^{104}C_{20}$
(c) $2 \times {}^{52}C_{20}$ (d) None of these

More Than One Correct Option

15. The number of ways of arranging seven persons (having A, B, C and D among them) in a row, so that A, B, C and D are always in order A-B-C-D (not necessarily together) is
(a) 210 (b) 5040
(c) $6 \times {}^7C_3$ (d) ${}^7P_3$

16. Two players P_1 and P_2 plays a series of $2n$ games. Each game can result in either a win or loss for P_1. Total number of ways in which P_1 can win the series of these games, is equal to
(a) $\frac{1}{2}(2^{2n} - {}^{2n}C_n)$ (b) $\frac{1}{2}(2^{2n} - 2 \cdot {}^{2n}C_n)$
(c) $\frac{1}{2}\left(2^n - \frac{2n!}{n!\,n!}\right)$ (d) None of these

17. Total number of ways of giving atleast one coin out of three 25 paise and two 50 paise coins to a beggar is
(a) 32 (b) 12
(c) 11 (d) ${}^{12}P_1 - 1$

Comprehension Based Questions

Passage

Directions (Q. Nos. 18-20) *Different words are being formed by arranging the letters of the word 'SUCCESS'. All the words obtained by written in the form of a dictionary.*

18. The number of words in which the two C are together but no two S are together, is
(a) 120 (b) 96 (c) 24 (d) 420

19. The number of words in which the consonants appear in alphabetic order is
(a) 42 (b) 40 (c) 420 (d) 280

20. The rank of the word 'SUCCESS' in the dictionary is
(a) 328 (b) 329
(c) 330 (d) 331

Assertion and Reason

Directions (Q. Nos. 21-32) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*) *and* (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

21. **Statement I** The number of different car licence plates can be constructed, if the licences contain three letters of the English alphabet followed by a three digit number is $(26)^3 \times (900)$ (if repetitions are allowed).

Statement II The number of permutations of n different things taken r at a time when each things may be repeated any number of times is n^r.

22. **Statement I** A number of four different digit is formed with the help of the digits 1, 2, 3, 4, 5, 6, 7 in all possible ways. Then, number of ways which are exactly divisible by 4 is 200.

Statement II A number divisible by 4, if unit place digit divisible by 4.

23. **Statement I** The number of non-negative integral solutions of $x_1 + x_2 + x_3 + \ldots + x_n = r$ is ${}^{r+n-1}C_r$.

Statement II The number of ways in which n identical things can be distributed into r different groups is ${}^{n+r-1}C_n$.

24. **Statement I** From a group of 8 men and 4 women at team of 5, including atleast one woman can be formed in 736 ways.

Statement II Number of ways of selecting atleast one woman from m men and n women is ${}^{m+n}C_n - {}^{m}C_n$.

25. **Statement I** Product of five consecutive natural numbers is divisible by 4!.

Statement II Product of n consecutive natural numbers is divisible by $(n+1)!$.

26. **Statement I** Number of rectangle on a chess board is ${}^8C_2 \times {}^8C_2$.

Statement II To form a rectangle we have to select any two of the horizontal line and any two of the vertical line.

27. **Statement I** The sum of the digits in the tens place of all numbers formed with the help of 2, 3, 4, 5 taken all at a time is 84.

Statement II The sum of the digits in the units place of all numbers formed with the help of $a_1, a_2, \ldots, a_n$ taken all at a time is
$(n-1)!(a_1 + a_2 + \ldots + a_n)$ (repetition of digits is not allowed).

28. **Statement I** Number of ways in which 10 identical toys can be distributed among 3 students, if each receives atleast one toys is ${}^9C_2$.

Statement II Number of positive integral solutions of $x + y + z + w = 7$ is ${}^6C_2$.

29. **Statement I** Let $E = \{1, 2, 3, 4\}$ and $F = \{a, b\}$. Then, the number of onto functions from E to F is 14.

Statement II Number of ways in which four distinct objects can be distributed into two different boxes is 14, if no box remains empty.

30. **Statement I** Number of ways in which Indian team (11 players) can bat, if Yuvraj wants to bat before Dhoni and Pathan wants to bat after Dhoni is 11!/3!.

Statement II Yuvraj, Dhoni and Pathan can be arranged in batting order in 3! ways.

31. **Statement I** The number of ways distributing 10 identical balls in 4 distinct boxes such that no box is empty is ${}^9C_3$.

Statement II The number of ways of choosing any 3 places, from 9 different places is ${}^9C_3$.

32. In a shop there are five types of ice-creams available. A child buys six ice-creams.

Statement I The number of different ways the child can buy the six ice-creams is ${}^{10}C_5$.

Statement II The number of different ways the child can buy the six ice-creams is equal to the number of different ways of arranging 6 A's and 4 B's in a row.

Previous Years' Questions

33. Let A and B two sets containing 2 elements and 4 elements respectively. The number of subsets of $A \times B$ having 3 or more elements is [JEE Main 2013]
(a) 256 (b) 220
(c) 219 (d) 211

34. Let T_n be the number of all possible triangles formed by joining vertices of an n-sided regular polygon. If $T_{n+1} - T_n = 10$, then the value of n is [JEE Main 2013]
(a) 7 (b) 5
(c) 10 (d) 8

35. Assuming the balls to be identical except for difference in colours, the number of ways in which one or more balls can be selected from 10 white, 9 green and 7 black balls is [AIEEE 2012]
(a) 880 (b) 629
(c) 630 (d) 879

36. Let $X = \{1, 2, 3, 4, 5\}$. The number of different ordered pairs (Y, Z) that can formed such that $Y \subseteq X, Z \subseteq X$ and $Y \cap Z$ is empty, is [AIEEE 2012]
(a) 5^2 (b) 3^5 (c) 2^5 (d) 5^3

37. There are two urns. Urn A has 3 distinct red balls and urn B has 9 distinct blue balls. From each urn two balls are taken out at random and then transferred to the other. The number of ways in which this can be done, is [AIEEE 2010]
(a) 3 (b) 36 (c) 66 (d) 108

38. From 6 different novels and 3 different dictionaries, 4 novels and 1 dictionary are to be selected and arranged in a row on the shelf so that the dictionary is always in the middle. Then, the number of such arrangements is [AIEEE 2009]
(a) atleast 500 but less than 750
(b) atleast 750 but less than 1000
(c) atleast 1000
(d) less than 500

39. How many different words can be formed by jumbling the letters in the word MISSISSIPPI in which no two S are adjacent ? [AIEEE 2008]
(a) $7 \cdot {}^6C_4 \cdot {}^8C_4$ (b) $8 \cdot {}^6C_4 \cdot {}^7C_4$
(c) $6 \cdot 7 \cdot {}^8C_4$ (d) $6 \cdot 8 \cdot {}^7C_4$

40. The set $S = \{1, 2, 3, \ldots, 12\}$ is to be partitioned into three sets A, B and C of equal size. Thus, $A \cup B \cup C = S$, $A \cap B = B \cap C = A \cap C = \phi$. The number of ways to partition S is [AIEEE 2007]
(a) $12!/3!(4!)^3$
(b) $12!/3!(3!)^4$
(c) $12!/(4!)^3$
(d) $12!/(3!)^4$

41. At an election, a voter may vote for any number of candidates not greater than the number to be elected. There are 10 candidates and 4 are to be elected. If a voter votes for atleast one candidate, then the number of ways in which he can vote, is [AIEEE 2006]
(a) 6210 (b) 385
(c) 1110 (d) 5040

42. If the letters of the word SACHIN are arranged in all possible ways and these words are written out as in dictionary, then the word SACHIN appears at serial number [AIEEE 2005]
(a) 602 (b) 603
(c) 600 (d) 601

43. How many ways are there to arrange the letters in the word GARDEN with the vowels in alphabetical order? [AIEEE 2004]
(a) 120 (b) 240 (c) 360 (d) 480

44. The number of ways of distributing 8 identical balls in 3 distinct boxes, so that none of the boxes is empty, is [AIEEE 2004]
(a) 5 (b) 21
(c) 3^8 (d) ${}^8C_3$

45. A student is to answer 10 out of 13 questions in an examination such that he must choose atleast 4 from the first five questions. The number of choices available to him is [AIEEE 2003]
(a) 140 (b) 196
(c) 280 (d) 346

46. The number of ways in which 6 men and 5 women can dine at a round table, if no two women are to sit together, is given by [AIEEE 2003]
(a) $6! \times 5!$ (b) 30
(c) $5! \times 4!$ (d) $7! \times 5!$

47. If ${}^nC_r$ denotes the number of combinations of n things taken r at a time, then the expression ${}^nC_{r+1} + {}^nC_{r-1} + 2 \times {}^nC_r$ equals [AIEEE 2003]
(a) ${}^{n+2}C_r$ (b) ${}^{n+2}C_{r+1}$
(c) ${}^{n+1}C_r$ (d) ${}^{n+1}C_{r+1}$

Answers

the **Guidance**

Round I

1. Number of ways to fill the IIIrd place = 8

Number of ways to fill the IVth place = 7

6	7			
I	II	III	IV	V

Number of ways to fill the Vth place = 6

Hence, by FPC total number of ways $= 8 \times 7 \times 6 = 56 \times 6$

$= 336$

2. Number of ways choose the first flag = 5

Number of ways to choose the second flag from the rest of four flags = 4

Hence, by FPC total number of ways $= 5 \times 4 = 20$

3. Out of 8 persons, one person can be chosen for chairman in 8 ways. Now, a person cannot hold more than one position *i.e.*, out of 7 persons, one person can be chosen for vice-chairman in 7 ways.

Hence, by FPC total number of ways $= 8 \times 7 = 56$

4. Given, $\frac{1}{6!} + \frac{1}{7!} = \frac{x}{8!} \Rightarrow \frac{1}{6!} + \frac{1}{7 \times 6!} = \frac{x}{8 \times 7 \times 6!}$

$$\frac{1}{6!}\left[1 + \frac{1}{7}\right] = \frac{x}{8 \times 7 \times 6!} \Rightarrow \frac{1}{1} + \frac{1}{7} = \frac{x}{8 \times 7}$$

$$\Rightarrow \quad \frac{7+1}{7} = \frac{x}{8 \times 7}$$

$$\Rightarrow \quad x = 8 \times 8 = 64$$

5. Now, $[1 \cdot 3 \cdot 5 \ldots (2n-3)(2n-1)]2^n$

$$= \frac{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \ldots (2n-1)\,(2n)2^n}{2 \cdot 4 \cdot 6 \ldots 2n}$$

$$= \frac{(2n)!\,2^n}{2^n(1 \cdot 2 \cdot 3 \ldots n)} = \frac{(2n)!}{n!}$$

6. The product of r consecutive natural numbers

$$= 1 \cdot 2 \cdot 3 \cdot 4 \ldots r = r!$$

The natural number will divided by $r!$.

7. Now, $100! = 1 \cdot 2 \cdot 3 \cdot \ldots 98 \cdot 99 \cdot 100$

$$= (1 \cdot 2 \cdot 4 \cdot 5 \ldots 98 \cdot 100)(3 \cdot 6 \cdot 9 \cdot \ldots 96 \cdot 99)$$

$$= K \cdot 3^{33}(1 \cdot 2 \cdot 3 \ldots 32 \cdot 33)$$

$(\because \text{let } K = 1 \cdot 2 \cdot 4 \cdot 5 \ldots 98 \cdot 100)$

$= [K(1\cdot 2\cdot 4\ldots 31\cdot 32)]\, 3^{33}\cdot(3\cdot 9\cdot 12\ldots 30\cdot 33)$

$= K_1\cdot 3^{33}\cdot 3^{11}(1\cdot 2\cdot 3\ldots 10\cdot 11)$

$[\because \text{let } K(1\cdot 2\cdot 4\ldots 31\cdot 32) = K_1]$

$= K_1(1\cdot 2\cdot 4\ldots 10\cdot 11)3^{33}\cdot 3^{11}(3\cdot 6\cdot 9\cdot 12)$

$= K_2 3^{33}\cdot 3^{11}\cdot 3^4(1\cdot 2\cdot 3\cdot 4)$

$= K_3\cdot 3^{33}\cdot 3^{11}\cdot 3^4\cdot 3 \qquad [\because \text{let } K_2(1\cdot 2\cdot 3\cdot 4) = K_3]$

$= K_3\cdot 3^{49}$

Hence, exponent of 3 is 49.

8. Given, ${}^5P_r = 2\ {}^6P_{r-1}$

$$\frac{5!}{(5-r)!} = 2\times\frac{6!}{(6-r+1)!} \qquad \left[\because {}^nP_r = \frac{n!}{(n-r)!}\right]$$

$$\Rightarrow \quad \frac{5!}{(5-r)!} = 2\times\frac{6\times 5!}{(7-r)!}$$

$$\Rightarrow \quad \frac{1}{(5-r)!} = \frac{12}{(7-r)(6-r)(5-r)!}$$

$$\Rightarrow \quad (7-r)(6-r) = 12$$

$$\Rightarrow \quad 42 - 7r - 6r + r^2 = 12$$

$$\Rightarrow \quad r^2 - 13r + 30 = 0$$

$$\Rightarrow \quad r^2 - 10r - 3r + 30 = 0$$

$$\Rightarrow \quad r(r-10) - 3(r-10) = 0$$

$$\Rightarrow \quad (r-10)(r-3) = 0$$

$$\therefore \quad r = 10, 3$$

But we will take only $r = 3$ as $0 \le r \le 5$.

9. The word 'PERMUTATIONS' has

P	—	1 time
E	—	1 time
R	—	1 time
M	—	1 time
U	—	1 time
T	—	2 times
A	—	1 time
I	—	1 time
O	—	1 time
N	—	1 time
S	—	1 time

(i) Word start with P and end with S *i.e.*,

P											S

First and last position are already filled by P and S, respectively.

Remaining 10 positions can be filled $= \dfrac{10!}{2!}$ ways

$$= \frac{10\times 9\times 8\times 7\times 6\times 5\times 4\times 3\times 2!}{2!}$$

$= 720\times 7\times 6\times 5\times 4\times 3$

$= 720\times 2520 = 1814400$

10. In a nine digits number, there are four even places for the four odd digits 3, 3, 5, 5.

$\therefore$ Required number of ways $= \dfrac{4!}{2!\,2!}\cdot\dfrac{5!}{2!\,3!} = 60$

11. The number will be even, if last digit is either 2, 4, 6 or 8 *i.e.*, the last digit can be filled in 4 ways and remaining two digits can be filled in ${}^8P_2$ ways. Hence, required number of numbers of three different digits $= {}^8P_2\times 4 = 224$.

12. The total number of 9-digit numbers, having all digits are different $= 9\times {}^9P_8$

$$= \frac{9\times 9!}{1!} = 9\times 9!$$

($\because$ in first place we select any one of nine numbers except zero. In rest of the eight places, we select any eight numbers from remaining 9 numbers.)

13. In a word ARTICLE, vowels are A, E, I and consonants are C, L, R, T.

In a seven letter word, there are three even places in which three vowels are placed in 3! way. In rest of the four places, four consonants are placed in 4! ways.

$\therefore$ Required number of ways $= 3!\times 4!$

$= 6\times 24 = 144$

14. Two women occupy the chair from 1 to 4 in ${}^4P_2$ ways and 3 men occupy the remaining chairs in ${}^6P_3$ ways.

$\therefore$ Required number of ways $= {}^4P_2\times {}^6P_3$

$= 12\times 120 = 1440$

15. In a word RACHIT, the number of words beginning with A, C, H, I is 5! and the next word we get RACHIT.

$\therefore$ Required number of words $= 4\times 5! + 1$

$= 4\times 120 + 1 = 481$

16. In a word TRIANGLE, vowels are (A, E, I) and consonants are (G, L, N, R, T).

First, we fix the 5 consonants in alternate position in 5! ways.

_G_L_N_R_T_

In rest of the six blank position, three vowels can be arranged in ${}^6P_3$ ways.

$\therefore$ Total number of different words $= 5!\times {}^6P_3$

$= 120\times 6\times 5\times 4 = 14400$

17. Given, total number of digits are 4.

$\therefore$ Total four digit numbers can be formed

$= {}^4P_4 = 4! = 24$

18. The sum of the digit in unit place of all the numbers formed

$= 3!(3 + 4 + 5 + 6)$

$= 6\times 18 = 108$

19. Using the digits 0, 1, 2, ... , 9 the number of five digits telephone numbers which can be formed is 10^5 (since, repetition is allowed).

The number of five digits telephone numbers, which have none of the digits repeated

$$= {}^{10}P_5 = 30240$$

$\therefore$ The required number of telephone number

$$= 10^5 - 30240 = 69760$$

20. In the word INTEGER, we have 5 letters other than 'I' and 'N' of which two are identical (E's). We can arrange these letters in $\frac{5!}{2!}$ ways. In any such arrangements, 'I' and 'N' can be placed in 6 available gaps in ${}^6P_2$ ways.

So, required number of ways $= \frac{5!}{2!} \cdot {}^6P_2 = m_1$. Now, if word start with 'I' and end with 'R', then the remaining letters are 5.

So, total number of ways $= \frac{5!}{2!} = m_2$

$$\therefore \quad \frac{m_1}{m_2} = \frac{5!}{2!} \cdot \frac{6!}{4!} \cdot \frac{2!}{5!} = 30$$

21. The number of words starting from A are $= 5! = 120$

The number of words starting from I are $= 5! = 120$

The number of words starting from KA are $= 4! = 24$

The number of words starting from KI are $= 4! = 24$

The number of words starting from KN are $= 4! = 24$

The number of words starting from KRA are $= 3! = 6$

The number of words starting from KRIA are $= 2! = 2$

The number of words starting from KRIN are $= 2! = 2$

The number of words starting from KRISA are $= 1! = 1$

The number of words starting from KRISNA are $= 1! = 1$

Hence, rank of the word KRISNA

$$= 2(120) + 3(24) + 6 + 2(2) + 2(1) = 324$$

22. The number of words starting from E are $= 5! = 120$

The number of words starting from H are $= 5! = 120$

The number of words starting from ME are $= 4! = 24$

The number of words starting from MH are $= 4! = 24$

The number of words starting from MOE are $= 3! = 6$

The number of words starting from MOH are $= 3! = 6$

The number of words starting from MOR are $= 3! = 6$

The number of words starting from MOTE are $= 2! = 2$

The number of words starting from MOTHER are $= 1! = 1$

Hence, rank of the word MOTHER

$$= 2(120) + 2(24) + 3(6) + 2 + 1$$
$$= 309$$

23. Since, three particular things must occur together. Therefore, we have to select $r - 3$ person from $n - 3$. And there are $r - 3$ person can be arranged in $(r - 2)!\,3!$.

$\therefore$ Required number of permutation

$$= {}^{n-3}C_{r-3}(r-2)!\,3!$$

24. In out of 10 persons, P_1 is always consider and P_4 and P_5 is not consider.

i.e., We have to select 4 persons out of 7 person and after that they arrange it.

$\therefore$ Required number of ways $= {}^7C_4 \times 5! = \frac{7 \times 6 \times 5}{3 \times 2 \times 1} \times 120$

$$= 35 \times 120 = 4200$$

25. **Hint** We have, $\quad a = {}^{x+2}P_{x+2} = (x+2)!$

and $\quad b = {}^xP_{11} = \frac{x!}{(x-11)!}$ and $c = {}^{x-11}P_{x-11} = (x-11)!$

26. At first we have to a accommodate those 5 animals in cages which cannot enter in 4 small cages, therefore number of ways are ${}^6P_5$ and rest of the five animals arrange in $5!$ ways.

Total number of ways $= 5! \times {}^6P_5$

$$= 120 \times 720 = 86400$$

27. When we arrange one things at a time, the number of possible permutations is n. When we arrange them two at a time the number of possible permutations are $n \times n = n^2$ and so on. Thus, the total number of permutations are

$$n + n^2 + \ldots + n^r = \frac{n(n^r - 1)}{n - 1} \qquad (\because n > 1)$$

28. Two positions for A_1 and A_{10} can be selected in ${}^{10}C_2$ ways. Rest eight students can be ranked in 8! ways. Hence, total number of ways is ${}^{10}C_2 \times 8! = (1/2)(10!)$.

29. Since, out of eleven members two members sit together, then the number of arrangements $= 9! \times 2$

($\because$ two numbers can be sit in two ways.)

30. $\because$ Remaining 5 can be seated in 4! ways.

Now, on cross marked five places 2 person can sit in ${}^5P_2$ ways.

So, number of arrangements

$$= 4! \times \frac{5!}{3!} = 24 \times 20 = 480 \text{ ways}$$

31. Since, total members are 15 but three special members constitute one member.

Therefore, required number of arrangements are $12! \times 2$, because, chairman remains between the two specified persons and the person can sit in two ways.

32. There are total $20+1=21$ persons. The two particular persons and the host be taken as one unit so that these remain $21-3+1=19$ persons be arranged in round table in 18! ways. But the two persons on either sides of the host can themselves be arranged in 2! ways.

$\therefore$ Required number of ways $=2!\times 18!=2\cdot 18!$

33. First we fix the alternate position of girls and they arrange in 4! ways and in the five places five boys can be arranged in ${}^5P_5$ ways.

$\therefore$ Total number of ways $=4!\times {}^5P_5=4!\times 5!$

34. ***Case* I** When number in two digits.

Total number of ways $={}^9C_1\times {}^9C_1=9\times 9=81$

***Case* II** When number in three digits

Total number of ways $={}^9C_1\times {}^9C_1\times {}^9C_1=9\times 9\times 9=729$

$\therefore$ Total number of ways $=81+729=810$

35. Since, each element of a domain can image any of the elements of codomain.

$\therefore$ Required number of ways $=10\times 10\ldots\times 10=10^{10}$

36. Each digit can be placed in 2 ways.

$\therefore$ Required number of ways $=2^{10}$

37. Any number between 1 to 999 is a 3-digit number xyz where the digits x, y, z are any digits from 0 to 9.

Now, we first count the numbers in which 3 occurs once only. Since, 3 can occur at one place in ${}^3C_1$ ways, there are ${}^3C_1\cdot(9\times 9)=3\cdot 9^2$ such numbers.

Again, 3 can occur in exactly two places in ${}^3C_2\cdot(9)$ such numbers. Lastly ,3 can occur in all the three digits in one such number only 333.

$\therefore$ The number of times 3 occurs

$$=1\times(3\times 9^2)+2\times(3\times 9)+3\times 1=300$$

38. The number forms by the figure 4, 5, 6, 7, 8 which is greater than 56000 is in two cases.

***Case* I** Let the ten thousand digit place number be greater than 5. The number of numbers

$$={}^3C_1\times {}^4C_1\times {}^3C_1\times {}^2C_1\times {}^1C_1=3\times 4\times 3\times 2\times 1=72$$

***Case* II** Let the ten thousand digit number be 5 and thousand digit number be either 6 or greater than 6.

Then, the number of numbers

$$={}^3C_1\times {}^3C_1\times {}^2C_1\times {}^1C_1=3\times 3\times 2\times 1=18$$

$\therefore$ Required number of ways $=72+18=90$

39. Given, $\quad {}^nC_{12}={}^nC_8$

$\therefore \quad {}^nC_{n-12}={}^nC_8 \qquad (\because {}^nC_r={}^nC_{n-r})$

$\Rightarrow \quad n-12=8\Rightarrow n=20$

40. $${}^{47}C_4+\sum_{r=1}^{5}{}^{52-r}C_3={}^{47}C_4+{}^{51}C_3+{}^{50}C_3+{}^{49}C_3+{}^{48}C_3+{}^{47}C_3$$

$$={}^{51}C_3+{}^{50}C_3+{}^{49}C_3+{}^{48}C_3+({}^{47}C_3+{}^{47}C_4)={}^{52}C_4$$

41. ${}^nC_r+2\,{}^nC_{r-1}+{}^nC_{r-2}={}^nC_r+{}^nC_{r-1}+{}^nC_{r-1}+{}^nC_{r-2}$

$$={}^{n+1}C_r+{}^{n+1}C_{r-1}={}^{n+2}C_r$$

42. ${}^nC_3+{}^nC_4>{}^{n+1}C_3$

$\Rightarrow \quad {}^{n+1}C_4>{}^{n+1}C_3 \quad ({}^nC_r+{}^nC_{r+1}={}^{n+1}C_{r+1})$

$\Rightarrow \quad \dfrac{{}^{n+1}C_4}{{}^{n+1}C_3}>1\Rightarrow \dfrac{n-2}{4}>1\Rightarrow n>6$

43. Total number of available courses $=9$

Out of these 5 courses have to be chosen. But it is given that 2 courses are compulsory for every student *i. e.*, you have to choose only 3 courses instead of 5, out of 7 instead of 9.

It can be done in ${}^7C_3$ ways $=\dfrac{7\times 6\times 5}{6}=35$ ways

44. Let total number of persons be n.

Since, total number of hand shakes $=66$

$\therefore \quad {}^nC_2=66\Rightarrow \dfrac{n(n-1)}{2}=66$

$\Rightarrow \quad n^2-n-132=0\Rightarrow (n-12)(n+11)=0$

$\Rightarrow \quad n=12 \quad (\because n$ cannot be negative)

45. $\therefore$ Required number of ways $={}^{22-4-2}C_{11-2}={}^{16}C_9$

46. A selection of 3 balls so as to include atleast one black ball, can be made in the following 3 mutually exclusive ways

(i) The number of ways in which 1 black balls and 2 others are selected

$$={}^3C_1\times {}^6C_2=3\times 15=45$$

(ii) The number of ways in which 2 black balls and 1 other are selected

$$={}^3C_2\times {}^6C_1=3\times 6=18$$

(iii) The number of ways in which 3 black balls and no other are selected $={}^3C_3=1$

$\therefore$ Total numbers of ways $=45+18+1=64$

47. The number of ways in which we can choose a committee = Choose two men and four women + Choose three men and six women

$$={}^4C_2\times {}^6C_4+{}^4C_3\times {}^6C_6$$

$$=6\times 15+4\times 1=90+4=94$$

48. Since, a five digit number is formed using digits { 0, 1, 2, 3, 4 and 5} divisible by 3 *i.e.*, only possible when sum of digits is multiple of 3 which gives two cases.

***Case* I** {using digits 0, 1, 2, 4, 5}

Number of numbers

$$={}^4C_1\times {}^4C_1\times {}^3C_1\times {}^2C_1\times {}^1C_1=4\times 4\times 3\times 2\times 1=96$$

***Case* II** {using digits 1, 2, 3, 4, 5}

Number of numbers

$$={}^5C_1\times {}^4C_1\times {}^3C_1\times {}^2C_1\times {}^1C_1=5\times 4\times 3\times 2\times 1=120$$

$\therefore$ Total numbers formed $=120+96=216$

49. Total number of ways =

$$^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + {}^{10}C_4 + {}^{10}C_5 + {}^{10}C_6 + \ldots + {}^{10}C_{10}$$

$$= 2^{10} - 1 \qquad (\because {}^nC_0 + {}^nC_1 + {}^nc_2 + \ldots = 2^n)$$

50. Any number divisible by 5, if either 0 or 5 in unit place

6			0 or 5
Th	H	T	U

In unit place, the number of ways = $^2C_1 = 2$

In thousand place, number 6 is fixed. In ten and hundred place the number of ways of selection $= 8 \times 7$.

$\therefore$ Required number of ways $= 2 \times 8 \times 7 = 112$

51. Since, questions 1 and 2 are compulsory, so students has to select two question in out of four questions.

$\therefore$ Required number of ways = $^3C_2 = 3$

52. There are two cases arises

***Case* I** Choose six from class XI and five from class XII

$\therefore$ Number of ways = $^{20}C_6 \times {}^{20}C_5$

***Case* II** Choose five from class XI and six from class XII

$\therefore$ Number of ways = $^{20}C_5 \times {}^{20}C_6$

$\therefore$ Required number of ways $= 2(^{20}C_5 \times {}^{20}C_6)$

53. $\because$ 26 cards can be chosen out of 52 cards in $^{52}C_{26}$ ways. There are two ways in which each card can be dealt because a card can be either from the first pack or from the second.

$\therefore$ Total number of ways = $^{52}C_{26} \cdot 2^{26}$

54. First we fix the alternate position of English books. Then, there are 22 vacant places for Hindi books.

Hence, total number of ways = $^{22}C_{19} = \dfrac{22!}{3!9!} = 1540$

55. Man goes from Gwalior to Bhopal in 4 ways and they come back in 3 ways.

$\therefore$ Total number of ways = $^4C_1 \times {}^3C_1 = 4 \times 3 = 12$ ways

56. Let there are n teams.

Each team play to every other team in $^nC_2$ ways

$\therefore \quad {}^nC_2 = 153$ (given)

$\Rightarrow \quad \dfrac{n!}{(n-2)!2!} = 153$

$\Rightarrow \quad n(n-1) = 306$

$\Rightarrow \quad n^2 - n - 306 = 0$

$\Rightarrow \quad (n-18)(n+17) = 0$

$\Rightarrow \quad n = 18 \quad (\because n$ is never negative)

57. The number of times he will go to the garden is same as the number of selecting 3 children from 8.

Therefore, the required number of ways = $^8C_3 = 56$

58. Since, 2 persons can drive the car, therefore we have to select 1 from these two. This can be done in $^2C_1$ ways. Now, from the remaining 5 persons we have to select 2 which can be done in $^5C_2$ ways.

Therefore, the required number of ways in which the car can be filled = $^5C_2 \times {}^2C_1 = 10 \times 2 = 20$

59. In all, we have 8 squares in which 6 'X' have to be placed and it can be done in $^8C_6 = 28$ ways.

But this includes the possibility that either the top or horizontal row does not have any 'X'. Since, we want each row must have atleast one 'X', these two possibilities are to be excluded.

Hence, required number of ways $= 28 - 2 = 26$

60. The number of ways that the candidate may select

(i) if 2 questions from A and 4 questions from B

$$= {}^5C_2 \times {}^5C_4 = 50$$

(ii) 3 questions from A and 3 questions from B

$$= {}^5C_3 \times {}^5C_3 = 100$$

and (iii) 4 questions from A and 2 questions from B

$$= {}^5C_4 \times {}^5C_2 = 50$$

Hence, total number of ways $= 50 + 100 + 50 = 200$

61. Each question can be answered in 4 ways and all question can be answered correctly in only one way.

So, required number of ways $= (^4C_1)^3 - 1 = 4^3 - 1 = 63$

62. Let there be 'n' men participants. Then, the number of games that the men play between themselves is $2 \cdot {}^nC_2$ and the number of games that the men played with the women is $2 \cdot (2n)$.

$\therefore \quad 2 \cdot {}^nC_2 - 2 \cdot 2n = 66$ (given)

$\Rightarrow \quad n(n-1) - 4n - 66 = 0 \Rightarrow n^2 - 5n - 66 = 0$

$\Rightarrow \quad (n+5)(n-11) = 0 \Rightarrow n = 11$

$\therefore$ Number of participants = 11 men + 2 women = 13

63. There are two cases arise

***Case* I** They do not invite the particular friend

$$= {}^8C_6 = 28$$

***Case* II** They invite one particular friend

$$= {}^8C_5 \times {}^2C_1 = 112$$

$\therefore$ Required number of ways $= 28 + 112 = 140$

64. Since, the person is allowed to select atmost n coins out of $(2n+1)$ coins, therefore in order to select one, two, three, ..., n coins. Thus, if T is the total number of ways of selecting atleast one coin, then

$$T = {}^{2n+1}C_1 + {}^{2n+1}C_2 + \ldots + {}^{2n+1}C_n = 255 \qquad \ldots(i)$$

Using the binomial theorem

$$^{2n+1}C_0 + {}^{2n+1}C_1 + {}^{2n+1}C_2 + \ldots + {}^{2n+1}C_n + {}^{2n+1}C_{n+1} + {}^{2n+1}C_{n+2} + \ldots + {}^{2n+1}C_{2n+1}$$

$$= (1+1)^{2n+1} = 2^{2n+1}$$

$$\Rightarrow \quad {}^{2n+1}C_0 + 2({}^{2n+1}C_1 + {}^{2n+1}C_2 + \ldots + {}^{2n+1}C_n) + {}^{2n+1}C_{2n+1} = 2^{2n+1}$$

$$\Rightarrow \quad 1 + 2(T) + 1 = 2^{2n+1}$$

$$\Rightarrow \quad 1 + T = \frac{2^{2n+1}}{2} = 2^{2n} \quad \text{[from Eq. (i)]}$$

$$\Rightarrow \quad 1 + 255 = 2^{2n}$$

$$\Rightarrow \quad 2^{2n} = 2^8 \Rightarrow n = 4$$

65. First stall can be filled in 3 ways, second stall can be filled in 3 ways and so on.

$\therefore$ Number of ways of loading steamer

$$= {}^3C_1 \times {}^3C_1 \times \ldots \times {}^3C_1 \text{ (12 times)}$$

$$= 3 \times 3 \times \ldots \times 3 \text{ (12 times)} = 3^{12}$$

66. $\because$ The candidate is unsuccessful, if he fails in 9 or 8 or 7 or 6 or 5 papers.

$\therefore$ Numbers of ways to be unsuccessful

$$= {}^9C_9 + {}^9C_8 + {}^9C_7 + {}^9C_6 + {}^9C_5$$

$$= {}^9C_0 + {}^9C_1 + {}^9C_2 + {}^9C_3 + {}^9C_4$$

$$= \frac{1}{2}({}^9C_0 + {}^9C_1 + \ldots + {}^9C_9)$$

$$= \frac{1}{2}(2^9) = 2^8 = 256$$

67. In each dye of chosen, there are two possibility either chose or reject it.

$\therefore$ The total number of ways in which atleast one green and one blue dye is chosen

$$= (2^5 - 1)(2^4 - 1)2^3 = 31 \times 15 \times 8 = 3720$$

68. The number of ways in which four different balls can be placed in four different boxes

$$= {}^4C_1 + {}^3C_1 + {}^2C_1 + {}^1C_1$$

$$= 4 + 3 + 2 + 1 = 10$$

$\therefore$ Required number of ways $= 10 - 1 = 9$

(since, only one way in which the same ball have a same box).

69. Let the boxes be marked as A, B, C. We have to ensure that no box remains empty and all five balls have to put in. There will be two possibilities.

(i) Any two box containing one ball each and 3rd box containing 3 balls. Number of ways

$$= A(1)\, B(1)\, C(3)$$

$$= {}^5C_1 \cdot {}^4C_1 \cdot {}^3C_3 = 5 \cdot 4 \cdot 1 = 20$$

Since, the box containing 3 balls could be any of the three boxes A, B, C. Hence, the required number of ways $20 \times 3 = 60$.

(ii) Any two box containing 2 balls each and 3rd containing 1 ball, the number of ways

$$= A(2)\, B(2)\, C(1) = {}^5C_2 \cdot {}^3C_2 \cdot {}^1C_1$$

$$= 10 \times 3 \times 1 = 30$$

Since, the box containing 1 ball could be any of the three boxes A, B, C. Hence, the required number of ways $= 30 \times 3 = 90$.

Hence, total number of ways $= 60 + 90 = 150$

70. For the first player, distribute the cards in ${}^{52}C_{17}$ ways. Now, out of 35 cards left 17 cards can be put for second player in ${}^{35}C_{17}$ ways. Similarly, for third player put them in ${}^{18}C_{17}$ ways. One card for the last player can be put in ${}^1C_1$ way. Therefore, the required number of ways for the proper distribution

$$= {}^{52}C_{17} \times {}^{35}C_{17} \times {}^{18}C_{17} \times {}^1C_1$$

$$= \frac{52!}{35!17!} \times \frac{35!}{18!17!} \times \frac{18!}{17!1!} \times 1! = \frac{52!}{(17!)^3}$$

71. $\dfrac{\text{Total arrangement}}{\text{Equally likely arrangement}} = \dfrac{18!}{6!6!6!} = \dfrac{18!}{(6!)^3}$

72. Total number of ways

= (Attempt 3 from group I and 4 from group II)

+ (Attempt 4 from group I and 3 from group II)

+ (Attempt 5 from group I and 2 from group II)

+ (Attempt 2 from group I and 5 from group II)

$$= {}^6C_3 \times {}^6C_4 + {}^6C_4 \times {}^6C_3 + {}^6C_5 \times {}^6C_2 + {}^6C_2 \times {}^6C_5$$

$$= 2({}^6C_3 \times {}^6C_4) + 2({}^6C_5 \times {}^6C_2) = 2(20 \times 15) + 2(6 \times 15)$$

$$= 600 + 180 = 780$$

73. Required number of ways

$$= \text{Coefficient of } x^{16} \text{ in } (x^3 + x^4 + x^5 + \ldots + x^{16})^4$$

$$= \text{Coefficient of } x^{16} \text{ in } x^{12}(1 + x + x^2 + \ldots + x^{12})^4$$

$$= \text{Coefficient of } x^4 \text{ in } (1 - x^{13})^4 (1 - x)^{-4}$$

$$= \text{Coefficient of } x^4 \text{ in } (1 - 13x^5 + \ldots) \times \left[1 + 4x + \ldots + \frac{(r+1)(r+2)(r+3)}{3!} x^r\right]$$

$$= \frac{(4+1)(4+2)(4+3)}{3!} = 35$$

74. Total number of books $= a + 2b + 3c + d$

$\therefore$ The total number of arrangements

$$= \frac{(a + 2b + 3c + d)!}{a!(b!)^2(c!)^3}$$

75. Since, the books consisting of 5 Mathematics, 4 Physics and 2 Chemistry can be put together of the same subject in $5!\,4!\,2!$ ways.

But these subject books can be arranged itself in 3! ways

$\therefore$ Required number of ways $= 5!\,4!\,3!\,2!$.

76. We can think of three packets. One consisting of three boys of class X, other consisting of four boys of class XI and last one consisting of five boys of class XII. These packets can be arranged in 3! ways and contents of these packets can be further arranged in 3!4! and 5! ways, respectively. Hence, the total number of ways is $3! \times 3! \times 4! \times 5!$.

77. If the function is one one, then select any three from the set B in ${}^7C_3$ ways *i.e.*, 35 ways.

If the function is many one, then there are two possibilities. All three corresponds to same element number of such functions $= {}^7C_1 = 7$ ways. Two corresponds to same element. Select any two from the set B. The larger one corresponds to the larger and the smaller one corresponds to the smaller the third may corresponds to any two.

Number of such functions $= {}^7C_2 \times 2 = 42$

So, the required number of mappings $= 35 + 7 + 42 = 84$

78. Total number of functions

$$= \text{Number of dearrangement of 5 objects}$$
$$= 5!\left(\frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!}\right) = 44$$

79. We know, a triangle will be formed by taking three points at a time.

$\therefore$ Required number of triangles $= {}^{12}C_3 - {}^7C_3$

$$= \frac{12 \times 11 \times 10}{3 \times 2 \times 1} - \frac{7 \times 6 \times 5}{3 \times 2} = 220 - 35 = 185$$

80. Total number of parallelogram formed

$$= {}^4C_2 \times {}^3C_2 = 6 \times 3 = 18$$

81. Two circles intersect maximum at two distinct points.

Now, two circles can be selected in ${}^6C_2$ ways.

$\therefore$ Total number of points of intersection are

$${}^6C_2 \times 2 = 30$$

82. Let n be the number of diagonals of a polygon.

Then, $\quad {}^nC_2 - n = 44$

$\Rightarrow \quad \dfrac{n(n-1)}{2} - n = 44 \Rightarrow n^2 - 3n - 88 = 0$

$\Rightarrow \quad n = -8$ or $11 \quad \therefore n = 11$

83. Required number of diagonals $= {}^mC_2 - m$

$$= \frac{m(m-1)}{2!} - m = \frac{m}{2!}(m-3)$$

84. The triangle will be formed by joining any three non-collinear points.

$\therefore$ Required number of ways $= {}^8C_3 - {}^5C_3 - {}^3C_3$

$$= {}^8C_3 - {}^5C_3 - 1$$

85. Total number of points are $m + n + k$, the triangles formed by these points $= {}^{m+n+k}C_3$

Joining of three points on the same line gives no triangle, the number of such triangles is ${}^mC_3 + {}^nC_3 + {}^kC_3$

$\therefore$ Required number of triangles

$$= {}^{m+n+k}C_3 - {}^mC_3 - {}^nC_3 - {}^kC_3$$

86. Number of lines from 6 points $= {}^6C_2 = 15$

Points of intersection obtained from these lines $= {}^{15}C_2 = 105$

Now, we find the number of times, the original 6 points come.

Consider one point say A_1. Joining A_1 to remaining 5 points, we get 5 lines and any two lines from these 5 lines gives A_1 as the point of intersection.

$\therefore A_1$ is common in ${}^5C_2 = 10$ times out of 105 points of intersections.

Similar is the case with other five points.

$\therefore$ 6 original points come $6 \times 10 = 60$ times in points of intersection.

Hence, the number of distinct points of intersection

$$= 105 - 60 + 6 = 51$$

87. The required number of points

$$= {}^8C_2 \times 1 + {}^4C_2 \times 2 + ({}^8C_1 \times {}^4C_1) \times 2$$
$$= 28 + 12 + 32 \times 2 = 104$$

88. Since, there are n distinct points on a circle.

For making a pentagon it requires a five points.

According to given condition,

$${}^nC_5 = {}^nC_3 \quad \Rightarrow \quad n = 8$$

89. $\because$ The factors of $9600 = 2^7 \times 3^1 \times 5^2$

$\therefore$ The number of divisors $= (7+1)(1+1)(2+1)$

$$= 8 \times 2 \times 3 = 48$$

90. Since, $\quad 240 = 2^4 \cdot 3 \cdot 5$

$\therefore$ Total number of divisors $= (4+1)(1+1)(1+1) = 20$

Out of these 2, 6, 10 and 30 are of the form $4n + 2$.

91. Since, $\quad 38808 = 2^3 \times 3^2 \times 7^2 \times 11^1$

$\therefore$ Number of divisors $= 4 \times 3 \times 3 \times 2 - 2 = 72 - 2 = 70$

92. The number of divisors of ab^2c^2de

$$= (1+1)(2+1)(2+1)(1+1)(1+1) - 1$$
$$= 2 \cdot 3 \cdot 3 \cdot 2 \cdot 2 - 1 = 71$$

93. The required number of ways is equal to the number of dearrangements of 10 objects.

$\therefore$ Required number of ways

$$= 10!\left\{1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + \frac{1}{10!}\right\}$$

94. The number of ordered triples of positive integers which are solution of $x + y + z = 100$

$=$ coefficient of x^{100} in $(x + x^2 + x^3 + \ldots)^3$

$=$ coefficient of x^{100} in $x^3(1-x)^{-3}$

$=$ coefficient of x^{97} in

$$\left\{1 + 3x + 6x^2 + \ldots + \frac{(n+1)(n+2)}{2}x^n + \ldots\right\}$$

$$= \frac{(97+1)(97+2)}{2} = 49 \times 99 = 4851$$

95. Given, 4 vowels and 5 consonants

$\therefore$ Total number of words $= {}^4C_2 \times {}^5C_3 \times 5! = 6 \times 10 \times 120$

$$= 7200$$

96. For each historical monument, there are two possibilities either he visit or does not visit.

Total number of ways $= 2^5 \cdot 2^6 (2^7 - 1)$

Round II

1. We have, 32 places for teeth. For each place, we have two choices either there is a tooth or there is no tooth. Therefore, the number of ways to fill up these places is 2^{32}. As there is no person without a tooth, the maximum population is $2^{32}-1$.

2. For length, number of choices is

$$(2m-1)+(2m-3)+\ldots+3+1=m^2$$

Similarly, for breadth number of choices is

$$(2n-1)+(2n-3)+\ldots+3+1=n^2$$

Hence, required number of choices is m^2n^2.

3. Total time required = (total number of dials required to sure open the lock) $\times 5\,s$

$$=10^5\times 5\,s=\frac{500000}{60\times 60\times 13}\text{ days}$$

$$=10.7\text{ days}$$

Hence, 11 days are enough to open the safe.

4. Let n be the number of sides of the polygon.

$$n\cdot 160^\circ=(n-2)\cdot 180^\circ\Rightarrow 20^\circ\cdot n=360^\circ$$

$$\therefore\quad n=18$$

Then number of diagonals $={}^{18}C_2-18=153-18=135$

5. Required number of ways $={}^9C_4=126$

6. Total number of m elements subsets of $A={}^nC_m$ ...(i)

and number of m elements subsets of A each containing the element $a_4={}^{n-1}C_{m-1}$

According to the question, ${}^nC_m=\lambda\cdot{}^{n-1}C_{m-1}$

$$\Rightarrow\quad \frac{n}{m}\cdot{}^{n-1}C_{m-1}=\lambda\cdot{}^{n-1}C_{m-1}$$

$$\Rightarrow\quad \lambda=\frac{n}{m}\quad\Rightarrow\quad n=m\lambda$$

7. Number of ways of giving one prize for running $=16$

Number of ways of giving two prizes for swimming

$$=16\times 15$$

Number of ways of giving three prizes for riding

$$=16\times 15\times 14$$

$\therefore$ Required ways of giving prizes

$$=16\times 16\times 15\times 16\times 15\times 14$$

$$=16^3\times 15^2\times 14$$

8. The number of ways of selecting four numbers from 1 to 30 without any restriction is ${}^{30}C_4$. The number of ways of selecting four consecutive [*i.e.*, (1, 2, 3, 4), (2, 3, 4, 5), ..., (27, 28, 29, 30)] number is 27. Hence, the number of ways of selecting four integers which excludes consecutive four selections is

$${}^{30}C_4-27=\frac{30\times 29\times 28\times 27}{24}-27=27378$$

9. Other than 2, remaining five places can be filled by 1 and 3 for each place. The number of ways for five places is $2\times 2\times 2\times 2\times 2=2^5$. For 2, selecting 2 places out of 7 is ${}^7C_2$. Hence, for required number of ways is ${}^7C_2\times 2^5$.

10. **Hint** ${}^nP_3-{}^nC_3>100$

$$\Rightarrow\quad \frac{n!}{(n-3)!}-\frac{n!}{3!(n-3)!}>100$$

11. The number of ways he can select atleast one parantha is $2^3-1=7$. The number of ways he can select atleast one vegetable dish is $2^4-1=15$. The number of ways be can select zero or more items from salads and sauces is 2^5. Hence, the total number of ways is $7\times 15\times 32=3360$.

12. Select any three points from total $3p$ points, which can be done in ${}^{3p}C_3$ ways. But this also includes selection of three collinear points. Now, three collinear points from each straight line can be selected in ${}^pC_3$ ways. Then, the number of triangles is ${}^{3p}C_3-3\cdot{}^pC_3=p^2(4p-3)$.

13. No group of four numbers from the first 12 natural numbers can have the common difference 4.

If one group including 1 is selected with the common difference 1, then the other two group can have the common difference 1 or 2.

If one group including 1 is selected with the common difference 2, then one of the other two group can have the common difference 2 and the remaining group will have common difference 1.

If one group including 1 is selected with the common difference 3, then the other two groups can have the common difference 3.

Therefore, the required number of ways is $2+1+1=4$.

14. 20 cards can be chosen out of 52 cards in ${}^{52}C_{20}$ ways. There are two ways in which each card can be dealt, because a card can be either from the first pack or from the second. Hence, the total number of ways is ${}^{52}C_{20}\times 2^{20}$.

15. Total number of arrangements $=7!$

Number of arrangements of A, B, C, D among themselves $=4!$

$\therefore$ Number of arrangements when A, B, C, D occur in a particular order

$$=\frac{7!}{4!}=210\;={}^7P_3=3!\times{}^7C_3$$

16. Total number of ways $=\sum_{r=1}^{n}{}^{2n}C_{n+r}$

$$={}^{2n}C_{n+1}\ldots+{}^{2n}C_{2n}=\frac{1}{2}(2^{2n}-{}^{2n}C_n)$$

$$=\frac{1}{2}\left(2^{2n}-\frac{2n!}{n!n!}\right)$$

17. Required number = Number of selections of one or more out of three 25 paise coins and two 50 paise coins

$= 4 \times 3 - 1 = 11 = {}^{12}P_1 - 1$

18. Considering CC as single object, U, CC, E can be arranged in 3! ways.

$\times U \times CC \times E \times$

Now, the three S are to be placed in four available places.

Hence, required number of ways $= {}^4P_3 = 24$

19. Total number of ways $= \dfrac{7!}{2!\,3!} = 420$

Consonants in SUCCESS are S, C, C, S, S.

Number of ways arranging consonants $= \dfrac{5!}{2!\,3!} = 10$

Hence, number of words in which the consonants appear in alphabetic order $= \dfrac{420}{10} = 42$

20. The alphabetic order is C, E, S, U. The number of words beginning with C is $\dfrac{6!}{3!} = 120$ and number of words beginning with E is $\dfrac{6!}{2!3!} = 60$

Number of words beginning with SC, $\dfrac{5!}{2!} = 60$,

beginning with SE, $\dfrac{5!}{2!2!} = 30$ and number of words

beginning SS, $\dfrac{5!}{2!} = 60$

After which the next word is SUCCESS.

Thus, the rank of SUCCESS is

$120 + 60 + 60 + 30 + 60 + 1 = 331$

21. Total letters $= 26$ (*i.e.*, $A, B, C, \ldots, Y, Z$) and total digit number $= 10$ (*i.e.*, 0, 1, 2, 3, ..., 9)

$\because$ Repetition of letters is allowed.

$\therefore$ The three letters can be filled by $26 \times 26 \times 26 = (26)^3$ ways and three digit numbers on plate by 999 ways.

(*i.e.*, 001, 002, ..., 999)

$\therefore$ Required number of ways $= (26)^3 \times 999$

22. For the number exactly divisible by 4, then last two digit must be divisible by 4, the last two digits are *viz*.

12, 16, 24, 32, 36, 52, 56, 64, 72, 76

Total 10 ways. Now, the remaining two first places on the left of 4-digit numbers are to be filled from the remaining 5-digits and this can be done in ${}^5P_2 = 20$ ways.

$\therefore$ Required number of ways $= 20 \times 10 = 200$

23. The number of non-negative integral solutions

$=$ Coefficient of x^r in $(1 + x + x^2 + \ldots)^n$

$=$ Coefficient of x^r in $(1 - x)^{-n}$

$= {}^{n+r-1}C_r$ or ${}^{n+r-1}C_{r-1}$

24. Number of required ways

= (1 woman, 4 men) or (2 women, 3 men) or (3 Women, 2 men) or (4 women, 1 man)

$= {}^4C_1 \times {}^8C_4 + {}^4C_2 \times {}^8C_3 + {}^4C_3 \times {}^8C_2 + {}^4C_4 \times {}^8C_1$

$= 736$

25. Product of n consecutive natural number

$= (m+1)(m+2)(m+3)\ \ldots (m+n), m \in$ whole number

$= \dfrac{(m+n)!}{m!} = n! \times \dfrac{(m+n)!}{m!\,n!}$

$= n! \times {}^{m+n}C_m$

$\Rightarrow$ Product is divisible by $n!$, then it is always divisible by $(n-1)!$ but not by $(n+1)!$.

26. In a chess board there are 9 horizontal and 9 vertical lines. Number of rectangles of any size are ${}^9C_2 \times {}^9C_2$.

Hence, option (d) is correct.

27. Sum of the digits in the tenth place

= Sum of the digits in the unit's place

$= (4-1)!\,(2 + 3 + 4 + 5) = 3! \times 14 = 84$

28. Since, each student receive atleast one toy. Then, firstly we give each student one toy and the remaining 7 toys can be distributed in three students in ${}^{7-1}C_{3-1} = {}^6C_2$ ways.

Hence, statement I is false and statement II is true.

29. In onto function each image must be assigned atleast one pre-image. Now, if we consider the images a and b as two different boxes, then four distinct objects 1, 2, 3 and 4 (pre-images) can be distributed in $2^4 - {}^2C_1(2-1)^4 = 14$ ways.

Hence, both statements are correct and statement II is correct explanation of statement I.

30. The batting order of 11 players can be decided in 11! ways. Now, Yuvraj, Dhoni and Pathan can be arranged in 3! ways. But the order of these three players is fixed, *i.e.*, Yuvraj-Dhoni-Pathan. Now, 11! answer is 3! times more, hence the required number of ways is 11!/3!.

31. Let the number of ways of distributing n identical objects, among r persons such that each person gets atleast one object is same as the number of ways of selecting $(r-1)$ places out of $(n-1)$ different places, *i.e.*, ${}^{n-1}C_{r-1}$.

32. Since, the number of ways that child can buy the six ice-creams is equal to the number of different ways of arranging 6A's and 4B's in a row.

$\therefore$ Number of ways to arrange 6A's and 4B's in a row.

$= \dfrac{10!}{6!\,4!} = {}^{10}C_4$

and number of integral solution of the equation

$x_1 + x_2 + x_3 + x_4 + x_5 = 6 = {}^{6+5-1}C_{5-1} = {}^{10}C_4 \neq {}^{10}C_5$

Statement I is false and statement II is true.

33. Given, $n(A) = 2, n(B) = 4 \therefore n(A \times B) = 8$

The number of subsets of $A \times B$ having 3 or more elements

$$= {}^8C_3 + {}^8C_4 + \ldots + {}^8C_8$$
$$= ({}^8C_0 + {}^8C_1 + {}^8C_2 + {}^8C_3 + \ldots + {}^8C_8) - ({}^8C_0 + {}^8C_1 + {}^8C_2)$$

$\therefore \quad 2^n = {}^nC_0 + {}^nC_1 + \ldots + {}^nC_n$

$$= 2^8 - {}^8C_0 - {}^8C_1 - {}^8C_2 = 256 - 1 - 8 - 28 = 219$$

34. **Hint** $\quad T_n = {}^nC_3$

$$T_{n+1} = {}^{n+1}C_3$$

$\therefore \quad T_{n+1} - T_n = {}^{n+1}C_3 - {}^nC_3 = 10$ (given)

35. The number of ways to choose zero or more white balls

$= (10 + 1)$

($\because$ all white balls are mutually identical)

Number of ways to choose zero or more green balls

$= (9 + 1)$

($\because$ all green balls are mutually identical)

Number of ways to choose zero or more black balls

$= (7 + 1)$

($\because$ all black balls are mutually identical)

Hence, number of ways to choose zero or more balls of any colour $= (10 + 1)(9 + 1)(7 + 1)$

Also, number of ways to choose a total of zero balls $= 1$

Hence, the number of ways to choose atleast one ball (irrespective of any colour)

$$= (10 + 1)(9 + 1)(7 + 1) - 1 = 880 - 1 = 879$$

36. The number of different ordered pairs (Y, Z) such that $Y \subseteq X, Z \subseteq X$ and $Y \cap Z = \phi$. Since, $Y \subseteq X, Z \subseteq X$, hence we can only use the elements of X to construct sets Y and Z.

$n(Y)$	Number of ways to make Y	Number of ways to make Z such that $Y \cap Z = \phi$
0	${}^5C_0$	2^5
1	${}^5C_1$	2^4
2	${}^5C_2$	2^3
3	${}^5C_3$	2^2
4	${}^5C_4$	2^1
5	${}^5C_5$	2^0

Hence, total number of ways to construct sets Y and Z such that $Y \cap Z = \phi$ is

$${}^5C_0 \times 2^5 + {}^5C_1 \times 2^{5-1} + \ldots + {}^5C_5 \times 2^{5-5} = (2 + 1)^5 = 3^5$$

37.

The number of ways in which two balls from urn A and two balls from urn B can be selected $= {}^3C_2 \times {}^9C_2 = 3 \times 36 = 108$

38. The number of ways in which 4 novels can be selected

$$= {}^6C_4 = 15$$

The number of ways in which 1 dictionary can be selected

$$= {}^3C_1 = 3$$

4 novels can be arranged in 4! ways.

$\therefore$ The total number of ways

$$= 15 \times 4! \times 3 = 15 \times 24 \times 3 = 1080$$

39. Given word is MISSISSIPPI.

Here, I = 4 times, S = 4 times,

P = 2 times, M = 1 time

_M_I_I_I_I_P_P_

Required number of words $= {}^8C_4 \times \dfrac{7!}{4!2!} = {}^8C_4 \times \dfrac{7 \times 6!}{4!2!}$

$$= 7 \cdot {}^8C_4 \cdot {}^6C_4$$

40. $\therefore$ Required number of ways $= {}^{12}C_4 \times {}^8C_4 \times {}^4C_4$

$$= \frac{12!}{8!4!} \times \frac{8!}{4!4!} \times 1 = \frac{12!}{(4!)^3}$$

41. Total number of ways $= {}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + {}^{10}C_4$

$$= 10 + 45 + 120 + 210 = 385$$

42. In the word SACHIN order of alphabets is A, C, H, I, N, S. Number of words start with $A = 5!$, so with C, H, I, N, now words start with S and after that ACHIN are in ascending orders of position, so $5 \cdot 5! = 600$ words are in dictionary before words start with S and position of this words is 601.

43. Total number of ways in which all letters can be arranged in alphabetical order $= 6!$

There are two vowels in the word GARDEN.

Total number of ways in which these two vowels can be arranged $= 2!$

$\therefore$ Total number of required ways $= \dfrac{6!}{2!} = 360$

44. Required number of ways $= {}^{8-1}C_{3-1} = {}^7C_2 = \dfrac{7!}{2!5!} = \dfrac{7 \cdot 6}{2 \cdot 1} = 21$

45. The number of choices available to him

$$= {}^5C_4 \times {}^8C_6 + {}^5C_5 \times {}^8C_5 = 5 \times \frac{8 \times 7}{2} + 1 \times \frac{8 \times 7 \times 6}{3 \times 2}$$
$$= 5 \times 4 \times 7 + 8 \times 7 = 140 + 56 = 196$$

46. The number of ways to sit men $= 5!$

and the number of ways to sit women $= {}^6P_5$

Total number of ways $= {}^6P_5 \times 5! = 6! \times 5!$

47. ${}^nC_{r+1} + {}^nC_{r-1} + 2\,{}^nC_r = {}^nC_{r+1} + {}^nC_r + {}^nC_{r-1} + {}^nC_r$

$$= {}^{n+1}C_{r+1} + {}^{n+1}C_r = {}^{n+2}C_{r+1}$$

7 Mathematical Induction

JEE Main MILESTONE

- Peano's Theorem
- Principle of Mathematical Induction
- Simple Applications of Mathematical Induction

7.1 Peano's Theorem

The statement or proposition $P(n)$ is assumed to be true for all values of $n \in N$,

(a) $P(1)$ is true

(b) $P(m)$ is true

$\Rightarrow$ $P(m + 1)$ is true

7.2 Principle of Mathematical Induction

Suppose there is a given statement $P(n)$ involving the natural number n such that

(i) The statement is true for $n = 1$, *i.e.*, $P(1)$ is true and

(ii) If the statement is true for $n = k$ (where, k is some positive integer), then the statement is also true for $n = k + 1$, *i.e.*, truth of $P(k)$ implies the truth of $P(k + 1)$.

Then, $P(n)$ is true for all natural numbers n.

There are following steps given below

Step I Verification step Actual verification of the proposition for the starting value 'i'.

Step II Induction step Assuming the proposition to be true for 'k', $k \geq i$ and then providing that it is true for the value $(k + 1)$ which is the next higher integer.

Step III Generalization step Combine the above two steps.

The word induction means the generalization from particular cases or facts. In algebra or in other disciplines of mathematics, there are certain results or statements that are formulated in terms of n, where n is a positive integer. To prove such statements the well suited principle that is used based on specific technique, is the principle of mathematical induction.

Hot Spot

Solution by Mathematical Induction

In these types of problems, generally a series is given and we have to find its name.
These types of problems are directly asked in various years in AIEEE (JEE Main) 2008, 2005, 2004.

Step I Firstly, we consider the given expression is equal to $P(n)$.

Step II Put $n = 1$ and verify it.

Step III Assume given expression is true for $P(k)$.

Step IV Verify for $P(k + 1)$. Hence, we can say that it is true for all natural numbers.

Sample Problem 1 *The series*

$$1\cdot 2\cdot 3 + 2\cdot 3\cdot 4 + \ldots + n(n+1)(n+2) \text{ is equal to}$$

(a) $\dfrac{n(n+1)(n+2)(n+3)}{8}$ (b) $\dfrac{n(n+1)(n+2)(n+3)}{4}$

(c) $\dfrac{n(n+1)(n+2)(n+3)}{3}$ (d) *None of these*

Interpret (b) **Step I** Consider the given expression is equal to $P(n)$.

Let $P(n) : 1\cdot 2\cdot 3 + 2\cdot 3\cdot 4 + \ldots + n(n+1)(n+2)$

$$= \frac{n(n+1)(n+2)(n+3)}{4}$$

Step II Put $n = 1$ and verify it

$$\therefore \quad P(1) : \frac{1(1+1)(1+2)(1+3)}{4} = \frac{1\times 2\times 3\times 4}{4} = 1\cdot 2\cdot 3$$

which is true.

Step III Assume given expression is true for $P(k)$.

$$\therefore \quad P(k) : 1\cdot 2\cdot 3 + 2\cdot 3\cdot 4 + \ldots + k(k+1)(k+2) = \frac{k(k+1)(k+2)k+3)}{4}$$

Step IV Verify for $P(k + 1)$.

$$\therefore \quad P(k+1) : 1\cdot 2\cdot 3 + 2\cdot 3\cdot 4 + \ldots + k(k+1)(k+2)(k+3)$$

$$= \frac{k(k+1)(k+2)(k+3)}{4} + (k+1)(k+2)(k+3)$$

$$= \frac{k(k+1)(k+2)(k+3) + 4(k+1)(k+2)(k+3)}{4}$$

$$= \frac{(k+1)(k+2)(k+3)(k+4)}{4}$$

$\therefore P(k + 1)$ is true, when $P(k)$ is true.

Hence, the principle of mathematical induction, the statement is true for all natural numbers n.

Sample Problem 2 *For all $n \in N$,*

$$\cos\alpha + \cos(\alpha+\beta) + \cos(\alpha+2\beta) + \ldots + \cos\{\alpha + (n-1)\beta\}$$

is equal to [NCERT Exemplar]

(a) $\dfrac{\cos\left[\alpha + \frac{(n+1)}{2}\beta\right]\sin\frac{n\beta}{2}}{\sin\beta}$ (b) $\dfrac{\cos\left[\alpha + \frac{(n-1)}{2}\beta\right]\sin\frac{n\beta}{2}}{\sin\frac{\beta}{2}}$

(c) $\dfrac{\cos\left[\alpha + \frac{(n-1)}{2}\beta\right]\sin\frac{n\beta}{2}}{\sin\beta}$ (d) *None of these*

Interpret (b) Let the given statement be $P(n)$.

i.e.,

$$P(n) : \cos\alpha + \cos(\alpha+\beta) + \cos(\alpha+2\beta) + \ldots + \cos[\alpha + (n-1)\beta]$$

$$= \frac{\cos\left[\alpha + \left(\frac{n-1}{2}\right)\beta\right]\sin\left(\frac{n\beta}{2}\right)}{\sin\frac{\beta}{2}}$$

Step I For $n = 1$,

$$P(1) : \frac{\cos\left[\alpha + \frac{1-1}{2}\beta\right]\sin\left(\frac{1\times\beta}{2}\right)}{\sin\frac{\beta}{2}} = \frac{\cos(\alpha+0)\sin\frac{\beta}{2}}{\sin\frac{\beta}{2}} = \cos\alpha$$

which is true.

Step II Let it is true for $n = k$, *i.e.,*

$$\cos\alpha + \cos(\alpha+\beta) + \cos(\alpha+2\beta) + \ldots + \cos[\alpha + (k-1)\beta]$$

$$= \frac{\cos\left[\alpha + \left(\frac{k-1}{2}\right)\beta\right]\sin\frac{k\beta}{2}}{\sin\frac{\beta}{2}} \quad \ldots\text{(i)}$$

Step III For $n = k + 1$,

$$\cos\alpha + \cos(\alpha+\beta) + \ldots + \cos[\alpha + (k-1)\beta] + \cos(\alpha + k\beta)$$

$$= \frac{\cos\left[\alpha + \frac{(k-1)}{2}\beta\right]\sin\frac{k\beta}{2}}{\sin\frac{\beta}{2}} + \cos(\alpha + k\beta) \quad \text{[using Eq. (i)]}$$

$$= \frac{\cos\left[\alpha + \left(\frac{k-1}{2}\right)\beta\right]\sin\frac{k\beta}{2} + \cos(\alpha+k\beta)\sin\frac{\beta}{2}}{\sin\frac{\beta}{2}}$$

$$= \frac{2\cos\left[\alpha + \left(\frac{k-1}{2}\right)\beta\right]\sin\frac{k\beta}{2} + 2\cos(\alpha+k\beta)\sin\frac{\beta}{2}}{2\sin\frac{\beta}{2}}$$

$$= \frac{\sin\left[\alpha + \left(\frac{k-1}{2}\right)\beta + \frac{k\beta}{2}\right] - \sin\left[\left(\alpha + \frac{k-1}{2}\beta\right) - \frac{k\beta}{2}\right] + \sin\left(\alpha + k\beta + \frac{\beta}{2}\right) - \sin\left(\alpha + k\beta - \frac{\beta}{2}\right)}{2\sin\frac{\beta}{2}}$$

$[\because 2\cos A \sin B = \sin(A+B) - \sin(A-B)]$

$$= \frac{\sin\left(\alpha + k\beta - \frac{\beta}{2}\right) - \sin\left(\alpha - \frac{\beta}{2}\right) + \sin\left(\alpha + k\beta + \frac{\beta}{2}\right) - \sin\left(\alpha + k\beta - \frac{\beta}{2}\right)}{2\sin\frac{\beta}{2}}$$

$$= \frac{\sin\left(\alpha + k\beta + \frac{\beta}{2}\right) - \sin\left(\alpha - \frac{\beta}{2}\right)}{2\sin\frac{\beta}{2}}$$

$$= \frac{2\cos\frac{\alpha + k\beta + \frac{\beta}{2} + \alpha - \frac{\beta}{2}}{2}\sin\frac{\alpha + k\beta + \frac{\beta}{2} - \alpha + \frac{\beta}{2}}{2}}{2\sin\frac{\beta}{2}}$$

$$\left(\because \sin C - \sin D = 2\cos\frac{C+D}{2}\sin\frac{C-D}{2}\right)$$

$$= \frac{2\cos\left(\frac{2\alpha + k\beta}{2}\right)\sin\left(\frac{k\beta + \beta}{2}\right)}{2\sin\frac{\beta}{2}}$$

$$= \frac{\cos\left[\alpha + \frac{\{(k+1)-1\}\beta}{2}\right]\sin\left[\frac{\beta(k+1)}{2}\right]}{\sin\frac{\beta}{2}}$$

Therefore, $P(k+1)$ is true when $P(k)$ is true.

Hence, from the principle of mathematical induction, the statement is true for all natural numbers n.

7.3 Simple Applications of Mathematical Induction

Mathematical induction can be used in various types of problems.

Type I **Use identity type problems.**

This can be explained by given example.

***Sample* Problem 3** *The identity* $1^3 + 2^3 + 3^3 + \ldots + n^3$ *is equal to* **[NCERT]**

(a) $\left[\frac{n(n-1)}{2}\right]^2$ (b) $\frac{n(n+1)}{2}$

(c) $\frac{\{n(n+1)\}^2}{2}$ (d) $\left[\frac{n(n+1)}{2}\right]^2$

Interpret (*d*) Let the given statement be $P(n)$.

i.e., $P(n): 1^3 + 2^3 + 3^3 + \ldots + n^3 = \left[\frac{n(n+1)}{2}\right]^2$

Step I For $n = 1$,

$$P(1): \left[\frac{1(1+1)}{2}\right]^2 = \left[\frac{1\times 2}{2}\right]^2 = 1^2 = 1 = 1^3$$

which is true.

Step II Let it is true for $n = k$,

i.e., $1^3 + 2^3 + 3^3 + \ldots + k^3 = \left[\frac{k(k+1)}{2}\right]^2$ ...(i)

Step III For $n = k+1$, $(1^3 + 2^3 + 3^3 + 4^3 + \ldots + k^3) + (k+1)^3$

$$= \left[\frac{k(k+1)}{2}\right]^2 + (k+1)^3 \quad \text{[using Eq. (i)]}$$

$$= \frac{k^2(k+1)^2}{4} + \frac{(k+1)^3}{1} = \frac{k^2(k+1)^2 + 4(k+1)^3}{4}$$

On taking $(k+1)^2$ common in numerator part,

$$= \frac{(k+1)^2[k^2 + 4(k+1)]}{4} = \frac{(k+1)^2(k^2 + 4k + 4)}{4}$$

$$= \frac{(k+1)^2(k+2)^2}{4} = \frac{(k+1)^2[(k+1)+1]^2}{4}$$

$$= \left[\frac{(k+1)\{(k+1)+1\}}{2}\right]^2$$

Therefore, $P(k+1)$ is true when $P(k)$ is true. Hence, from the principle of mathematical induction, the statement is true for all natural numbers n.

Type II **Use divisibility type problems.**

This can be explained by given example.

***Sample* Problem 4** *For all* $n \in N$, $a^n - b^n$ *is divisible by*

(a) $(a+b)$ (b) $(a-b)$

(c) $2(a-b)$ (d) *None of these*

Interpret (*b*) Let $P(n) = a^n - b^n$

Step I For $n = 1$,

$P(1) = a - b$, which is divisible by $a - b$. Therefore, the result is true for $n = 1$.

Step II Assume that the result is true for $n = k$, *i.e.*, $P(k) = a^k - b^k$ is divisible by $a - b$.

$\Rightarrow$ $P(k) = (a-b)r$, where r is an integer.

Step III For $n = k+1$,

$\therefore$ $P(k+1) = a^{k+1} - b^{k+1}$

Now, $a^k - b^k)a^{k+1} - b^{k+1}(a$

$$\underline{-\ a^{k+1} \mp ab^k}$$

$$ab^k - b^{k+1} = b^k(a-b)$$

$\therefore$ $a^{k+1} - b^{k+1} = a(a^k - b^k) + b^k(a-b)$

i.e., $P(k+1) = aP(k) + b^k(a-b)$

But we know that $P(k)$ is divisible by $a - b$. Also, $b^k(a - b)$ is clearly divisible by $a - b$.

Hence, $P(k + 1)$ is divisible by $a - b$. This shows that the result is true for $n = k + 1$. Hence, by the principle of mathematical induction, the result is true for all $n \in N$.

Type III Use inequality type problems.

This can be explained by given example.

Sample Problem 5 *The sum of series is less than*

(a) $\frac{1}{8}(2n+1)^2$ (b) $\frac{1}{12}(2n+1)^2$

(c) $\frac{1}{8}(2n+1)$ (d) *None of these*

Interpret (a) Let the given statement be $P(n)$.

i.e., $P(n): 1 + 2 + 3 + \ldots + n < \frac{1}{8}(2n+1)^2$

Step I For $n = 1$,

$$1 < \frac{1}{8}(2 \cdot 1 + 1)^2 \Rightarrow 1 < \frac{1}{8} \times 3^2 \Rightarrow 1 < \frac{9}{8}$$

which is true.

Step II Let it is true for $n = k$,

$$1 + 2 + 3 + \ldots + k < \frac{1}{8}(2k+1)^2 \quad \ldots(i)$$

Step III For $n = k + 1$,

$$(1 + 2 + 3 + \ldots + k) + (k + 1) < \frac{1}{8}(2k+1)^2 + (k+1) \text{ [using Eq. (i)]}$$

$$= \frac{(2k+1)^2}{8} + \frac{k+1}{1} = \frac{(2k+1)^2 + 8k + 8}{8}$$

$$= \frac{4k^2 + 1 + 4k + 8k + 8}{8} = \frac{4k^2 + 12k + 9}{8}$$

$$= \frac{(2k+3)^2}{8} = \frac{(2k+2+1)^2}{8} = \frac{[2(k+1)+1]^2}{8}$$

$$\Rightarrow \quad 1 + 2 + 3 + \ldots + k + (k+1) < \frac{[2(k+1)+1]^2}{8}$$

Therefore, $P(k + 1)$ is true when $P(k)$ is true. Hence, from the principle of mathematical induction, the statement is true for all natural numbers n.

Type IV Use recursion type of problems.

This can be explained by given example.

Sample Problem 6 *If* $u_{n+1} = 3u_n - 2u_{n-1}$ *and* $u_0 = 2$, $u_1 = 3$, *then* u_n *is equal to*

(a) $1 - 2^n$ (b) $2^n + 1$ (c) $2^n - 1$ (d) $2^n + 2$

Interpret (b) $\because$ $u_{n+1} = 3u_n - 2u_{n-1}$ ...(i)

Step I Given, $u_1 = 3 = 2 + 1 = 2^1 + 1$

which is true for $n = 1$,

Put $n = 1$ in Eq. (i),

then $u_{1+1} = 3u_1 - 2u_{1-1}$

$\Rightarrow$ $u_2 = 3u_1 - 2u_0$

$= 3 \cdot 3 - 2 \cdot 2 = 5 = 2^2 + 1$

which is true for $n = 2$.

Therefore, the result are true for $n = 1$ and $n = 2$.

Step II Assume it is true for $n = k$, then it is also true for $n = k - 1$.

Then, $u_k = 2^k + 1$ ...(ii)

and $u_{k-1} = 2^{k-1} + 1$ ...(iii)

Step III On putting $n = k$ in Eq. (i), we get

$$u_{k+1} = 3u_k - 2u_{k-1}$$

$$= 3(2^k + 1) - 2(2^{k-1} + 1) \quad \text{[from Eqs. (ii) and (iii)]}$$

$$= 3 \cdot 2^k + 3 - 2 \cdot 2^{k-1} - 2$$

$$= 3 \cdot 2^k + 3 - 2^k - 2 = (3 - 1)2^k + 1$$

$$= 2 \cdot 2^k + 1 = 2^{k+1} + 1$$

This shows that the result is true for $n = k + 1$, hence by the principle of mathematical induction the result is true for all $n \in N$.

Check Point 1

1. For positive integer n, $10^{n-2} > 81n$, if
   (a) $n > 5$ (b) $n \geq 5$
   (c) $n < 5$ (d) $n > 6$
2. If $n \in N$, $7^{2n} - 48n - 1$ is divisible by
   (a) 25 (b) 26
   (c) 1234 (d) 2304
3. For all $n \geq 2$, $n^2(n^4 - 1)$ is divisible by
   (a) 60 (b) 50
   (c) 40 (d) 70
4. For each $n \in N$, the correct statement is
   (a) $2^n < n$ (b) $n^2 > 2n$
   (c) $n^4 < 10^n$ (d) $2^{3n} > 7n + 1$
5. If $n \in N$, then the highest positive integer which divides $n(n-1)(n-2)$ is
   (a) 3 (b) 6 (c) 9 (d) 12
6. For every positive integer n, $\frac{n^7}{7} + \frac{n^5}{5} + \frac{2n^3}{3} - \frac{n}{105}$ is
   (a) an integer (b) a rational number
   (c) a negative real number (d) an odd integer

WORKED OUT Examples

Example 1 *The sum of series* $1\cdot 3 + 2\cdot 3^2 + 3\cdot 3^3 + \ldots + n\cdot 3^n$ *is*

(a) $\dfrac{(2n+1)3^{n+1}+3}{4}$ (b) $\dfrac{(2n-1)3^{n+1}+3}{4}$

(c) $\dfrac{(2n-1)3^{n-1}-3}{4}$ (d) *None of these*

Solution (b) Let the given statement be $P(n)$.

i.e., $P(n): 1\cdot 3 + 2\cdot 3^2 + 3\cdot 3^3 + \ldots + n\cdot 3^n = \dfrac{(2n-1)3^{n+1}+3}{4}$

Step I For $n = 1$,

$$P(1): \frac{(2\cdot 1-1)3^{1+1}+3}{4} = \frac{3^2+3}{4} = \frac{9+3}{4} = \frac{12}{4}$$

$\Rightarrow$ $3 = 1\cdot 3$

which is true.

Step II Let it is true for $n = k$,

i.e., $1\cdot 3 + 2\cdot 3^2 + 3\cdot 3^3 + \ldots + k\cdot 3^k = \dfrac{(2k-1)3^{k+1}+3}{4}$ ...(i)

Step III For $n = k+1$,

$$(1\cdot 3 + 2\cdot 3^2 + 3\cdot 3^3 + \ldots + k\cdot 3^k) + (k+1)3^{k+1}$$

$$= \frac{(2k-1)3^{k+1}+3}{4} + (k+1)3^{k+1} \quad \text{[using Eq. (i)]}$$

$$= \frac{(2k-1)3^{k+1}+3+4(k+1)3^{k+1}}{4}$$

On taking 3^{k+1} common in first and last term of numerator part,

$$= \frac{3^{k+1}(2k-1+4k+4)+3}{4}$$

$$= \frac{3^{k+1}(6k+3)+3}{4}$$

On taking 3 common in first term of numerator part,

$$= \frac{3^{k+1}\cdot 3(2k+1)+3}{4}$$

$$= \frac{3^{(k+1)+1}(2k+2-1)+3}{4}$$

$$= \frac{\{2(k+1)-1\}3^{(k+1)+1}+3}{4}$$

Therefore, $P(k+1)$ is true when $P(k)$ is true. Hence, from the principle of mathematical induction, the statement is true for all natural numbers n.

Example 2 *By mathematical induction*

$\dfrac{1}{1\cdot 2\cdot 3} + \dfrac{1}{2\cdot 3\cdot 4} + \ldots + \dfrac{1}{n(n+1)(n+2)}$ *is equal to* **[NCERT]**

(a) $\dfrac{n(n+1)}{4(n+2)(n+3)}$ (b) $\dfrac{n(n+3)}{4(n+1)(n+2)}$

(c) $\dfrac{n(n+2)}{4(n+1)(n+3)}$ (d) *None of these*

Solution (b) Let $P(n): \dfrac{1}{1\cdot 2\cdot 3} + \dfrac{1}{2\cdot 3\cdot 4} + \ldots + \dfrac{1}{n(n+1)(n+2)}$

$$= \frac{n(n+3)}{4(n+1)(n+2)} \quad \ldots\text{(i)}$$

Step I For $n = 1$,

$$\text{LHS} = \frac{1}{1\cdot 2\cdot 3} = \frac{1}{6} \quad \text{and RHS} = \frac{1(1+3)}{4(1+1)(1+2)} = \frac{1}{6}$$

$\therefore$ $P(1)$ is true.

Step II Let $P(k)$ is true, then

$$P(k): \frac{1}{1\cdot 2\cdot 3} + \frac{1}{2\cdot 3\cdot 4} + \ldots + \frac{1}{k(k+1)(k+2)} = \frac{k(k+3)}{4(k+1)(k+2)}$$

Step III For $n = k+1$, then

$$P(k+1): \frac{1}{1\cdot 2\cdot 3} + \frac{1}{2\cdot 3\cdot 4} + \ldots + \frac{1}{k(k+1)(k+2)} + \frac{1}{(k+1)(k+2)(k+3)}$$

$$= \frac{(k+1)(k+4)}{4(k+2)(k+3)}$$

$$\text{LHS} = \frac{1}{1\cdot 2\cdot 3} + \frac{1}{2\cdot 3\cdot 4} + \ldots + \frac{1}{k(k+1)(k+2)} + \frac{1}{(k+1)(k+2)(k+3)}$$

$$= \frac{k(k+3)}{4(k+1)(k+2)} + \frac{1}{(k+1)(k+2)(k+3)} \quad \text{[from Eq. (i)]}$$

$$= \frac{k(k+3)^2+4}{4(k+1)(k+2)(k+3)} = \frac{k^3+6k^2+9k+4}{4(k+1)(k+2)(k+3)}$$

$$= \frac{(k+1)^2(k+4)}{4(k+1)(k+2)(k+3)} = \frac{(k+1)(k+4)}{4(k+2)(k+3)} = \text{RHS}$$

Hence, $P(k+1)$ is true.

Hence, by principle of mathematical induction for all $n \in N$, $P(n)$ is true.

Example 3 *By principle of mathematical induction* $\cos\theta \cos 2\theta \cos 4\theta \ldots \cos(2^{n-1}\theta)$, $\forall\, n \in N$ *is equal to*

[**NCERT Exemplar**]

(a) $\dfrac{\sin 2^n \theta}{2^n \sin\theta}$ (b) $\dfrac{\cos 2^n \theta}{2^n \sin\theta}$

(c) $\dfrac{\sin 2^n \theta}{2^{n-1} \sin\theta}$ (d) *None of these*

Solution (a) Let

$$P(n) : \cos\theta \cos 2\theta \cos 4\theta \ldots \cos(2^{n-1}\theta) = \frac{\sin 2^n \theta}{2^n \sin\theta} \quad \ldots(\text{i})$$

Step I For $n = 1$,

$$\text{LHS} = \cos\theta$$

and $$\text{RHS} = \frac{\sin 2\theta}{2\sin\theta} = \cos\theta$$

$\therefore$ $P(1)$ is true.

Step II Let $P(k)$ is true, then

$$P(k) : \cos\theta \cos 2\theta \cos 4\theta \ldots \cos(2^{k-1}\theta) = \frac{\sin 2^k\theta}{2^k \sin\theta}$$

Step III For $n = k + 1$

$$P(k+1) : \cos\theta \cos 2\theta \ldots \cos(2^k\theta) = \frac{\sin 2^{k+1}\theta}{2^{k+1}\sin\theta}$$

$$\text{LHS} = \cos\theta \cos 2\theta \ldots \cos 2^{(k-1)}\theta \cos 2^k\theta$$

$$= \frac{\sin(2^k\theta)}{2^k \sin\theta} \cdot \cos(2^k\theta)$$

$$= \frac{2\sin(2^k\theta)\cdot\cos(2^k\theta)}{2^{k+1}\sin\theta} = \frac{\sin 2^{k+1}\theta}{2^{k+1}\sin\theta} = \text{RHS}$$

$\therefore$ For $n = k + 1$, $P(n)$ is true.

Hence, by principle for mathematical induction for all $n \in N$, $P(n)$ is true.

Example 4 *If* $\dfrac{4^n}{n+1} < \dfrac{(2n)!}{(n!)^2}$, *then* $P(n)$ *is true for*

(a) $n \geq 1$ (b) $n > 0$

(c) $n < 0$ (d) $n \geq 2$

Solution (d) Let $P(n) : \dfrac{4^n}{n+1} < \dfrac{(2n)!}{(n!)^2}$

For $n = 2$,

$$P(2) : \frac{4^2}{2+1} < \frac{4!}{(2)^2}$$

$$\Rightarrow \quad \frac{16}{3} < \frac{24}{4}$$

which is true.

Let for $n = m \geq 2$, $P(m)$ is true.

i.e., $$\frac{4^m}{m+1} < \frac{(2m)!}{(m!)^2} \quad \ldots(\text{i})$$

Now, $$\frac{4^{n+1}}{m+2} = \frac{4^m}{m+1} \cdot \frac{4(m+1)}{m+2}$$

$$< \frac{(2m)!}{(m!)^2} \cdot \frac{4(m+1)}{(m+2)}$$

$$= \frac{(2m)!(2m+1)(2m+2)\,4(m+1)(m+1)^2}{(2m+1)(2m+2)(m!)^2(m+1)^2(m+2)}$$

$$= \frac{[2(m+1)]!}{[(m+1)!]^2} \cdot \frac{2(m+1)^2}{(2m+1)(m+2)} < \frac{[2(m+1)]!}{[(m+1)!]^2}$$

Hence, for $n \geq 2$, $P(n)$ is true.

Example 5 *If* $a_n = 2^{2^n} + 1$, *then for* $n > 1$, *last digit of* a_n *is*

(a) 3 (b) 5

(c) 7 (d) 8

Solution (c) For $n = 2$, $a_n = 2^{2^2} + 1 = 16 + 1 = 17$

Assume that, $a_k = 2^{2^k} + 1 = 10\,m + 7$, where $k > 1$ and m is some positive integer.

Now, $$a_{k+1} = 2^{2^{k+1}} + 1 = (2^{2^k})^2 + 1 = (10\,m + 6)^2 + 1$$

$$= 10\,(10\,m^2 + 12\,m + 3) + 7$$

Hence, last digit of a_n is 7, $\forall\, n > 1$.

Example 6 *By principle of mathematical induction* $3^{2n+2} - 8n - 9$ *is divisible by*

(a) 9 (b) 8 (c) 7 (d) 6

Solution (b) Let the given statement be $P(n)$.

i.e., $P(n) : 3^{2n+2} - 8n - 9$ is divisible by 8.

Step I For $n = 1$,

i.e., $$P(1) : 3^{2\times 1+2} - 8\times 1 - 9 = 3^4 - 8 - 9 = 81 - 17$$

$$= 64 = 8 \times 8$$

which is divisible by 8.

Step II Let it is true for $n = k$,

i.e., $$3^{2k+2} - 8k - 9 = 8\lambda \quad \ldots(\text{i})$$

Step III For $n = k + 1$,

$$3^{2(k+1)+2} - 8(k+1) - 9$$

$$= 3^{2k+2+2} - 8k - 8 - 9 = 3^{2k+2}3^2 - 8k - 17$$

$$= (8\lambda + 8k + 9)3^2 - 8k - 17 \quad \text{[using Eq. (i)]}$$

$$= (8\lambda + 8k + 9)9 - 8k - 17$$

$$= 72\lambda + 72k + 81 - 8k - 17$$

$$= 72\,\lambda + 64k + 64 = 8(9\lambda + 8k + 8)$$

which is divisible by 8.

Therefore, $P(k+1)$ is true when $P(k)$ is true. Hence, from the principle of mathematical induction, the statement is true for all natural numbers n.

Start Practice for JEE Main

Round I (Topically Divided Problems)

Principle of Mathematical Induction

1. For $n \in N$, $\left(\frac{1}{5}\right)n^5 + \left(\frac{1}{3}\right)n^3 + \left(\frac{7}{15}\right)n$ is [NCERT Exemplar]

(a) an integer (b) a natural number
(c) a positive fraction (d) None of these

2. The value of $\left(1+\frac{3}{1}\right)\left(1+\frac{5}{4}\right)\left(1+\frac{7}{9}\right)\ldots\left(1+\frac{2n+1}{n^2}\right)$ is [NCERT]

(a) $(n+1)$ (b) $(n+1)^2$
(c) $2(n+1)^2$ (d) None of these

3. For all $n \in N$, $n(n+1)(n+5)$ is a multiple of [NCERT Exemplar]

(a) 4 (b) 3 (c) 5 (d) 7

4. If $P(n)$ is a statement $(n \in N)$ such that, if $P(k)$ is true, $P(k+1)$ is true for $k \in N$, then $P(n)$ is true

(a) for all n (b) for all $n > 1$
(c) for all $n > 2$ (d) Nothing can be said

5. If $P(n)$ is a statement such that $P(3)$ is true. Assuming $P(k)$ is true $\Rightarrow P(k+1)$ is true for all $k \geq 3$, then $P(n)$ is true

(a) for all n (b) for $n \geq 3$
(c) for $n > 4$ (d) None of these

6. Let $P(n): n^2 + n + 1$ is an even integer. If $P(k)$ is assumed true $\Rightarrow P(k+1)$ is true. Therefore, $P(n)$ is true

(a) for $n > 1$ (b) for all $n \in N$
(c) for $n > 2$ (d) None of these

7. If $A = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}$, then for $n \in N$, A^n is equal to

(a) $\begin{bmatrix} \cos^n\theta & \sin^n\theta \\ -\sin^n\theta & \cos^n\theta \end{bmatrix}$ (b) $\begin{bmatrix} \cos n\theta & \sin n\theta \\ -\sin n\theta & \cos n\theta \end{bmatrix}$

(c) $\begin{bmatrix} n\cos\theta & n\sin\theta \\ -n\sin\theta & n\cos\theta \end{bmatrix}$ (d) None of these

8. If $A = \begin{pmatrix} 1 & x \\ 0 & 1 \end{pmatrix}$, then for $x \in N$, A^{10} is equal to

(a) $\begin{pmatrix} 1 & 10x \\ 0 & 1 \end{pmatrix}$ (b) $\begin{pmatrix} 1 & x^{10} \\ 0 & 1 \end{pmatrix}$

(c) $\begin{pmatrix} 10 & x \\ 0 & 10 \end{pmatrix}$ (d) $\begin{pmatrix} 10x & 0 \\ 0 & 10x \end{pmatrix}$

Applications of Mathematical Induction

9. If $1 + 5 + 12 + 22 + 35 + \ldots$ to n terms $= \frac{n^2(n+1)}{2}$, nth term of series is

(a) $\frac{n(4n-1)}{3}$ (b) $\frac{n(3n-1)}{2}$

(c) $\frac{n(3n+1)}{2}$ (d) $\frac{n(4n+1)}{3}$

10. The smallest positive integer n for which $n! < \left(\frac{n+1}{2}\right)^n$ holds, is

(a) 1 (b) 2 (c) 3 (d) 4

11. The inequality $n! > 2^{n-1}$ is true for

(a) $n > 2$ (b) $n \in N$
(c) $n > 3$ (d) None of these

12. The greatest positive integer, which divides $(n+2)(n+3)(n+4)(n+5)(n+6)$ for all $n \in N$, is

(a) 4 (b) 120 (c) 240 (d) 24

13. If m, n are any two odd positive integer with $n < m$, then the largest positive integers which divides all the numbers of the type $m^2 - n^2$ is

(a) 4 (b) 6 (c) 8 (d) 9

14. For all $n \in N$, $3 \cdot 5^{2n+1} + 2^{3n+1}$ is divisible by [NCERT Exemplar]

(a) 19 (b) 17
(c) 23 (d) 25

15. If $x^n - 1$ is divisible by $x - k$, then the least positive integral value of k is [NCERT Exemplar]
(a) 1 (b) 2
(c) 3 (d) 4

16. For all $n \in N$, $41^n - 14^n$ is a multiple of
(a) 26 (b) 27
(c) 25 (d) None of these

17. For all $n \in N$, $2 \cdot 4^{2n+1} + 3^{3n+1}$ is divisible by
(a) 2 (b) 9
(c) 3 (d) 11

18. For each $n \in N$, $10^{2n-1} + 1$ is divisible by [NCERT]
(a) 11 (b) 13
(c) 9 (d) None of these

19. $2^{3n} - 7n - 1$ is divisible by
(a) 64 (b) 36
(c) 49 (d) 25

20. For each $n \in N$, $3^{2n} - 1$ is divisible by [NCERT Exemplar]
(a) 8 (b) 16
(c) 32 (d) None of these

21. $x(x^{n-1} - n\alpha^{n-1}) + \alpha^n(n-1)$ is divisible by $(x - \alpha)^2$ for
(a) $n > 1$
(b) $n > 2$
(c) all $n \in N$
(d) None of the above

22. If $x^{2n-1} + y^{2n-1}$ is divisible by $x + y$, if n is
(a) a positive integer (b) an even positive integer
(c) an odd positive integer (d) None of these

23. If $49^n + 16^n + k$ is divisible by 64 for $n \in N$, then the least negative integral value of k is [NCERT Exemplar]
(a) −1 (b) −2
(c) −3 (d) −4

Round II (Mixed Bag)

Only One Correct Option

1. For all positive integral values of n, $3^{2n} - 2n + 1$ is divisible by
(a) 2 (b) 4 (c) 8 (d) 12

2. If $n \in N$, then $11^{n+2} + 12^{2n+1}$ is divisible by
(a) 113 (b) 123
(c) 133 (d) None of these

3. For natural number n, $2^n(n-1)! < n^n$, if
(a) $n < 2$ (b) $n > 2$
(c) $n \geq 2$ (d) never

4. For a positive integer n,
let $a(n) = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \ldots + \frac{1}{(2^n) - 1}$. Then,
(a) $a(100) \leq 100$ (b) $a(100) > 100$
(c) $a(200) \leq 100$ (d) None of these

5. $10^n + 3(4^{n+2}) + 5$ is divisible by $(n \in N)$ [NCERT Exemplar]
(a) 7 (b) 5 (c) 9 (d) 17

6. Let $P(n)$ denotes the statement that $n^2 + n$ is odd. It is seen that $P(n) \Rightarrow P(n+1)$, $P(n)$ is true for all
(a) $n > 1$ (b) n
(c) $n > 2$ (d) None of these

7. If $P(n) = 2 + 4 + 6 + \ldots + 2n, n \in N$, then $P(k) = k(k+1) + 2 \Rightarrow P(k+1) = (k+1)(k+2) + 2$ for all $k \in N$. So, we can conclude that $P(n) = n(n+1) + 2$ for
(a) all $n \in N$ (b) $n > 1$
(c) $n > 2$ (d) nothing can be said

8. The remainder when 5^{99} is divided by 13, is
(a) 6 (b) 8
(c) 9 (d) 10

9. For all positive integers $n > 1$, $\{x(x^{n-1} - na^{n-1}) + a^n(n-1)\}$ is divisible by
(a) $(x - a)^2$ (b) $x - a$
(c) $2(x - a)$ (d) $x + a$

10. For all $n \in N$, $\int_0^{\pi} \frac{\sin(2nx)}{\sin x} dx$ is equal to
(a) 0 (b) π
(c) $\frac{\pi}{2}$ (d) $-\pi$

More Than One Correct Option

11. The product of three consecutive natural numbers is divisible by
(a) 2 (b) 3 (c) 6 (d) 4

Comprehension Based Questions

Directions (Q. Nos. 12 and 13) *Let us consider the series* $S_n = 2 \cdot 7^n + 3 \cdot 5^n - 5$.

12. S_n is divisible by the multiple of
(a) 5 (b) 7
(c) 24 (d) None of these

13. If S_n is divisible for every n, then S_n is
(a) > 0 (b) > 1
(c) > 5 (d) None of these

Assertion and Reason

Directions (Q. Nos. 14-17) *Each of these questions contains two statements : Statement* I *(Assertion) and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*), (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

14. **Statement I** $\frac{(n+2)!}{(n-1)!}$ is divisible by 6.

Statement II Product of 3 consecutive integers is divisible by 3!.

15. **Statement I** For all $n \in N$, $3 \cdot 5^{2n+1} + 2^{3n+1}$ is divisible by 17.

Statement II For all $n \in N$, $10^{2n-1} + 1$ is divisible by 11.

16. **Statement I** If $P(n)$ is defined as $2^n < n!$, then $P(n)$ is true for all $n > 3$.

Statement II In $P(n)$, n may be negative.

17. **Statement I** For every natural number $n \geq 2$

$$\frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \ldots + \frac{1}{\sqrt{n}} > \sqrt{n}.$$

Statement II For every natural number $n \geq 2$

$$\sqrt{n(n+1)} < n + 1$$ [AIEEE 2008]

Previous Years' Questions

18. If $A = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$ and $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$, then which one of the following holds for all $n \geq 1$, by the principle of mathematical induction ? [AIEEE 2005]

(a) $A^n = 2^{n-1}A + (n-1)I$
(b) $A^n = nA + (n-1)I$
(c) $A^n = 2^{n-1}A - (n-1)I$
(d) $A^n = nA - (n-1)I$

19. Let $S(k) = 1 + 3 + 5 + \ldots + (2k-1) = 3 + k^2$. Then, which of the following is true? [AIEEE 2004]

(a) $S(1)$ is correct
(b) $S(k) \Rightarrow S(k+1)$
(c) $S(k) \not\Rightarrow S(k+1)$
(d) Principle of mathematical induction can be used to prove the formula

the Guidance

Round I

1. Let $P(n): \left(\frac{1}{5}\right)n^5 + \left(\frac{1}{3}\right)n^3 + \left(\frac{7}{15}\right)n$

$$\therefore \quad P(1) = \left(\frac{1}{5}\right)(1)^5 + \left(\frac{1}{3}\right)(1)^3 + \left(\frac{7}{15}\right)1$$

$$= \frac{1}{5} + \frac{1}{3} + \frac{7}{15} = \frac{3+5+7}{15} = \frac{15}{15} = 1 \in N$$

$$P(2) = \left(\frac{1}{5}\right)(2)^5 + \left(\frac{1}{3}\right)(2)^3 + \left(\frac{7}{15}\right)2$$

$$= \frac{32}{5} + \frac{8}{3} + \frac{14}{15}$$

$$= \frac{96+40+14}{15} = \frac{150}{15} = 10 \in N$$

$\therefore$ By mathematical induction $P(n)$ is a natural number.

2. Let the given statement be $P(n)$.

i.e., $P(n): \left(1+\frac{3}{1}\right)\left(1+\frac{5}{4}\right)\left(1+\frac{7}{9}\right)\ldots\left(1+\frac{2n+1}{n^2}\right) = (n+1)^2$

Step I For $n = 1$, *i.e.,* $P(1) = (1+1)^2 = 2^2 = 4 = \left(1+\frac{3}{1}\right)$

which is true.

Step II Let it is true for $n = k$,

i.e., $\left(1+\frac{3}{1}\right)\left(1+\frac{5}{4}\right)\left(1+\frac{7}{9}\right)\ldots\left(1+\frac{2k+1}{k^2}\right) = (k+1)^2 \quad \ldots(i)$

Step III For $n = k+1$,

$$\left\{\left(1+\frac{3}{1}\right)\left(1+\frac{5}{4}\right)\left(1+\frac{7}{9}\right)\ldots\left(1+\frac{2k+1}{k^2}\right)\right\}\left\{1+\frac{2k+2+1}{(k+1)^2}\right\}$$

$$= (k+1)^2\left\{1+\frac{2k+3}{(k+1)^2}\right\} \quad \text{[using Eq. (i)]}$$

$$= (k+1)^2\left[\frac{(k+1)^2+2k+3}{(k+1)^2}\right] = k^2+2k+1+2k+3$$

$$= (k+2)^2 = [(k+1)+1]^2$$

$$[\because (a+b)^2 = a^2+2ab+b^2]$$

Therefore, $P(k+1)$ is true when $P(k)$ is true. Hence, from the principle of mathematical induction, the statement is true for all natural numbers n.

3. Let the given statement be $P(n)$.

i.e., $P(n): n(n+1)(n+5)$ is a multiple of 3.

Step I For $n = 1$,

$1(1+1)(1+5) = 1 \times 2 \times 6 = 12 = 3 \times 4$

which is a multiple of 3, that is true.

Step II Let it is true for $n = k$,

i.e., $k(k+1)(k+5) = 3\lambda$

$\Rightarrow \quad k(k^2+5k+k+5) = 3\lambda$

$\Rightarrow \quad k^3+6k^2+5k = 3\lambda \quad \ldots(i)$

Step III For $n = k+1$,

$(k+1)(k+1+1)(k+1+5)$

$= (k+1)(k+2)(k+6) = (k^2+2k+k+2)(k+6)$

$= (k^2+3k+2)(k+6) = k^3+6k^2+3k^2+18k+2k+12$

$= (k^3)+9k^2+20k+12$

$= (3\lambda - 6k^2 - 5k)+9k^2+20k+12 \quad$ [using Eq. (i)]

$= 3\lambda + 3k^2 + 15k + 12 = 3(\lambda + k^2 + 5k + 4)$

which is a multiple of 3.

Therefore, $P(k+1)$ is true when $P(k)$ is true. Hence, from the principle of mathematical induction, the statement is true for all natural numbers n.

4. Unless we prove $P(1)$ is true, nothing can be said.

5. Since, $P(3)$ is true.

Assume $P(k)$ is true $\Rightarrow P(k+1)$ is true means, if $P(3)$ is true $\Rightarrow P(4)$ is true $\Rightarrow P(5)$ is true and so on. So, statement is true for all $n \geq 3$.

6. Given, $P(n): n^2+n+1$

At $n = 1$, $P(1): 3$, which is not an even integer.

$\therefore$ $P(1)$ is not true (principle of induction is not applicable).

Also, $n(n+1)+1$ is always an odd integer.

7. Given, $A = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}$

Now, $A^2 = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}\begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}$

$$= \begin{bmatrix} \cos^2\theta - \sin^2\theta & 2\sin\theta\cos\theta \\ -2\sin\theta\cos\theta & \cos^2\theta - \sin^2\theta \end{bmatrix}$$

$$= \begin{bmatrix} \cos 2\theta & \sin 2\theta \\ -\sin 2\theta & \cos 2\theta \end{bmatrix}$$

$\therefore$ By induction, $A^n = \begin{bmatrix} \cos n\theta & \sin n\theta \\ -\sin n\theta & \cos n\theta \end{bmatrix}$

8. Since, $A = \begin{pmatrix} 1 & x \\ 0 & 1 \end{pmatrix}$

$\Rightarrow \quad A^2 = \begin{pmatrix} 1 & x \\ 0 & 1 \end{pmatrix}\begin{pmatrix} 1 & x \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 2x \\ 0 & 1 \end{pmatrix}$

$\Rightarrow \quad A^3 = A^2 \cdot A = \begin{pmatrix} 1 & 2x \\ 0 & 1 \end{pmatrix}\begin{pmatrix} 1 & x \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 3x \\ 0 & 1 \end{pmatrix}$

$\therefore$ By induction, $A^{10} = \begin{pmatrix} 1 & 10x \\ 0 & 1 \end{pmatrix}$

9. Let $P(n) : 1 + 5 + 12 + 22 + 35 + \ldots + (n \text{ terms}) = \dfrac{n^2(n+1)}{2}$

nth term of LHS $= P(n) - P(n-1)$

$\Rightarrow \quad P(n) - P(n-1) = \dfrac{n^2(n+1)}{2} - \dfrac{(n-1)^2 n}{2}$

$\Rightarrow \quad P(n) - P(n-1) = \dfrac{n}{2}\{n^2 + n - n^2 + 2n - 1\}$

$\therefore \quad T_n = P(n) - P(n-1)$

$= \dfrac{n}{2}(3n-1)$

10. Given, $\quad n! < \left(\dfrac{n+1}{2}\right)^n$

At $n = 1$, $\quad 1! \not< 1$

At $n = 2$, $\quad 2! < \left(\dfrac{3}{2}\right)^2$

$\Rightarrow \quad 2 < 2.25$ which is true.

11. Let $P(n) \equiv n! > 2^{n-1}$

$P(3) \equiv 6 > 4$

Let $P(k) \equiv k! > 2^{k-1}$ is true.

$\therefore \quad P(k+1) = (k+1)! = (k+1)k!$

$> (k+1)\, 2^{k-1}$

$> 2^k \quad$ (as $k + 1 > 2$)

12. Let $P(n) : (n+2)(n+3)(n+4)(n+5)(n+6)$

$\therefore$ Put $n = 1$

$P(1) = (1+2)(1+3)(1+4)(1+5)(1+6)$

$= 3 \times 4 \times 5 \times 6 \times 7 = 120 \times 21$

Put $n = 2$,

$P(2) = (2+2)(2+3)(2+4)(2+5)(2+6)$

$= 4 \times 5 \times 6 \times 7 \times 8 = 120 \times 56$

Hence, $P(n)$ is always divisible by 120.

13. Let $\quad m = 2k + 1, n = 2k - 1 \ (k \in N)$

$\therefore \quad m^2 - n^2 = 4k^2 + 1 + 4k - 4k^2 + 4k - 1 = 8k$

Hence, all the numbers of the form $m^2 - n^2$ are always divisible by 8.

14. $3 \cdot 5^{2n+1} + 2^{3n+1}$

Put $\quad n = 1$

$3 \times 5^3 + 2^4 = 391$

which is divisible by 17

15. $x - 1$ is always a factor of $x^n - 1$.

$\Rightarrow \quad k = 1$

16. Let the given statement be $P(n)$.

i.e., $\quad P(n) : 41^n - 14^n$ is a multiple of 27.

Step I For $n = 1$,

i.e., $\quad P(1) = 41^1 - 14^1 = 27 = 1 \times 27$

which is a multiple of 27 that is true.

Step II Let it is true for $n = k$,

i.e., $\quad 41^k - 14^k = 27\lambda \quad$ ...(i)

Step III For $n = k + 1$, $41^{k+1} - 14^{k+1}$

$= 41^k 41 - 14^k 14$

$= (27\lambda + 14^k)41 - 14^k 14 \quad$ [using Eq. (i)]

$= 27\lambda \times 41 + 14^k \times 41 - 14^k \times 14$

$= 27\lambda \times 41 + 14^k(41 - 14)$

$= 27\lambda \times 41 + 14^k \times 27 = 27(41\lambda + 14^k)$

which is multiple of 27.

Therefore, $P(k+1)$ is true when $P(k)$ is true. Hence, from the principle of mathematical induction, the statement is true for all natural numbers n.

17. Let $P(n) = 2 \cdot 4^{2n+1} + 3^{3n+1}$

$P(1) \equiv 128 + 81 = 209$ (divisible by 11 only)

18. Let $\quad P(n) = 10^{2n-1} + 1$

$P(1) = 10 + 1 = 11$

Let $\quad P(k) \equiv 10^{2k-1} + 1 = 11\, l$ is true

Now, $\quad P(k+1) \equiv 10^{2k+1} + 1$

$= (11l - 1)\, 100 + 1$

$= 1100l - 99 = 11 l_1$

So, $P(k+1)$ is true.

19. Let $\quad P(n) = 2^{3n} - 7n - 1$

$\therefore \quad P(1) = 0$

$P(2) = 49$

$P(1)$ and $P(2)$ are divisible by 49.

Let $\quad P(k) \equiv 2^{3k} - 7k - 1 = 49l$

$\therefore \quad P(k+1) \equiv 2^{3k+3} - 7k - 8$

$= 8\,(49l + 7k + 1) - 7k - 8$

$= 49(8l) + 49k = 49 l_1$

Hence, by mathematical induction $2^{3n} - 7n - 1$ is divisible by 49.

20. Let $P(n) = 3^{2n} - 1$

At $n = 1$, $P(1) = 8$ which is divisible by 8.

$\therefore$ $P(1)$ is true.

Let $P(k)$ is true, then

$P(k) \equiv 3^{2k} - 1 = 8l$

$\therefore \quad P(k+1) \equiv 3^{2k+2} - 1 = (8l + 1)\, 9 - 1 = 72\, l + 8 = 8 l_1$

$\therefore$ $P(n)$ is divisible by 8, $\forall\, n \in N$.

21. Let $P(n) = x(x^{n-1} - n\alpha^{n-1}) + \alpha^n (n-1) = (x-\alpha)^2 g(x)$

$P(1) \equiv 0$ is true.

Let $P(k)$ is true.

i.e., $x(x^{k-1} - k\alpha^{k-1}) + \alpha^k (k-1) = (x-\alpha)^2 g(x)$

Now, $P(k+1) \equiv x[x^k - (k+1)\alpha^k] + \alpha^{k+1}(k)$

$\equiv (x-\alpha)^2 [xg(x) + k\alpha^{k-1}]$ (true)

So, holds for all $n \in N$.

22. Let $P(n) \equiv x^{2n-1} + y^{2n-1} = \lambda(x+y)$

$P(1) \equiv x + y = \lambda_1 (x+y)$

$P(2) \equiv x^3 + y^3 = \lambda_2 (x+y)$

Hence, for $\forall\, n \in N$, $P(n)$ is true.

23. Let $P(n) = 49^n + 16^n + k$

For $n = 1$, we get

$$P(1) = 49^1 + 16^1 + k = 65 + k$$

As $P(1)$ is divisible by 64, we take

$$k = -1$$

$\therefore$ $P(1) = 65 - 1 = 64$, which is divisible by 64.

Round II

1. On putting $n = 2$ in $3^{2n} - 2n + 1$, we get

$$3^{2\times 2} - 2\times 2 + 1 = 81 - 4 + 1 = 78$$

which is divisible by 2.

2. On putting $n = 1$ in $11^{n+2} + 12^{2n+1}$, we get

$$11^{1+2} + 12^{2\times 1+1} = 11^3 + 12^3 = 3059$$

which is divisible by 133.

3. The condition $2^n (n-1)! < n^n$ is satisfied for $n > 2$.

4. It can be proved with the help of mathematical induction that $\frac{n}{2} < a(n) \le n$.

$\therefore$ $\frac{200}{2} < a(200)$

$\Rightarrow$ $a(200) > 100$

and $a(100) \le 100$

5. On putting $n = 2$ in $10^n + 3(4^{n+2}) + 5$, we get

$$10^2 + 3\times 4^4 + 5 = 100 + 768 + 5 = 873$$

which is divisible by 9.

6. $P(n) = n^2 + n$

It is always odd but square of any odd number is always odd and also sum of two odd number is always even. So, for no any n for which this statement is true.

7. It is obvious, nothing can be said.

8. $5^{99} = 5(5^2)^{49} = 5(25)^{49} = 5(26-1)^{49}$

$= 5 \times 26 \times$ (positive term) $- 5$

So, when it is divided by 13, it gives the remainder -5 or 8.

9. Let $P(n) : x(x^{n-1} - na^{n-1}) + a^n(n-1)$, where $n > 1$

$P(2) : x(x-2a) + a^2 = (x-a)^2$

$P(3) : x(x^2 - 3a^2) + 2a^3 = x^3 - 3a^2x + 2a^3$

$\Rightarrow$ $P(3) = (x-a)(x^2 + a - 2a^2)$

which are divisible by $(x-a)$

10. Let $P(n) = \int_0^\pi \frac{\sin 2nx}{\sin x} dx$

Step I For $n = 1$,

$\Rightarrow$ $P(1) = \int_0^\pi \frac{\sin 2x}{\sin x} dx = 2\int_0^\pi \cos x dx = 0$

Step II For $n = m$,

let us assume that the proposition is true for $n = m$

$\therefore$ $P(m) = \int_0^\pi \frac{\sin 2kx}{\sin x} dx = 0$ ...(i)

Step III Let us prove the proposition for $n = m + 1$,

if the proposition is true for $n = m + 1$, then it was also true for $n = m$. Thus, the proposition will be true for all $n \in N$

$$P(m+1) - P(m) = \int_0^\pi \frac{\sin[2(k+1)x] - \sin 2kx}{\sin x} dx$$

$$P(m+1) - P(m) = \int_0^\pi \frac{2\cos(2k+1)x \sin x}{\sin x} dx$$

$\Rightarrow$ $P(m+1) - P(m) = 2\left[\frac{\sin(2k+1)x}{(2k+1)}\right]_0^\pi$

$\Rightarrow$ $P(m+1) - P(m) = \frac{2}{2k+1}(0-0) = 0$

$\therefore$ $P(m+1) = P(m)$

Since, the proposition is true for $n = m + 1$, thus it was also true for $n = m$. Hence, the proposition is true, $\forall\, n \in N$.

11. Let $P(n) : n(n+1)(n+2)$, where $n \in N$

$\Rightarrow$ $P(1) : (1)(2)(3) = 6$

Also, $P(2) : (2)(3)(4) = 24$

which is divisible by 2, 3 and 6.

12. Let $P(n) : 2\cdot 7^n + 3\cdot 5^n - 5$

Then, $P(1) : 2\cdot 7 + 3\cdot 5 - 5 = 24$

Let $P(m)$ be true.

$\therefore$ $P(m) : 2\cdot 7^m + 3\cdot 5^m - 5$

$= 24k, k \in N$ ...(i)

Now, $P(m+1) - P(m)$:

$$2(7^{m+1} - 7^m) + 3(5^{m+1} - 5^m)$$
$$= 2 \cdot 7^m (7-1) + 3 \cdot 5^m (5-1)$$
$$= 12(7^m + 5^m)$$

Since, 7^m and 5^m are odd integers and for all $m \in N$, their sum must be even say $7^m + 5^m = 2\lambda, \lambda \in N$.

$\therefore \quad P(m+1) - P(m) : 24\lambda$

$\Rightarrow \quad P(m+1) : 24\lambda + P(m)$

$\Rightarrow \quad P(m+1) : 24(\lambda + k)$ [from Eq. (i)]

Here, $P(m+1)$ is divisible by 24.

13. S_n is divisible for every n. So, S_n is greater than zero.

14. $\dfrac{(n+2)!}{(n-1)!} = \dfrac{(n+2)(n+1)n(n-1)!}{(n-1)!}$

$$= (n+2)(n+1)n$$

It is a product of 3 consecutive integrals and it is divisible by 3!.

15. Let $P_1(n) : 3 \cdot 5^{2n+1} + 2^{3n+1}$

$$P_1(1) : 3 \cdot 5^3 + 2^4 = 3(125) + 16 = 391$$
$$P_1(2) : 3 \cdot 5^5 + 2^7 = 3 \cdot 3125 + 128 = 9503$$

16. Since, $P(n) : 2^n < n!$

Put $n = 1, 2, 3$ respectively, we get $2 \not< 1!$, $4 \not< 2$ and $8 \not< 6$

At $n = 4$

$16 < 24$ which is true.

Hence, it is true for $n > 3$.

17. Let $\quad P(n) = \dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} + \ldots + \dfrac{1}{\sqrt{n}}$

Now, $\quad P(2) = \dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} > \sqrt{2}$

Let us assume that $P(k) = \dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} + \ldots + \dfrac{1}{\sqrt{k}} > \sqrt{k}$ is true

$\therefore P(k+1) = \dfrac{1}{\sqrt{1}} + \dfrac{1}{\sqrt{2}} + \ldots + \dfrac{1}{\sqrt{k}} + \dfrac{1}{\sqrt{k+1}} > \sqrt{k+1}$ has to be true

$$\text{LHS} > \sqrt{k} + \frac{1}{\sqrt{k+1}} = \frac{\sqrt{k(k+1)} + 1}{\sqrt{k+1}}$$

Since, $\quad \sqrt{k(k+1)} > k (\forall k \le 0)$

$\therefore \quad \dfrac{\sqrt{k(h+1)} + 1}{\sqrt{k+1}} > \dfrac{k+1}{\sqrt{k+1}} = \sqrt{k+1}$

Let $\quad P(n) = \sqrt{n(n+1)} < n + 1$

Statement I is correct.

Now, $\quad P(2) = \sqrt{2 \times 3} < 3$

If $P(k) = \sqrt{k(k+1)} < (k+1)$ is true.

Now, $\quad P(k+1) = \sqrt{(k+1)(k+2)} < (k+2)$ has to be true

Since, $\quad (k+1) < k + 2$

$\therefore \quad \sqrt{(k+1)(k+2)} < (k+2)$

Hence, statement II is not a correct explanation of statement I.

18. Given that, $\quad A = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$

$$\therefore \quad A^2 = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}\begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}$$
$$A^3 = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}\begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 3 & 1 \end{bmatrix}$$
$$\vdots \; \vdots \; \vdots \; \vdots \; \vdots \; \vdots \; \vdots$$

$A^n = \begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix}$ can be verified by induction. Now, taking options

(b) $\begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix} = \begin{bmatrix} n & 0 \\ n & n \end{bmatrix} + \begin{bmatrix} n-1 & 0 \\ 0 & n-1 \end{bmatrix}$

$\Rightarrow \begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix} \neq \begin{bmatrix} 2n-1 & 0 \\ n & 2n-1 \end{bmatrix}$

(d) $nA - (n-1)I = \begin{bmatrix} n & 0 \\ n & n \end{bmatrix} - \begin{bmatrix} n-1 & 0 \\ 0 & n-1 \end{bmatrix}$

$$= \begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix} = A^n$$

Hence, option (d) is the required answer.

19. $S(k) = 1 + 3 + 5 + \ldots + (2k-1) = 3 + k^2$

Put $k = 1$ in both sides, we get

$$\text{LHS} = 1$$

and $\quad \text{RHS} = 3 + 1 = 4$

$\Rightarrow \quad \text{LHS} \neq \text{RHS}$

Put $(k+1)$ in place of k

$$\text{LHS} = 1 + 3 + 5 + \ldots + (2k-1) + (2k+1)$$
$$\text{RHS} = 3 + (k+1)^2 = 3 + k^2 + 2k + 1$$

Let $\quad \text{LHS} = \text{RHS}$

$\Rightarrow \quad 1 + 3 + 5 + \ldots + (2k-1) + (2k+1) = 3 + k^2 + 2k + 1$

$\Rightarrow \quad 1 + 3 + 5 + \ldots + (2k-1) = 3 + k^2$

If $S(k)$ is true, then $S(k+1)$ is also true.

Hence, $\quad S(k) \Rightarrow S(k+1)$

8 Binomial Theorem and its Applications

JEE Main MILESTONE

- Binomial Theorem
- Binomial Theorem For Positive Integer Index
- General Term is the Expansion of $(x + a)^n$
- Middle Term in Binomial Expansion
- Greatest Term in the Expansion of $(x + a)^n$
- Binomial Theorem for Negative/Rational Index
- Important Expansions
- Multinomial Theorem

8.1 Binomial Theorem

An algebraic expression consisting of two terms with +ve or –ve sign between, then is called binomial expression.

e.g., $(a+2b), \left(\frac{p}{x^2}-\frac{q}{x^4}\right)$

Binomial theorem is the formula obtained by which the binomial raised to the power of n, where n can be positive or negative or fraction.

There are two types of Binomial Theorem.

(i) Binomial theorem for positive Integral Index.

(ii) Binomial theorem for negative/Rational Index.

In elementary algebra, the ***binomial theorem*** *describes the algebraic expansion of powers of a binomial. According to the theorem, it is possible to expand the power $(x+y)^n$ into a sum involving terms of the form ax^by^c, where the exponents b and c are non-negative integers with $b + c = n$ and the coefficient a of each term is a specific positive integer depending on n and b.*

8.2 Binomial Theorem for Positive Integer Index

If n is a positive integer and $x, a \in R$, then

$$(x+a)^n = {}^nC_0x^n + {}^nC_1x^{n-1}a + {}^nC_2x^{n-2}a^2 + \ldots + {}^nC_na^n$$

$$= \sum_{r=0}^{n} {}^nC_r x^{n-r} a^r \quad \text{...(i)}$$

and $$(x-a)^n = {}^nC_0x^n - {}^nC_1x^{n-1}a + {}^nC_2x^{n-2}a^2 - \ldots + (-1)^na^n$$

$$= \sum_{r=0}^{n} (-1)^r {}^nC_r x^{n-r} a^r \quad \text{...(ii)}$$

Here, ${}^nC_0, {}^nC_1, {}^nC_2, .., {}^nC_n$ are known as binomial coefficients or it can be rewritten as $C_0, C_1, C_2, \ldots, C_n$.

Also, $$ {}^nC_r = \frac{n!}{r!(n-r)!} $$

On adding and subtracting Eqs. (i) and (ii) respectively, we get

$$(x+a)^n + (x-a)^n = 2\,[{}^nC_0 x^n + {}^nC_2 x^{n-2} a^2 + \ldots]$$

= 2 (sum of odd places terms)

($\because$ the last term may be ${}^nC_n a^n$ or ${}^nC_{n-1}\, x a^{n-1}$ according as n is even or odd, respectively)

and $$(x+a)^n - (x-a)^n = 2\,[{}^nC_1 x^{n-1} a^1 + {}^nC_3 x^{n-3} a^3 + \ldots]$$

= 2 (sum of even places terms)

($\because$ the last term may be ${}^nC_{n-1} x\, a^{n-1}$ or ${}^nC_n a^n$ as n is even or odd respectively)

Note

- The coefficient of x^r in $(a+x)^n$ is ${}^nC_r$.
- The coefficient of x^r in $(a-x)^n$ is $(-1)^n \cdot {}^nC_r$.

Pascal's Triangle

Let us consider the following expansion given below.

(i) $(x+a)^1 = {}^1C_0 x + {}^1C_1 a = x + a$

(ii) $(x+a)^2 = {}^2C_0 x^2 + {}^2C_1 xa + {}^2C_2 xa^2 = x^2 + 2xa + a^2$

(iii) $(x+a)^3 = {}^4C_0 x^4 + {}^4C_1 x^3 a + {}^4C_2 x^2 a^2 + {}^4C_3 x a^3 + {}^4C_4 a^4$

$= x^4 + 4x^3 a + 6x^2 a^2 + 4xa^3 + a^4$

and so on

The given below, the Pascal's Triangle showing the coefficients of various terms in a binomial expansion.

In the above triangle, each row is bounded on 1 on both sides. Any entry, except the first and the last, in the row is the sum of two entries above it in the preceding row.

Properties of Binomial Theorem

(i) The sum of indices of x and a in each term is n.

(ii) The number of terms in $(x+a)^n$ is $(n+1)$.

(iii) The coefficient of terms equidistant from the beginning and the end are equal.

(iv) (i) $(x+a)^n + (x-a)^n = 2[{}^nC_0 x^n + {}^nC_2 x^{n-2} a^2 + \ldots]$

(ii) $(x+a)^n - (x-a)^n = 2[{}^nC_1 x^{n-1} a + {}^nC_3 x^{n-3} a^3 + \ldots]$

(v) If n is odd, then $\{(x+a)^n + (x-a)^n\}$ and $\{(x+a)^n - (x-a)^n\}$ both have the same number of terms equal to $\left(\frac{n+1}{2}\right)$, whereas if n is even, then $\{(x+a)^n + (x-a)^n\}$ has $\left(\frac{n}{2}+1\right)$ terms and $\{(x+a)^n - (x-a)^n\}$ has $\frac{n}{2}$ terms.

(vi) In the binomial expansion of $(x+a)^n$, the rth term from the end is $(n-r+2)$th term from the beginning.

Hot Spot

Coefficient of x^n or General Term of $(x+a)^n$

In these type of equation a either a binomial expression or an expression convertable to binomial expression is given. We have to find the coefficient of a particular power of variable a general term in the expansion of given binomial expression.

These types of problems are directly or indirectly asked in various years in AIEEE (JEE Main) 2005, 2004, 2002.

To solve such types of problems following steps are given below.

Step I Firstly, if the given expression is not in binomial expression, convert it into binomial expression.

Step II Take a coefficient of x^n in the expansion of $(x+a)^n$ is ${}^nC_n$.

Step III Simplify it and get the result.

Sample **Problem 1** *Find the coefficient of x^9 in $(1+3x+3x^2+x^3)^{15}$.*

(a) $\frac{45!}{46!\,9!}$ (b) $\frac{45!}{46!\,8!}$

(c) $-\frac{45!}{46!\,9!}$ (d) $\frac{45!}{46!\,7!}$

Interpret (*d*) **Step I** Firstly convert the expression into standard form.

i.e., $\{(1+x)^3\}^{15} = (1+x)^{45}$

Step II Taking the coefficient of x^9 *i.e.,* ${}^{45}C_9$.

Step III Simplify, ${}^{45}C_9 = \dfrac{45!}{36!9!}$

***Sample* Problem 2** *The coefficient of x^5 in the product $(1+2x)^6(1-x)^7$ is* [NCERT]

(*a*) −171 (*b*) 171 (*c*) 172 (*d*) −172

Interpret (*b*)

$$(1+2x)^6(1-x)^7 = \{{}^6C_0 + {}^6C_1(2x) + {}^6C_2(2x)^2 + {}^6C_3(2x)^3 + {}^6C_4(2x)^4 + {}^6C_5(2x)^5 + {}^6C_6(2x)^6\}$$
$$\times\{{}^7C_0 - {}^7C_1x + {}^7C_2x^2 - {}^7C_3x^3 + {}^7C_4x^4 - {}^7C_5x^5 + {}^7C_6x^6 - {}^7C_7x^7\}$$
$$= ({}^6C_0 + {}^6C_1\times 2\times x + {}^6C_2\times 4\times x^2 + {}^6C_3\times 8\times x^3 + {}^6C_4\times 2^4\times x^4 + {}^6C_5\times 2^5\times x^5 + {}^6C_6\, 2^6\times x^6)$$
$$\times({}^7C_0 - {}^7C_1x + {}^7C_2x^2 - {}^7C_3x^3 + {}^7C_4x^4 - {}^7C_5x^5 + {}^7C_6x^6 - {}^7C_7x^7)$$

For coefficient of x^5, in $(1+2x)^6(1-x)^7$

$$= {}^6C_0(-{}^7C_5) + {}^6C_1\times 2\times {}^7C_4 + {}^6C_2\times 4\times(-{}^7C_3) + {}^6C_3\times 8\times {}^7C_2 + {}^6C_4\times 2^4\times(-{}^7C_1) + {}^6C_5\times 2^5({}^7C_0)$$
$$= -{}^6C_0\times {}^7C_2 + {}^6C_1\times 2\times {}^7C_3 - {}^6C_2\times 4\times {}^7C_3 + {}^6C_3\times 8\times {}^7C_2 - {}^6C_2\times 16\times {}^7C_1 + {}^6C_1\times 2^5$$
$$(\because {}^nC_r = {}^nC_{n-r})$$
$$= -\frac{1\times 7\times 6}{2} + \frac{6\times 2\times 7\times 6\times 5}{6} - \frac{6\times 5}{2}\times 4\times\frac{7\times 6\times 5}{6} + \frac{6\times 5\times 4}{6}\times\frac{8\times 7\times 6}{2} - \frac{6\times 5}{2}\times 16\times 7 + 6\times 32$$
$$= -21 + 12\times 35 - 15\times 28\times 5 + 20\times 24\times 7 - 15\times 16\times 7 + 192$$
$$= -21 + 420 - 420\times 5 + 3360 - 1680 + 192$$
$$= 3972 - 2100 - 21 - 1680$$
$$= 3972 - 3801 = 171$$

8.3 General Term in the Expansion of $(x+a)^n$

Let us consider the binomial expansion

$$(x+a)^n = {}^nC_0x^n + {}^nC_1x^{n-1}a + {}^nC_2x^{n-2}a^2 + \ldots + {}^nC_r\,x^{n-r}\,a^r$$

In this expansion first term is ${}^nC_0\,x^n$, second term is ${}^nC_2\,x^{n-2}\,a^2$ and so on. On the basis of that we can say that rth term is $T_{r-1} = {}^nC_r\,x^{n-r}\,a^r$.

Note General term in the expansion of $(x-a)^n$ is

$$T_{r+1} = (-1)^r\cdot {}^nC_r\,x^{n-r}a^r$$

General term in the expansion of $(1+x)^n$ is

$$T_{r+1} = {}^nC_rx^r$$

General term in the expansion of $(1-x)^n$ is

$$T_{r+1} = (-1)^r\,{}^nC_rx^r$$

***Sample* Problem 3** *The term independent of x in the expansion of $\left(x+\dfrac{1}{x}\right)^{2n}$ is*

(*a*) $\dfrac{1\cdot 3\cdot 5\ldots(2n-1)}{n!}$ (*b*) $\dfrac{1\cdot 3\cdot 5\ldots(2n-1)}{n!}2^n$

(*c*) $\dfrac{1\cdot 3\cdot 5\ldots(2n+1)}{(n+1)!}2^n$ (*d*) *None of these*

Interpret (*b*) Let $(r+1)$th term is independent of x in the expansion of $\left(x+\dfrac{1}{x}\right)^{2n}$.

$\therefore$ $T_{r+1} = {}^{2n}C_r\,x^{2n-2r}$

This term is independent of x.

$\therefore$ $2n-2r=0 \Rightarrow r=n$

Thus, $T_{r+1} = {}^{2n}C_n$

$$= \frac{(2n)!}{n!n!} = \frac{1\cdot 2\cdot 3\cdot 4\ldots(2n-1)(2n)}{n!n!}$$
$$= \frac{\{1\cdot 3\cdot 5\ldots(2n-1)\}\{1\cdot 2\ldots n\}2^n}{n!n!} = \frac{1\cdot 3\cdot 5\ldots(2n-1)}{n!}2^n$$

***Sample* Problem 4** *The coefficient of x^p in the expansion of $\left(x^2+\dfrac{1}{x}\right)^{2n}$ is* [NCERT]

(*a*) $\dfrac{(2n)!}{\left(\dfrac{4n-p}{3}\right)!\left(\dfrac{2n+p}{3}\right)!}$ (*b*) $\dfrac{(2n)!}{\left(\dfrac{4n-p}{3}\right)!\left(\dfrac{4n-p}{3}\right)!}$

(*c*) $\dfrac{(n)!}{\left(\dfrac{4n-p}{3}\right)!\left(\dfrac{2n+p}{3}\right)!}$ (*d*) *None of these*

Interpret (a) The general term in the expansion of $\left(x^2+\dfrac{1}{x}\right)^{2n}$ is

$$T_{r+1} = {}^{2n}C_r\,(x^2)^{2n-r}\left(\frac{1}{x}\right)^r = {}^{2n}C_r\,x^{4n-2r}\,\frac{1}{x^r} \Rightarrow T_{r+1} = {}^{2n}C_r\,x^{4n-3r}$$

On putting $4n-3r=p$

$\Rightarrow$ $3r = 4n-p \Rightarrow r = \dfrac{4n-p}{3}$

$\Rightarrow$ Coefficient of $x^p = {}^{2n}C_{\frac{4n-p}{3}} = \dfrac{(2n)!}{\left(2n-\dfrac{4n-p}{3}\right)!\left(\dfrac{4n-p}{3}\right)!}$

$$= \frac{2n!}{\left(\dfrac{2n+p}{3}\right)!\left(\dfrac{4n-p}{3}\right)!}$$

8.4 Middle Term in Binomial Expansion

Consider binomial expansion

$$(x+a)^n = {}^nC_0x^n + {}^nC_1x^{n-1}a + {}^nC_2x^{n-2}a^2 + \ldots + {}^nC_na^n$$

or $$(x-a)^n = {}^nC_0x^n - {}^nC_1x^{n-1}a + {}^nC_2x^{n-2}a^2 + \ldots + (-1)^n\,{}^nC_na^n$$

(i) If n is an even number, then $\left(\frac{n}{2}+1\right)$th term is middle term in the expansion of $(x+a)^n$ or $(x-a)^n$

$$\therefore \quad T_{\frac{n}{2}+1} = {}^nC_{n/2}\,x^{n/2}a^{n/2}$$

or $$(-1)^{n/2}x^{n/2}a^{n/2}$$

(ii) If n is an odd number, then $\left(\frac{n+1}{2}\right)$th and $\left(\frac{n+3}{2}\right)$th terms are middle terms in the expansion of $(x+a)^n$ or $(x-a)^n$

i.e., $$\frac{T_{n+1}}{2} = {}^2C_{\frac{n-1}{2}}x^{\frac{n+1}{2}}a^{\frac{n-1}{2}}$$

and $$T_{\frac{n+3}{2}} = {}^nC_{\frac{n+1}{2}}x^{\frac{n-1}{2}}a^{\frac{n+1}{2}}$$

or $$T_{\frac{n+1}{2}} = (-1)^{\frac{n+1}{2}}\,{}^nC_{\frac{n-1}{2}}(x)^{\frac{n+1}{2}}a^{\frac{n-1}{2}}$$

and $$T_{\frac{n+3}{2}} = (-1)^{\frac{n+3}{2}}\,{}^nC_{\frac{n+1}{2}}(x)^{\frac{n-1}{2}}a^{\frac{n+1}{2}}$$

Note

- When there are two middle terms in the expansion, then their binomial coefficients are equal.
- Binomial coefficient of middle term is the greatest binomial coefficient.

***Sample* Problem 5** *The middle term in the expansion of* $\left(x^2+\frac{1}{x^2}+2\right)^n$ *is*

(a) $\frac{2n!}{n!n!}$ (b) $\frac{2n!}{n!}$

(c) $\frac{n!}{(n-1)}$ (d) *None of these*

Interpret (a) $\because \left(x^2+\frac{1}{x^2}+2\right)^n = \left(x+\frac{1}{x}\right)^{2n}$

$\therefore$ Number of terms $= 2n+1$

Here, $2n$ is even, then middle term will be $(n+1)$th term. Thus, middle term,

$$T_{n+1} = {}^{2n}C_nx^{2n-n}\left(\frac{1}{x}\right)^n = \frac{2n!}{n!n!}$$

8.5 Greatest Term in the Expansion of $(x+a)^n$

If T_r and T_{r+1} be the rth and $(r+1)$th terms in the expansion of $(x+a)^n$, then

$$\frac{T_{r+1}}{T_r} = \frac{{}^nC_rx^{n-r}a^r}{{}^nC_{r-1}x^{n-r+1}a^{r-1}}$$

$$= \left(\frac{n-r+1}{r}\right)\left|\frac{a}{x}\right|$$

$\because$ $$\frac{T_{r+1}}{T_r} \geq 1$$

$\therefore$ $$\frac{n-r+1}{r}\left|\frac{a}{x}\right| \geq 1$$

$\Rightarrow$ $$(n-r+1)|a| \geq r|x|$$

$\Rightarrow$ $$r \leq \frac{(n+1)|a|}{|x|+|a|}$$

Let $$\frac{(n+1)|a|}{|x|+|a|} = I + f$$

where, I is an integer and $0 \leq f < 1$.

Greatest Binomial Coefficient

The greatest coefficient depends upon the value of n.

n	Number of greatest Coefficient (s)	Greatest coefficient
Even	1	${}^nC_{\frac{n+2}{2}}$
odd	2	${}^nC_{\frac{n-1}{2}}$ and ${}^nC_{\frac{n+1}{2}}$

It is clearly that, greatest binomial coefficient compounds to the coefficient of middle term.

***Sample* Problem 6** *Numerically the greatest term in the expansion of* $(2+3x)^9$ *when* $x = \frac{3}{2}$, *is*

(a) $\frac{7\times 3^3}{2}$ (b) $\frac{7\times 3^{13}}{2}$

(c) $\frac{3^{13}}{2}$ (d) *None of these*

Interpret (b) Since, $(2+3x)^9 = 2^9\left(1+\frac{3x}{2}\right)^9$

Now, in the expansion of $\left(1+\frac{3}{2}x\right)^9$, we have

$$T_{\frac{r+1}{T_r}} = \left(\frac{9-r+1}{r}\right)\left|\frac{3}{2}x\right|$$

$$=\left(\frac{10-r}{r}\right)\left(\frac{9}{4}\right)=\frac{90-9r}{4r} \qquad \left(\because x=\frac{3}{2}\right)$$

$$\because \quad \frac{T_{r+1}}{T_r}\geq 1 \Rightarrow \frac{90-9r}{4r}\geq 1 \Rightarrow 90\geq 13r$$

$$\Rightarrow \quad r\leq \frac{90}{13} \Rightarrow r\leq 6\frac{12}{13}$$

$\therefore$ Maximum value of r is 6.

So, greatest term $=2^9\cdot T_{6+1}$

$$=2^9\cdot {}^9C_6\left(\frac{3}{2}x\right)^6$$

$$=2^9\cdot {}^9C_3\left(\frac{3}{2}\times\frac{3}{2}\right)^6$$

$$=2^9\cdot\frac{9\cdot 8\cdot 7}{1\cdot 2\cdot 3}\cdot\frac{3^{12}}{2^{12}}=\frac{7\times 3^{13}}{2}$$

Properties of Binomial Coefficients

(i) If ${}^nC_r={}^nC_s$, then either $r=s$ or $r+s=n$

(ii) ${}^nC_0+{}^nC_1+\ldots+{}^nC_n=2^n$

(iii) ${}^nC_0+{}^nC_2+{}^nC_4+\ldots={}^nC_1+{}^nC_3+\ldots=2^{n-1}$

(iv) ${}^nC_0-{}^nC_1+{}^nC_2-{}^nC_3+\ldots(-1)^n\,{}^nC_n=0$

(v) $\dfrac{{}^nC_r}{{}^nC_{r-1}}=\dfrac{n-r+1}{r}$

(vi) ${}^nC_r+{}^nC_{r-1}={}^{n+1}C_r$

(vii) ${}^{n+1}C_{r+1}=\dfrac{n+1}{r+1}\cdot{}^nC_r$

(viii) ${}^nC_1+2\,{}^nC_2+3\,{}^nC_3+\ldots+n\,{}^nC_n=n\cdot 2^{n-1}$

(ix) ${}^nC_1-2\,{}^nC_2+3\,{}^nC_3-\ldots=0$

(x) ${}^nC_0+2\,{}^nC_1+3\,{}^nC_2+\ldots+(n+1)\,{}^nC_n=(n+2)2^{n-1}$

(xi) $C_0C_r+C_1C_{r+1}+\ldots+C_{n-r}C_n=\dfrac{(2n)!}{(n-r)!(n+r)!}$

(xii) $C_0^2+C_1^2+C_2^2+\ldots+C_n^2=\dfrac{(2n)!}{(n!)^2}$

(xiii) $C_0^2-C_1^2+C_2^2-C_3^2+\ldots=\begin{cases}0, & \text{if } n \text{ is odd}\\ (-1)^{n/2}, & \text{if } n \text{ is even}\end{cases}$

(xiv) $C_1^2-2C_2^2+3C_3^2-\ldots+(-1)^n n\cdot C_n^2$

$$=(-1)^{\frac{n}{2}-1}\cdot\frac{n}{2}\cdot\frac{n!}{\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!}, \text{ when } n \text{ is even.}$$

***Sample* Problem 7** $\sum_{r=0}^{n} 3^r\,{}^nC_r$ *is equal to* [NCERT]

(a) 4^{n-1} (b) 4^n (c) $\dfrac{4^n}{3}$ (d) 3^{n-1}

Interpret (b) $\because \sum_{r=0}^{n}{}^nC_r\times 3^r$

$$={}^nC_0 3^0+{}^nC_1 3+{}^nC_2 3^2+{}^nC_3 3^3+\ldots+{}^nC_n 3^n$$

$$={}^nC_0+{}^nC_1 3+{}^nC_2 3^2+{}^nC_3 3^3+\ldots+{}^nC_n 3^n=(1+3)^n=4^n$$

***Sample* Problem 8** *The value of*

$${}^{47}C_4+\sum_{j=0}^{3}{}^{50-j}C_3+\sum_{k=0}^{5}{}^{56-k}C_{53-k} \text{ is}$$

(a) ${}^{57}C_4$ (b) ${}^{57}C_3$ (c) ${}^{57}C_5$ (d) ${}^{57}C_6$

Interpret (a) We have, ${}^{47}C_4+\sum_{j=0}^{3}{}^{50-j}C_3+\sum_{k=0}^{5}{}^{56-k}C_{53-k}$

$$={}^{47}C_4+({}^{50}C_3+{}^{49}C_3++{}^{48}C_3+{}^{47}C_3)+({}^{56}C_{53}+{}^{55}C_{52}+{}^{54}C_{51}+{}^{53}C_{50}+{}^{52}C_{49}+{}^{51}C_{48})$$

$$={}^{47}C_4+({}^{47}C_3+{}^{48}C_3+{}^{49}C_3+{}^{50}C_3)+({}^{56}C_3+{}^{55}C_3+{}^{54}C_3+{}^{53}C_3+{}^{52}C_3+{}^{51}C_3)$$

$$(\because {}^nC_r={}^nC_{n-r})$$

$$=({}^{47}C_4+{}^{47}C_3)+({}^{48}C_3+{}^{49}C_3+{}^{50}C_3)+({}^{51}C_3+{}^{52}C_3+\ldots+{}^{56}C_3)$$

$$(\because {}^nC_r+{}^nC_{r-1}={}^{n+1}C_r)$$

$$=({}^{48}C_4+{}^{48}C_3)+{}^{49}C_3+{}^{50}C_3+\ldots+{}^{56}C_3={}^{57}C_4$$

Applications of Binomial Theorem

(i) *R-f* Factor Relation

Here, we are going to discuss problems involving

$$(\sqrt{A}+B)^n=I+f,$$

where I and n are positive integers.

$$0\leq f\leq 1, \left|A-B^2\right|=k \text{ and } \left|\sqrt{A}-B\right|<1$$

Approach for these type of problems can be learnt from following examples.

***Sample* Problem 9** *Integral part of* $(7+4\sqrt{3})^n$ *is* $(n\in N)$

(a) *an even number*

(b) *an odd number*

(c) *an even or an odd number depending upon the value of n*

(d) *None of the above*

Interpret (b) Here, $\forall\, n\in N, (7+4\sqrt{3})^n\notin N$

$\therefore$ Denote $(7+4\sqrt{3})^n$ by $I+f$,

where, I is an integer and $f \in R$ such that $0 < f < 1$

$\because \quad 0 < 7 - 4\sqrt{3} < 1$

$\therefore$ We can denote $(7 - 4\sqrt{3})^n$ by G.

where, $G \in R$ such that $0 < G < 1$

Now, $I + f = (7 + 4\sqrt{3})^n = 7^n + {}^nC_1 7^{n-1}(4\sqrt{3})$

$$+ {}^nC_2 7^{n-2}(4\sqrt{3})^2 + \ldots \quad \ldots(i)$$

$$G = (7 - 4\sqrt{3})^n = 7^n - {}^nC_1 7^{n-1}(4\sqrt{3}) + {}^nC_2 7^{n-2}(4\sqrt{3})^2 \ldots \quad \ldots(ii)$$

To cancel irrational terms we add Eqs. (i) and (ii), we get

$$I + f + G = 2(7^n + {}^nC_2 7^{n-2}(48) + {}^nC_4 7^{n-4}(48)^2 + \ldots)$$

$$= 2k, \text{ where } k \text{ is an integer}$$

$\because$ I is an integer.

$\therefore$ $f + G = 2k - I$ is an integer. ...(iii)

Now, $0 < f < 1$

and $0 < G < 1$

$\Rightarrow$ $0 < f + G < 2$ ...(iv)

Form Eqs. (iii) and (iv), $f + G = 1$

Now, form Eq. (iii) $I = 2k - 1$

$\Rightarrow$ Integral part of $(7 + 4\sqrt{3})^n$

i.e., I is an odd integer.

(ii) Divisibility Problem

In the expansion,

$$(1 + \alpha)^n = 1 + {}^nC_1\alpha + {}^nC_2\alpha^2 + \ldots + {}^nC_n\alpha^n.$$

We can conclude that,

(i) $(1 + \alpha)^n - 1 = {}^nC_1\alpha + {}^nC_2\alpha^2 + \ldots + {}^nC_n\alpha^n$ is divisible by α *i.e.*, it is a multiple of α

***Sample* Problem 10** *For all $n \in R$, $9^{n+1} - 8n - 9$ is divisible by*

(a) 64 (b) 63 (c) 62 (d) 65

Interpret (a) $9^{n+1} - 8n - 9 = 9^n \times 9 - 8n - 9$

$= (1 + 8)^n \times 9 - 8n - 9$

$= ({}^nC_0 + {}^nC_1 8 + {}^nC_2 8^2 + {}^nC_3 8^3 + \ldots + {}^nC_n 8^n)\,9 - 8n - 9$

$= (1 + 8n + {}^nC_2 8^2 + {}^nC_3 8^3 + \ldots + {}^nC_n 8^n)\,9 - 8n - 9$

$= 9 + 72n + ({}^nC_2 8^2 + {}^nC_3 8^3 + \ldots + {}^nC_n 8^n)\,9 - 8n - 9$

$= (72n - 8n) + 8^2({}^nC_2 + {}^nC_3 8 + \ldots + {}^nC_n 8^{n-2})\,9$

$= 64n + 64\,({}^nC_2 + {}^nC_3 8 + \ldots + {}^nC_n 8^{n-2})\,9$

$= 64\,[n + ({}^nC_2 + {}^nC_3 8 + \ldots + {}^nC_n 8^{n-2})\,9]$

$= 64 \times$ Some constant numbers = Divisible by 64

(iii) Differentiability Problem

Sometimes to generalise the result we use the differentiation.

***Sample* Problem 11** *Series*

$${}^nC_1 + 1 \cdot {}^nC_2 + 2 \cdot {}^nC_3 + \ldots + n \cdot {}^nC_n \text{ is equal to}$$

(a) $n2^{n-1}$ (b) 2^{n-1} (c) $n2^n$ (d) 2^{3-1}

Interpret (a) Since,

$$(1 + x)^n = {}^nC_0 + {}^nC_1 x + {}^nC_2 x^2 + \ldots + {}^nC_n x^n$$

On differentiating w.r.t., x, we get

$$n(1 + x)^{n-1} = 0 + {}^nC_1 + 2 \cdot x \cdot {}^nC_2 + \ldots + n \cdot {}^nC_n x^{n-1}$$

Put $x = 1$, we get

$$n(1 + 1)^{n-1} = {}^nC_1 + 2 \cdot {}^nC_2 + \ldots + n \cdot {}^nC_n$$

$$\Rightarrow \quad n\,2^{n-1} = {}^nC_1 + 2 \cdot {}^nC_2 + \ldots + n \cdot {}^nC_n$$

Check Point 1

1. The term independent of x in the expansion of $(1 + x + 2x^3)\left(\frac{3}{2}x^2 - \frac{1}{3x}\right)^9$ is
   (a) 17 / 54 (b) 15 / 54
   (c) 13 / 54 (d) None of these
2. The 14th term from the end in the expansion of $(\sqrt{x} - \sqrt{y})^{17}$ is
   (a) ${}^{17}C_5(-x^6)(-\sqrt{y})^5$ (b) ${}^{17}C_6(\sqrt{x})^{11}y^3$
   (c) ${}^{17}C_4 x^{13/2}y^2$ (d) None of these
3. The ratio of the coefficient of x^{10} in $(1 - x^2)^{10}$ and the term independent of x in $\left(x - \frac{2}{x}\right)^{10}$ is
   (a) 1 : 16 (b) 1 : 8 (c) 64 : 1 (d) 1: 32
4. The value of $(1.0025)^{10}$ correct to five decimal places is
   (a) 1.025281 (b) 1.034285
   (c) 1.005293 (d) None of these
5. The number of terms which are free from radical signs in the expansion of $(y^{1/5} + x^{1/10})^{55}$ is
   (a) 5 (b) 6 (c) 7 (d) 4
6. $(\sqrt{2} + 1)^6 - (\sqrt{2} - 1)^6$ is equal to
   (a) 101 (b) $70\sqrt{2}$ (c) $140\sqrt{2}$ (d) $120\sqrt{2}$
7. If the coefficient of rth, (r + 1)th and (r + 2)th term in the expansion of $(1 + x)^{14}$ are in AP, then the value of r is
   (a) 5 or 8 (b) 4 or 9 (c) 5 or 9 (d) 6 or 7
8. ${}^{10}C_1 + {}^{10}C_3 + {}^{10}C_5 + {}^{10}C_7 + {}^{10}C_9$ is equal to
   (a) 2^9 (b) 2^{10} (c) $2^{10} - 1$ (d) 2^8
9. $C_1 + 2C_2 + 3C_3 + \ldots + nC_n$ is equal to
   (a) $(n - 1)2^{n-1}$ (b) $n2^{n-1}$ (c) $n2^n$ (d) $n2^{n-2}$
10. For all $n \in N$, $2^{4n} - 15n - 1$ is divisible by
   (a) 225 (b) 125
   (c) 325 (d) None of these

8.6 Binomial Theorem for Negative/Rational Index

Let n is a rational number and x is a real number such that $|x|<1$, then

$$(1+x)^n = 1 + nx + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \ldots$$

e.g., (i) The expansion of $(x+a)^n$

$$= a^n\left(1+\frac{x}{a}\right)^n$$

$$= a^n\left\{1 + n\left(\frac{x}{a}\right) + \frac{n(n-1)}{2!}\left(\frac{x}{a}\right)^2 + \ldots\right\}$$

The above expansion is valid only, when $\left|\frac{x}{a}\right| < 1$.

(ii) The expansion $(2+3x)^{-5}$ upto four terms in decreasing power of x, is as follows

$$(2+3x)^{-5} = \left[3x\left(1+\frac{2}{3x}\right)\right]^{-5}$$

$$= \frac{1}{243x^5}\left[1 + (-5)\left(\frac{2}{3x}\right) + \frac{(-5)(-6)}{2!}\left(\frac{2}{3x}\right)^2 + \frac{(-5)(-6)(-7)}{3!}\left(\frac{2}{3x}\right)^3 + \ldots\right]$$

$$= \frac{1}{243x^5}\left[1 - \frac{10}{3x} + \frac{20}{3x^2} - \frac{280}{27x^3} + \ldots\right]$$

$$= \frac{1}{243}\left[\frac{1}{x^5} - \frac{10}{3}\cdot\frac{1}{x^6} + \frac{20}{3}\cdot\frac{1}{x^7} - \frac{280}{27}\cdot\frac{1}{x^8} + \ldots\right]$$

Note

- If n is a whole number, then there is no need of condition $|x|<1$.
- In the expansion of $(1+x)^n$,
  - (i) if n is natural number, then there are finite number terms exist.
  - (ii) if n is negative/rational number, then there are infinite number of terms exist.

General Term in the Expansion of $(1+x)^n$

General term in the expansion of $(1+x)^n$ is as follows

$$T_{r+1} = \frac{[n(n-1)(n-2)\ldots\{n-(r-1)\}]}{r!}x^r$$

Note

- General term in the expansion of $(1-x)^n$ is
$$T_{r+1} = (-1)^r\frac{n(n-1)(n-2)\ldots(n-(r-1))}{r!}x^r$$
- General term in the expansion of $(1+x)^{-n}$ is
$$T_{r+1} = (-1)^r\frac{n(n+1)(n+2)+\ldots+(n+(r-1))}{r!}x^r$$
- General term in the expansion of $(1-x)^{-n}$ is
$$T_{r+1} = \frac{n(n+1)(n+2)+\ldots+(n+(r-1))}{r!}x^r$$

8.7 Important Expansions

(i) $(1+x)^{-n} = 1 - nx + \frac{n(n+1)}{2!}x^2 - \frac{n(n+1)(n+2)}{3!}x^3 + \ldots + \frac{(-1)^r n(n+1)(n+2)\ldots(n+r-1)x^r}{r!} + \ldots$

(ii) $(1-x)^{-n} = 1 + nx + \frac{n(n+1)}{2!}x^2 + \frac{n(n+1)(n+2)}{3!}x^3 + \ldots + \frac{n(n+1)(n+2)\ldots(n+r-1)}{r!}x^r + \ldots$

(iii) $(1-x)^n = 1 - nx + \frac{n(n-1)}{2!}x^2 - \ldots + (-1)^r\frac{n(n-1)(n-2)\ldots(n-r+1)x^r}{r!} + \ldots$

(iv) $(1+x)^{-1} = 1 - x + x^2 - x^3 + \ldots + (-1)^r x^r + \ldots$

(v) $(1-x)^{-1} = 1 + x + x^2 + x^3 + \ldots + x^r + \ldots$

(vi) $(1+x)^{-2} = 1 - 2x + 3x^2 - 4x^3 + \ldots + (-1)^r(r+1)x^r + \ldots$

(vii) $(1-x)^{-2} = 1 + 2x + 3x^2 + 4x^3 + \ldots + (r+1)x^r + \ldots$

(viii) $(1+x)^{-3} = 1 - 3x + 6x^2 - \ldots$

(ix) $(1-x)^{-3} = 1 + 3x + 6x^2 + \ldots$

Note

If the value of x is so small, then on leaving square and higher powers of x, we get $(1+x)^n = 1 + nx$

***Sample* Problem 12** *If $(r+1)$th term is the first negative term in the expansion of $(x+1)^{7/2}$, then the value of r is*

(a) 5 (b) 6
(c) 4 (d) 7

Interpret (a) The general term of $(x+1)^{7/2}$ is

$$T_{r+1} = \frac{\frac{7}{2}\left(\frac{7}{2}-1\right)\left(\frac{7}{2}-2\right)\ldots\left(\frac{7}{2}-r+1\right)x^r}{r!}$$

This will be the first negative term, when $\frac{7}{2} - r + 1 < 0 \Rightarrow r > \frac{9}{2}$

$\therefore \quad r = 5$

***Sample* Problem 13** *Assume that x is so small that its, second and higher power may be neglected, then the simplified value of $\frac{(1-2x)^{2/3}(4+5x)^{3/2}}{\sqrt{1-x}}$ is*

(a) $8 - \frac{25}{3}x$ (b) $8 + \frac{25}{3}x$ (c) $8 + \frac{25}{4}x$ (d) $4 + \frac{25}{3}x$

Interpret (b) Using binomial expansion for rational index

$$\frac{(1-2x)^{2/3}(4+5x)^{3/2}}{\sqrt{1-x}}$$

$$= (1-2x)^{2/3}\cdot 4^{3/2}\left(1+\frac{5}{4}x\right)^{3/2}(1-x)^{-1/2}$$

$$= 8(1-2x)^{2/3}\cdot\left(1+\frac{5}{4}x\right)^{3/2}(1-x)^{-1/2}$$

$$=8\left[\left\{1+\frac{2}{3}\times(-2x)+\ldots\right\}\times\left\{1+\frac{3}{2}\times\frac{5}{4}x+\ldots\right\}\times\left\{1+\left(-\frac{1}{2}\right)(-x)+\ldots\right\}\right]$$

$$=8\left[\left(1-\frac{4}{3}x\right)\left(1+\frac{15}{8}x\right)\left(1+\frac{1}{2}x\right)\right]$$

($\because$ neglecting x^2 and higher powers of x)

$$=8\left[\left(1-\frac{4}{3}x+\frac{15}{8}x\right)\left(1+\frac{x}{2}\right)\right] \quad (\because \text{ neglecting } x^2)$$

$$=8\left[\left(1+\frac{13}{24}x\right)\left(1+\frac{x}{2}\right)\right] \quad (\because \text{ neglecting } x^2)$$

$$=8\left[1+\frac{1}{2}x+\frac{13}{24}x\right] \quad (\because \text{ neglecting } x^2)$$

$$=8\left[1+\frac{25}{24}x\right]$$

$$=8+\frac{25}{3}x$$

8.8 Multinomial Theorem

If n is a positive integer and $a_1, a_2, \ldots, a_k \in R$, then

$$(a_1+a_2+\ldots+a_k)^n=\sum_{r_1+r_2+\ldots+r_k=n}\frac{n!\,a_1^{r_1}\cdot a_2^{r_2}\ldots a_k^{r_k}}{r_1!\,r_2!\ldots r_k!}$$

Note

The number of terms in $(x+y+z)^n$ is ${}^{n+2}C_2$.

The number of terms in the expansion of $(a_1+a_2+\ldots+a_k)^n$ is ${}^{n+k-1}C_{k-1}$.

Coefficient of $x^{n_1}\cdot y^{n_2}\cdot z^{n_3}$ in the expansion of $(x+y+z)^n$ is $\frac{n!}{n_1!n_2!n_3!}$ where, $n=n_1+n_2+n_3$.

Sum of coefficients in the expansion of $(a+bx+cx^2)^n$ is $(a+b+c)^n$.

***Sample* Problem 14** *The coefficient of $a^3b^4c^5$ in the expansion of $(bc+ca+ab)^6$ is*

(a) 6 (b) 60
(c) 61 (d) *None of these*

Interpret (*b*) In this case, we write

$$a^3b^4c^5=(ab)^x(bc)^y(ca)^z$$

$$\Rightarrow \quad a^3b^4c^5=a^{z+x}\cdot b^{x+y}\cdot c^{y+z}$$

$$\Rightarrow \quad z+x=3, x+y=4, y+z=5 \quad \ldots(i)$$

On adding these equations, we get

$$2(x+y+z)=12$$

$$\therefore \quad x+y+z=6 \quad \ldots(ii)$$

On solving Eqs. (i) and (ii), we get

$$x=1, y=3, z=2$$

Therefore, the coefficient of $a^3b^4c^5$ in the expansion of $(bc+ca+ab)^6=$ The coefficient of $(ab)^1(bc)^3(ca)^2$ in the expansion of $(bc+ca+ab)^6=\frac{6!}{1!3!2!}=60$

Check Point 2

1. The 4th term in the expansion of $(1-2x)^{3/2}$ will be
(a) $-\frac{3}{4}x^4$ (b) $\frac{x^2}{2}$
(c) $-\frac{x^3}{2}$ (d) $\frac{3}{4}x^4$

2. If $(r+1)$th term is the first negative term in the expansion of $(1+x)^{7/2}$, then the value of r is
(a) 5 (b) 6
(c) 4 (d) 7

3. If x is so small that its square and higher powers may be neglected, then the value of $\frac{(8+3x)^{2/3}}{(2+3x)(4-5x)^{1/2}}$ is
(a) $1-\frac{3}{2}x$ (b) $1+\frac{5}{8}x$
(c) $1-\frac{5}{8}x$ (d) None of these

4. Sum of infinite series $1+\frac{2}{3}\cdot\frac{1}{2}+\frac{2}{3}\cdot\frac{5}{6}\cdot\frac{1}{2^2}+\frac{2}{3}\cdot\frac{5}{6}\cdot\frac{8}{9}\cdot\frac{1}{2^3}+\ldots\infty$ is
(a) $2^{1/3}$ (b) $4^{1/3}$ (c) $8^{1/3}$ (d) None of these

5. If is very small in magnitude compared with a such that $\left(\frac{a}{a+x}\right)^{1/2}+\left(\frac{a}{a-x}\right)^{1/2}=2+k\cdot\frac{x^2}{a^2}$, then the value of k is
(a) $\frac{1}{4}$ (b) $\frac{1}{2}$
(c) $\frac{3}{4}$ (d) 1

6. The approximate value of $(7.995)^{1/3}$ correct to four decimal places is
(a) 1.9995 (b) 1.9996 (c) 1.9990 (d) 1.9991

7. The number of dissimilar terms in the expansion of $(a+b-c)^{2n-1}-(a+b-c)^{2n+1}$ is
(a) $(n+1)^2$ (b) $(n-1)^2$
(c) $4n^2-1$ (d) None of these

WORKED OUT Examples

Example 1 *The coefficient of* $\frac{1}{x^{17}}$ *in the expansion of* $\left(x^4 - \frac{1}{x^3}\right)^{15}$ *is*

[**NCERT Exemplar**]

(*a*) 1365 (*b*) −1365

(*c*) −1450 (*d*) *None of these*

Solution (*b*) General term in the expansion of $\left(x^4 - \frac{1}{x^3}\right)^{15}$ is $T_{r+1} = {}^{15}C_r\,(x^4)^{15-r}\left(-\frac{1}{x^3}\right)^r$

$$= {}^{15}C_r\,(-1)^r\,x^{60-7r}$$

For coefficient of $\frac{1}{x^{17}}$ *i.e.*, x^{-7}

Put $60 - 7r = -17 \Rightarrow r = 11$

$\therefore$ Coefficient of $\frac{1}{x^{17}} = {}^{15}C_{11}(-1)^{11} = -1365$

Example 2 *Using binomial theorem, which number is larger* $(1\cdot 1)^{1000}$ *or* 1000*?*

[**NCERT**]

(*a*) $(1\cdot 1)^{1000}$ (*b*) 1000

(*c*) *Cannot to determined* (*d*) *None of these*

Solution (*b*) $(1\cdot 1)^{10000} = (1 + 0\cdot 1)^{10000}$

$= {}^{10000}C_0\,(1)^{10000} + {}^{10000}C_1\,(1)^{9999}\,(0\cdot 1) + \ldots$ other terms

$= 1\times 1 + 10000 \times 0.1 + \ldots$ other terms $\quad (\because {}^nC_0 = 1, {}^nC_1 = n)$

$= 1 + 1000 +$ other terms

$= (1001 +$ other terms$) > 1000$

$\Rightarrow \quad (1\cdot 1)^{10000} > 1000$

Example 3 *The middle term in the expansion of* $\left(x - \frac{1}{x}\right)^{2n}$ *is*

[**NCERT**]

(*a*) $\frac{1\times 3\times 5\times\ldots\times(2n+1)}{n!}(-2)^n$ (*b*) $\frac{1\times 3\times 5\times\ldots\times(2n-1)}{n!}(-2)^n$

(*c*) $\frac{1\times 3\times 5\times\ldots\times(2n-1)}{n!}2^n$ (*d*) *None of these*

Solution (*b*) $N = 2n$ (even), total terms $= 2n + 1$

$\therefore$ Middle term $= \frac{(2n+1+1)\text{th}}{2}$ term

$= (n+1)$ th the middle term

$$T_{r+1} = {}^{2n}C_r(x)^{2n-r}\left(-\frac{1}{x}\right)^r$$

Putting $r = n$,

$$T_{n+1} = {}^{2n}C_n(x)^{2n-1}\left(-\frac{1}{x}\right) = \frac{2n!}{n!\,n!}(x)^n(1)^n\,\frac{1}{(x^n)}$$

$$= \frac{2n\,(2n-1)(2n-2)(2n-3)\ldots 3\cdot 2\cdot 1}{n!\,n!}(-1)^n$$

$$= \frac{2^n\,[n(n-1)(n-2)\ldots 3\cdot 2\cdot 1][(2n-1)(2n-3)\ldots 5\cdot 3\cdot 1]}{n!\,n!}\times(-1)^n$$

$$= \frac{2^n \times n![1\times 3\times 5\ldots\times(2n-1)]}{n!\,n!}(-1)^n$$

$$= \frac{2^n \times [1\times 3\times 5\ldots\times(2n-1)]}{n!}(-1)^n$$

$$= \frac{1\cdot 3\cdot 5\ \ldots\ (2n-1)}{n!}(-2)^n$$

Example 4 *If the Coefficient of second, third and fourth terms in the expansion of* $(1+x)^{2n}$ *are in* AP*, then* $2n^2 - 9n$ *is equal to*

[**NCERT Exemplar**]

(*a*) −7 (*b*) 7

(*c*) 6 (*d*) −6

Solution (*a*) The general term of $(1+x)^{2n}$ is

$$T_{r+1} = {}^{2n}C_r\,x^r$$

$$T_2 = {}^{2n}C_1x^2,\ T_3 = {}^{2n}C_2x^3,\ T_4 = {}^{2n}C_3x^4$$

Since , coefficients are in AP.

$\Rightarrow \quad {}^{2n}C_1,\ {}^{2n}C_2,\ {}^{2n}C_3$, are in AP

$\Rightarrow \quad 2\times {}^{2n}C_2 = {}^{2n}C_1 + {}^{2n}C_3$

$\Rightarrow \quad 2 = \frac{{}^{2n}C_1}{{}^{2n}C_2} + \frac{{}^{2n}C_3}{{}^{2n}C_2}$

$\Rightarrow \quad 2 = \frac{2}{(2n-2+1)} + \frac{2n-3+1}{3}$

$\Rightarrow \quad 2 = \frac{2}{2n-1} + \frac{2n-2}{3}$

$\Rightarrow \quad 2n^2 - 9n + 7 = 0$

$\therefore \quad 2n^2 - 9n = -7$

Example 5 *The coefficient of x^5 in the expansion of $(1+2x)^6(1-x)^7$ is*

(a) 192 (b) 171
(c) 21 (d) *None of these*

Solution (b) $(1+2x)^6(1-x)^7 = [1 + {}^6C_1(2x) + {}^6C_2(2x)^2 + {}^6C_3(2x)^3 + {}^6C_4(2x)^4 + {}^6C_5(2x)^5 + {}^6C_6(2x)^6]$
$\times [1 - {}^7C_1x + {}^7C_2x^2 - {}^7C_3x^3 + {}^7C_4x^4 \ldots]$

$= (1 + 12x + 60x^2 + 160x^3 + 240x^4 + 192x^5 + \ldots)$
$\times (1 - 7x + 21x^2 - 35x^3 + 35x^4 - 21x^5 + \ldots)$

$\therefore$ Coefficient of x^5 in the expansion of $(1+2x)^6(1-x)^7$

$= 1 \times (-21) + 12 \times 35 + 60 \times (-35) + 160 \times 21 + 240 \times (-7) + 192$

$= -21 + 420 - 2100 + 3360 - 1680 + 192 = 171$

Example 6 *The coefficient of x^4 in the expansion of $(1 + x + x^2 + x^3)^{11}$ is*

(a) 900 (b) 909
(c) 990 (d) 999

Solution (c) Let $E = (1 + x + x^2 + x^3)^{11}$

$= [(1+x)(1+x^2)]^{11}$

$= (1+x)^{11}(1+x^2)^{11}$

$\therefore$ General term of E is,

$T(r,k) = [{}^{11}C_r x^r)({}^{11}C_k(x^2)^k]$

$= {}^{11}C_r \cdot {}^{11}C_k\, x^{r+2k}$

For taking coefficient of x^4, we take

$r + 2k = 4$

r	0	1	2	3	4	5
$k = \frac{4-r}{2}$	2	x	1	x	0	x

$\therefore$ Coefficient of $x^4 = T_{(0,2)} + T_{(2,1)} + T_{(4,0)}$

$= {}^{11}C_0\,{}^{11}C_2 + {}^{11}C_2\,{}^{11}C_1 + {}^{11}C_4\,{}^{11}C_0$

$= 55 + 55 \times 11 + 330$

$= 55 + 605 + 330 = 990$

Example 7 *In the expansion of $(1+x)^n$,*

$\frac{C_1}{C_0} + 2\frac{C_2}{C_1} + 3\frac{C_3}{C_2} + \ldots + n\frac{C_n}{C_{n-1}}$ *is equal to*

(a) $\frac{(n+1)}{2}$ (b) $\frac{n}{2}$
(c) $\frac{n(n+1)}{2}$ (d) *None of these*

Solution (c) Since, we know that $\frac{{}^nC_r}{{}^nC_{r-1}} = \frac{n-r+1}{r}$

$\therefore \quad \frac{C_1}{C_0} = n,\ \frac{C_2}{C_1} = \frac{n-1}{2},\ \frac{C_3}{C_2} = \frac{n-2}{3}, \ldots$

Thus, $\frac{C_1}{C_0} + 2\frac{C_2}{C_1} + 3\frac{C_3}{C_2} + \ldots = n + 2\cdot\frac{n-1}{2} + 3\cdot\frac{n-2}{3} + \ldots + n\cdot\frac{1}{n}$

$= [n + (n-1) + (n-2) + \ldots + 1]$

$= \frac{n(n+1)}{2}$

Example 8 $(C_0 + C_1)(C_1 + C_2) \ldots (C_{n-1} + C_n)$ *is equal to*

(a) $(C_0C_1C_2 \ldots C_{n-1})(n+1)$
(b) $(C_0C_1C_2 \ldots C_{n-1})(n+1)^n$
(c) $\frac{(C_0C_1C_2 \ldots C_{n-1})(n+1)^n}{n!}$
(d) *None of the above*

Solution (c) $(C_0 + C_1)(C_1 + C_2) \ldots (C_{n-1} + C_n)$

$= C_0\left(1 + \frac{C_1}{C_0}\right) C_1\left(1 + \frac{C_2}{C_1}\right) \ldots C_{n-1}\left(1 + \frac{C_n}{C_{n-1}}\right)$

$= \{C_0C_1C_2 \ldots C_{n-1}\}\left(1 + \frac{C_1}{C_0}\right)\left(1 + \frac{C_2}{C_1}\right) \ldots \left(1 + \frac{C_n}{C_{n-1}}\right)$

$= \{C_0C_1C_2 \ldots C_{n-1}\}(n+1)\left(1 + \frac{n-1}{2}\right) \ldots \left(1 + \frac{1}{n}\right)$

$= \{C_0C_1C_2 \ldots C_{n-1}\}(n+1)\left(\frac{n+1}{2}\right)\left(\frac{n+1}{3}\right) \ldots \left(\frac{n+1}{n}\right)$

$= \frac{\{C_0C_1C_2 \ldots C_{n-1}\}(n+1)^n}{n!}$

Example 9 $C_0C_r + C_1C_{r+1} + C_2C_{r+2} + \ldots + C_{n-r}C_n$ *is equal to*

(a) $\frac{(2n)!}{(n-r)!(n+r)!}$ (b) $\frac{n!}{r!(n+r)!}$
(c) $\frac{n!}{(n-r)!}$ (d) None of these

Solution (a) We know,

$(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_rx^r + \ldots$ ...(i)

and $\left(1 + \frac{1}{x}\right)^n = C_0 + C_1\frac{1}{x} + C_2\frac{1}{x^2} + \ldots + C_r\frac{1}{x^r}$
$+ C_{r+1}\frac{1}{x^{r+1}} + C_{r+2}\frac{1}{x^{r+2}} \ldots C_n\frac{1}{x^n}$ ...(ii)

On multiplying Eqs. (i) and (ii), equating coefficient of x^r in $\frac{1}{x^n}(1+x)^{2n}$ or the coefficient of x^{n+r} in $(1+x)^{2n}$, we get the value of required expression which is

$${}^{2n}C_{n+r} = \frac{(2n)!}{(n-r)!(n+r)!}$$

Example 10 $(100)^{50} + (99)^{50}$

(*a*) $< (101)^{50}$ (*b*) (101) (*c*) $> (101)^{50}$ (*d*) $> (101)$

Solution (*a*) Since, $(101)^{50} = (101+1)^{50} = 100^{50} + {}^{50}C_1 100^{49} + {}^{50}C_2 100^{48} + \ldots + 1$ ... (i)

and $(99)^{50} = (100-1)^{100} = 100^{50} - {}^{50}C_1 100^{49} + {}^{50}C_2 100^{48} - \ldots + 1$ ... (ii)

On subtracting Eq. (ii) from Eq. (i), we get

$$(101)^{50} - (99)^{50} = 2\{{}^{50}C_1 100^{49} + {}^{50}C_3 100^{47} + \ldots\}$$
$$= 2 \times {}^{50}C_1 100^{49} + (2 \times {}^{50}C_3 \times 100^{47} + \ldots\}$$
$$= 100 \times 100^{49} + \text{a positive number}$$
$$> 100^{50}$$

$\Rightarrow$ $(101)^{50} - (99)^{50} > (100)^{50}$

$\Rightarrow$ $(101)^{50} > (100)^{50} + (99)^{50}$

Example 11 *The sum of the series*

$$1 + \frac{1}{3^2} + \frac{1\cdot 4}{1\cdot 2}\cdot\frac{1}{3^4} + \frac{1\cdot 4\cdot 7}{1\cdot 2\cdot 3}\cdot\frac{1}{3^6} + \ldots \text{ is}$$

(*a*) $\sqrt{\frac{3}{2}}$ (*b*) $\left(\frac{3}{2}\right)^{1/3}$

(*c*) $\sqrt{\frac{1}{3}}$ (*d*) *None of these*

Solution (*b*) We know, $(1+x)^n = 1 + nx + \frac{n(n-1)}{2}x^2 + \ldots + x^n$

Here, $nx = \frac{1}{3^2}$ ...(i)

and $\frac{n(n-1)}{2}x^2 = \frac{1\cdot 4}{1\cdot 2}\cdot\frac{1}{3^4}$ ...(ii)

From Eqs. (i) and (ii), we get

$$n = -\frac{1}{3} \text{ and } x = -\frac{1}{3}$$

$\therefore$ Required sum $= \left(1 - \frac{1}{3}\right)^{-1/3} = \left(\frac{3}{2}\right)^{1/3}$

Example 12 *If* $(1 + x - 2x^2)^6 = 1 + a_1 x + a_2 x^2 + \ldots + a_{12}x^{12}$, *then the expression* $a_2 + a_4 + a_6 + \ldots + a_{12}$ *has the value*

(*a*) 32 (*b*) 63 (*c*) 64 (*d*) 31

Solution (*d*) $(1 + x - 2x^2)^6 = 1 + a_1 x + a_2 x^2 + \ldots + a_{12}x^{12}$

On putting $x = 1$ and $x = -1$ and adding the results.

$$64 = 2(1 + a_2 + a_4 + \ldots)$$

$\Rightarrow$ $a_2 + a_4 + a_6 + \ldots + a_{12} = 31$

Example 13 *For* $\forall\, n \in N$, $2^{3n+3} - 7n - 8$ *is divisible by*

(*a*) 49 (*b*) 7

(*c*) 343 (*d*) *None of these*

Solution (*d*) Now, $2^{3n+3} - 7n - 8$

$$= (2^3)^{n+1} - 7(n+1) - 1$$
$$= (1+7)^{n+1} - 7(n+1) - 1$$
$$= {}^{n+1}C_0 + {}^{n+1}C_1 7 + {}^{n+1}C_2 7^2 + {}^{n+1}C_3 7^3 \ldots + {}^{n+1}C_{n+1}\, 7^{n+1} - 7(n+1) - 1$$
$$= 7^2\,({}^{n+1}C_2 + {}^{n+1}C_3 7^1 \ldots + {}^{n+1}C_{n+1}\, 7^{n-1},$$

which is divisible by 49.

Example 14 *If* $(2+\sqrt{3})^n = I + f$ *where I and n are positive integers and* $0 < f < 1$, *then* $(1-f)(I+f)$

(*a*) -1 (*b*) 1

(*c*) 2 (*d*) *None of these*

Solution (*b*) $I + f = (2+\sqrt{3})^n = 2^n + {}^nC_1 2^{n-1}\sqrt{3} + {}^nC_2 2^{n-2}(\sqrt{3})^2 + {}^nC_3 2^{n-3}(\sqrt{3})^3 + \ldots$ ... (i)

Now, $0 < 2 - \sqrt{3} < 1$

$\Rightarrow$ $0 < (2-\sqrt{3})^n < 1$

Let $(2-\sqrt{3})^n = f'$ where $0 < f' < 1$

$\Rightarrow$ $f' = 2^n - {}^nC_1 2^{n-1}\sqrt{3} + {}^nC_2 2^{n-2}(\sqrt{3})^2 - {}^nC_3 2^{n-3}(\sqrt{3})^3 + \ldots$ ... (ii)

On adding Eqs. (i) and (ii), we get

$$I + f + f' = 2[2^n + {}^nC_2 2^{n-2}\cdot 3 + \ldots] \quad \text{...(iii)}$$

$\Rightarrow$ $I + f + f' =$ even integer

Now, $0 < f < 1$

and $0 < f' < 1$

$\Rightarrow$ $0 < f + f' < 2$

Hence, from Eq. (iii) we conclude that $f + f'$ is an integer between 0 and 2.

$\Rightarrow$ $f + f' = 1$

$\Rightarrow$ $f' = 1 - f$ ...(iv)

$\therefore$ $I + f = (2+\sqrt{3})^n$, $f' = 1 - f = (2-\sqrt{3})^n$

$\Rightarrow$ $(I+f)(1-f) = [(2+\sqrt{3})(2-\sqrt{3})]^n = (4-3)^n = 1$

$\Rightarrow$ $(I+f)(1-f) = 1$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Binomial Theorem for Positive Integer Index

1. The total number of terms in the expansion of $(x+a)^{100}+(x-a)^{100}$ after simplification will be [NCERT Exemplar]

(a) 202 (b) 51
(c) 50 (d) None of these

2. If $(1+ax)^n = 1+8x+24x^2+\ldots$, then the values of a and n are

(a) 2, 4 (b) 2, 3 (c) 3, 6 (d) 1, 2

3. By using the first three terms of its expansion , the approximate value of $(0.99)^5$ is [NCERT]

(a) 0.949 (b) 0.951
(c) 0.954 (d) None of these

General, Middle and Greatest Term in the Binomial Expansion

4. The coefficient of x^n in the expansion of $(1+x)^{2n}$ and $(1+x)^{2n-1}$ are in the ratio [NCERT Exemplar]

(a) 1:2 (b) 1:3 (c) 3:1 (d) 2:1

5. The value of $(1.002)^{12}$ upto fourth place of decimal is

(a) 1.0242 (b) 1.0245
(c) 1.0004 (d) 1.0254

6. The coefficient of x^4 in the expansion of $(1+x+x^2+x^3)^n$ is

(a) ${}^nC_4$ (b) ${}^nC_4 + {}^nC_2$
(c) ${}^nC_4 + {}^nC_2 + {}^nC_2$ (d) ${}^nC_4 + {}^nC_2 + {}^nC_1 \cdot {}^nC_2$

7. In the expansion of the following expression $1+(1+x)+(1+x)^2+\ldots+(1+x)^n$, the coefficient of x^4 $(0 \le k \le n)$ is

(a) ${}^{n+1}C_{k+1}$ (b) ${}^nC_k$
(c) ${}^nC_{n-k-1}$ (d) None of these

8. The coefficient of x^5 in the expansion of $(1+x)^{21}+(1+x)^{22}+\ldots+(1+x)^{30}$ is

(a) ${}^{51}C_5$ (b) ${}^9C_5$
(c) ${}^{31}C_6 - {}^{21}C_6$ (d) ${}^{30}C_5 + {}^{20}C_5$

9. The coefficient of t^{24} in the expansion of $(1+t^2)^{12}(1+t^{12})(1+t^{24})$ is

(a) ${}^{12}C_6 + 2$ (b) ${}^{12}C_5$
(c) ${}^{12}C_6$ (d) ${}^{12}C_7$

10. The coefficient of x^{53} in the following expansion $\sum_{m=0}^{100} {}^{100}C_m (x-3)^{100-m} \cdot 2^m$ is

(a) ${}^{100}C_{47}$ (b) ${}^{100}C_{53}$
(c) $-{}^{100}C_{53}$ (d) $-{}^{100}C_{100}$

11. In the polynomial $(x-1)(x-2)(x-3)\ldots(x-100)$, the coefficient of x^{99} is

(a) 5050 (b) – 5050 (c) 100 (d) 99

12. If in the expansion of $(1+x)^m(1-x)^n$, the coefficient of x and x^2 are 3 and – 6 respectively, then m is

(a) 6 (b) 9 (c) 12 (d) 24

13. If for positive integers $r>1$, $n>2$, the coefficient of the $(3r)$th and $(r+2)$th powers of x in the expansion of $(1+x)^{2n}$ are equal, then

(a) $n=2r$ (b) $n=3r$
(c) $n=2r+1$ (d) None of these

14. If the coefficients of three consecutive terms in the expansion of $(1+x)^n$ are in the ratio $1:7:42$, then the value of n is

(a) 60 (b) 70
(c) 55 (d) None of these

15. The digit at the unit place in the number $19^{2005}+11^{2005}-9^{2005}$ is

(a) 2 (b) 1 (c) 0 (d) 8

16. If a_1, a_2, a_3, a_4 are the coefficients of any four consecutive terms in the expansion of $(1+x)^n$, then $\frac{a_1}{a_1+a_2}+\frac{a_3}{a_3+a_4}$ is equal to

(a) $\frac{a_2}{a_2+a_3}$ (b) $\frac{1}{2}\frac{a_2}{(a_2+a_3)}$

(c) $\frac{2a_2}{a_2+a_3}$ (d) $\frac{2a_3}{a_2+a_3}$

17. If the coefficients of p th, $(p+1)$th and $(p+2)$th terms in the expansion of $(1+x)^n$ are in AP, then

(a) $n^2-2np+4p^2=0$

(b) $n^2-n(4p+1)+4p^2-2=0$

(c) $n^2-n(4p+1)+4p^2=0$

(d) None of the above

18. If $(1+x-2x^2)^6=1+a_1x+a_2x^2+\ldots+a_{12}x^{12}$, then the expression $a_2+a_4+a_6+\ldots+a_{12}$ has the value

(a) 32 (b) 63

(c) 64 (d) None of these

19. If $(1-x+x^2)^n=a_0+a_1x+a_2x^2+\ldots+a_{2n}x^{2n}$, then $a_0+a_2+a_4+\ldots+a_{2n}$ is equal to

(a) $\frac{3^n+1}{2}$ (b) $\frac{3^n-1}{2}$

(c) $\frac{1-3^n}{2}$ (d) $3^n+\frac{1}{2}$

20. The 4th term in the expansion of $(x-2y)^{12}$ is [NCERT]

(a) $1760x^3y^9$ (b) $-1760x^9y^3$

(c) $1760x^9y^3$ (d) None of these

21. The rth term in the expansion of $(a+2x)^n$ is

(a) $\frac{n(n+1)\ \ldots(n-r+1)}{r!}a^{n-r+1}(2x)^r$

(b) $\frac{n(n-1)\ldots(n-r+2)}{(r-1)!}a^{n-r+1}(2x)^{r-1}$

(c) $\frac{n(n+1)\ldots(n-r)}{(r+1)}a^{n-r}(x)^r$

(d) None of the above

22. The $(r+1)$th term in the expansion of $(1-x)^{-4}$ will be

(a) $\frac{x^r}{r!}$ (b) $\frac{(r+1)(r+2)(r+3)}{6}x^r$

(c) $\frac{(r+2)(r+3)}{2}x^r$ (d) None of these

23. In the expansion of $(1+a)^{m+n}$, the coefficients of a^m and a^n are [NCERT]

(a) equal (b) not equal

(c) do not say anything (d) None of these

24. Given the integers, $r>1, n>2$ and coefficients of $(3r)$th and $(r+2)$nd terms in the binomial expansion of $(1+x)^{2n}$ are equal, then [NCERT Exemplar]

(a) $n=2r$ (b) $n=3r$

(c) $n=2r+1$ (d) None of these

25. If the coefficients of x^2 and x^3 in the expansion of $(3+ax)^9$ are equal, then the value of a is [NCERT]

(a) $\frac{5}{7}$ (b) $\frac{9}{7}$ (c) $\frac{7}{9}$ (d) $\frac{-9}{7}$

26. The two successive terms in the expansion of $(1+x)^{24}$ whose coefficients are in the ratio 1:4 are [NCERT Exemplar]

(a) 3rd and 4th (b) 4th and 5th

(c) 5th and 6th (d) 6th and 7th

27. If the coefficients of 2nd, 3rd and the 4th terms in the expansion of $(1+x)^n$ are in AP, then value of n is [NCERT Exemplar]

(a) 2 (b) 7 (c) 11 (d) 14

28. If in the expansion of $(a-2b)^n$, the sum of 4th and 5th term is zero, then the value of $\frac{a}{b}$ is

(a) $\frac{n-4}{5}$ (b) $\frac{n-3}{2}$

(c) $\frac{5}{n-4}$ (d) $\frac{5}{2(n-4)}$

29. The value of x in the expression $(x+x^{\log_{10}x})^5$, if the third term in the expansion is 1000000, is

(a) 10 (b) 11

(c) 12 (d) None of these

30. The first 3 terms in the expansion of $(1+ax)^n$ $(n\neq 0)$ are $1, 6x$ and $16x^2$. Then, the values of a and n are respectively

(a) 2 and 9 (b) 3 and 2

(c) $\frac{2}{3}$ and 9 (d) $\frac{3}{2}$ and 6

31. If the last term in the binomial expansion of $\left(2^{1/3}-\frac{1}{\sqrt{2}}\right)^n$ is $\left(\frac{1}{3^{5/3}}\right)^{\log_3 8}$, then the 5th term from the beginning is

(a) 210 (b) 420

(c) 105 (d) None of these

32. If x^{2k} occurs in the expansion of $\left(x+\frac{1}{x^2}\right)^{n-3}$, then

(a) $n-2k$ is a multiple of 2

(b) $n-2k$ is a multiple of 3

(c) $k=0$

(d) None of the above

33. The coefficient of the term independent of x in the expansion of $(1+x+2x^3)\left(\frac{3}{2}x^2-\frac{1}{3x}\right)^9$ is

(a) $\frac{1}{3}$ (b) $\frac{19}{54}$

(c) $\frac{17}{54}$ (d) $\frac{1}{4}$

34. If the term free from x in the expansion of $\left(\sqrt{x}-\frac{k}{x^2}\right)^{10}$ is 405, then the value of k is [NCERT Exemplar]

(a) ± 1 (b) ± 2
(c) ± 3 (d) ± 4

35. The coefficient of x in the expansion of $(1-3x+7x^2)(1-x)^{16}$ is [NCERT Exemplar]

(a) 19 (b) -19
(c) 18 (d) -18

36. The term independent of x in the expansion of $\left(3x-\frac{2}{x^2}\right)^{15}$ is [NCERT Exemplar]

(a) $-3003\,(3^{10})\,(2^5)$ (b) $-3003\,(3^{10})\,(2^4)$
(c) $3003\,(3^{10})\,(2^5)$ (d) None of these

37. The middle term in the expansion of $\left(x+\frac{1}{2x}\right)^{2n}$ is

(a) $\frac{1\cdot 3\cdot 5\ldots(2n-3)}{n!}$ (b) $\frac{1\cdot 3\cdot 5\ldots(2n-1)}{n!}$
(c) $\frac{1\cdot 3\cdot 5\ldots(2n+1)}{n!}$ (d) None of these

38. If the middle term of $\left(\frac{1}{x}+x\sin x\right)^{10}$ is equal to $7\frac{7}{8}$, then value of x is [NCERT Exemplar]

(a) $2n\pi+\frac{\pi}{6}$ (b) $n\pi+\frac{\pi}{6}$
(c) $n\pi+(-1)^n\frac{\pi}{6}$ (d) $n\pi+(-1)^n\frac{\pi}{3}$

39. If p is a real number and if the middle term in the expansion of $\left(\frac{p}{2}+2\right)^8$ is 1120, then the value of p is [NCERT Exemplar]

(a) ± 3 (b) ± 1
(c) ± 2 (d) None of these

40. If n is even, then the middle term in the expansion of $\left(x^2+\frac{1}{x}\right)^n$ is $924\,x^6$, then n is equal to

(a) 10 (b) 12
(c) 14 (d) None of these

41. The largest term in the expansion of $(3+2x)^{50}$, where $x=\frac{1}{5}$ is

(a) 5th (b) 3th
(c) 7th (d) 6th

42. If the sum of the coefficients in the expansion of $(x-2y+3z)^n$ is 128, then the greatest coefficient in the expansion of $(1+x)^n$ is

(a) 35
(b) 20
(c) 10
(d) None of the above

43. The greatest value of the term independent of x, as α varies over R, in the expansion of $\left(x\cos\alpha+\frac{\sin\alpha}{x}\right)^{20}$ is

(a) ${}^{20}C_{10}$ (b) ${}^{20}C_{15}$
(c) ${}^{20}C_{19}$ (d) None of these

44. The interval in which x must lie, so that the greatest term in the expansion of $(1+x)^{2n}$ has the greatest coefficient, is

(a) $\left(\frac{n-1}{n},\frac{n}{n-1}\right)$ (b) $\left(\frac{n}{n+1},\frac{n+1}{n}\right)$
(c) $\left(\frac{n}{n+2},\frac{n+2}{n}\right)$ (d) None of these

Properties of Binomial Coefficients

45. If $a_n=\sum_{r=0}^{n}\frac{1}{{}^nC_r}$, then $\sum_{r=0}^{n}\frac{r}{{}^nC_r}$ is equal to

(a) $(n-1)\,a_n$ (b) na_n
(c) $\frac{1}{2}na_n$ (d) None of these

46. $\sum_{r=0}^{n}(-1)^r\,({}^nC_r)\,\frac{1+rx}{1+nx}$ is equal to

(a) 1 (b) -1 (c) n (d) 0

47. $\binom{30}{0}\binom{30}{10}-\binom{30}{1}\binom{30}{11}+\ldots+\binom{30}{20}\binom{30}{30}$ is equal to

(a) ${}^{30}C_{11}$ (b) ${}^{60}C_{10}$
(c) ${}^{30}C_{10}$ (d) ${}^{65}C_{55}$

48. If $(1+x)^n=C_0+C_1x+C_2x^2+\ldots+C_nx^n$, then $C_0^2+C_1^2+C_2^2+C_3^2+\ldots+C_n^2$ is equal to

(a) $\frac{n!}{n!\,n!}$ (b) $\frac{(2n)!}{n!\,n!}$
(c) $\frac{(2n)!}{n!}$ (d) None of these

49. $\frac{C_1}{C_0}+2\frac{C_2}{C_1}+3\frac{C_3}{C_2}+\ldots+15\frac{C_{15}}{C_{14}}$ is equal to

(a) 100 (b) 120
(c) -120 (d) None of these

50. If $n\in N, n>1$, then value of $E=a-{}^nC_1(a-1)+{}^nC_2(a-2)+\ldots+(-1)^n(a-n)\,{}^nC_n$ is

(a) a (b) 0 (c) a^2 (d) 2^n

51. ${}^nC_0-\frac{1}{2}{}^nC_1+\frac{1}{3}{}^nC_2-\ldots+(-1)^n\frac{{}^nC_n}{n+1}$ is equal to

(a) n (b) $\frac{1}{n}$ (c) $\frac{1}{n+1}$ (d) $\frac{1}{n-1}$

52. If $(1+x)^n = \sum_{r=0}^{n} C_r x^r$, then

$\left(1+\frac{C_1}{C_0}\right)\left(1+\frac{C_2}{C_1}\right)\ldots\left(1+\frac{C_n}{C_{n-1}}\right)$ is equal to

(a) $\frac{n^{n-1}}{(n-1)}!$ (b) $\frac{(n+1)^{n-1}}{(n-1)!}$

(c) $\frac{(n+1)^n}{n!}$ (d) $\frac{(n+1)^{n+1}}{n!}$

53. If C_r stands for ${}^nC_r$, the sum of the given series

$$\frac{2\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!}{n!}\cdot[C_0^2 - 2C_1^2 + 3C_2^2 - \ldots + (-1)^n (n+1) C_n^2],$$

where n is an even positive integer, is

(a) 0 (b) $(-1)^{n/2}(n+1)$

(c) $(-1)^n(n+2)$ (d) $(-1)^{n/2}(n+2)$

54. If n is odd, then $C_0^2 - C_1^2 + C_2^2 - C_3^2 + \ldots + (-1)^n C_n^2$ is equal to

(a) 0 (b) 1

(c) ∞ (d) $\frac{n!}{\left(\frac{n}{2}\right)^2!}$

Applications of Binomial Theorem

55. If $(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_n x^n$, then the value of $C_0 + 2C_1 + 3C_2 + \ldots + (n+1)C_n$ will be

(a) $(n+2)2^{n-1}$ (b) $(n+1)2^n$

(c) $(n+1)2^{n-1}$ (d) $(n+2)2^n$

56. If $n > (8+3\sqrt{7})^{10}$, $n \in N$, then the least value of n is

(a) $(8+3\sqrt{7})^{10} - (8-3\sqrt{7})^{10}$

(b) $(8+3\sqrt{7})^{10} + (8-3\sqrt{7})^{10}$

(c) $(8+3\sqrt{7})^{10} - (8-3\sqrt{7})^{10} + 1$

(d) $(8+3\sqrt{7})^{10} - (8-3\sqrt{7})^{10} - 1$

57. Let $R = (2+\sqrt{3})^{2n}$ and $f = R - [R]$, where $[\cdot]$ denotes the greatest integer function, then $R(1-f)$ is equal to

(a) 1 (b) 2^{2n}

(c) $2^{2n} - 1$ (d) ${}^{2n}C_n$

58. If a_r is the coefficient of x^r, in the expansion of $(1+x+x^2)^n$, then $a_1 - 2a_2 + 3a_3 - \ldots - 2n\,a_{2n}$ is equal to

(a) 0 (b) n (c) $-n$ (d) $2n$

59. If $(1+x+x^2)^n = \sum_{r=0}^{2n} a_r x^r$, then

$a_1 - 2a_2 + 3a_3 \ldots - 2na_{2n}$ is equal to

(a) n (b) $-n$ (c) 0 (d) $2n$

60. If $(1+x)^{15} = C_0 + C_1x + C_2x^2 + \ldots + C_{15}x^{15}$, then $C_2 + 2C_3 + 3C_4 + \ldots + 14C_{15}$ is equal to

(a) $14 \cdot 2^{14}$ (b) $13 \cdot 2^{14} + 1$

(c) $13 \cdot 2^{14} - 1$ (d) None of these

61. If a and d are two complex numbers, then the sum to $(n+1)$ terms of the following series

$aC_0 - (a+d)C_1 + (a+2d)C_2 - \ldots + \ldots$ is

(a) $\frac{a}{2^n}$ (b) na

(c) 0 (d) None of these

62. $49^n + 16n - 1$ is divisible by

(a) 3 (b) 19 (c) 64 (d) 29

63. If $A = 1000^{1000}$ and $B = (1001)^{999}$, then

(a) $A > B$ (b) $A = B$

(c) $A < B$ (d) None of these

Binomial Theorem for Negative/Rational Index

64. Cube root of 217 is

(a) 6.01 (b) 6.04

(c) 6.02 (d) None of these

65. For $|x| < 1$, the constant term in the expansion of $\frac{1}{(x-1)^2(x-2)}$ is

(a) 2 (b) 1 (c) 0 (d) $-\frac{1}{2}$

66. The expansion of $\frac{1}{(4-3x)^{1/2}}$ by binomial theorem will be valid, if

(a) $x < 1$

(b) $|x| < 1$

(c) $-\frac{2}{\sqrt{3}} < x < \frac{2}{\sqrt{3}}$

(d) None of the above

67. The expression $\frac{1}{\sqrt[3]{6-3x}}$ is equal to

(a) $6^{1/3}\left[1+\frac{x}{6}+\frac{2x^2}{6^2}+\ldots\right]$ (b) $6^{-1/3}\left[1+\frac{x}{6}+\frac{2x^2}{6^2}+\ldots\right]$

(c) $6^{1/3}\left[1-\frac{x}{6}+\frac{2x^2}{6^2}-\ldots\right]$ (d) $6^{-1/3}\left[1-\frac{x}{6}+\frac{2x^2}{6^2}-\ldots\right]$

68. If the value of x is so small that x^2 and greater powers can be neglected, then $\frac{\sqrt{1+x}+\sqrt[3]{(1-x)^2}}{1+x+\sqrt{1+x}}$ is equal to

(a) $1+\frac{5}{6}x$ (b) $1-\frac{5}{6}x$

(c) $1+\frac{2}{3}x$ (d) $1-\frac{2}{3}x$

69. If $\dfrac{(1-3x)^{1/2}+(1-x)^{5/3}}{\sqrt{4-x}}$ is approximately equal to $a + bx$ for small values of x, then (a, b) is equal to

(a) $\left(1, \dfrac{35}{24}\right)$ (b) $\left(1, -\dfrac{35}{24}\right)$

(c) $\left(2, \dfrac{35}{12}\right)$ (d) $\left(2, -\dfrac{35}{12}\right)$

Miscellaneous

70. The number of terms in the expansion of $(a + b + c)^n$ will be

(a) $n + 1$

(b) $n + 3$

(c) $\dfrac{(n+1)(n+2)}{2}$

(d) None of the above

71. Let $[x]$ denote the greatest integer less than or equal to x. If $x = (\sqrt{3}+1)^5$, then $[x]$ is equal to

(a) 75 (b) 50 (c) 76 (d) 152

72. $1+\dfrac{1}{3}x+\dfrac{1\cdot 4}{3\cdot 6}x^2+\dfrac{1\cdot 4\cdot 7}{3\cdot 6\cdot 9}x^3+\ldots$ is equal to

(a) x (b) $(1+x)^{1/3}$

(c) $(1-x)^{1/3}$ (d) $(1-x)^{-1/3}$

73. $1+\dfrac{2\cdot 1}{3\cdot 2}+\dfrac{2\cdot 5}{3\cdot 6}\left(\dfrac{1}{2}\right)^2+\dfrac{2\cdot 5\cdot 8}{3\cdot 6\cdot 9}\cdot\left(\dfrac{1}{2}\right)^3+\ldots$ is equal to

(a) $2^{1/3}$ (b) $3^{1/4}$

(c) $4^{1/3}$ (d) $3^{1/3}$

74. $\dfrac{1}{1!(n-1)!}+\dfrac{1}{3!(n-3)!}+\dfrac{1}{5!(n-5)!}+\ldots$ is equal to

(a) $\dfrac{2^n}{n!}$ (b) $\dfrac{2^{n-1}}{n!}$

(c) 0 (d) None of these

75. The coefficient of x^n in the polynomial $(x + {}^nC_0)(x+3\,{}^nC_1)(x+5\,{}^nC_2)\ldots[x+(2n+1)\,{}^nC_n]$ is

(a) $n\cdot 2^n$ (b) $n\cdot 2^{n+1}$

(c) $(n+1)\,2^n$ (d) $n\cdot 2^n+1$

76. Let T_n denotes the number of triangles which can be formed using the vertices of a regular polygon of n sides. If $T_{n+1}-T_n = 21$, then n is equal to

(a) 5 (b) 7

(c) 6 (d) 4

77. The coefficient of x^7 in $(1+3x-2x^3)^{10}$ is equal to

(a) 62640 (b) 26240

(c) 64620 (d) None of these

Round II (Mixed Bag)

Only One Correct Option

1. The coefficient of $x^{2^{m+1}}$ in the expansion of

$$E=\frac{1}{(1+x)(1+x^2)(1+x^4)(1+x^8)\ldots(1+x^{2^m})},\ |x|<1$$

is

(a) 3 (b) 2

(c) 1 (d) 0

2. The coefficient of $x^r[0\le r\le(n-1)]$ in the expansion of $(x+3)^{n-1}+(x+3)^{n-2}(x+2)+(x+3)^{n-3}(x+2)^2+\ldots+(x+2)^{n-1}$ is

(a) ${}^nC_r(3^r-2^n)$ (b) ${}^nC_r(3^{n-r}-2^{n-r})$

(c) ${}^nC_r(3^r+2^{n-1})$ (d) None of these

3. The sum of the series

$$\sum_{r=0}^{n}(-1)^r\,{}^nC_r\left(\frac{1}{2^r}+\frac{3^r}{2^{2r}}+\frac{7^r}{2^{3r}}+\frac{15^r}{2^{4r}}+\ldots+m\text{ terms}\right)\text{ is}$$

(a) $\dfrac{2^{mn}-1}{2^{mn}(2^n-1)}$ (b) $\dfrac{2^{mn}-1}{2^n-1}$

(c) $\dfrac{2^{mn}+1}{2^n+1}$ (d) None of these

4. The value of x, for which the 6th term in the expansion of

$$\left\{2^{\log_2\sqrt{(9^{x-1}+7)}}+\frac{1}{2^{(1/5)\log_2(3^{x-1}+1)}}\right\}^7 \text{ is 84, is equal to}$$

(a) 4 (b) 3 (c) 2 (d) 5

5. The sum $\displaystyle\sum_{i=0}^{m}\binom{10}{i}\binom{20}{m-i}$, $\left[\text{where, }\dbinom{p}{q}=0,\text{ if } p<q\right]$ is maximum, when m is

(a) 5 (b) 10 (c) 15 (d) 20

6. If ${}^{n-1}C_r=(k^2-3)\cdot{}^nC_{r+1}$, then k is belongs to

(a) $(-\infty,-2]$ (b) $[2,\infty)$

(c) $[-\sqrt{3},\sqrt{3}]$ (d) $(\sqrt{3},2]$

7. If $(5+2\sqrt{6})^n = I+f$; $n, I\in N$ and $0\le f<1$, then I is equal to

(a) $\dfrac{1}{f}-f$ (b) $\dfrac{1}{1+f}-f$

(c) $\dfrac{1}{1+f}+f$ (d) $\dfrac{1}{1-f}-f$

8. The coefficients of $x^2 y^2$, yzt^2 and $xyzt$ in the expansion of $(x + y + z + t)^4$ are in the ratio
(a) 4 : 2 : 1 (b) 1 : 2 : 4
(c) 2 : 4 : 1 (d) 1 : 4 : 2

9. If sum of the coefficients of the first, second and third terms of the expansion of $\left(x^2 + \frac{1}{x}\right)^m$ is 46, then the coefficient of the term that does not contain x is
(a) 84 (b) 92 (c) 98 (d) 106

More Than One Correct Option

10. The last digit of $3^{3^{4n}} + 1$, $n \in N$, is
(a) ${}^4C_3$ (b) ${}^8C_7$
(c) 8 (d) 4

11. The number $101^{100} - 1$ is divisible by
(a) 100 (b) 1000
(c) 10000 (d) 100000

12. Which of the following is/are correct ?
(a) $101^{50} - 99^{50} > 100^{50}$
(b) $101^{50} - 100^{50} > 99^{50}$
(c) $(1000)^{1000} > (1001)^{999}$
(d) $(1001)^{999} > (1000)^{1000}$

Comprehension Based Questions

Passage

Directions (Q. Nos. 13-15) *The 2nd, 3rd and 4th terms in the expansion of* $(x + a)^n$ *are* 240, 720 *and* 1080, *respectively.*

13. The value of $(x - a)^n$ can be
(a) 64 (b) –1
(c) –32 (d) None of these

14. The value of least term in the expansion is
(a) 16 (b) 160
(c) 32 (d) 81

15. The sum of odd numbered terms is
(a) 1664 (b) 2376
(c) 1562 (d) 1486

Assertion and Reason

Directions (Q. Nos. 16-25) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*) *and* (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

16. **Statement I** The number of terms in the expansion of $\left(x + \frac{1}{x} + 1\right)^n$ is $2n + 1$.

Statement II $(a_1 + a_2 + a_3 + \ldots + a_m)^n$ is ${}^{n+m-1}C_{m-1}$.

17. **Statement I** If $\sum_{r=1}^{n} r^3 \left(\frac{{}^nC_r}{{}^nC_{r-1}}\right) = 196$, then the sum of the coefficients of power x in the expansion of the polynomial $(x - 3x^2 + x^3)^n$ is – 1.

Statement II $\frac{{}^nC_r}{{}^nC_{r-1}} = \left(\frac{n - r + 1}{r}\right)$, $\forall\ n \in N$ and $r \in W$.

18. Three consecutive binomial coefficients are given.

Statement I They cannot be in GP and HP.

Statement II They always are in AP.

19. **Statement I** $(\sqrt{2} - 1)^n$ can be expressed as of $\sqrt{N} - \sqrt{(N - 1)}$ for all $N > 1$ and n is positive integer.

Statement II $(\sqrt{2} - 1)^n$ can be expressed as $A + B\sqrt{2}$, where A and B are integers and n is positive integer.

20. **Statement I** If n is an odd prime, then the integral part of $(\sqrt{5} + 2)^n - 2^{n+1}$ is divisible by $2n$

Statement II If n is prime, then ${}^nC_1, {}^nC_2, \ldots, {}^nC_{n-1}$ must be divisible by n.

21. **Statement I** If n is even, then
$${}^{2n}C_1 + {}^{2n}C_3 + \ldots + {}^{2n}C_{n-1} = 2^{2n-1}.$$
Statement II ${}^{2n}C_1 + {}^{2n}C_3 + \ldots + {}^{2n}C_{2n-1} = 2^{2n-1}$

22. **Statement I** The term independent of x in the expansion of $\left(x + \frac{1}{x} + 2\right)^m$ is $\frac{(4m)!}{(2m!)^2}$.

Statement II The coefficient of x^6 in the expansion of $(1 + x)^n$ is ${}^nC_6$.

23. **Statement I** Greatest term in the expansion of $(1+x)^{12}$, when $x = 11/10$ is 7th.

Statement II Seventh term in the expansion of $(1+x)^{12}$ has the factor ${}^{12}C_6$ which is greatest value of ${}^{12}C_r$.

24. **Statement I** $3^{2n+2} - 8n - 9$ is divisible by 64, $\forall\ n \in N$.

Statement II $(1+x)^n - nx - 1$ is divisible by x^2, $\forall\ n \in N$.

25. **Statement I** $\sum_{r=0}^{n} (r + 1) \cdot {}^nC_r = (n + 2)2^{n-1}$

Statement II $\sum_{r=0}^{n} (r + 1)\ {}^nC_r \cdot x^r = (1 + x)^n + nx(1 + x)^{n-1}$

Previous Years' Questions

26. The term independent of x in expansion of $\left(\frac{x+1}{x^{2/3}-x^{1/3}+1}-\frac{x-1}{x-x^{1/2}}\right)^{10}$ is [JEE Main 2013]

(a) 4 (b) 120 (c) 210 (d) 310

27. If n is a positive integer, then $(\sqrt{3}+1)^{2n}-(\sqrt{3}-1)^{2n}$ is [AIEEE 2012]

(a) an irrational number
(b) an odd positive integer
(c) an even positive integer
(d) a rational number other than positive integers

28. The coefficient of x^7 in the expansion of $(1-x-x^2+x^3)^6$ is [AIEEE 2011]

(a) -132 (b) -144 (c) 132 (d) 144

29. The remainder left out when $8^{2n}-(62)^{2n+1}$ is divided by 9 is [AIEEE 2009]

(a) 0 (b) 2 (c) 7 (d) 8

30. In the binomial expansion of $(a-b)^n$, $n \geq 5$, the sum of 5th and 6th terms is zero, then $\frac{a}{b}$ is equal to [AIEEE 2007]

(a) $\frac{5}{n-4}$ (b) $\frac{6}{n-5}$ (c) $\frac{n-5}{6}$ (d) $\frac{n-4}{5}$

31. The sum of the series
${}^{20}C_0 - {}^{20}C_1 + {}^{20}C_2 - {}^{20}C_3 + \ldots + {}^{20}C_{10}$ is [AIEEE 2007]

(a) $-{}^{20}C_{10}$ (b) $\frac{1}{2}\,{}^{20}C_{10}$ (c) 0 (d) ${}^{20}C_{10}$

32. If the expansion in powers of x of the function $\frac{1}{(1-ax)(1-bx)}$ is $a_0 + a_1x + a_2x^2 + a_3x^3 + \ldots$, then a_n is [AIEEE 2006]

(a) $\frac{a^n-b^n}{b-a}$ (b) $\frac{a^{n+1}-b^{n+1}}{b-a}$
(c) $\frac{b^{n+1}-a^{n+1}}{b-a}$ (d) $\frac{b^n-a^n}{b-a}$

33. For natural numbers m, n, if

$$(1-y)^m(1+y)^n = 1 + a_1y + a_2y^2 + \ldots$$

and $a_1 = a_2 = 10$, then (m, n) is [AIEEE 2006]

(a) 35, 20 (b) 45, 35 (c) 35, 45 (d) 20, 65

34. The value of ${}^{50}C_4 + \sum_{r=1}^{6} {}^{56-r}C_3$ is [AIEEE 2005]

(a) ${}^{56}C_4$ (b) ${}^{56}C_3$
(c) ${}^{55}C_3$ (d) ${}^{55}C_4$

35. If the coefficients of rth, $(r+1)$ th and $(r+2)$ th terms in the binomial expansion of $(1+y)^m$ are in AP, then m and r satisfy the equation [AIEEE 2005]

(a) $m^2 - m(4r-1) + 4r^2 + 2 = 0$
(b) $m^2 - m(4r+1) + 4r^2 - 2 = 0$
(c) $m^2 - m(4r+1) + 4r^2 + 2 = 0$
(d) $m^2 - m(4r-1) + 4r^2 - 2 = 0$

36. If the coefficient of x^7 in $\left[ax^2 + \frac{1}{bx}\right]^{11}$ equals to the coefficient of x^{-7} in $\left[ax - \frac{1}{bx^2}\right]^{11}$, then a and b satisfy the relation [AIEEE 2005]

(a) $ab = 1$ (b) $\frac{a}{b} = 1$ (c) $a + b = 1$ (d) $a - b = 1$

37. If x is so small that x^3 and higher powers of x may be neglected, then $\frac{(1+x)^{3/2} - \left(1+\frac{1}{2}x\right)^3}{(1-x)^{1/2}}$ may be approximated as [AIEEE 2005]

(a) $\frac{x}{2} - \frac{3}{8}x^2$ (b) $-\frac{3}{8}x^2$ (c) $3x + \frac{3}{8}x^2$ (d) $1 - \frac{3}{8}x^2$

38. The coefficient of the middle term in the binomial expansion in powers of x of $(1+\alpha x)^4$ and of $(1-\alpha x)^6$ is the same, if α is equal to [AIEEE 2004]

(a) $-\frac{5}{3}$ (b) $\frac{10}{3}$ (c) $-\frac{3}{10}$ (d) $\frac{3}{5}$

39. If $s_n = \sum_{r=0}^{n} \frac{1}{{}^nC_r}$ and $t_n = \sum_{r=0}^{n} \frac{r}{{}^nC_r}$, then $\frac{t_n}{s_n}$ is equal to [AIEEE 2004]

(a) $\frac{n}{2}$ (b) $\frac{n}{2} - 1$ (c) $n - 1$ (d) $\frac{2n-1}{2}$

40. The coefficient of x^n in expansion of $(1+x)(1-x)^n$ is [AIEEE 2004]

(a) $(n-1)$ (b) $(-1)^n(1-n)$
(c) $(-1)^{n-1}(n-1)^2$ (d) $(-1)^{n-1}n$

41. The number of integral terms in the expansion of $(\sqrt{3} + \sqrt[8]{5})^{256}$ is [AIEEE 2003]

(a) 32 (b) 33 (c) 34 (d) 35

42. If x is positive, the first negative term in the expansion of $(1+x)^{27/5}$ is [AIEEE 2003]

(a) 7th term (b) 5th term (c) 8th term (d) 6th term

43. The coefficient of x^5 in $(1 + 2x + 3x^2 + \ldots)^{-3/2}$ is [AIEEE 2002]

(a) 21 (b) 25
(c) 26 (d) None of these

44. If $|x| < 1$, then the coefficient of x^n in expansion of $(1 + x + x^2 + x^3 + \ldots)^2$ is [AIEEE 2002]

(a) n (b) $n - 1$ (c) $n + 2$ (d) $n + 1$

the **Guidance**

Round I

1. In $(x+a)^{100} + (x-a)^{100}$ n is even.

$\therefore$ Total number of terms $= \frac{n}{2} + 1 = \frac{100}{2} + 1 = 51$

2. Given that, $(1+ax)^n = 1 + 8x + 24x^2 + \ldots$

$\Rightarrow \; 1 + \frac{n}{1}ax + \frac{n(n-1)}{1\cdot 2}a^2x^2 + \ldots = 1 + 8x + 24x^2 + \ldots$

On comparing the coefficients of x, x^2, we get

$$na = 8, \frac{n(n-1)}{1\cdot 2}a^2 = 24$$

$\Rightarrow \quad na(n-1)a = 48$

$\Rightarrow \quad 8(8-a) = 48$

$\Rightarrow \quad 8 - a = 6$

$\Rightarrow \quad a = 2$

$\Rightarrow \quad n = 4$

3. $(0.99)^5 = (1-0.01)^5$

$= {}^5C_0(1)^5 - {}^5C_1(1)^4(0.01) + {}^5C_2(1)^3(0.01)^2$

(ignore the other terms)

$= 1 - 5\times 1\times 0.01 + \frac{5\times 4}{2}\times 1\times 0.01\times 0.01$

$= 1 - 0.05 + 10\times 0.0001 = 1 - 0.05 + 0.001$

$= 1.001 - 0.05 = 0.951$

4. Coefficient of x^n in $(1+x)^{2n} = {}^{2n}C_n$

and coefficient of x^n in $(1+x)^{2n-1} = {}^{2n-1}C_n$

$\therefore$ Required ratio $= \frac{{}^{2n}C_n}{{}^{2n-1}C_n} = \frac{\frac{(2n)!}{n!n!}}{\frac{(2n-1)!}{n!(n-1)!}} = 2:1$

5. We have, $(1.002)^{12}$ or it can be rewritten as $(1+0.002)^{12}$

$\Rightarrow \quad (1.002)^{12} = 1 + {}^{12}C_1(0.002) + {}^{12}C_2(0.002)^2 + {}^{12}C_3(0.002)^3 + \ldots$

We want the answer upto 4 decimal places and as such we have left further expansion.

$\therefore \quad (1.002)^{12} = 1 + 12(0.002) + \frac{12\cdot 11}{1\cdot 2}(0.002)^2 + \frac{12\cdot 11\cdot 10}{1\cdot 2\cdot 3}(0.002)^3 + \ldots$

$= 1 + 0.024 + 2.64\times 10^{-4} + 1.76\times 10^{-6} + \ldots$

$= 1.0242$

6. $(1+x+x^2+x^3)^n = \{(1+x)^n (1+x^2)^n\}$

$$= (1 + {}^nC_1 x + {}^nC_2 x^2 + \ldots + {}^nC_n x^n)$$
$$(1 + {}^nC_1 x^2 + {}^nC_2 x^4 + \ldots + {}^nC_n x^{2n})$$

Therefore, the coefficient of $x^4 = {}^nC_2 + {}^nC_2 {}^nC_1 + {}^nC_4$

$$= {}^nC_4 + {}^nC_2 + {}^nC_1 {}^nC_2$$

7. The given expression is

$1 + (1+x) + (1+x)^2 + \ldots + (1+x)^n$ being in GP.

Let $S = 1 + (1+x) + (1+x)^2 + \ldots + (1+x)^n$

$$= \frac{(1+x)^{n+1} - 1}{(1+x) - 1} = x^{-1}[(1+x)^{n+1} - 1]$$

$\therefore$ The coefficient of x^k in S.

= The coefficient of x^{k+1} in $[(1+x)^{n+1} - 1]$

$= {}^{n+1}C_{k+1}$

8. $(1+x)^{21} + (1+x)^{22} + \ldots + (1+x)^{30}$

$$= (1+x)^{21} [1 + (1+x)^1 + \ldots + (1+x)^9]$$
$$= (1+x)^{21} \left[\frac{(1+x)^{10} - 1}{(1+x) - 1}\right]$$
$$= \frac{1}{x}[(1+x)^{31} - (1+x)^{21}]$$

$\therefore$ Coefficient of x^5 in the given expression

= Coefficient of x^5 in $\frac{1}{x}[(1+x)^{31} - (1+x)^{21}]$

= Coefficient of x^6 in $[(1+x)^{31} - (1+x)^{21}]$

$= {}^{31}C_6 - {}^{21}C_6$

9. We have, $(1+t^2)^{12} (1+t^{12}) (1+t^{24})$

$$= (1 + {}^{12}C_1 t^2 + {}^{12}C_2 t^4 + \ldots + {}^{12}C_6 t^{12}$$
$$+ \ldots + {}^{12}C_{12} t^{24} + \ldots)(1 + t^{12} + t^{24} + t^{36})$$

$\therefore$ Coefficient of t^{24} in $(1+t^2)^{12}(1+t^{12})(1+t^{24})$

$$= {}^{12}C_6 + {}^{12}C_{12} + 1 = {}^{12}C_6 + 2$$

10. The given sigma expansion

$\sum_{m=0}^{100} {}^{100}C_m (x-3)^{100-m} \cdot 2^m$ can be written as

$$[(x-3) + 2]^{100} = (x-1)^{100} = (1-x)^{100}$$

$\therefore$ Coefficient of x^{53} in $(1-x)^{100} = (-1)^{53}\ {}^{100}C_{53}$

$$= -{}^{100}C_{53}$$

11. We have, $(x-1)(x-2)(x-3)\ldots(x-100)$

Number of terms $= 100$

$\therefore$ Coefficient of x^{99} in $(x-1)(x-2)(x-3)\ldots(x-100)$

$$= (-1-2-3-\ldots-100)$$
$$= -(1+2+\ldots+100) = -\frac{100 \times 101}{2} = -5050$$

12. $(1+x)^m (1-x)^n = \left\{1 + mx + \frac{m(m-1)x^2}{2!} + \ldots\right\}$

$$\left[1 - nx + \frac{n(n-1)}{2!}x^2 - \ldots\right]$$

$$= 1 + (m-n)x + \left[\frac{n^2-n}{2} - mn + \frac{(m^2-m)}{2}\right]x^2 + \ldots$$

Given, $m - n = 3 \Rightarrow n = m - 3$

and $\frac{n^2-n}{2} - mn + \frac{m^2-m}{2} = -6$

$\Rightarrow \frac{(m-3)(m-4)}{2} - m(m-3) + \frac{m^2-m}{2} = -6$

$\Rightarrow m^2 - 7m + 12 - 2m^2 + 6m + m^2 - m + 12 = 0$

$\Rightarrow -2m + 24 = 0 \Rightarrow m = 12$

13. In the expansion of $(1+x)^{2n}$, the general term

$$= {}^{2n}C_k x^k, 0 \le k \le 2n$$

As given for $r > 1, n > 2$, ${}^{2n}C_{3r} = {}^{2n}C_{r+2}$

$\Rightarrow$ Either $3r = r + 2$ or $3r = 2n - (r+2)$ $(\because {}^nC_r = {}^nC_{n-r})$

$\Rightarrow r = 1$ or $n = 2r + 1$

We take the relation only

$n = 2r + 1$ $(\because r > 1)$

14. Let $(r+1)$th, $(r+2)$th and $(r+3)$th be three consecutive terms.

Then, ${}^nC_r : {}^nC_{r+1} : {}^nC_{r+2} = 1 : 7 : 42$

Now, $\frac{{}^nC_r}{{}^nC_{r+1}} = \frac{1}{7} \Rightarrow \frac{r+1}{n-r} = \frac{1}{7} \Rightarrow n - 8r = 7$ ...(i)

and $\frac{{}^nC_{r+1}}{{}^nC_{r+2}} = \frac{7}{42}$

$\Rightarrow \frac{r+2}{n-r-1} = \frac{1}{6}$

$\Rightarrow n - 7r = 13$ ...(ii)

On solving Eqs. (i) and (ii), we get $n = 55$

15. $(19)^{2005} + (11)^{2005} - (9)^{2005}$

$$= (10+9)^{2005} + (10+1)^{2005} - (9)^{2005}$$
$$= \{9^{2005} + {}^{2005}C_1 (9)^{2004} \times 10 + \ldots\}$$
$$+ ({}^{2005}C_0 + {}^{2005}C_1 10 + \ldots) - (9)^{2005}$$

$= ({}^{2005}C_1 9^{2004} \times 10 + \text{multiple of } 10) + (1 + \text{multiple of } 10)$

$\therefore$ Unit digit $= 1$

16. Let a_1, a_2, a_3, a_4 be respectively the coefficients of $(r+1)$th, $(r+2)$th, $(r+3)$th and $(r+4)$th terms in the expansion of $(1+x)^n$. Then,

$a_1 = {}^nC_r, a_2 = {}^nC_{r+1}, a_3 = {}^nC_{r+2}, a_4 = {}^nC_{r+3}$

Now, $\frac{a_1}{a_1 + a_2} + \frac{a_3}{a_3 + a_4} = \frac{{}^nC_r}{{}^nC_r + {}^nC_{r+1}} + \frac{{}^nC_{r+2}}{{}^nC_{r+2} + {}^nC_{r+3}}$

$$= \frac{{}^nC_r}{{}^{n+1}C_{r+1}} + \frac{{}^nC_{r+2}}{{}^{n+1}C_{r+3}} \qquad (\because {}^nC_r + {}^nC_{r+1} = {}^{n+1}C_{r+1})$$

$$= \frac{{}^nC_r}{\frac{n+1}{r+1}\,{}^nC_r} + \frac{{}^nC_{r+2}}{\frac{n+1}{r+3}\,{}^nC_{r+2}} \qquad \left(\because {}^nC_r = \frac{n}{r}\,{}^{n-1}C_{r-1}\right)$$

$$= \frac{r+1}{n+1} + \frac{r+3}{n+1} = \frac{2(r+2)}{n+1}$$

$$= 2\frac{{}^nC_{r+1}}{{}^{n+1}C_{r+2}} = 2\frac{{}^nC_{r+1}}{{}^nC_{r+1} + {}^nC_{r+2}} = \frac{2a_2}{a_2 + a_3}$$

17. Coefficients of pth, $(p+1)$th and $(p+2)$th terms in the expansion $(1+x)^n$ are ${}^nC_{p-1}$, ${}^nC_p$, ${}^nC_{p+1}$, respectively.

Since, these are in AP.

$$\therefore \qquad 2\,{}^nC_p = {}^nC_{p-1} + {}^nC_{p+1}$$

$$\Rightarrow 2\frac{n!}{(n-p)!\,p!} = \frac{n!}{(n-p+1)!\,(p-1)!} + \frac{n!}{(n-p-1)!\,(p+1)!}$$

$$\Rightarrow \frac{2}{(n-p)!\,p!} = \frac{p}{(n-p+1)\,(n-p)!\,p!} + \frac{n-p}{(n-p)!\,(p+1)\,p!}$$

$$\Rightarrow \qquad \frac{2}{1} = \frac{p}{(n-p+1)} + \frac{n-p}{p+1}$$

$$\Rightarrow \qquad n^2 - n(4p+1) + 4p^2 - 2 = 0$$

18. Given that, $(1 + x - 2x^2)^6 = 1 + a_1x + a_2x^2 + \ldots + a_{12}x^{12}$

On putting $x = 1$ and $x = -1$ and adding the results, we get

$$64 = 2(1 + a_2 + a_4 + \ldots + a_{12})$$

$$\therefore \qquad a_2 + a_4 + a_6 + \ldots + a_{12} = 31$$

19. $(1 - x + x^2)^n = a_0 + a_1x + a_2x^2 + \ldots + a_{2n}x^{2n}$

On putting $x = 1$, we get

$$(1 - 1 + 1)^n = a_0 + a_1 + a_2 + \ldots + a_{2n}$$

$$\Rightarrow \qquad 1 = a_0 + a_1 + a_2 + \ldots + a_{2n} \qquad \ldots(\text{i})$$

Again, putting $x = -1$, we get

$$3^n = a_0 - a_1 + a_2 - \ldots + a_{2n} \qquad \ldots(\text{ii})$$

On adding Eqs. (i) and (ii), we get

$$\frac{3^n + 1}{2} = a_0 + a_2 + a_4 + \ldots + a_{2n}$$

20. General term in the expansion of $(x - 2y)^{12}$ is

$$T_{r+1} = {}^{12}C_r(x)^{12-r}(-2y)^r$$

On putting $r = 3$, we get

$$T_{3+1} = {}^{12}C_3x^{12-3}(-2y)^3$$

$$T_4 = \frac{12 \times 11 \times 10}{6}x^9(-2)^3y^3$$

$$= 2 \times 11 \times 10x^9(-8)y^3$$

$$= 220 \times (-8)x^9y^3 = -1760x^9y^3$$

21. The rth term of $(a + 2x)^n$ is ${}^nC_{r-1}(a)^{n-r+1}(2x)^{r-1}$

$$= \frac{n!}{(n-r+1)!\,(r-1)!}a^{n-r+1}(2x)^{r-1}$$

$$= \frac{n(n-1)\ldots(n-r+2)}{(r-1)!}a^{n-r+1}(2x)^{r-1}$$

22. $(1-x)^{-4} = 1 \cdot x^0 + 4x^1 + \frac{4 \cdot 5}{2}x^2 + \ldots$

$$= \left[\frac{1 \cdot 2 \cdot 3}{6}x^0 + \frac{2 \cdot 3 \cdot 4}{6}x + \frac{3 \cdot 4 \cdot 5}{6}x^2 + \frac{4 \cdot 5 \cdot 6}{6}x^3 + \ldots + \frac{(r+1)(r+2)(r+3)}{6}x^r + \ldots\right]$$

Therefore, $\quad T_{r+1} = \frac{(r+1)(r+2)(r+3)}{6}x^r$

23. In the expansion of $(1 + a)^{m+n}$, the general term is

$$T_{r+1} = {}^{m+n}C_r(a)^r$$

For coefficient of a^m, putting $r = m$

Then, $\quad T_{m+1} = {}^{m+n}C_m(a)^m$

$\Rightarrow$ Coefficient of $a^m = {}^{m+n}C_m \qquad \ldots(\text{i})$

For coefficient of a^n, putting $r = n$, then

$$T_{n+1} = {}^{m+n}C_na^n$$

$\Rightarrow$ Coefficient of $a^n = {}^{m+n}C_n$

$$= {}^{m+n}C_{m+n-n} \qquad (\because {}^nC_r = {}^nC_{n-r})$$

$$= {}^{m+n}C_m \qquad \ldots(\text{ii})$$

From Eqs. (i) and (ii), the coefficient of a^m is equal to coefficient of a^n.

24. The general term in the expansion of $(1 + x)^{2n}$ is

$$T_{r+1} = {}^{2n}C_rx^r$$

$$T_{3r} = {}^{2n}C_{3r-1}x^{3r-1}$$

and $\quad T_{r+2} = {}^{2n}C_{r+1}x^{r+1}$

Now, $\quad {}^{2n}C_{3r-1} = {}^{2n}C_{r+1}$

$$\Rightarrow \qquad 3r - 1 + r + 1 = 2n \Rightarrow n = 2r$$

25. The general term in the expansion of $(3 + ax)^9$ is

$$T_{r+1} = {}^9C_r3^{9-r}a^rx^r$$

For coefficient of x^2, put $r = 2$

$$T_{2+1} = {}^9C_23^{9-2}a^2x^2$$

$\Rightarrow$ Coefficient of $x^2 = {}^9C_23^7a^2 \qquad \ldots(\text{i})$

For coefficient of x^3, put $r = 3$

$$T_{3+1} = {}^9C_33^{9-3}a^3x^3 = {}^9C_33^6a^3x^3$$

$\Rightarrow$ Coefficient of $x^3 = {}^9C_33^6a^3 \qquad \ldots(\text{ii})$

Given, coefficient of x^2 = coefficient of x^3

$$\Rightarrow \qquad {}^9C_23^7a^2 = {}^9C_33^6a^3 \quad [\text{from Eqs. (i) and (ii)}]$$

$\Rightarrow \quad \frac{9\times 8}{2}\times 3\times 1=\frac{9\times 8\times 7}{6}\times 1\times a$

$\Rightarrow \quad \frac{3}{2}=\frac{7}{6}\times a \Rightarrow a=\frac{9}{7}$

26. Given expression is $(1+x)^{24}$.

Let two successive terms are $(r+1)$th and $(r+2)$th terms

$\Rightarrow \quad T_{r+1}={}^{24}C_r x^r$ and $T_{r+2}={}^{24}C_{r+1}x^{r+1}$

Now, ratio of coefficients $=\frac{1}{4}$

$\Rightarrow \quad \frac{{}^{24}C_r}{{}^{24}C_{r+1}}=\frac{1}{4}$

$\Rightarrow \quad \frac{r+1}{24-r}=\frac{1}{4}\Rightarrow 4r+4=24-r$

$\Rightarrow \quad r=4$

$\therefore$ Required terms are 5th and 6th.

27. Given expression is $(1+x)^n$. Coefficients of 2nd, 3rd and 4th terms are ${}^nC_1$, ${}^nC_2$ and ${}^nC_3$, respectively.

Since, ${}^nC_1$, ${}^nC_2$, ${}^nC_3$ are in AP.

$\Rightarrow \quad 2{}^nC_2={}^nC_1+{}^nC_3$

$\Rightarrow \quad 2=\frac{{}^nC_1}{{}^nC_2}+\frac{{}^nC_3}{{}^nC_2}$

$\Rightarrow \quad 2=\frac{2}{n-1}+\frac{n-2}{3}$

$\Rightarrow \quad n^2-9n+14=0\Rightarrow n=2,7$

But $\quad n\neq 2$

$\therefore \quad n=7$

28. Here, $T_4={}^nC_3(a)^{n-3}(-2b)^3$

and $\quad T_5={}^nC_4(a)^{n-4}(-2b)^4$

Given, $\quad T_4+T_5=0$

$\Rightarrow \quad {}^nC_3(a)^{n-3}(-2b)^3+{}^nC_4(a)^{n-4}(-2b)^4=0$

$\Rightarrow \quad (a)^{n-4}(-2b)^3[a\,{}^nC_3+{}^nC_4(-2b)]=0$

$\Rightarrow \quad \frac{a}{b}=\frac{2\,{}^nC_4}{{}^nC_3}$

$=\frac{2\cdot n(n-1)(n-2)(n-3)}{4\cdot 3\cdot 2\cdot 1}\times\frac{3\cdot 2\cdot 1}{n(n-1)(n-2)}=\frac{n-3}{2}$

29. Given expression is $(x+x^{\log_{10}x})^5$.

$\therefore \quad T_3={}^5C_2\cdot x^3(x^{\log_{10}x})^2=10^6$ (given)

Put $x=10$, then $10^4\cdot 10^2=10^6$ is satisfied. Hence, $x=10$

30. Given that,

$T_1={}^nC_0=1$ ...(i)

$T_2={}^nC_1ax=6x$

$\Rightarrow \quad \frac{n!}{(n-1)!}a=6$

$\Rightarrow \quad na=6$ ...(ii)

and $\quad T_3={}^nC_2(ax)^2=16x^2$

$\Rightarrow \quad \frac{n(n-1)}{2}a^2=16$ ...(iii)

Only option (c) is satisfying Eqs. (ii) and (iii).

31. Last term of $\left(2^{1/3}-\frac{1}{\sqrt{2}}\right)^n$ is

$T_{n+1}={}^nC_n(2^{1/3})^{n-n}\left(-\frac{1}{\sqrt{2}}\right)^n$

$={}^nC_n(-1)^n\frac{1}{2^{n/2}}=\frac{(-1)^n}{2^{n/2}}$

Also, we have

$\left(\frac{1}{3^{5/3}}\right)^{\log_3 8}=3^{-(5/3)\log_3 2^3}=2^{-5}$

Thus, $\quad \frac{(-1)^n}{2^{n/2}}=2^{-5}\Rightarrow\frac{(-1)^n}{2^{n/2}}=\frac{(-1)^{10}}{2^5}$

$\Rightarrow \quad \frac{n}{2}=5 \quad\Rightarrow\quad n=10$

Now, $\quad T_5=T_{4+1}={}^{10}C_4(2^{1/3})^{10-4}\left(-\frac{1}{\sqrt{2}}\right)^4$

$=\frac{10!}{4!6!}(2^{1/3})^6(-1)^4(2^{-1/2})^4$

$=210(2)^2(1)(2^{-2})=210$

32. The general term in the expansion of $\left(x+\frac{1}{x^2}\right)^{n-3}$ is given by

$T_{r+1}={}^{n-3}C_r(x)^{n-3-r}\left(\frac{1}{x^2}\right)^r={}^{n-3}C_r\,x^{n-3-3r}$

As x^{2k} occurs in the expansion of $\left(x+\frac{1}{x^2}\right)^{n-3}$, we must have $n-3-3r=2k$ for some non-negative integer r.

$\Rightarrow \quad 3(1+r)=n-2k$

$\Rightarrow n-2k$ is a multiple of 3.

33. The general term in the expansion of $\left(\frac{3}{2}x^2-\frac{1}{3x}\right)^9$ is

$T_{r+1}={}^9C_r\left(\frac{3}{2}x^2\right)^{9-r}\left(-\frac{1}{3x}\right)^r$

$={}^9C_r\left(\frac{3}{2}\right)^{9-r}\left(-\frac{1}{3}\right)^r x^{18-3r}$ ...(i)

Now, the coefficients of the terms x^0, x^{-1} and x^{-3} in $\left(\frac{3}{2}x^2-\frac{1}{3x}\right)^9$ is

For x^0, $\quad 18-3r=0 \quad\Rightarrow\quad r=6$

For x^{-1}, there exists no integer value of r

For x^{-3}, $\quad 18-3r=-3 \quad\Rightarrow\quad r=7$

Now, the coefficient of the term independent of x in the expansion of

$(1+x+2x^3)\left(\frac{3}{2}x^2-\frac{1}{3x}\right)^9$

$=1\cdot {}^9C_6(-1)^6\left(\frac{3}{2}\right)^{9-6}\left(\frac{1}{3}\right)^6+0+2\cdot {}^9C_7(-1)^7\left(\frac{3}{2}\right)^{9-7}\left(\frac{1}{3}\right)^7$

$=\frac{9\cdot 8\cdot 7}{1\cdot 2\cdot 3}\cdot\frac{3^3}{2^3}\cdot\frac{1}{3^6}+2\cdot\frac{9\cdot 8}{1\cdot 2}(-1)\frac{3^2}{2^2}\cdot\frac{1}{3^7}$

$=\frac{7}{18}-\frac{2}{27}=\frac{17}{54}$

34. General term of $\left(\sqrt{x}-\frac{k}{x^2}\right)^{10}$ is

$$T_{r+1}={}^{10}C_r(\sqrt{x})^{10-r}\left(-\frac{k}{x^2}\right)^r$$

$$={}^{10}C_r\,x^{\frac{10-r}{2}-2r}(-k)^r={}^{10}C_r(-k)^r x^{\frac{10-5r}{2}-}$$

The term free from x,

Put $\frac{10-5r}{2}=0\Rightarrow r=2$

$\Rightarrow$ ${}^{10}C_2(-k)^2=405$

$\Rightarrow$ $\frac{10\times 9}{2}\times k^2=405$

$\therefore$ $k=\pm 3$

35. $(1-3x+7x^2)(1-x)^{16}$

$=(1-3x+7x^2)({}^{16}C_0-{}^{16}C_1x+{}^{16}C_2x^2+\ldots)$

After multiplying, the term containing x is $-{}^{16}C_1x-3x^{16}C_0x$

$\therefore$ Coefficient of $x=-16-3=-19$

36. The general term of $\left(3x-\frac{2}{x^2}\right)^{15}$ is

$$T_{r+1}={}^{15}C_r(3x)^{15-r}\left(\frac{-2}{x^2}\right)^r$$

$$={}^{15}C_r(3)^{15-r}(-2)^r x^{15-3r}$$

For independent term of x,

Put $15-3r=0\Rightarrow r=5$

$\therefore$ Coefficient $={}^{15}C_5(3)^{15-5}(-2)^5=-3003(3^{10})(2^5)$

37. Given expression is $\left(x+\frac{1}{2x}\right)^{2n}$.

$\therefore$ Middle term $={}^{2n}C_n(x)^n\left(\frac{1}{2x}\right)^n$

$$=\frac{2n!}{n!n!2^n}=\frac{1\cdot 3\cdot 5\ldots(2n-1)}{n!}$$

38. $\left(\frac{1}{x}+x\sin x\right)^{10}$

Here, $n=10$ (even)

$\Rightarrow$ Middle term $=\left(\frac{10}{2}+1\right)$th $=6$th

$$T_6={}^{10}C_5\left(\frac{1}{x}\right)^{10-5}(x\sin x)^5$$

$\Rightarrow$ $252(\sin x)^5=\frac{63}{8}$

$\Rightarrow$ $(\sin x)^5=\frac{1}{32}$

$\Rightarrow$ $\sin x=\frac{1}{2}\Rightarrow \sin x=\sin\pi/6$

$\therefore$ $x=n\pi+(-1)^n\frac{\pi}{6}$

39. Given expression is $\left(\frac{p}{2}+2\right)^8$

Here, $n=8$ (even)

$\Rightarrow$ Middle term $=\left(\frac{8}{2}+1\right)$th $=5$th

$$T_5={}^8C_4(p/2)^{8-4}(2)^4$$

$\Rightarrow$ $\frac{8\times 7\times 6\times 5}{4\times 3\times 2\times 1}\times\frac{p^4}{2^4}\times 2^4=1120$

$\Rightarrow$ $P^4=16\therefore p=\pm 2$

40. Since, n is even, therefore $\left(\frac{n}{2}+1\right)$th term is the middle term.

$\therefore$ $T_{\frac{n}{2}+1}={}^nC_{n/2}(x^2)^{n/2}\left(\frac{1}{x}\right)^{n/2}=924x^6$ (given)

$\Rightarrow$ $x^{n/2}=x^6\Rightarrow n=12$

41. $\because$ $(3+2x)^{50}=3^{50}\left(1+\frac{2x}{3}\right)^{50}$

Here, $T_{r+1}=3^{50}\,{}^{50}C_r\left(\frac{2x}{3}\right)^r$

and $T_r=3^{50}\,{}^{50}C_{r-1}\left(\frac{2x}{3}\right)^{r-1}$

But $x=\frac{1}{5}$ (given)

$\therefore$ $\frac{T_{r+1}}{T_r}\geq 1\Rightarrow\frac{{}^{50}C_r}{{}^{50}C_{r-1}}\frac{2}{3}\cdot\frac{1}{5}\geq 1$

$\Rightarrow$ $102-2r\geq 15r\Rightarrow r\leq 6$

42. Sum of the coefficients in the expansion of $(x-2y+3z)^n$ is $(1-2+3)^n=2^n$ (put $x=y=z=1$)

$\therefore$ $2^n=128\Rightarrow n=7$

Therefore, the greatest coefficient in the expansion of $(1+x)^7$ is ${}^7C_3$ or ${}^7C_4$ because both are equal to 35.

43. The general term in the expansion of $\left(x\cos\alpha+\frac{\sin\alpha}{x}\right)^{20}$ is

${}^{20}C_r(x\cos\alpha)^{20-r}\left(\frac{\sin\alpha}{x}\right)^r={}^{20}C_rx^{20-2r}(\cos\alpha)^{20-r}(\sin\alpha)^r$

For this term to be independent of x, we get

$20-2r=0\Rightarrow r=10$

Let $\beta =$ Term independent of x

$= {}^{20}C_{10}(\cos\alpha)^{10}(\sin\alpha)^{10}$

$= {}^{20}C_{10}(\cos\alpha\sin\alpha)^{10} = {}^{20}C_{10}\left(\frac{\sin 2\alpha}{2}\right)^{10}$

Thus, the greatest possible value of β is ${}^{20}C_{10}\left(\frac{1}{2}\right)^{10}$.

44. Here, the greatest coefficient is ${}^{2n}C_n$.

$\therefore \quad {}^{2n}C_n x^n > {}^{2n}C_{n+1}x^{n-1} \Rightarrow x > \frac{n}{n+1}$

and $\quad {}^{2n}C_n x^n > {}^{2n}C_{n-1}x^{n+1} \Rightarrow x < \frac{n+1}{n}$

$\therefore$ x must lie in the interval $\left(\frac{n}{n+1}, \frac{n+1}{n}\right)$

45. Let $b = \sum_{r=0}^{n} \frac{r}{{}^nC_r} = \sum_{r=0}^{n} \frac{n-(n-r)}{{}^nC_r}$

$= n\sum_{r=0}^{n}\frac{1}{{}^nC_r} - \sum_{r=0}^{n}\frac{n-r}{{}^nC_r}$

$= na_n - \sum_{r=0}^{n}\frac{n-r}{{}^nC_{n-r}} \qquad (\because {}^nC_r = {}^nC_{n-1})$

$= n\,a_n - b$

$\Rightarrow \quad 2b = na_n \Rightarrow b = \frac{n}{2}a_n$

46. Let $\quad E = \sum_{r=0}^{n}(-1)^r\,{}^nC_r\left(\frac{1+rx}{1+nx}\right)$

$= \left(\frac{1}{1+nx}\right)\sum_{r=0}^{n}(-1)^r\,{}^nC_r(1+rx)$

$= \left(\frac{1}{1+nx}\right)\left\{\sum_{r=0}^{n}(-1)^r\cdot{}^nC_r + x\sum_{r=0}^{n}r(-1)^r\,{}^nC_r\right\}$

$= \left(\frac{1}{1+nx}\right)(0+0) = 0$

$[\because {}^nC_0 - {}^nC_1 + {}^nC_2 - {}^nC_3 + \ldots(-1)^n\,{}^nC_n = 0]$

47. Let

$A = \binom{30}{0}\binom{30}{10} - \binom{30}{1}\binom{30}{11} + \binom{30}{2}\binom{30}{12} - \ldots + \binom{30}{20}\binom{30}{30}$

or $A = {}^{30}C_0\cdot{}^{30}C_{10} - {}^{30}C_1\cdot{}^{30}C_{11}$

$+ {}^{30}C_2\cdot{}^{30}C_{12} - \ldots + {}^{30}C_{20}\cdot{}^{30}C_{30}$

$=$ Coefficient of x^{20} in $(1+x)^{30}(1-x)^{30}$

$=$ Coefficient of x^{20} in $(1-x^2)^{30}$

$=$ Coefficient of x^{20} in $\sum_{r=0}^{30}(-1)^r\,{}^{30}C_r(x^2)^r$

$= (-1)^{10}\,{}^{30}C_{10} \qquad$ (for coefficient of x^{20}, let $r = 10$)

$= {}^{30}C_{10}$

48. We have,

$(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n \qquad \ldots$(i)

and $\quad \left(1+\frac{1}{x}\right)^n = C_0 + C_1\frac{1}{x} + C_2\left(\frac{1}{x}\right)^2 + \ldots + C_n\left(\frac{1}{x}\right)^n \qquad \ldots$(ii)

On multiplying Eqs. (i) and (ii) and taking the coefficient of constant terms in right hand side

$= C_0^2 + C_1^2 + C_2^2 + \ldots + C_n^2$

In right hand side $(1+x)^n\left(1+\frac{1}{x}\right)^n$ or in $\frac{1}{x^n}(1+x)^{2n}$ or term containing x^n in $(1+x)^{2n}$. Clearly, the coefficient of x^n in $(1+x)^{2n}$ is equal to ${}^{2n}C_n = \frac{(2n)!}{n!n!}$.

49. We know that,

$\frac{C_1}{C_0} + 2\frac{C_2}{C_1} + 3\frac{C_3}{C_2} + \ldots + n\frac{C_n}{C_{n-1}} = \frac{n(n+1)}{2}$

On putting $n = 15$, then $\frac{15\times(15+1)}{2} = 15\times 8 = 120$

50. Given equation can be rewritten as

$E = a[{}^nC_0 - {}^nC_1 + {}^nC_2 - \ldots + (-1)^n\,{}^nC_n]$

$+ [{}^nC_1 - (2)({}^nC_2) + (3)({}^nC_3) - \ldots + (-1)^n(n)({}^nC_n)]$

$\Rightarrow \qquad E = 0 + 0 = 0 \qquad$ (by properties)

51. Given, $\quad {}^nC_0 - \frac{1}{2}\,{}^nC_1 + \frac{1}{3}\,{}^nC_2 - \ldots + (-1)^n\frac{{}^nC_n}{n+1}$

At $n = 1$, ${}^1C_0 - \frac{1}{2}\,{}^1C_1 = 1 - \frac{1}{2} = \frac{1}{2}$

At $n = 2$, ${}^2C_0 - \frac{1}{2}\,{}^2C_1 + \frac{1}{3}\,{}^2C_2 = 1 - 1 + \frac{1}{3} = \frac{1}{3}$

Which is satisfied only in option (c).

52. We have, $\left(1+\frac{C_1}{C_0}\right)\left(1+\frac{C_2}{C_1}\right)\ldots\left(1+\frac{C_n}{C_{n-1}}\right)$

$= \left(1+\frac{n}{1}\right)\left[1+\frac{\frac{n(n-1)}{2!}}{n}\right]\ldots\left(1+\frac{1}{n}\right)$

$= \frac{(1+n)}{1}\cdot\frac{(1+n)}{2}\cdot\frac{(1+n)}{3}\ldots\frac{(1+n)}{n} = \frac{(n+1)^n}{n!}$

53. We have, $C_0^2 - 2C_1^2 + 3C_2^2 - \ldots + (-1)^n(n+1)C_n^2$

$= [C_0^2 - C_1^2 + C_2^2 - \ldots + (-1)^nC_n^2]$

$- [C_1^2 - 2C_2^2 + 3C_3^2 - \ldots + (-1)^n n C_n^2]$

$= (-1)^{n/2}\frac{n!}{\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!}\cdot -(-1)^{n/2-1}\cdot\frac{1}{2}n\frac{n!}{\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!}$

$= (-1)^{n/2}\cdot\frac{n!}{\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!}\cdot\left(1+\frac{n}{2}\right)$

Therefore, the value of the given expression is

$$\frac{2\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!}{n!}\times(-1)^{n/2}\cdot\frac{(n)!}{\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!}\left(1+\frac{n}{2}\right)=(-1)^{n/2}(2+n)$$

54. We know that,

$$(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n$$

$$(x-1)^n = C_0x^n - C_1x^{n-1} + C_2x^{n-2} - \ldots + (-1)^nC_n$$

On multiplying both equations and equating the coefficient of x^n, we get

$$C_0^2 - C_1^2 + C_2^2 - \ldots + (-1)^n C_n^2 = {}^nC_{n/2}(-1)^{n/2}(x^2)^{n/2}$$

Above is possible only when $\frac{n}{2}$ is an integer *i.e.*, n is even and in case n is odd, then term x^n will not occur.

55. Since, $x(1+x)^n = xC_0 + C_1x^2 + C_2x^3 + \ldots + C_nx^{n+1}$

On differentiating w.r.t. x, we get

$$(1+x)^n + nx(1+x)^{n-1} = C_0 + 2C_1x + 3C_2x^2 + \ldots + (n+1)C_nx^n$$

Put $x = 1$, we get

$$C_0 + 2C_1 + 3C_2 + \ldots + (n+1)C_n = 2^n + n2^{n-1} = 2^{n-1}(n+2)$$

56. Let $f = (8-3\sqrt{7})^{10}$, here $0 < f < 1$

$\therefore$ $(8+3\sqrt{7})^{10} + (8-3\sqrt{7})^{10}$ is an integer, hence this is the value of n.

57. Given that, $R = (2+\sqrt{3})^{2n}$ and $f = R - [R]$

As $0 < 2-\sqrt{3} < 1$, we get $0 < F = (2-\sqrt{3})^{2n} < 1$

We have, $R + F = (2+\sqrt{3})^{2n} + (2-\sqrt{3})^{2n}$

$$= 2[{}^{2n}C_0 2^{2n} + {}^{2n}C_2 2^{2n-2}(\sqrt{3})^2 + {}^{2n}C_4(2^{2n-4})(\sqrt{3})^4 + \ldots + {}^{2n}C_{2n}(\sqrt{3})^{2n}]$$

$\Rightarrow$ $R + F$ is an even integer.

$\Rightarrow$ $[R] + f + F$ is an even integer.

$\Rightarrow$ $f + F$ is an integer.

But $0 \le f < 1$ and $0 < F < 1$

$\Rightarrow$ $0 < f + F < 2$

But the only integer between 0 and 2 is 1. Thus,

$f + F = 1 \Rightarrow 1 - f = F$

Now, $R(1-f) = RF = (2+\sqrt{3})^{2n}(2-\sqrt{3})^{2n}$

$$= (4-3)^{2n} = 1^{2n} = 1$$

58. Let us take $a_0 + a_1x + a_2x^2 + \ldots + a_{2n}x^{2n} = (1+x+x^2)^n$

On differentiating both sides w.r.t. x, we get

$$a_1 + 2a_2x + \ldots + 2na_{2n}x^{2n-1} = n(1+x+x^2)^{n-1}(2x+1)$$

Put $x = -1$

$\Rightarrow$ $a_1 - 2a_2 + 3a_3 - \ldots - 2na_{2n} = -n$

59. We have,

$$(1+x+x^2)^n = a_0 + a_1x + a_2x^2 + a_3x^3 + \ldots + a_{2n}x^{2n}$$

On differentiating both sides, we get

$$n(1+x+x^2)^{n-1}(1+2x) = a_1 + 2a_2x + 3a_3x^2 + \ldots + 2na_{2n}x^{2n-1}$$

On putting $x = -1$, we get

$$n(1-1+1)^{n-1}(1-2) = a_1 - 2a_2 + 3a_3 - \ldots - 2na_{2n}$$

$\Rightarrow$ $a_1 - 2a_2 + 3a_3 - \ldots - 2na_{2n} = -n$

60. We have, $(1+x)^{15} = C_0 + C_1x + C_2x^2 + \ldots + C_{15}x^{15}$

$$\Rightarrow \frac{(1+x)^{15}-1}{x} = C_1 + C_2x + \ldots + C_{15}x^{14}$$

On differentiating both sides w.r.t. x, we get

$$\frac{x\cdot 15(1+x)^{14} - (1+x)^{15} + 1}{x^2} = C_2 + 2C_3x + \ldots + 14C_{15}x^{13}$$

On putting $x = 1$, we get

$$C_2 + 2C_3 + \ldots + 14C_{15} = 15\cdot 2^{14} - 2^{15} + 1 = 13\cdot 2^{14} + 1$$

61. We can write,

$aC_0 - (a+d)C_1 + (a+2d)C_2 - \ldots$ upto $(n+1)$ terms

$= a(C_0 - C_1 + C_2 - \ldots) + d(-C_1 + 2C_2 - 3C_3 + \ldots)$ ...(i)

We know,

$$(1-x)^n = C_0 - C_1x + C_2x^2 - \ldots + (-1)^nC_nx^n \quad \text{...(ii)}$$

On differentiating Eq. (ii) w.r.t. x, we get

$$-n(1-x)^{n-1} = -C_1 + 2C_2x - \ldots + (-1)^nC_n nx^{n-1} \quad \text{...(iii)}$$

On putting $x = 1$ in Eqs. (ii) and (iii), we get

$$C_0 - C_1 + C_2 - \ldots + (-1)^nC_n = 0 \quad \text{...(iv)}$$

and $$-C_1 + 2C_2 - \ldots + (-1)^n nC_n = 0 \quad \text{...(v)}$$

From Eq. (i),

$aC_0 - (a+d)C_1 + (a+2d)C_2 - \ldots$ upto $(n+1)$ terms

$= a\cdot 0 + d\cdot 0 = 0$ [from Eqs. (iv) and (v)]

62. We have, $49^n + 16n - 1 = (1+48)^n + 16n - 1$

$$= 1 + {}^nC_1(48) + {}^nC_2(48)^2 + \ldots + {}^nC_n(48)^n + 16n - 1$$

$$= (48n + 16n) + {}^nC_2(48)^2 + {}^nC_3(48)^3 + \ldots + {}^nC_n(48)^n$$

$$= 64n + 8^2[{}^nC_2\cdot 6^2 + {}^nC_3\cdot 6^3\cdot 8 + {}^nC_4\cdot 6^4 8^2 + \ldots + {}^nC_n\cdot 6^n\cdot 8^{n-2}]$$

Hence, $49^n + 16n - 1$ is divisible by 64.

63. Since, $\left(1+\frac{1}{n}\right)^n < 3$ for $\forall\, n \in N$

Now, $$\frac{(1001)^{999}}{(1000)^{1000}} = \frac{1}{1001}\cdot\left(\frac{1001}{1000}\right)^{1000}$$

$$= \frac{1}{1001}\left(1+\frac{1}{1000}\right)^{1000} < \frac{1}{1001}\cdot 3 < 1$$

$$(1001)^{999} < (1000)^{1000}$$

$\therefore$ $B < A$

64. Cube root of $217 = (217)^{1/3} = (6^3 + 1)^{1/3} = 6\left(1+\frac{1}{6^3}\right)^{1/3}$

$$\therefore\ 6\left(1+\frac{1}{6^3}\right)^{1/3} = 6\left[1+\frac{1}{3\times 216}-\frac{1\times 2}{3\times 3\times 2}\left(\frac{1}{216}\right)^2+\ldots\right]$$

$$= 6\left(1+\frac{1}{648}\right) \qquad \text{(neglect the other terms)}$$

$$= 6.01$$

65. $\because \frac{1}{(x-1)^2(x-2)} = \frac{1}{-2(1-x)^2\left(1-\frac{x}{2}\right)}$

$$= -\frac{1}{2}\left[(1-x)^{-2}\left(1-\frac{x}{2}\right)^{-1}\right]$$

$$= -\frac{1}{2}\left[(1+2x+\ldots)\left(1+\frac{x}{2}+\ldots\right)\right]$$

$\therefore$ Coefficient of constant term is $-\frac{1}{2}$.

66. The given expression of $\frac{1}{(4-3x)^{1/2}}$ can be rewritten as

$4^{-1/2}\left(1-\frac{3}{4}x\right)^{-1/2}$ and it is valid only when $\left|\frac{3}{4}x\right| < 1$

$$\Rightarrow \qquad -\frac{4}{3} < x < \frac{4}{3}$$

67. $\frac{1}{(6-3x)^{1/3}} = (6-3x)^{-1/3} = 6^{-1/3}\left[1-\frac{x}{2}\right]^{-1/3}$

$$= 6^{-1/3}\left[1+\left(-\frac{1}{3}\right)\left(-\frac{x}{2}\right)+\frac{\left(-\frac{1}{3}\right)\left(-\frac{4}{3}\right)}{2\cdot 1}\left(-\frac{x}{2}\right)^2+\ldots\right]$$

$$= 6^{-1/3}\left[1+\frac{x}{6}+\frac{2x^2}{6^2}+\ldots\right]$$

68. Given expression $\frac{\sqrt{1+x}+\sqrt[3]{(1-x)^2}}{1+x+\sqrt{1+x}}$ can be rewritten as

$$\frac{(1+x)^{1/2}+(1-x)^{2/3}}{1+x+(1+x)^{1/2}}$$

$$= \frac{\left[1+\frac{1}{2}x-\frac{1}{8}x^2+\ldots\right]+\left[1-\frac{2}{3}x-\frac{1}{9}x^2-\ldots\right]}{1+x+\left[1+\frac{1}{2}x-\frac{1}{8}x^2+\ldots\right]}$$

$$= \frac{2-\frac{1}{6}x-\frac{17}{72}x^2+\ldots}{2+\frac{3}{2}x-\frac{1}{8}x^2+\ldots} = \frac{\left[1-\frac{1}{12}x-\frac{17}{144}x^2+\ldots\right]}{\left[1+\frac{3}{4}x-\frac{1}{16}x^2+\ldots\right]}$$

$$= \left[1-\frac{1}{12}x-\frac{17}{144}x^2+\ldots\right]\left[1+\frac{3}{4}x-\frac{1}{16}x^2+\ldots\right]^{-1}$$

$$= 1-\frac{5}{6}x+\ldots$$

$$= 1-\frac{5}{6}x \qquad \text{(on neglecting the higher powers of } x\text{)}$$

69. $\frac{(1-3x)^{1/2}+(1-x)^{5/3}}{2\left(1-\frac{x}{4}\right)^{1/2}}$

$$= \frac{\left[\left\{1+\frac{1}{2}(-3x)+\frac{1}{2}\left(-\frac{1}{2}\right)\frac{1}{2}(-3x)^2+\ldots\right\} + \left\{1+\frac{5}{3}(-x)+\frac{5}{3}\cdot\frac{2}{3}\cdot\frac{1}{2}(-x)^2+\ldots\right\}\right]}{2\left[1+\frac{1}{2}\left(-\frac{x}{4}\right)+\frac{1}{2}\left(-\frac{1}{2}\right)\frac{1}{2}\left(-\frac{x}{4}\right)^2+\ldots\right]}$$

$$= \frac{2\left(1-\frac{19}{12}x-\frac{41}{144}x^2-\ldots\right)}{2\left(1-\frac{x}{8}-\frac{1}{128}x^2-\ldots\right)}$$

$$= \left(1-\frac{19}{12}x-\frac{41}{144}x^2-\ldots\right)\left(1-\frac{x}{8}-\frac{1}{128}x^2\ldots\right)^{-1}$$

$$= 1-\frac{35}{24}x+\ldots$$

On neglecting higher powers of x, we get

$$a+bx = 1-\frac{35}{24}x \Rightarrow a = 1, \quad b = -\frac{35}{24}$$

70. The number of terms in the expansion of $(a+b+c)^n$

$$= \frac{(n+1)(n+2)}{2}$$

71. $x = (\sqrt{3}+1)^5 = (\sqrt{3})^5 + {}^5C_1(\sqrt{3})^4 + {}^5C_2(\sqrt{3})^3 + {}^5C_3(\sqrt{3})^2 + {}^5C_4(\sqrt{3}) + {}^5C_5$

$$= 9\sqrt{3}+45+30\sqrt{3}+30+5\sqrt{3}+1$$

$$= 76+44\sqrt{3}$$

$$\therefore \quad [x] = [(\sqrt{3}+1)^5] = (76+44\sqrt{3}) = (76)+(44\times 1.732)$$

$$= 76+(76.2) = 76+76 = 152$$

72. Let $1+\frac{1}{3}x+\frac{1\cdot 4}{3\cdot 6}x^2+\frac{1\cdot 4\cdot 7}{3\cdot 6\cdot 9}x^3+\ldots = (1+y)^n$

$$= 1+ny+\frac{n(n-1)}{2!}y^2+\ldots$$

On comparing the terms, we get

$$ny = \frac{1}{3}x, \quad \frac{n(n-1)}{2!}y^2 = \frac{1\cdot 4}{3\cdot 6}x^2$$

On solving, we get

$$n = -\frac{1}{3}, \quad y = -x$$

$\therefore$ Required expansion is $(1-x)^{-1/3}$.

73. Let $S = 1+\frac{2\cdot 1}{3\cdot 2}+\frac{2\cdot 5}{3\cdot 6}\left(\frac{1}{2}\right)^2+\frac{2\cdot 5\cdot 8}{3\cdot 6\cdot 9}\left(\frac{1}{2}\right)^3+\ldots$

$$= 1+\frac{\frac{2}{3}}{1}\left(\frac{1}{2}\right)+\frac{\left(\frac{2}{3}\right)\left(\frac{5}{3}\right)}{2!}\left(\frac{1}{2}\right)^2+\frac{\left(\frac{2}{3}\right)\left(\frac{5}{3}\right)\left(\frac{8}{3}\right)}{3!}\left(\frac{1}{2}\right)^3+\ldots$$

$$= \left(1-\frac{1}{2}\right)^{-2/3} = \left(\frac{1}{2}\right)^{-2/3} = 2^{2/3} = 4^{1/3}$$

$$\left[\because (1-x)^{-n} = 1+nx+\frac{n(n+1)}{2!}x^2+\ldots\right]$$

74. Given that, $\frac{1}{1!(n-1)!}+\frac{1}{3!(n-3)!}+\frac{1}{5!(n-5)!}+\ldots$

$$=\frac{1}{n!}\left[\frac{n!}{1!(n-1)!}+\frac{n!}{3!(n-3)!}+\frac{n!}{5!(n-5)!}+\ldots\right]$$

$$=\frac{1}{n!}({}^nC_1+{}^nC_3+{}^nC_5+\ldots)=\frac{2^{n-1}}{n!}$$

75. There are total $(n+1)$ factors, let $P(x)=0$

Let $(x+{}^nC_0)(x+3\,{}^nC_1)(x+5\,{}^nC_2)\ldots[x+(2n+1)\,{}^nC_n]$

$$=a_nx^n+a_{n-1}x^{n-1}+\ldots+a_1x+a_0$$

Clearly, $a_n=1$ and roots of the equation $P(x)=0$ are $-{}^nC_0, -3\,{}^nC_1, \ldots$

Sum of roots $=-a_{n-1}/a_n=-{}^nC_0-3\,{}^nC_1-5\,{}^nC_2\ldots$

$\Rightarrow \quad a_{n-1}=(n+1)\,2^n$

76. According to given condition, $T_n={}^nC_3$

and $\quad T_{n+1}-T_n=21 \Rightarrow {}^{n+1}C_3-{}^nC_3=21$

$$\Rightarrow \frac{1}{6}(n+1)(n)(n-1)-\frac{1}{6}n(n-1)(n-2)=21$$

$$\Rightarrow \frac{n(n-1)}{6}[(n+1)-(n-2)]=21$$

$$\Rightarrow \frac{n(n-1)\cdot 3}{6}=21 \Rightarrow n(n-1)=42 \Rightarrow n=7$$

77. The coefficient of x^7 in $(1+3x-2x^3)^{10}$

$$=\frac{\sum 10!}{n_1!n_2!n_3!}(1)^{n_1}(3)^{n_2}(-2)^{n_3},$$

where $n_1+n_2+n_3=10$, $n_2+3n_3=7$

Different possibilities are as follow

n_1	n_2	n_3
3	7	0
5	4	1
7	1	2

$$\therefore \text{Coefficient of } x^7=\frac{10!}{3!7!}(1)^3(3)^7(-2)^0+\frac{10!}{5!4!1!}(1)^5(3)^4(-2)^1+\frac{10!}{7!1!2!}(1)^7(3)^1(-2)^2$$

$$=62640$$

Round II

1. Multiplying the numerator and denominator by $1-x$, we have

$$E=\frac{1-x}{(1-x)(1+x)(1+x^2)(1+x^4)\ldots(1+x^{2^m})}$$

$$=\frac{1-x}{(1-x^2)(1+x^2)(1+x^4)\ldots(1+x^{2^m})}$$

$$=\frac{1-x}{(1-x^4)(1+x^4)\ldots(1+x^{2^m})}=\frac{1-x}{(1-x^{2^{m+1}})}$$

$$=(1-x)(1-x^{2^{m+1}})^{-1}$$

$$=(1-x)(1+x^{2^{m+1}}+x^{2^{m+2}}+\ldots)$$

$\therefore$ Coefficient of $x^{2^{m+1}}$ is 1.

2. We have, $(x+3)^{n-1}+(x+3)^{n-2}(x+2)+(x+3)^{n-3}(x+2)^2+\ldots+(x+2)^{n-1}$

$$=\frac{(x+3)^n-(x+2)^n}{(x+3)-(x+2)}$$

$$=(x+3)^n-(x+2)^n$$

$$\left(\because \frac{x^n-a^n}{x-a}=x^{n-1}+x^{n-2}a^1+x^{n-3}a^2+\ldots+a^{n-1}\right)$$

Therefore, the coefficient of x^r in the given expression

$=$ coefficient of x^r in $[(x+3)^n-(x+2)^n]$

$$={}^nC_r\,3^{n-r}-{}^nC_r\,2^{n-r}$$

$$={}^nC_r\,(3^{n-r}-2^{n-r})$$

3. $\sum_{r=0}^{n}(-1)^r\,{}^nC_r\left\{\frac{1}{2^r}+\frac{3^r}{2^{2r}}+\frac{7^r}{2^{3r}}+\ldots \text{ upto } m \text{ terms}\right\}$

$$=\sum_{r=0}^{n}(-1)^r\,{}^nC_r\cdot\frac{1}{2^r}+\sum_{r=0}^{n}(-1)^r\cdot{}^nC_r\,\frac{3^r}{2^{2r}}+\sum_{r=0}^{n}(-1)^r\,{}^nC_r\,\frac{7^r}{2^{3r}}+\ldots$$

$$=\left(1-\frac{1}{2}\right)^n+\left(1-\frac{3}{4}\right)^n+\left(1-\frac{7}{8}\right)^n+\ldots \text{ upto } m \text{ terms}$$

$$=\frac{1}{2^n}+\frac{1}{2^{2n}}+\frac{1}{2^{3n}}\ldots \text{ upto } m \text{ terms}$$

$$=\frac{\frac{1}{2^n}\left\{1-\left(\frac{1}{2^n}\right)^m\right\}}{\left(1-\frac{1}{2^n}\right)}=\frac{2^{mn}-1}{2^{mn}(2^n-1)}$$

4. We have, $\left[2^{\log_2\sqrt{9^{x-1}+7}}+\frac{1}{2^{(1/5)\log_2(3^{x-1}+1)}}\right]^7$

$$=\left[\sqrt{9^{x-1}+7}+\frac{1}{(3^{x-1}+1)^{1/5}}\right]^7$$

$$\therefore \quad T_6={}^7C_5\,(\sqrt{9^{x-1}+7})^{7-5}\left[\frac{1}{(3^{x-1}+1)^{1/5}}\right]^5$$

$$={}^7C_5\,(9^{x-1}+7)\frac{1}{(3^{x-1}+1)}$$

$$\Rightarrow \quad 84={}^7C_5\,\frac{(9^{x-1}+7)}{(3^{x-1}+1)}$$

$\Rightarrow \quad 9^{x-1} + 7 = 4(3^{x-1} + 1)$

$\Rightarrow \quad \frac{3^{2x}}{9} + 7 = 4\left(\frac{3^x}{3} + 1\right)$

$\Rightarrow \quad 3^{2x} - 12(3^x) + 27 = 0$

$\Rightarrow \quad y^2 - 12y + 27 = 0 \quad$ (put $y = 3^x$)

$\Rightarrow \quad (y-3)(y-9) = 0$

$\Rightarrow \quad y = 3, 9 \Rightarrow 3^x = 3, 9 \Rightarrow x = 1, 2$

5. $\because \sum_{i=0}^{m} \binom{10}{i}\binom{20}{m-i} = \sum_{i=0}^{m} {}^{10}C_i \cdot {}^{20}C_{m-1}$

$= $ Coefficient of x^m in the expansion of

$(1+x)^{10}(1+x)^{20} = {}^{30}C_m$

It is maximum, when

$$m = \frac{30}{2} = 15$$

6. $\because \quad (k^2 - 3) = \frac{{}^{n-1}C_r}{{}^{n}C_{r+1}} = \frac{{}^{n-1}C_r}{\left(\frac{n}{r+1}\right){}^{n-1}C_r} = \left(\frac{r+1}{n}\right) \quad$ ...(i)

$\because \quad 0 \le r \le n-1$

$\Rightarrow \quad 1 \le r+1 \le n$

$\Rightarrow \quad \frac{1}{n} \le \frac{r+1}{n} \le 1$

$\Rightarrow \quad \frac{1}{n} \le k^2 - 3 \le 1 \quad$ [from Eq. (i)]

$\Rightarrow \quad 3 + \frac{1}{n} \le k^2 \le 4$

When $n \to \infty, 3 \le k^2 \le 4$ or $k \in [-2, -\sqrt{3}] \cup (\sqrt{3}, 2]$

7. $\because \quad I + f + f' = (5 + 2\sqrt{6})^n + (5 - 2\sqrt{6})^n = 2k$ (even integer)

$\therefore \quad f + f' = 1$

Now, $\quad (I + f)f' = (5 + 2\sqrt{6})^n(5 - 2\sqrt{6})^n = (1)^n = 1$

$\Rightarrow \quad (I + f)(1 - f) = 1$ or $I = \frac{1}{(1-f)} - f$

8. Coefficient of x^2y^2 in $(x + y + z + t)^4 = \frac{4!}{2!2!} = 6$ and coefficient of yzt^2 in $(x + y + z + t)^4$

$$= \frac{4!}{1!1!1!2!} = 12$$

Also, coefficient of $xyzt$ in

$$(x + y + z + t)^4 = \frac{4!}{1!1!1!1!} = 24$$

$\therefore$ Required ratio is $6 : 12 : 24 = 1 : 2 : 4$

9. Given, $\quad {}^mC_0 + {}^mC_1 + {}^mC_2 = 46$

$\Rightarrow \quad 2m + m(m-1) = 90$

$\Rightarrow \quad m^2 + m - 90 = 0 \Rightarrow m = 9$ as $m > 0$

Now, $(r+1)$th term of $\left(x^2 + \frac{1}{x}\right)^m$ is

$${}^mC_r\,(x^2)^{m-r}\left(\frac{1}{x}\right)^r = {}^mC_r\,x^{2m-3r}$$

For this to be independent of x put

$$2m - 3r = 0 \Rightarrow r = 6$$

$\therefore$ Coefficient of the term independent of x is ${}^9C_6 = 84$.

10. $\because 3^{4n} = 81^n = (1 + 80)^n = 1 + 80\lambda, \lambda \in N$

$\therefore \quad 3^{3^{4n}} = 3^{1+80\lambda} = 3 \cdot 3^{80\lambda} = 3 \cdot (9)^{40\lambda} = 3(10-1)^{40\lambda}$

$= 3(1 + 10\mu) = 3 + 30\ \mu$

$\therefore$ Last digit of $3^{3^{4n}} + 1$ is 4.

11. $(101)^{100} - 1 = (1 + 100)^{100} - 1$

$= 1 + {}^{100}C_1(100) + {}^{100}C_2(100)^2 + \ldots$

$+ {}^{100}C_{100}(100)^{100} - 1$

$= 10^4\lambda, \forall \lambda \in N$

12. $\because (101)^{50} - (99)^{50} = (100 + 1)^{50} - (100 - 1)^{50}$

$= 2\{{}^{50}C_1(100)^{49} + {}^{50}C_3(100)^{47} + {}^{50}C_5(100)^{45} + \ldots\}$

$= (100)^{50} + 2\{{}^{50}C_3(100)^{47} + {}^{50}C_5(100)^{45} + \ldots\}$

$> (100)^{50}$

$\Rightarrow \quad (101)^{50} - (99)^{50} > (100)^{50}$

$\Rightarrow \quad (101)^{50} - (100)^{50} > (99)^{50}$

Also, $\left(\frac{1001}{1000}\right)^{999} = \left(1 + \frac{1}{1000}\right)^{999}$

$= 1 + {}^{999}C_1\left(\frac{1}{1000}\right) + {}^{999}C_2\left(\frac{1}{1000}\right)^2 + \ldots$

$< 1 + 1 + 1 + 1 + \ldots + 1$

$= 1000$

$\therefore \quad \left(\frac{1001}{1000}\right)^{999} < 1000$

$\Rightarrow \quad (1001)^{999} < (1000)^{1000}$

Solutions (Q. Nos. 13-15)

2nd term is ${}^nC_1x^{n-1}a = 240$ ...(i)

3rd term is ${}^nC_2x^{n-2}a^2 = 720$ ...(ii)

4th term is ${}^nC_3x^{n-3}a^3 = 1080$ ...(iii)

On multiplying Eqs. (i) and (iii) and dividing by the square of Eq. (ii), we get

$$\frac{{}^nC_1 \times {}^nC_3}{({}^nC_2)^2} = \frac{240 \times 1080}{(720)^2}$$

$\Rightarrow \quad \frac{n \times n(n-1)(n-2)(2!)^2}{n^2(n-1)^2 \times 3!} = \frac{1}{2}$

$\Rightarrow \quad 4(n-2) = 3(n-1) \quad (\because n \ne 1)$

$\Rightarrow \quad n = 5$

On putting $n=5$, from Eqs. (i) and (ii), we get

$$5x^4a=240$$

and $$10x^3a^2=270$$

$\Rightarrow$ $$\frac{(5x^4a)^2}{10x^3a^2}=\frac{(240)^2}{720} \text{ or } x^5=32$$

$\therefore$ $$x=2$$

$\therefore$ $$a=\frac{240}{5x^4}=\frac{48}{2^4}=3$$

13. Hence, $x=2, a=3$ and $n=5$.

$$(x-a)^n=(2-3)^5=-1$$

14. Also,

$$(2+3)^5=2^5+{}^5C_1 2^4\times 3+{}^5C_2 2^3\times 3^2+{}^5C_3 2^2\times 3^3+{}^5C_4 2\times 3^4+{}^5C_5 3^5$$

$$=32+240+720+1080+810+243$$

Hence, least value of the term is 32.

15. Sum of odd numbered terms is $32+720+810=1562$

16. Given expression $=\left\{1+\left(x+\frac{1}{x}\right)\right\}^n$

$$=1+{}^nC_1\left(x+\frac{1}{x}\right)+{}^nC_2\left(x+\frac{1}{x}\right)^2+{}^nC_3\left(x+\frac{1}{x}\right)^3+\ldots+\left(x+\frac{1}{x}\right)^n$$

This will be of the form

$$=a_0+a_1x+a_2x^2+\ldots+a_nx^n+\frac{b_1}{x}+\frac{b_2}{x^2}+\frac{b_3}{x^3}+\ldots+\frac{b_n}{x^n}$$

$\therefore$ Number of terms $=1+n+n=2n+1$

17. $$\sum_{r=1}^{n} r^3\left(\frac{n-r+1}{r}\right)^2=\sum_{r=1}^{n} r(n-r+1)^2$$

$$=\sum_{r=1}^{n} r\{(n+1)^2-2(n+1)r+r^2\}$$

$$=(n+1)^2\sum r-2(n+1)\sum r^2+\sum r^3$$

$$=(n+1)^2\times\frac{n(n+1)}{2}-\frac{2(n+1)\times n(n+1)(2n+1)}{6}+\left[\frac{n(n+1)}{2}\right]^2$$

$$=\frac{(n+1)^2\cdot n\cdot(n+2)}{12}=14^2 \quad \text{(given)}$$

$$=7^2\times 2^2=\frac{7^2\cdot 6\cdot 8}{12} \quad \therefore n=6$$

Sum of coefficients $=(1-3+1)^6=(-1)^6=1$

18. The coefficients of rth, $(r+1)$th and $(r+2)$th terms in the expansion of $(1+x)^n$ are ${}^nC_{r-1}, {}^nC_r, {}^nC_{r+1}$

Statement I If ${}^nC_{r-1}, {}^nC_r, {}^nC_{r+1}$ are in AP, then

$$2\cdot{}^nC_r={}^nC_{r-1}+{}^nC_{r+1}$$

$\Rightarrow$ $$2=\frac{{}^nC_{r-1}}{{}^nC_r}+\frac{{}^nC_{r+1}}{{}^nC_r}$$

$$=\frac{r}{n-r+1}+\frac{n-r}{r+1}$$

Then, we get $(n-2r)^2=n+2$, which is true.

Statement II If ${}^nC_{r-1}, {}^nC_r, {}^nC_{r+1}$ are in GP, then

$$\frac{{}^nC_r}{{}^nC_{r-1}}=\frac{{}^nC_{r+1}}{{}^nC_r}$$

$\Rightarrow$ $$\frac{n-r+1}{r}=\frac{n-r}{r+1}$$

$\Rightarrow$ $$(n-r+1)(r+1)=(n-r)r$$

We get, $$n+1=0$$

$\therefore$ $n=-1$, which is not possible, since n is a positive integer.

Statement III If ${}^nC_{r-1}, {}^nC_r, {}^nC_{r+1}$ are in HP, then

$$\frac{2}{{}^nC_r}=\frac{1}{{}^nC_{r-1}}+\frac{1}{{}^nC_{r+1}}$$

$\Rightarrow$ $$2=\frac{{}^nC_r}{{}^nC_{r-1}}+\frac{{}^nC_r}{{}^nC_{r+1}}$$

$\Rightarrow$ $$2=\frac{n-r+1}{r}+\frac{r+1}{n-r}$$

$\Rightarrow$ $$2r(n-r)=(n-r+1)(n-r)+r(r+1)$$

$\Rightarrow$ $$n^2-4nr+4r^2+n=0$$

$\Rightarrow$ $$(n-2r)^2+n=0$$

This is not possible, as $(n-2r)^2\geq 0$

and n is a positive integer.

19. For $n=1$, $\sqrt{2}-1=\sqrt{2}-\sqrt{1}$

For $n=2$, $(\sqrt{2}-1)^2=3-2\sqrt{2}=\sqrt{9}-\sqrt{8}$

For $n=3$, $(\sqrt{2}-1)^3=5\sqrt{2}-7=\sqrt{50}-\sqrt{49}$

$\therefore$ Statement I is true for all natural numbers by mathematical induction.

Statement II is also true.

$\because$ $(\sqrt{2}-1)^n$ = Rational part + Irrational part

The irrational part will have only $\sqrt{2}$.

Hence, statement II is not a correct explanation of statement I.

20. Let $(\sqrt{5}+2)^n=N+f$, where N is an integer and $0<f<1$.

Let $(\sqrt{5}-2)^n=f'$, then $0<f'<1$

Let $(\sqrt{5}+2)^n-(\sqrt{5}-2)^n$ = integer $\quad(\because n$ is odd)

$\therefore$ $$N=(\sqrt{5}+2)^n-(\sqrt{5}-2)^n$$

$$=2[{}^nC_1\cdot 2\cdot 5^{(n-1)/2}+{}^nC_3\cdot 2^3\cdot 5^{(n-3)/2}+\ldots]$$

$\Rightarrow$ N is divisible by $2n$ on using statement II

(if n is prime and $r<n$, then there is no factor which will cut n $\Rightarrow$ ${}^nC_r$ will be divisible by n)

21. Since, n is even, put $n = 2$

$$\text{LHS} = {}^4C_1 = 4 \quad \text{and} \quad \text{RHS} = 2^3 = 8$$

Hence, statement I is false but statement II is true.

22. $\left(x + \frac{1}{x} + 2\right)^m = \left(\frac{x^2 + 2x + 1}{x}\right)^m = \frac{(1+x)^{2m}}{x^m}$

Term independent of x is coefficient of x^m in the expansion of $(1+x)^{2m} = {}^{2m}C_m = \frac{(2m)!}{(m!)^2}$

Hence, statement I is false and statement II is true.

23. $\frac{T_{r+1}}{T_r} = \frac{12 - r + 1}{r}\frac{11}{10}$

Let $\quad T_{r+1} \geq T_r \Rightarrow 13 - r \geq 1.1r$

$\Rightarrow \quad 13 \geq 2.1r \Rightarrow r \leq 6.19$

Hence, the greatest term occurs for $r = 6$.

Hence, 7th term is the greatest term. Also, the binomial coefficient of 7th term is ${}^{12}C_6$ which is the greatest binomial coefficient.

But this is not the reason for which T_7 is the greatest.

Here, it is coincident that the greatest term has the greatest binomial coefficient.

Hence, statement I is true, statement II is true but statement II is not a correct explanation of statement I.

24. $(1+x)^n - nx - 1 = (1 + {}^nC_1x + {}^nC_2x^2 + \ldots + {}^nC_nx^n) - nx - 1 \quad \ldots(i)$

$= {}^nC_2x^2 + \ldots + {}^nC_nx^n = x^2({}^nC_2 + {}^nC_3x + \ldots + {}^nC_nx^{n-2})$

Hence, $(1+x)^n - nx - 1$ is divisible by x^2.

Now, in Eq. (i), replace x by 8 and n by $n+1$.

Then, we have

$(1+8)^{n+1} - (n+1)8 - 1 = 8^2({}^nC_2 + {}^nC_38 + \ldots + {}^nC_n8^{n-2})$

$\Rightarrow \quad 9^{2n+2} - 8n - 9 = 8^2({}^nC_2 + {}^nC_38 + \ldots + {}^nC_n8^{n-2})$,

which is divisible by 64.

Hence, both the statements are correct and statement II is a correct explanation of statement I.

25. Since, $\quad \sum_{r=0}^{n} {}^nC_r \cdot x^r = (1+x)^n$

On multiplying by x, we get

$$\sum_{r=0}^{n} {}^nC_r \cdot x^{r+1} = x(1+x)^n$$

On differentiating w.r.t. x, we get

$$\sum_{r=0}^{n} (r+1) \cdot {}^nC_r \cdot x^r = (1+x)^n + nx(1+x)^{n-1}$$

Statement II is true.

If $x = 1$, then

$$\sum_{r=0}^{n} (r+1) \cdot {}^nC_r = 2^n + n(2)^{n-1} = (n+2)2^{n-1}$$

$\therefore$ Statement I is true and statement II is a correct explanation of statement I.

26. $\left[\frac{x+1}{x^{2/3} - x^{1/3} + 1} - \frac{(x-1)}{x - x^{1/2}}\right]^{10}$

$$= \left[\frac{(x^{1/3})^3 + 1^3}{x^{2/3} - x^{1/3} + 1} - \frac{\{(\sqrt{x})^2 - 1\}}{\sqrt{x}(\sqrt{x} - 1)}\right]^{10}$$

$$= \left[\frac{(x^{1/3} + 1)(x^{2/3} + 1 - x^{1/3})}{x^{2/3} - x^{1/3} + 1} - \frac{\{(\sqrt{x})^2 - 1\}}{\sqrt{x}(\sqrt{x} - 1)}\right]^{10}$$

$$= \left[(x^{1/3} + 1) - \frac{(\sqrt{x} + 1)}{\sqrt{x}}\right]^{10} = (x^{1/3} - x^{-1/2})^{10}$$

$\therefore$ The general term is

$$T_{r+1} = {}^{10}C_r(x^{1/3})^{10-r}(-x^{-1/2})^r$$

$$= {}^{10}C_r(-1)^r x^{\frac{10-r}{3} - \frac{r}{2}}$$

For independent of x, put

$$\frac{10-r}{3} - \frac{r}{2} = 0$$

$\Rightarrow \quad 20 - 2r - 3r = 0$

$\Rightarrow \quad 20 = 5r \Rightarrow r = 4$

$\therefore \quad T_5 = {}^{10}C_4 = \frac{10 \times 9 \times 8 \times 7}{4 \times 3 \times 2 \times 1} = 210$

27. $(\sqrt{3} + 1)^{2n} = {}^{2n}C_0(\sqrt{3})^{2n} + {}^{2n}C_1(\sqrt{3})^{2n-1} + {}^{2n}C_2(\sqrt{3})^{2n-2} + \ldots + {}^{2n}C_{2n}(\sqrt{3})^{2n-2n}$

and $(\sqrt{3} - 1)^{2n} = {}^{2n}C_0(\sqrt{3})^{2n}(-1)^0 + {}^{2n}C_1(\sqrt{3})^{2n-1}(-1)^1 + {}^{2n}C_2(\sqrt{3})^{2n-2}(-1)^2 + \ldots + {}^{2n}C_{2n}(\sqrt{3})^{2n-2n}(-1)^{2n}$

$\therefore \quad (\sqrt{3} + 1)^{2n} - (\sqrt{3} - 1)^{2n} = 2[{}^{2n}C_1(\sqrt{3})^{2n-1} + {}^{2n}C_3(\sqrt{3})^{2n-3} + {}^{2n}C_5(\sqrt{3})^{2n-5} + \ldots + {}^{2n}C_{2n-1}(\sqrt{3})^{2n-(2n-1)}]$

which is most certainly an irrational number because of odd powers of $\sqrt{3}$ in each of the terms.

28. Here, $(1 - x - x^2 + x^3)^6 = \{(1-x) - x^2(1-x)\}^6$

$$= \{(1-x)(1-x^2)\}^6 = (1-x)^6 \cdot (1-x^2)^6$$

$$= \left\{\sum_{r=0}^{6} (-1)^r \, {}^6C_r \cdot x^r\right\}\left\{\sum_{s=0}^{6} (-1)^s \, {}^6C_s \cdot x^{2s}\right\}$$

$$= \sum_{r=0}^{6} \sum_{s=0}^{6} (-1)^{r+s} \cdot {}^6C_r \cdot {}^6C_s \cdot x^{r+2s}$$

For coefficient of x^7, $+ r + 2s = 7$

i.e., $\quad (s = 1, r = 5)$ or $(s = 2, r = 3)$ or $(s = 3, r = 1)$

$\therefore$ Coefficient of x^7 is

$\{(-1)^{5+1} \cdot {}^6C_5 \cdot {}^6C_1\} + \{(-1)^{3+2} \cdot {}^6C_3 \cdot {}^6C_2\} + \{(-1)^{1+3} \cdot {}^6C_1 \cdot {}^6C_3\}$

$= (36) - (20)(15) + 6(20)$

$= 36 - 300 + 120 = -144$

29. $8^{2n} - (62)^{2n+1} = (1+63)^n - (63-1)^{2n+1}$

$= (1+63)^n + (1-63)^{2n+1}$

$= [1 + {}^nC_1 63 + {}^nC_2(63)^2 + \ldots + (63)^n]$

$+ [1 - {}^{(2n+1)}C_1 63 + {}^{(2n+1)}C_2(63)^2$

$+ \ldots + (-1)(63)^{(2n+1)}]$

$= 2 + 63\,[{}^nC_1 + {}^nC_2(63) + \ldots + (63)^{n-1}$

$- {}^{(2n+1)}C_1 + {}^{(2n+1)}C_2(63) - \ldots - (63)^{(2n)}]$

$\therefore$ Remainder is 2.

30. Since, in a binomial expansion of $(a-b)^n, n \geq 5$, the sum of 5th and 6th terms is equal to zero.

$\therefore \quad {}^nC_4 a^{n-4}(-b)^4 + {}^nC_5 a^{n-5}(-b)^5 = 0$

$\Rightarrow \quad \dfrac{n!}{(n-4)!\,4!} a^{n-4} \cdot b^4 - \dfrac{n!}{(n-5)!\,5!} a^{n-5} b^5 = 0$

$\Rightarrow \quad \dfrac{n!}{(n-5)!\,4!} a^{n-5} \cdot b^4 \left(\dfrac{a}{n-4} - \dfrac{b}{5}\right) = 0$

$\Rightarrow \quad \dfrac{a}{b} = \dfrac{n-4}{5}$

31. We know that,

$(1+x)^{20} = {}^{20}C_0 + {}^{20}C_1 x + \ldots + {}^{20}C_{10}x^{10} + \ldots + {}^{20}C_{20}x^{20}$

On putting $x = -1$, we get

$0 = {}^{20}C_0 - {}^{20}C_1 + \ldots - {}^{20}C_9 + {}^{20}C_{10} - {}^{20}C_{11} + \ldots + {}^{20}C_{20}$

$\Rightarrow 0 = {}^{20}C_0 - {}^{20}C_1 + \ldots - {}^{20}C_9 + {}^{20}C_{10} - {}^{20}C_9 + \ldots + {}^{20}C_0$

$[\because {}^nC_r = {}^nC_{n-r}]$

$\Rightarrow \quad 0 = 2({}^{20}C_0 - {}^{20}C_1 + \ldots - {}^{20}C_9) + {}^{20}C_{10}$

$\Rightarrow \quad {}^{20}C_{10} = 2({}^{20}C_0 - {}^{20}C_1 + \ldots + {}^{20}C_{10})$

$\Rightarrow \quad {}^{20}C_0 - {}^{20}C_1 + \ldots + {}^{20}C_{10} = \dfrac{1}{2}\,{}^{20}C_{10}$

32. $\because \quad (1-ax)^{-1}(1-bx)^{-1}$

$= (1 + ax + a^2x^2 + \ldots)(1 + bx + b^2x^2 + \ldots)$

$\therefore \quad a_n$ = coefficient of x^n in $(1-ax)^{-1}(1-bx)^{-1}$

$= a^0b^n + ab^{n-1} + \ldots + a^nb^0$

$= a^0b^n \left[1 + \dfrac{a}{b} + \left(\dfrac{a}{b}\right)^2 + \ldots\right] = a^0b^n \left[\dfrac{\left(\dfrac{a}{b}\right)^{n+1} - 1}{\dfrac{a}{b} - 1}\right]$

$= \dfrac{b^n(a^{n+1} - b^{n+1})}{a-b} \cdot \dfrac{b}{b^{n+1}}$

$= \dfrac{a^{n+1} - b^{n+1}}{a-b}$

33. $(1-y)^m(1+y)^n = 1 + a_1y + a_2y^2 + a_3y^3 + \ldots$

On differentiating w.r.t. y, we get

$-m(1-y)^{m-1}(1+y)^n + (1-y)^m n(1+y)^{n-1}$

$= a_1 + 2a_2y + 3a_3y^2 + \ldots \quad \ldots(\text{i})$

On putting $y = 0$ in Eq. (i), we get

$-m + n = a_1 = 10 \quad \ldots(\text{ii})$

$(\because a_1 = 10$, given)

On again differentiating Eq. (i), we get

$-m[-(m-1)(1-y)^{m-2}(1+y)^n + (1-y)^{m-1}n(1+y)^{n-1}]$

$+ n[-m(1-y)^{m-1}(1+y)^{n-1} + (1-y)^m(n-1)(1+y)^{n-2}]$

$= 2a_2 + 6a_3y + \ldots \quad \ldots(\text{iii})$

On putting $y = 0$ in Eq. (iii), we get

$-m[-(m-1) + n] + n[-m + (n-1)] = 2a_2 = 20$

$\Rightarrow \quad m(m-1) - mn - mn + n(n-1) = 20$

$\Rightarrow \quad m^2 + n^2 - m - n - 2mn = 20$

$\Rightarrow \quad (m-n)^2 - (m+n) = 20$

$\Rightarrow \quad 100 - (m+n) = 20$

$\Rightarrow \quad m + n = 80 \quad \ldots(\text{iv})$

On solving Eqs. (ii) and (iv), we get

$m = 35$ and $n = 45$

34. ${}^{50}C_4 + {}^{55}C_3 + {}^{54}C_3 + {}^{53}C_3 + {}^{52}C_3 + {}^{51}C_3 + {}^{50}C_3$

$= {}^{50}C_3 + {}^{50}C_4 + {}^{51}C_3 + {}^{52}C_3 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3$

$= {}^{51}C_4 + {}^{51}C_3 + {}^{52}C_3 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3$

$(\because {}^nC_r + {}^nC_{r-1} = {}^{n+1}C_r)$

$= {}^{52}C_4 + {}^{52}C_3 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3$

$= {}^{53}C_4 + {}^{53}C_3 + {}^{54}C_3 + {}^{55}C_3$

$= {}^{54}C_4 + {}^{54}C_3 + {}^{55}C_3$

$= {}^{55}C_4 + {}^{55}C_3 = {}^{56}C_4$

35. Since, the coefficient of given terms are ${}^mC_{r-1}, {}^mC_r, {}^mC_{r+1}$ respectively and they are in AP.

$\therefore \quad {}^mC_{r-1} + {}^mC_{r+1} = 2\,{}^mC_r$

$\Rightarrow \quad \dfrac{m!}{(r-1)!(m-r+1)!} + \dfrac{m!}{(r+1)!(m-r-1)!} = 2\,\dfrac{m!}{r!(m-r)!}$

$\Rightarrow \quad \dfrac{1}{(m-r+1)(m-r)} + \dfrac{1}{(r+1)r} = \dfrac{2}{r(m-r)}$

$\Rightarrow \quad \dfrac{r(r+1) + (m-r+1)(m-r)}{r(r+1)(m-r+1)(m-r)} = \dfrac{2}{r(m-r)}$

$\Rightarrow \quad r^2 + r + m^2 + r^2 - 2mr + m - r$

$= 2(mr - r^2 + r + m - r + 1)$

$\Rightarrow \quad 4r^2 - 4mr - m - 2 + m^2 = 0$

$\Rightarrow \quad m^2 - m(4r+1) + 4r^2 - 2 = 0$

36. Let x^7 is contained in $(r+1)$th term in the expansion of $\left(ax^2 + \dfrac{1}{bx}\right)^{11}$.

$\therefore \quad T_{r+1} = {}^{11}C_r (ax^2)^{11-r} \left(\dfrac{1}{bx}\right)^r = {}^{11}C_r \dfrac{a^{11-r}}{b^r} \cdot x^{22-3r}$

For coefficient of x^7, put

$$22 - 3r = 7$$

$\Rightarrow$ $$r = 5 \therefore T_6 = {}^{11}C_5 \frac{a^6}{b^5} \cdot x^7$$

$\therefore$ Coefficient of x^7 in the expansion of $\left(ax^2 + \frac{1}{bx}\right)^{11}$ is

${}^{11}C_5 \frac{a^6}{b^5}$.

Similarly, coefficient of x^{-7} in the expansion of $\left(ax - \frac{1}{bx^2}\right)^{11}$

is ${}^{11}C_6 \frac{a^5}{b^6}$.

According to the given condition,

$$^{11}C_5 \frac{a^6}{b^5} = {}^{11}C_6 \frac{a^5}{b^6} \Rightarrow \frac{a^6}{b^5} = \frac{a^5}{b^6}$$

$\Rightarrow$ $$ab = 1$$

37. $$\frac{(1+x)^{3/2} - \left(1 + \frac{1}{2}x\right)^3}{(1-x)^{1/2}}$$

$$= \frac{\left(1 + \frac{3}{2}x + \frac{\frac{3}{2}\cdot\frac{1}{2}}{2}x^2\right) - \left(1 + \frac{3x}{2} + \frac{3\cdot 2}{2}\cdot\frac{x^2}{4}\right)}{(1-x)^{1/2}}$$

(neglecting higher powers of x^2)

$$= -\frac{3x^2}{8}(1-x)^{-1/2} = -\frac{3x^2}{8}\left(1 + \frac{1}{2}x + \frac{\frac{1}{2}\cdot\frac{3}{2}}{2}\cdot x^2\right)$$

$$= -\frac{3x^2}{8}$$ ($\because$ higher powers of x^2 can be neglected)

38. The coefficient of the middle term in powers of x of $(1 + \alpha x)^4 = {}^4C_2\,\alpha^2$

The coefficient of the middle term in powers of x of $(1 - \alpha x)^6 = {}^6C_3(-\alpha)^3$

According to the given condition,

$$^4C_2\alpha^2 = {}^6C_3(-\alpha)^3$$

$\Rightarrow$ $$\frac{4!}{2!2!}\alpha^2 = -\frac{6!}{3!3!}\alpha^3 \Rightarrow 6\alpha^2 = -20\alpha^3$$

$\Rightarrow$ $$\alpha = -\frac{6}{20} \Rightarrow \alpha = -\frac{3}{10}$$

39. Given that, $$s_n = \sum_{r=0}^{n} \frac{1}{{}^nC_r}$$

$$s_n = \sum_{r=0}^{n} \frac{1}{{}^nC_{n-r}} \qquad (\because {}^nC_r = {}^nC_{n-r})$$

$\Rightarrow$ $$ns_n = \sum_{r=0}^{n} \frac{n}{{}^nC_{n-r}}$$

$\Rightarrow$ $$ns_n = \sum_{r=0}^{n}\left(\frac{n-r}{{}^nC_{n-r}} + \frac{r}{{}^nC_{n-r}}\right)$$

$\Rightarrow$ $$ns_n = \sum_{r=0}^{n}\frac{n-r}{{}^nC_{n-r}} + \sum_{r=0}^{n}\frac{r}{{}^nC_r}$$

$\Rightarrow$ $$ns_n = \left(\frac{n}{{}^nC_n} + \frac{n-1}{{}^nC_{n-1}} + \ldots + \frac{1}{{}^nC_1}\right) + \sum_{r=0}^{n}\frac{r}{{}^nC_r}$$

$\Rightarrow$ $$ns_n = t_n + t_n \qquad \left(\because t_n = \sum_{r=0}^{n}\frac{r}{{}^nC_r}, \text{ given}\right)$$

$\Rightarrow$ $$ns_n = 2t_n \Rightarrow \frac{t_n}{s_n} = \frac{n}{2}$$

40. The coefficient of x^n in expansion of $(1+x)(1-x)^n$.

= Coefficient of x^n in $(1-x)^n$ + Coefficient of x^{n-1} in $(1-x)^n$

$$= (-1)^n \frac{n!}{n!0!} + (-1)^{n-1}\frac{n!}{1!(n-1)!}$$

$$= (-1)^n\left[\frac{n!}{n!0!} - \frac{n!}{1!(n-1)!}\right] = (-1)^n(1-n)$$

41. The general term of $(\sqrt{3} + \sqrt[8]{5})^{256}$ is

$$T_{r+1} = {}^{256}C_r(3)^{(256-r)/2}(5)^{r/8}$$

For integral terms, $\frac{256-r}{2}$ and $\frac{r}{8}$ are both positive integers.

i.e., $$r = 0, 8, 16, 24, 32, \ldots, 256$$

Hence, total number of terms are 33.

42. Since, $(r+1)$th term in the expansion of $(1+x)^{27/5}$

$$= \frac{\frac{27}{5}\left(\frac{27}{5} - 1\right)\ldots\left(\frac{27}{5} - r + 1\right)}{r!}x^r$$

Now, this term will be negative, if the last factor in numerator is the only one negative factor.

$\Rightarrow$ $$\frac{27}{5} - r + 1 < 0 \Rightarrow \frac{32}{5} < r$$

$\Rightarrow 6.4 < r \Rightarrow$ least value of r is 7.

Thus, first negative term will be 8th.

43. $(1 + 2x + 3x^2 + \ldots)^{-3/2} = [(1-x)^{-2}]^{-3/2} = (1-x)^3$

So, coefficient of x^5 in $(1 + 2x + 3x^2 + \ldots)^{-3/2}$

= Coefficient of x^5 in $(1-x)^3 = 0$

44. $(1 + x + x^2 + x^3 + \ldots)^2 = [(1-x)^{-1}]^2 = (1-x)^{-2}$

Coefficient of x^n in $(1 + x + x^2 + \ldots)^2$

= Coefficient of x^n in $(1-x)^{-2}$

$= {}^{n+2-1}C_{2-1} = {}^{n+1}C_1$

$= n + 1$

9.1 Measure of Angles

The measure of angle is the amount of rotation from the direction of one ray of the angle to the other. The initial and final positions of the revolving ray are respectively called the initial and terminal sides (arms). Also, the revolving line is called the generating side. *e.g.*, If initial and final positions of the revolving ray are OP and OQ, then the angle formed will be $\angle POQ$.

If the rotation is in clockwise sense, the angle measured is negative and if the rotation is in anti-clockwise sense, the angle measured is positive.

Trigonometry is a branch of Mathematics that studies triangles and the relationships between the lengths of their sides and the angles between those sides. Trigonometry defines the trigonometric functions, which describe those relationships and have applicability to physical phenomena, such as waves.

System of Measurement of Angles

There are three systems of measurement

(i) Sexagesimal system

(ii) Centesimal system

(iii) Circular system

(i) **Sexagesimal system** In this system each angle is divided into 90 equal parts and each part is known as a degree. Thus, a right angle is equal to 90 degrees. One degree is denoted as 1°.

Each degree is divided into 60 equal parts each of which is known as one minute. One minute is denoted as $1'$. Each minute is consist of 60 parts, each part is known as a second. One second is denoted by $1''$.

Hence, 1 right angle = 90° (90 degree)

1 degree = $1^\circ = 60'$ (60 minute)

1 minute = $1' = 60''$ (60 second)

(ii) **Centesimal system** In this system each angle is divided into 100 equal parts and one part is known as a grade. Thus, one right angle is equal to 100 grade. One grade is denoted as 1^g.

One grade is divided into 100 equal parts, one part is known as a minute and is denoted as $1'$.

One minute is also divided into 100 equal parts, one part is known as a second which is denoted by $1''$.

Hence, 1 right angle = 100^g (100 grade)

1 grade = $1^g = 100'$ (100 minute)

1 minute = $1' = 100''$ (100 second)

(iii) **Circular system** If the angle subtended by an arc of length l to the centre of circle of radius r is θ, then $\theta = \frac{l}{r}$.

If the length of arc is equal to the radius of the circle, then the angle subtended at the centre of the circle will be one radian. One radian is denoted by 1^c.

The ratio of the circumference of the circle to the diameter of the circle is denoted by a greek letter π and it is a constant quantity.

$$\therefore \quad \frac{\text{Circumference of circle}}{\text{Diameter of circle}} = \pi$$

This constant quantity π is a irrational quantity and generally its approximate value is $\frac{22}{7}$ and its general value upto six places of decimal is 3.142857.

Relation Among Degree, Radian and Grade

The number of radians of an angle subtended by an arc of a circle at the centre is equal to the ratios of arc and radius.

$$180^\circ = \pi^c = 100^g$$

and $$1 \text{ radian} = 57^\circ 17' 44.8''$$

Note If measure of an angle is given in degree, then to convert it into radians, multiply the measure of an angle by $\frac{\pi}{180^\circ}$ and if the measure of an angle is given in radians, then to convert it into degree, write 180° at the place of π.

***Sample* Problem 1** *Find the degree measure of the angle subtended at the centre of a circle of radius 100 cm by an arc of length 22 cm.* $\left(\text{use } \pi = \frac{22}{7}\right)$ **[NCERT]**

(a) $11^\circ 36'$ (b) $12^\circ 36'$
(c) $12^\circ 30'$ (d) $12^\circ 34'$

Interpret (b) Here, $l = 22$ cm and $r = 100$ cm

Using the formula $\theta = \frac{l}{r}$, we have

$$\Rightarrow \quad \theta = \frac{22}{100} = \frac{11}{50} \text{ rad} \qquad \left(\because \theta = \frac{l}{r}\right)$$

$$= \left(\frac{11}{50} \times \frac{180}{\pi}\right)^\circ = \left(\frac{11 \times 18 \times 7}{5 \times 22}\right)^\circ = \left(\frac{63}{5}\right)^\circ$$

$$= 12^\circ + \left(\frac{3}{5}\right)^\circ$$

$$= 12^\circ + \frac{3}{5} \times 60' \qquad (\because 1^\circ = 60')$$

$$= 12^\circ 36'$$

***Sample* Problem 2** *If the three angles of a quadrilateral are* 60°, 60^g *and* $\frac{5\pi}{6}$ *radians. Then, the fourth angle is*

(a) 60° (b) 96°
(c) 96^g (d) *None of these*

Interpret (b) First angle = 60°

$$\text{Second angle} = 60^g = 60 \times \frac{90}{100} = 54^\circ$$

$$\text{Third angle} = \frac{5\pi}{6} \text{ radians}$$

$$= \frac{5 \times 180^\circ}{6} = 150^\circ$$

$$\text{Fourth angle} = 360^\circ - (60^\circ + 54^\circ + 150^\circ)$$

$$= 360^\circ - 264^\circ$$

$$= 96^\circ$$

9.2 Trigonometric Ratios

Let us take a right angled ΔABC right angled at B.

Let $\angle CAB = \theta$, then

$$\sin\theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{BC}{AC}$$

$$\cos\theta = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{AB}{AC}$$

$$\tan\theta = \frac{\text{Perpendicular}}{\text{Base}} = \frac{BC}{AB}$$

$$\cot\theta = \frac{1}{\tan\theta} = \frac{\text{Base}}{\text{Perpendicular}} = \frac{AB}{BC}$$

$$\sec\theta = \frac{1}{\cos\theta} = \frac{\text{Hypotenuse}}{\text{Base}} = \frac{AC}{AB}$$

$$\text{cosec}\,\theta = \frac{1}{\sin\theta} = \frac{\text{Hypotenuse}}{\text{Perpendicular}} = \frac{AC}{BC}$$

Except these six ratios, there are two other terms which are known as 'versed sine' and 'coversed sine', respectively.

i.e., $\text{ver}\sin\theta = 1 - \cos\theta$

and $\text{cover}\sin\theta = 1 - \sin\theta$

Note Trigonometric ratios of any angle is always constant .

***Sample* Problem 3** *In a right angle ΔABC, whose base is 6 and perpendicular height is 8. Find the trigonometric ratios* sin *A*, cos *A* and tan *A, respectively.* **[NCERT]**

(a) $\frac{4}{5}, \frac{3}{5}, \frac{4}{3}$ (b) $\frac{2}{5}, \frac{3}{5}, \frac{4}{5}$

(c) $\frac{4}{5}, \frac{1}{5}, \frac{2}{3}$ (d) *None of these*

Interpret (a) By pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

$$= 6^2 + 8^2 = 36 + 64 = 100$$

$$\Rightarrow \quad AC = 10$$

$$\therefore \quad \sin A = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{BC}{AC} = \frac{8}{10} = \frac{4}{5}$$

$$\cos A = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{AB}{AC} = \frac{6}{10} = \frac{3}{5}$$

$$\tan A = \frac{\text{Perpendicular}}{\text{Base}} = \frac{BC}{AB} = \frac{8}{6} = \frac{4}{3}$$

9.3 Trigonometric Functions

Let $X'OX$ and YOY' be the coordinate axes. Taking O as the centre and a unit radius, draw a circle, cutting the coordinate axes at A, B, A' and B', as shown in the figure.

Let $\angle AOP = \theta$

$$\left(\because \angle AOP = \frac{\text{arc } AP}{\text{radius } OP} = \frac{\theta}{1} = \theta^c, \text{ using } \theta = \frac{l}{r}\right)$$

Now, the six trigonometric functions may be defined as under

(i) $\cos\theta = \frac{OM}{OP} = x$ (ii) $\sin\theta = \frac{PM}{OP} = y$

(iii) $\sec\theta = \frac{OP}{OM} = \frac{1}{x}, x \neq 0$ (iv) $\text{cosec}\,\theta = \frac{OP}{PM} = \frac{1}{y}, y \neq 0$

(v) $\tan\theta = \frac{PM}{OM} = \frac{y}{x}, x \neq 0$ (vi) $\cot\theta = \frac{OM}{PM} = \frac{x}{y}, y \neq 0$

9.4 Graph of Trigonometric Functions

(i) Graph of sin x

Facts Related to sin *x*

(a) Domain = R

(b) Range = $[-1, 1]$

(c) Period = 2π

(d) Graph of $\sin x$ is continuous for all real values of x.

(ii) Graph of cos x

Facts Related to cos *x*

(a) Domain = R

(b) Range = $[-1, 1]$

(c) Period = 2π

(d) Graph of $\cos x$ is continuous for all real values of x

(iii) Graph of tan x

Facts Related to tan x

(a) Domain = $R \sim (2n+1)\frac{\pi}{2}$, $n \in I$

(b) Range = $(-\infty, \infty)$

(c) Period = π

(d) Graph of $\tan x$ is discontinuous at $x = \frac{m\pi}{2}$, where m is an odd integer.

(iv) Graph of cot x

Facts Related to cot x

(a) Domain = $R \sim n\pi$, $n \in I$

(b) Range = $(-\infty, \infty)$

(c) Period = π

(d) Graph of $\cot x$ is discontinuous at $x = m\pi$, where m is an integer.

(v) Graph of sec x

Facts Related to sec x

(a) Domain = $R \sim (2n+1)\frac{\pi}{2}$, $n \in I$

(b) Range = $(-\infty, -1] \cup [1, \infty)$

(c) Period = 2π

(d) Graph of $\sec x$ is discontinuous at $x = \frac{m\pi}{2}$, where m is an odd integer.

(vi) Graph of cosec x

Facts Related to cosec x

(a) Domain = $R \sim n\pi$, $n \in I$

(b) Range = $(-\infty, -1] \cup [1, \infty)$

(c) Period = 2π

(d) Graph of $\operatorname{cosec} x$ is discontinuous at $x = m\pi$, where m is an integer.

9.5 Trigonometric Identities

A trigonometric equation is an identity, if it is true for all values of the angle or angles involved.

Some Important Identities are Given Below

(i) $\cos^2\theta + \sin^2\theta = 1$ or $\cos^2\theta = 1 - \sin^2\theta$

or $\sin^2\theta = 1 - \cos^2\theta$

(ii) $\sec^2\theta - \tan^2\theta = 1$ or $\sec^2\theta = 1 + \tan^2\theta$

or $\tan^2\theta = \sec^2\theta - 1$

(iii) $\operatorname{cosec}^2\theta - \cot^2\theta = 1$ or $\operatorname{cosec}^2\theta = 1 + \cot^2\theta$

or $\cot^2\theta = \operatorname{cosec}^2\theta - 1$

Transformation of One Trigonometric Ratio to Another Trigonometric Ratios

	$\sin\theta$	$\cos\theta$	$\tan\theta$	$\cot\theta$	$\sec\theta$	$\operatorname{cosec}\theta$
$\sin\theta$	$\sin\theta$	$\sqrt{(1-\cos^2\theta)}$	$\frac{\tan\theta}{\sqrt{(1+\tan^2\theta)}}$	$\frac{1}{\sqrt{(1+\cot^2\theta)}}$	$\frac{\sqrt{(\sec^2\theta-1)}}{\sec\theta}$	$\frac{1}{\operatorname{cosec}\theta}$
$\cos\theta$	$\sqrt{(1-\sin^2\theta)}$	$\cos\theta$	$\frac{1}{\sqrt{(1+\tan^2\theta)}}$	$\frac{\cot\theta}{\sqrt{(1+\cot^2\theta)}}$	$\frac{1}{\sec\theta}$	$\frac{\sqrt{(\operatorname{cosec}^2\theta-1)}}{\operatorname{cosec}\theta}$
$\tan\theta$	$\frac{\sin\theta}{\sqrt{(1-\sin^2\theta)}}$	$\frac{\sqrt{(1-\cos^2\theta)}}{\cos\theta}$	$\tan\theta$	$\frac{1}{\cot\theta}$	$\sqrt{(\sec^2\theta-1)}$	$\frac{1}{\sqrt{(\operatorname{cosec}^2\theta-1)}}$
$\cot\theta$	$\frac{\sqrt{(1-\sin^2\theta)}}{\sin\theta}$	$\frac{\cos\theta}{\sqrt{(1-\cos^2\theta)}}$	$\frac{1}{\tan\theta}$	$\cot\theta$	$\frac{1}{\sqrt{(\sec^2\theta-1)}}$	$\sqrt{(\operatorname{cosec}^2\theta-1)}$
$\sec\theta$	$\frac{1}{\sqrt{(1-\sin^2\theta)}}$	$\frac{1}{\cos\theta}$	$\sqrt{(1+\tan^2\theta)}$	$\frac{\sqrt{(1+\cot^2\theta)}}{\cot\theta}$	$\sec\theta$	$\frac{\operatorname{cosec}\theta}{\sqrt{(\operatorname{cosec}^2\theta-1)}}$
$\operatorname{cosec}\theta$	$\frac{1}{\sin\theta}$	$\frac{1}{\sqrt{(1-\cos^2\theta)}}$	$\frac{\sqrt{(1+\tan^2\theta)}}{\tan\theta}$	$\sqrt{(1+\cot^2\theta)}$	$\frac{\sec\theta}{\sqrt{(\sec^2\theta-1)}}$	$\operatorname{cosec}\theta$

Note Above table is applicable only when $\theta \in (0°, 90°)$.

***Sample* Problem 4** $(\sin\theta + \operatorname{cosec}\theta)^2 + (\cos\theta + \sec\theta)^2$ *is*

(a) ≥ 9 (b) ≤ 9
(c) $= 9$ (d) *None of these*

Interpret (a) $(\sin\theta + \operatorname{cosec}\theta)^2 + (\cos\theta + \sec\theta)^2$

$$= \sin^2\theta + \operatorname{cosec}^2\theta + 2 + \cos^2\theta + \sec^2\theta + 2$$

$$= 7 + \tan^2\theta + \cot^2\theta \quad \ldots(i)$$

And we know that, AM $\geq$ GM

$$\therefore \quad \frac{\tan^2\theta + \cot^2\theta}{2} \geq \sqrt{\tan^2\theta\cot^2\theta}$$

$$\Rightarrow \quad \tan^2\theta + \cot^2\theta \geq 2 \quad \ldots(ii)$$

From Eqs. (i) and (ii), we get

$$(\sin\theta + \operatorname{cosec}\theta)^2 + (\cos\theta + \sec\theta)^2 \geq 7 + 2$$

$$(\sin\theta + \operatorname{cosec}\theta)^2 + (\cos\theta + \sec\theta)^2 \geq 9$$

Hot Spot

Trigonometric Expression

Trigonometric ratios and function types of problems are directly or indirectly asked in various years in AIEEE (JEE Main) 2013, 2010, 2009, 2002. *To solve such types of problem following steps are given below.*

Step I Firstly use the trigonometric ratios or identities.

Step II If it is require, use transformation of trigonometric ratios or identities.

Step III After that, simplify it.

***Sample* Problem 5** *The expression*

$$\cos\left(\frac{3\pi}{2} + x\right)\cos(2\pi + x)\left[\cot\left(\frac{3\pi}{2} - x\right) + \cot(2\pi + x)\right]$$

is equal to [NCERT]

(a) 1 (b) 0
(c) 2 (d) -1

Interpret (a) **Step I** Use the trigonometric ratios.

$$\cos\left(\frac{3\pi}{2} + x\right)\cos(2\pi + x)\left[\cot\left(\frac{3\pi}{2} - x\right) + \cot(2\pi + x)\right]$$

$$= (\sin x)(\cos x)[\tan x + \cot x]$$

$$= \sin x\cos x\left[\frac{\sin x}{\cos x} + \frac{\cos x}{\sin x}\right] \quad \left[\begin{array}{l}\because \cot\left(\frac{3\pi}{2} - \theta\right) = \tan\theta \\ \cos\left(\frac{3\pi}{2} + \theta\right) = \sin\theta\end{array}\right]$$

Step II Use trigonometric identities.

$$= \sin x\cos x\left[\frac{\sin^2 x + \cos^2 x}{\cos x\sin x}\right] = \frac{\sin x\cos x}{\sin x\cos x}$$

Step III Simplifies it

$$= 1$$

9.6 Complementary and Supplementary Angles

If the sum of two angles is equal to a right angle, then these angles are known as complementary angles of each other. Thus, θ and $90° - \theta$ are complementary angles of each other.

Now, if the sum of two angles is equal to two right angles, then these angles are known as supplementary angles of each other.

Thus, θ and $180° - \theta$ are supplementary angles of each other.

e.g., 23° and 67° are complementary angles of each other while 167° and 13° are supplementary angles of each other.

Trigonometric Ratios of Complementary and Supplementary Angles

α	$\sin\alpha$	$\cos\alpha$	$\tan\alpha$	$\cot\alpha$	$\sec\alpha$	$\text{cosec}\,\alpha$
$-\theta$	$-\sin\theta$	$\cos\theta$	$-\tan\theta$	$-\cot\theta$	$\sec\theta$	$-\text{cosec}\,\theta$
$90° - \theta$	$\cos\theta$	$\sin\theta$	$\cot\theta$	$\tan\theta$	$\text{cosec}\,\theta$	$\sec\theta$
$90° + \theta$	$\cos\theta$	$-\sin\theta$	$-\cot\theta$	$-\tan\theta$	$-\text{cosec}\,\theta$	$\sec\theta$
$180° - \theta$	$\sin\theta$	$-\cos\theta$	$-\tan\theta$	$-\cot\theta$	$-\sec\theta$	$\text{cosec}\,\theta$
$180° + \theta$	$-\sin\theta$	$-\cos\theta$	$\tan\theta$	$\cot\theta$	$-\sec\theta$	$-\text{cosec}\,\theta$

Note

- $\sin\{n\pi + (-1)^n\theta\} = \sin\theta, n \in I$
- $\cos(2n\pi \pm \theta) = \cos\theta, n \in I$
- $\tan(n\pi + \theta) = \tan\theta, n \in I$

***Sample* Problem 6** *The value of* $\text{cosec}(-1410°)$ *is* [NCERT]

(*a*) 3 (*b*) 2 (*c*) −3 (*d*) −1

Interpret (*b*) $\text{cosec}(-1410°) = -\text{cosec}(1410°)$

$[\because \text{cosec}(-\theta) = -\text{cosec}\,\theta]$

$= -\text{cosec}(360 \times 4 - 30)°$

$= -(-\text{cosec}\,30°) = \text{cosec}\,30° = 2$ $[\because \text{cosec}(2n\pi - \theta) = -\text{cosec}\,\theta]$

Check Point 1

1. If $\text{cosec}\,\theta - \cot\theta = p$, then the value of $\text{cosec}\,\theta$ is
   (a) $\frac{1}{2}\left(p + \frac{1}{p}\right)$ (b) $\frac{1}{2}\left(1 - \frac{1}{p}\right)$
   (c) $\left(1 + \frac{1}{p}\right)$ (d) $\left(1 - \frac{1}{p}\right)$

2. If $\tan\alpha = \frac{\sin\theta - \cos\theta}{\sin\theta + \cos\theta}$, then $\sin\alpha$ is equal to
   (a) $\pm\frac{\sin\theta + \cos\theta}{\sqrt{2}}$ (b) $\pm\frac{\sin\theta - \cos\theta}{\sqrt{2}}$
   (c) $\pm(\sin\theta - \cos\theta)$ (d) None of these

3. If $\text{cosec}\,\theta - \sin\theta = a^3$ and $\sec\theta - \cos\theta = b^3$, then $a^2b^2(a^2 + b^2)$ is equal to
   (a) 2 (b) $\sin^2\theta$
   (c) $\cos^2\theta$ (d) 1

4. If $2\cos^2 B - 1 = \tan^2 A$, then $\cos A \cos B$ is equal to
   (a) $\pm\frac{1}{2}$ (b) $\pm\frac{1}{3}$
   (c) $\pm\frac{1}{\sqrt{2}}$ (d) None of these

5. The value of the expression $\frac{\tan\theta}{1 - \cot\theta} + \frac{\cot\theta}{1 - \tan\theta} - \sec\theta\,\text{cosec}\,\theta$ is equal to
   (a) −1 (b) 0
   (c) 1 (d) None of these

6. The angle subtended at the centre of a circle of diameter 50 cm by an arc of length 11 cm is
   (a) 25° 27′ (b) 23° 12′
   (c) 25° 12′ (d) None of these

7. If $\text{cosec}\,A + \cot A = \frac{11}{2}$, then $\tan A$ is equal to
   (a) $\frac{21}{22}$ (b) $\frac{15}{16}$
   (c) $\frac{117}{43}$ (d) $\frac{44}{117}$

8. If $3\sin\theta + 5\cos\theta = 5$, then the value of $5\sin\theta - 3\cos\theta$ is
   (a) ± 9 (b) ± 3
   (c) ± 4 (d) ± 5

9. If $\sec A = a + \left(\frac{1}{4a}\right)$, then $\sec A + \tan A$ is equal to
   (a) $2a$ or $\frac{1}{2a}$ (b) a or $\frac{1}{a}$
   (c) $2a$ or $\frac{1}{a}$ (d) a or $\frac{1}{2a}$

10. If $x\sin^3\theta + y\cos^3\theta = \cos\theta\sin\theta$ and $x\sin\theta = y\cos\theta$, then
    (a) $x^2 + y^2 = 2$
    (b) $x^2 + y^2 = 4$
    (c) $x^2 + y^2 = 3$
    (d) $x^2 + y^2 = 1$

9.7 Variation of Values of Trigonometrical Ratios in Different Quadrants

(i)

	II Except sin and cosec, all ratios are negative.	**I** All trigonometric ratios are positive.
	III Except tan and cot, all ratios are negative.	**IV** Except cos and sec, all ratios are negative.

(ii)

	II	**I**
sine	decreases from 1 to 0	increases from 0 to 1

***Sample* Problem 7** *The value of*

$$\tan 1^\circ \tan 2^\circ \tan 3^\circ \ldots \tan 89^\circ \text{ is}$$ **[NCERT Exemplar]**

(a) 0 (b) 1
(c) 2 (d) 3

Interpret (b) $\tan 1^\circ \cdot \tan 2^\circ \cdot \tan 3^\circ \ldots \tan 89^\circ$

$= (\tan 1^\circ \tan 89^\circ)(\tan 2^\circ \tan 88^\circ) \ldots (\tan 44^\circ \tan 46^\circ) \tan 45^\circ$

$= (\tan 1^\circ \cot 1^\circ)(\tan 2^\circ \cot 2^\circ) \ldots \tan 45^\circ = 1 \cdot 1 \ldots = 1$

***Sample* Problem 8** *The value of*

$$2\sin^2\frac{3\pi}{4} + 2\cos^2\frac{\pi}{4} + 2\sec^2\frac{\pi}{3} \text{ is}$$ **[NCERT Exemplar]**

(a) 10 (b) –10 (c) 12 (d) 14

Interpret (a) $2\sin^2\frac{3\pi}{4} + 2\cos^2\frac{\pi}{4} + 2\sec^2\frac{\pi}{3}$

$$= 2\sin^2\left(\pi - \frac{\pi}{4}\right) + 2\cos^2\frac{\pi}{4} + 2\sec^2\frac{\pi}{3}$$

$$= 2\sin^2\frac{\pi}{4} + 2\times\left(\frac{1}{\sqrt{2}}\right)^2 + 2(2)^2 \quad [\because \sin(\pi - \theta) = \sin\theta]$$

$$= 2\times\left(\frac{1}{\sqrt{2}}\right)^2 + 2\times\frac{1}{2} + 2\times 4 = 1 + 1 + 8 = 10$$

9.9 Trigonometric Ratios of Compound Angles

An angle made up of the algebraic sum of two or more angles is called compound angles.

Sum and Difference Formulae

(i) $\sin(A+B) = \sin A\cos B + \cos A\sin B$

(ii) $\sin(A-B) = \sin A\cos B - \cos A\sin B$

(iii) $\cos(A+B) = \cos A\cos B - \sin A\sin B$

(iv) $\cos(A-B) = \cos A\cos B + \sin A\sin B$

(v) $\tan(A+B) = \dfrac{\tan A + \tan B}{1 - \tan A\tan B}$

(vi) $\tan(A-B) = \dfrac{\tan A - \tan B}{1 + \tan A\tan B}$

(vii) $\cot(A+B) = \dfrac{\cot A\cot B - 1}{\cot A + \cot B}$

(viii) $\cot(A-B) = \dfrac{\cot A\cot B + 1}{\cot B - \cot A}$

(ix) $\sin(A+B)\sin(A-B) = \sin^2 A - \sin^2 B = \cos^2 B - \cos^2 A$

(x) $\cos(A+B)\cos(A-B) = \cos^2 A - \sin^2 B = \cos^2 B - \sin^2 A$

(xi) $\sin(A+B+C) = \sin A\cos B\cos C + \cos A\sin B\cos C + \cos A\cos B\sin C - \sin A\sin B\sin C$

Also,

$\sin(A+B+C) = \sin A\cos B\cos C(\tan A + \tan B + \tan C) - \tan A\tan B\tan C$

(xii) $\cos(A+B+C) = \cos A\cos B\cos C - \sin A\sin B\cos C - \sin A\cos B\sin C - \cos A\sin B\sin C$

Also, $\cos(A+B+C)$

$= \cos A\cos B\cos C(1 - \tan A\tan B - \tan B\tan C - \tan C\tan A)$

***Sample* Problem 9** *If* $\cos\theta + \sin\phi = m$ *and* $\sin\theta + \cos\phi = n$, *then* $\frac{1}{2}(m^2 + n^2 - 2)$ *is equal to* **[NCERT Exemplar]**

(a) $\sin(\theta - \phi)$ (b) $\sin(\theta + \phi)$
(c) $\cos(\theta - \phi)$ (d) $\cos(\theta + \phi)$

Interpret (b) Given $m = \cos\theta + \sin\phi$ ...(i)

and $n = \sin\theta + \cos\phi$ ...(ii)

On squaring and adding Eqs. (i) and (ii), we get

$$m^2 + n^2 = \cos^2\theta + \sin^2\phi + 2\sin\phi\cos\theta + \sin^2\theta + \cos^2\phi + 2\sin\theta\cos\phi$$

$$\Rightarrow \quad m^2 + n^2 = 2 + 2(\sin\theta\cos\phi + \cos\theta\sin\phi)$$

$$\Rightarrow \quad \sin(\theta + \phi) = \frac{m^2 + n^2 - 2}{2}$$

***Sample* Problem 10** *The expression* $\dfrac{\tan\left(\frac{\pi}{4} + x\right)}{\tan\left(\frac{\pi}{4} - x\right)}$ *is equal to* **[NCERT Exemplar]**

(a) $\left(\dfrac{1 - \tan x}{1 + \tan x}\right)^2$ (b) $\left(\dfrac{1 + \tan x}{1 - \tan x}\right)^2$

(c) $\dfrac{1 + \tan x}{1 - \tan x}$ (d) *None of these*

Interpret (b) $\dfrac{\tan\left(\frac{\pi}{4} + x\right)}{\tan\left(\frac{\pi}{4} - x\right)} = \dfrac{\tan\frac{\pi}{4} + \tan x}{1 - \tan\frac{\pi}{4}\tan x} \times \dfrac{1 + \tan\frac{\pi}{4}\tan x}{\tan\frac{\pi}{4} - \tan x}$

$$\left[\because \tan(A+B) = \frac{\tan A + \tan B}{1 - \tan A\tan B} \text{ and } \tan(A-B) = \frac{\tan A - \tan B}{1 + \tan A\tan B}\right]$$

$$= \frac{1 + \tan x}{1 - \tan x} \times \frac{1 + \tan x}{1 - \tan x} = \left(\frac{1 + \tan x}{1 - \tan x}\right)^2$$

Product into Sum and Difference Formulae

(i) $2\sin A\cos B = \sin(A+B) + \sin(A-B)$
(ii) $2\cos A\sin B = \sin(A+B) - \sin(A-B)$ } $A > B$

(iii) $2\cos A\cos B = \cos(A+B) + \cos(A-B)$

(iv) $2\sin A\sin B = \cos(A-B) - \cos(A+B)$

***Sample* Problem 11** $\dfrac{\sin 8\theta \cos\theta - \sin 6\theta \cos 3\theta}{\cos 2\theta \cos\theta - \sin 3\theta \sin 4\theta}$ *is equal to*

(*a*) $\dfrac{\sin 7\theta - \sin 3\theta}{\cos 7\theta + \cos 3\theta}$

(*b*) $\dfrac{\sin 7\theta + \sin 3\theta}{\cos 7\theta + \cos 3\theta}$

(*c*) $\dfrac{\sin 7\theta + \sin 3\theta}{\cos 7\theta - \cos 3\theta}$

(*d*) *None of the above*

Interpret (*a*) $\dfrac{\sin 8\theta \cos\theta - \sin 6\theta \cos 3\theta}{\cos 2\theta \cos\theta - \sin 3\theta \sin 4\theta}$

$$= \frac{2\sin 8\theta \cos\theta - 2\sin 6\theta \cos 3\theta}{2\cos 2\theta \cos\theta - 2\sin 3\theta \sin 4\theta}$$

$$= \frac{(\sin 9\theta + \sin 7\theta) - (\sin 9\theta + \sin 3\theta)}{(\cos 3\theta + \cos\theta) + (\cos 7\theta - \cos\theta)}$$

$$= \frac{\sin 7\theta - \sin 3\theta}{\cos 7\theta + \cos 3\theta}$$

Sum and Difference into Product Formulae

(i) $\sin C + \sin D = 2\sin\left(\dfrac{C+D}{2}\right)\cos\left(\dfrac{C-D}{2}\right)$

(ii) $\sin C - \sin D = 2\cos\left(\dfrac{C+D}{2}\right)\sin\left(\dfrac{C-D}{2}\right)$

(iii) $\cos C + \cos D = 2\cos\left(\dfrac{C+D}{2}\right)\cos\left(\dfrac{C-D}{2}\right)$

(iv) $\cos C - \cos D = 2\sin\left(\dfrac{C+D}{2}\right)\sin\left(\dfrac{D-C}{2}\right)$

***Sample* Problem 12** *The expression* $\dfrac{\cos 4x + \cos 3x + \cos 2x}{\sin 4x + \sin 3x + \sin 2x}$ *is equal to* [**NCERT**]

(*a*) $-\cot 3x$

(*b*) $\cot 3x$

(*c*) $\cot 2x$

(*d*) $-\cot 2x$

Interpret (*b*)

$$\frac{\cos 4x + \cos 3x + \cos 2x}{\sin 4x + \sin 3x + \sin 2x} = \frac{(\cos 4x + \cos 2x) + \cos 3x}{(\sin 4x + \sin 2x) + \sin 3x}$$

$$= \frac{2\cos\frac{4x+2x}{2}\cos\frac{4x-2x}{2} + \cos 3x}{2\sin\frac{4x+2x}{2}\cos\frac{4x-2x}{2} + \sin 3x} \quad \text{(by formulae)}$$

$$= \frac{2\cos 3x\cos x + \cos 3x}{2\sin 3x\cos x + \sin 3x}$$

$$= \frac{\cos 3x(2\cos x + 1)}{\sin 3x(2\cos x + 1)} = \cot 3x$$

Trigonometric Ratios of Multiples of an Angle

(i) $\sin 2\theta = 2\sin\theta\cos\theta = \dfrac{2\tan\theta}{1+\tan^2\theta}$

(ii) $\cos 2\theta = \cos^2\theta - \sin^2\theta = 1 - 2\sin^2\theta$

$$= 2\cos^2\theta - 1 = \frac{1-\tan^2\theta}{1+\tan^2\theta}$$

(iii) $\cos^2\theta = \dfrac{1}{2}(1+\cos 2\theta)$, $\sin^2\theta = \dfrac{1}{2}(1-\cos 2\theta)$

(iv) $\tan 2\theta = \dfrac{2\tan\theta}{1-\tan^2\theta}$

(v) $\cot 2\theta = \dfrac{\cot^2\theta - 1}{2\cot\theta}$

(vi) $\sin 3\theta = 3\sin\theta - 4\sin^3\theta$

(vii) $\cos 3\theta = 4\cos^3\theta - 3\cos\theta$

(viii) $\tan 3\theta = \dfrac{3\tan\theta - \tan^3\theta}{1 - 3\tan^2\theta}$

(ix) $\cot 3\theta = \dfrac{\cot^3\theta - 3\cot\theta}{3\cot^2\theta - 1} = \dfrac{3\cot\theta - \cot^3\theta}{1 - 3\cot^2\theta}$

***Sample* Problem 13** $\sqrt{3}\,\text{cosec}\,20° - \sec 20°$ *is equal to*

(*a*) 1 (*b*) 2

(*c*) 3 (*d*) 4

Interpret (*d*) $\sqrt{3}\,\text{cosec}\,20° - \sec 20°$

$$= \frac{\sqrt{3}}{\sin 20°} - \frac{1}{\cos 20°} = \frac{\sqrt{3}\cos 20° - \sin 20°}{\sin 20°\cdot\cos 20°}$$

$$= \frac{4\left(\frac{\sqrt{3}}{2}\cos 20° - \frac{1}{2}\sin 20°\right)}{2\sin 20°\cdot\cos 20°}$$

$$= \frac{4(\sin 60°\cos 20° - \cos 60°\sin 20°)}{\sin 40°}$$

$$= \frac{4\sin 40°}{\sin 40°} = 4$$

Trigonometric Ratios of Submultiple Angles

(i) $\sin\theta = 2\sin\frac{1}{2}\theta\cos\frac{1}{2}\theta = \dfrac{2\tan\frac{1}{2}\theta}{1+\tan^2\frac{1}{2}\theta}$

(ii) $\cos\theta = \cos^2\frac{1}{2}\theta - \sin^2\frac{1}{2}\theta = 1 - 2\sin^2\frac{1}{2}\theta$

$$= 2\cos^2\frac{1}{2}\theta - 1 = \frac{1-\tan^2\frac{1}{2}\theta}{1+\tan^2\frac{1}{2}\theta}$$

(iii) $\tan\theta = \dfrac{2\tan\frac{1}{2}\theta}{1-\tan^2\frac{1}{2}\theta}$ (iv) $\cot\theta = \dfrac{\cot^2\frac{1}{2}\theta - 1}{2\cot\frac{1}{2}\theta}$

Note

- $1 - \cos A = 2\sin^2\frac{A}{2}$
- $1 + \cos A = 2\cos^2\frac{A}{2}$
- $\sin(\alpha) + \sin(\alpha+\beta) + \sin(\alpha+2\beta) + \ldots + \sin[\alpha + (n-1)\beta]$
$$= \frac{\sin\left\{\alpha + (n-1)\left(\frac{\beta}{2}\right)\right\}\sin\left(\frac{n\beta}{2}\right)}{\sin\left(\frac{\beta}{2}\right)}$$
- $\cos(\alpha) + \cos(\alpha+\beta) + \cos(\alpha+2\beta) + \ldots + \cos[\alpha + (n-1)\beta]$
$$= \frac{\cos\left\{\alpha + (n-1)\frac{\beta}{2}\right\}\sin\frac{n\beta}{2}}{\sin\frac{\beta}{2}}$$

***Sample* Problem 14** $\sin\frac{\pi}{n} + \sin\frac{3\pi}{n} + \sin\frac{5\pi}{n} + \ldots$ *upto n terms is equal to*

(a) 1 (b) 2 (c) 3 (d) 0

Interpret (d) $\sin\frac{\pi}{n} + \sin\frac{3\pi}{n} + \sin\frac{5\pi}{n} + \ldots$ upto n terms

$$= \frac{\sin\frac{n\cdot 2\pi}{2n}}{\sin\frac{2\pi}{2n}}\cdot\sin\left(\frac{2\cdot\frac{\pi}{n} + (n-1)\frac{2\pi}{n}}{2}\right)$$

$$= \frac{\sin\pi}{\sin\frac{\pi}{n}}\cdot\sin\left(\frac{2\pi + 2n\pi - 2\pi}{2n}\right) = \frac{\sin^2\pi}{\sin\frac{\pi}{n}} = 0$$

$\therefore \sin\frac{\pi}{n} + \sin\frac{3\pi}{n} + \sin\frac{5\pi}{n} + \ldots$ upto n terms $= 0$

9.10 Maximum and Minimum (Greatest and Least) Value of $a\sin\theta + b\cos\theta$

Let $a = r\cos\alpha$ and $b = r\sin\alpha$

$\therefore \quad a\sin\theta + b\cos\theta = r(\cos\alpha\sin\theta + \sin\alpha\cos\theta)$

$= r\sin(\theta + \alpha)$

where, $r = \sqrt{a^2 + b^2}$

and $\alpha = \tan^{-1}\left(\frac{b}{a}\right)$

$\because$ Maximum and minimum values of $\sin(\theta + \alpha)$ are 1 and respectively.

Therefore,

(i) Maximum value of $a\sin\theta + b\cos\theta = \sqrt{a^2 + b^2}$

(ii) Minimum value of $a\sin\theta + b\cos\theta = -\sqrt{a^2 + b^2}$

***Sample* Problem 15** *The maximum and minimum value of* $6\sin x\cos x + 4\cos 2x$ *are respectively*

(a) 5, 5 (b) −5, 5
(c) 5, −5 (d) −4, 4

Interpret (c) $\because$ $6\sin x\cos x + 4\cos 2x = 3\sin 2x + 4\cos 2x$

$\therefore \quad -\sqrt{3^2 + 4^2} \le 3\sin 2x + 4\cos 2x \le \sqrt{3^2 + 4^2}$

$\Rightarrow \quad -5 \le 3\sin 2x + 4\cos 2x \le 5$

Thus, maximum and minimum value of

$6\sin x\cos x + 4\cos 2x$ are 5 and −5 respectively.

Check Point **2**

1. The expression $3\left\{\sin^4\left(\frac{3\pi}{2} - \alpha\right) + \sin^4(3\pi + \alpha)\right\} - 2\left\{\sin^6\left(\frac{\pi}{2} + \alpha\right) + \sin^6(5\pi - \alpha)\right\}$ is equal to

(a) 0 (b) 1
(c) 3 (d) $\sin 4\alpha + \cos 6\alpha$

2. $\cot\frac{\pi}{20}\cot\frac{3\pi}{20}\cot\frac{5\pi}{20}\cot\frac{7\pi}{20}\cot\frac{9\pi}{20}$ is equal to

(a) 0 (b) −1
(c) 1 (d) None of these

3. If $\cos\theta = -\frac{\sqrt{3}}{2}$ and $\sin\alpha = -\frac{3}{5}$, where θ does not lie in the third quadrant and α lies in the third quadrant, then $\frac{2\tan\alpha + \sqrt{3}\tan\theta}{\cot^2\theta + \cos\alpha}$ is equal to

(a) $\frac{5}{22}$ (b) $\frac{7}{22}$
(c) $\frac{9}{22}$ (d) $\frac{22}{5}$

4. The value of $\cos^4\frac{\pi}{8} + \cos^4\frac{3\pi}{8} + \cos^4\frac{5\pi}{8} + \cos^4\frac{7\pi}{8}$ is equal to

(a) 2 (b) 1/2
(c) 3/2 (d) None of these

5. If $\frac{\sqrt{1 - \sin\alpha}}{\sqrt{1 + \sin\alpha}} = \sec\alpha - \tan\alpha$, then the quadrants in which α lies are

(a) II and III (b) I and IV
(c) I and II (d) III or IV

6. The expression $(\sin 3x + \sin x)\sin x + (\cos 3x - \cos x)\cos x$ is equal to

(a) 0 (b) 1
(c) −1 (d) $\frac{1}{2}$

7. If $\sin\theta_1 + \sin\theta_2 + \sin\theta_3 = 3$, then $\cos\theta_1 + \cos\theta_2 + \cos\theta_3$ is equal to

(a) 3 (b) 2
(c) 1 (d) 0

8. If $\sin B = \frac{1}{5}\sin(2A + B)$, then $\frac{\tan(A+B)}{\tan A}$ is equal to
(a) $\frac{2}{3}$ (b) $\frac{3}{2}$
(c) $\frac{3}{4}$ (d) None of these

9. The minimum value of $9\tan^2\theta + 4\cot^2\theta$ is
(a) 13 (b) 9
(c) 6 (d) 12

10. If $(1+\tan\alpha)(1+\tan 4\alpha) = 2$, $\alpha \in (0, \pi/16)$, then α is equal to
(a) $\frac{\pi}{20}$ (b) $\frac{\pi}{30}$ (c) $\frac{\pi}{40}$ (d) $\frac{\pi}{60}$

11. $\frac{\sin 3\theta + \sin 5\theta + \sin 7\theta + \sin 9\theta}{\cos 3\theta + \cos 5\theta + \cos 7\theta + \cos 9\theta}$ is equal to
(a) $\tan 3\theta$ (b) $\cot 3\theta$
(c) $\tan 6\theta$ (d) $\cot 6\theta$

12. The greatest value of $4\sin\theta + 3\cos\theta + 10$ is
(a) 13 (b) 15 (c) −15 (d) −13

9.11 Trigonometric Equations

An equation involving one or more trigonometrical ratios of unknown angle is called a trigonometric equation.

e.g., $\cos^2\theta - \sin\theta = \frac{1}{2}$, $\tan m\theta = \cot n\theta$

etc., are trigonometric equations.

9.12 Solutions or Roots of a Trigonometric Equation

A value of the unknown angle which satisfies the given equation, is called a solution or root of the equation.

The trigonometric equation may have infinite number of solutions and can be classified as

(i) Principal solution
(ii) General solution

(i) Principal Solution

The least value of unknown angle which satisfies the given equation, is called a principal solution of trigonometric equation.

(ii) General Solution

We know that trigonometric functions are periodic and solutions of trigonometric equations can be generalized with the help of the periodicity of the trigonometric functions. The solution consisting of all possible solutions of a trigonometric equation is called its general solution.

Note A function $f(x)$ is said to be a periodic function, if a least positive real number T is such that $f(x+T) = f(x)$, then T is known as period of function $f(x)$.

General Solutions of Trigonometric Equations

(i)	$\sin\theta = 0$	$\theta = n\pi, n \in I$
(ii)	$\cos\theta = 0$	$\theta = (2n+1)\frac{\pi}{2}, n \in I$
(iii)	$\tan\theta = 0$	$\theta = n\pi, n \in I$
(iv)	$\sin\theta = \sin\alpha$	$\theta = n\pi + (-1)^n\alpha, \alpha \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right], n \in I$
(v)	$\cos\theta = \cos\alpha$	$\theta = 2n\pi \pm \alpha, \alpha \in [0, \pi], n \in I$
(vi)	$\tan\theta = \tan\alpha$	$\theta = n\pi + \alpha, \alpha \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right), n \in I$
(vii)	$\left.\begin{array}{l}\sin^2\theta = \sin^2\alpha \\ \cos^2\theta = \cos^2\alpha \\ \tan^2\theta = \tan^2\alpha\end{array}\right\}$	$\theta = n\pi \pm \alpha, n \in I$
(viii)	$\sin\theta = 1$	$\theta = (4n+1)\frac{\pi}{2}, n \in I$
(ix)	$\cos\theta = 1$	$\theta = 2n\pi, n \in I$
(x)	$\cos\theta = -1$	$\theta = (2n+1)\pi, n \in I$
(xi)	$\sin x = \sin\alpha$ and $\cos x = \cos\alpha$	$x = 2n\pi + \alpha$

Note

- If θ is an odd multiple of $\frac{\pi}{2}$ *i.e.*, when $\theta = (2n+1)\frac{\pi}{2}, n \in I$, then $\sec\theta$ and $\tan\theta$ are not defined.
- If θ is an even multiple of $\frac{\pi}{2}$, *i.e.*, when $\theta = n\pi, n \in I$, then $\operatorname{cosec}\theta$ and $\cot\theta$ are not defined.
- The general solution of equations containing $\operatorname{cosec}\theta$, $\sec\theta$ and $\cot\theta$ is equivalent to that of the equation involving $\sin\theta$, $\cos\theta$, $\tan\theta$.
- If value of θ which satisfies the two trigonometric equations, is least positive value α, then $\theta = 2n\pi + \alpha, n \in I$.

  e.g., $\sin\theta = \sin\alpha$ and $\cos\theta = \cos\alpha$,
  then $\theta = 2n\pi + \alpha, n \in I$

  When $\cos\theta = 0$, then $\sin\theta = 1$ or -1

  $\Rightarrow \quad \theta = \left(n + \frac{1}{2}\right)\pi$

  If $\sin\theta = 1$, then n is even and if $\sin\theta = -1$, then n is odd.
  Similarly, when $\sin\theta = 0$, then $\cos\theta = 1$ or -1

  $\Rightarrow \quad \theta = n\pi$

  If $\cos\theta = 1$, then n is even and if $\cos\theta = -1$, then n is odd.

***Sample* Problem 17** *The solution of the equation* $\sin x + \sin 3x + \sin 5x = 0$ *is* [**NCERT**]

(a) $\frac{n\pi}{3}, n\pi \pm \frac{\pi}{3}$ (b) $\frac{n\pi}{2}, n\pi \pm \frac{\pi}{3}$

(c) $\frac{n\pi}{3}, n\pi \pm \frac{\pi}{4}$ (d) *None of these*

Interpret (a) $\sin x + \sin 3x + \sin 5x = 0$

$\Rightarrow \quad (\sin 5x + \sin x) + \sin 3x = 0$

$\Rightarrow \quad 2 \sin \frac{5x + x}{2} \cos \frac{5x - x}{2} + \sin 3x = 0$

$$\left[\because \sin C + \sin D = 2 \sin\left(\frac{C+D}{2}\right) \cos\left(\frac{C-D}{2}\right)\right]$$

$\Rightarrow \quad 2 \sin 3x \cos 2x + \sin 3x = 0$

$\Rightarrow \quad \sin 3x (2 \cos 2x + 1) = 0$

Either $\sin 3x = 0$ or $2 \cos 2x + 1 = 0$

When $\sin 3x = 0$,

Then, $3x = n\pi \Rightarrow x = \frac{n\pi}{3}$

When $2 \cos 2x + 1 = 0$,

Then, $\cos 2x = -\frac{1}{2}$

$\Rightarrow \quad \cos 2x = -\cos \frac{\pi}{3}$

$\Rightarrow \quad \cos 2x = \cos\left(\pi - \frac{\pi}{3}\right) \quad [\because \cos(\pi - \theta) = -\cos\theta]$

$\Rightarrow \quad \cos 2x = \cos \frac{2\pi}{3}$

$\Rightarrow \quad 2x = 2n\pi \pm \frac{2\pi}{3}$

$\Rightarrow \quad x = n\pi \pm \frac{\pi}{3}$

***Sample* Problem 18** *The solution of* $\tan x + \tan 2x + \tan 3x = \tan x \tan 2x \tan 3x$ *is*

(a) $x = n\pi, n \in I$ (b) $x = \frac{n\pi}{2}, n \in I$

(c) $x = \frac{n\pi}{3}, n \in I$ (d) *None of these*

Interpret (c) We know that,

$$\tan 3x = \tan(x + 2x) = \frac{\tan x + \tan 2x}{1 - \tan x \tan 2x}$$

$\Rightarrow \quad \tan 3x - \tan x \tan 2x \tan 3x = \tan x + \tan 2x$

$\Rightarrow \quad \tan x \tan 2x \tan 3x = \tan 3x - \tan x - \tan 2x \quad \ldots(i)$

Now, $\tan x + \tan 2x + \tan 3x = \tan x \tan 2x \tan 3x$

$\Rightarrow \quad \tan x + \tan 2x + \tan 3x = \tan 3x - \tan x - \tan 2x$

[from Eq. (i)]

$\Rightarrow \quad 2 \tan x = -2 \tan 2x$

$\Rightarrow \quad \tan 2x = \tan(-x)$

$2x = n\pi + (-x) \Rightarrow \quad = n\pi$

$\Rightarrow \quad x = \frac{n\pi}{3}$, where $n \in I$

9.13 Solution of Trigonometric Equation of the Form $a \cos\theta + b \sin\theta = c$

Let the equation is

$$a \cos\theta + b \sin\theta = c$$

On dividing by $\sqrt{a^2 + b^2}$ both sides, we get

$$\frac{a}{\sqrt{a^2+b^2}} \cos\theta + \frac{b}{\sqrt{a^2+b^2}} \sin\theta = \frac{c}{\sqrt{a^2+b^2}} \quad \ldots(i)$$

Let $\tan\alpha = \frac{b}{a}$

$\therefore \quad \sin\alpha = \frac{b}{\sqrt{a^2+b^2}}$

and $\cos\alpha = \frac{a}{\sqrt{a^2+b^2}}$

From Eq. (i), we get

$$\cos\theta \cos\alpha + \sin\theta \sin\alpha = \frac{c}{\sqrt{a^2+b^2}}$$

$\Rightarrow \quad \cos(\theta - \alpha) = \frac{c}{\sqrt{a^2+b^2}}$

If $|c| > \sqrt{a^2+b^2}$,

then equation $a \cos\theta + b \sin\theta = c$ has no solution and if,

$$|c| \le \sqrt{a^2+b^2},$$

then let $\cos\phi = \frac{|c|}{\sqrt{a^2+b^2}}$

$\Rightarrow \quad \cos(\theta - \alpha) = \cos\phi$

$\Rightarrow \quad \theta - \alpha = 2n\pi \pm \phi$

$\Rightarrow \quad \theta = 2n\pi \pm \phi + \alpha, n \in I$

Moment to Think!

(i) While solving a trigonometric equation, squaring the equation at any step should be avoided as far as possible. If squaring is necessary, check the solution for extraneous values.

(ii) Never cancel terms, containing unknown terms on the two sides, which are in product. It may cause loss of genuine solution.

(iii) The answer should not contain such values of angles which make any of the terms undefined or infinite.

(iv) Domain should not change, if it changes, necessary corrections must be made.

(v) Check that denominator is not zero at any stage while solving equations.

***Sample* Problem 19** *The solution of the equation* $k \cos x - 3 \sin x = k + 1$ *is possible only if*

(a) $k \in (-\infty, 4]$ (b) $k \in (-\infty, \infty)$

(c) $k \in [4, \infty)$ (d) *None of these*

Interpret (a) Here, $k \cos x - 3 \sin x = k + 1$ could be rewritten as

$$\frac{k}{\sqrt{k^2+9}} \cos x - \frac{3}{\sqrt{k^2+9}} \sin x = \frac{k+1}{\sqrt{k^2+9}}$$

$$\Rightarrow \quad \cos(x + \phi) = \frac{k+1}{\sqrt{k^2+9}}$$

where, $\cos \phi = \dfrac{k}{\sqrt{k^2+9}}$ and $\sin \phi = \dfrac{3}{\sqrt{k^2+9}}$

which posses solution only, if

$$-1 \le \frac{k+1}{\sqrt{k^2+9}} \le 1 \Rightarrow \left|\frac{k+1}{\sqrt{k^2+9}}\right| \le 1$$

$$\Rightarrow \quad (k+1)^2 \le k^2 + 9$$

$$\Rightarrow \quad k^2 + 2k + 1 \le k^2 + 9$$

$$\Rightarrow \quad k \le 4$$

Hence, the interval in which $k \cos x - 3 \sin x = k + 1$ admits solution for k is $(-\infty, 4]$.

9.14 Solution of Trigonometric Inequalities by Graphs

To solve trigonometric inequality, we use graph of the trigonometric functions.

***Sample* Problem 20** *The solution set of inequality* $\sin x > \frac{1}{2}$ *is*

(a) $\bigcup_{n \in I} \left(2n\pi + \frac{\pi}{6}, n\pi + \frac{5\pi}{6}\right)$

(b) $\bigcup_{n \in I} \left(2n\pi - \frac{\pi}{6}, 2n\pi + \frac{5\pi}{6}\right)$

(c) $\bigcup_{n \in I} \left(n\pi + \frac{\pi}{6}, n\pi + \frac{5\pi}{6}\right)$

(d) $\bigcup_{n \in I} \left(2n\pi + \frac{\pi}{6}, 2n\pi + \frac{5\pi}{6}\right)$

Interpret (d) When $\sin x = \frac{1}{2}$, the two values of x between 0 and 2π are $\frac{\pi}{6}$ and $\frac{5\pi}{6}$. From the graph of $y = \sin x$, it is obvious that, between 0 and 2π,

$$\sin x < \frac{1}{2} \text{ for } \frac{\pi}{6} < x < \frac{5\pi}{6}$$

Hence, $\sin x > \frac{1}{2}$

$$\Rightarrow \quad 2n\pi + \frac{\pi}{6} < x < 2n\pi + \frac{5\pi}{6}$$

The required solution set is $\bigcup_{n \in I} \left(2n\pi + \frac{\pi}{6}, 2n\pi + \frac{5\pi}{6}\right)$.

***Sample* Problem 21** *The solution set of inequality* $\cos x \ge -\frac{1}{2}$ *is*

(a) $\bigcup_{n \in I} \left(2\pi n - \frac{2\pi}{3}, 2n\pi + \frac{2\pi}{3}\right)$

(b) $\bigcup_{n \in I} \left(2n\pi + \frac{2\pi}{3}, 2n\pi + \frac{2\pi}{3}\right)$

(c) $\bigcup_{n \in I} \left(n\pi - \frac{2\pi}{3}, n\pi + \frac{2\pi}{3}\right)$

(d) $\bigcup_{n \in I} \left(2n\pi - \frac{2\pi}{3}, n\pi - \frac{\pi}{3}\right)$

Interpret (a) From the graph of $y = \cos x$, it is obvious that $\cos x \ge -\frac{1}{2}$

if $-\frac{2\pi}{3} \le x \le \frac{2\pi}{3}$

Hence, $\cos x \ge -\frac{1}{2}$

$$\Rightarrow \quad 2n\pi - \frac{2\pi}{3} \le x \le 2n\pi + \frac{2\pi}{3}$$

The required solution set is

$$\bigcup_{n \in I} \left(2n\pi - \frac{2\pi}{3}, 2n\pi + \frac{2\pi}{3}\right)$$

Check Point **3**

1. If $4\sin^2\theta + 2(\sqrt{3}+1)\cos\theta = 4+\sqrt{3}$, the general value of θ is

(a) $2n\pi + \frac{\pi}{3}$ (b) $2n\pi + \frac{\pi}{4}$

(c) $n\pi - \frac{\pi}{3}$ (d) $2n\pi \pm \frac{\pi}{6}, 2n\pi \pm \frac{\pi}{3}$

2. The solution set of $\sin\left(x - \frac{\pi}{4}\right) - \cos\left(x + \frac{3\pi}{4}\right) = 1$ and $\frac{2\cos 7x}{\cos 3 + \sin 3} > 2^{\cos 2x}$ is (k is an integer)

(a) $k\pi + (-1)^k \frac{\pi}{4}$ (b) $\frac{\pi(8k+3)}{4}$

(c) $\frac{\pi(8k+1)}{4}$ (d) None of these

3. The minimum value of $2^{\sin x} + 2^{\cos x}$ is

(a) 1 (b) 2

(c) $2^{-\frac{1}{\sqrt{2}}}$ (d) $2^{1-\frac{1}{\sqrt{2}}}$

4. If $\frac{1-\tan x}{1+\tan x} = \tan y$ and $x - y = \frac{\pi}{6}$, then x and y are respectively

(a) $\frac{5\pi}{24}, \frac{\pi}{24}$ (b) $-\frac{7\pi}{24}, -\frac{11\pi}{24}$

(c) $-\frac{115\pi}{24}, -\frac{119\pi}{24}$ (d) All of these

5. The equation $\cos^4 x - (a+2)\cos^2 x - (a+3) = 0$ possesses a solution, if

(a) $a > -3$

(b) $a < -2$

(c) $-3 \le a \le -2$

(d) a is any positive integer

6. The general solution of the equation $\tan^2\theta + 2\sqrt{3}\tan\theta = 1$ is given by

(a) $\frac{\pi}{2}$ (b) $\left(n + \frac{1}{2}\right)\pi$

(c) $(6n+1)\frac{\pi}{12}$ (d) $\frac{n\pi}{12}$

7. If $5\cos 2\theta + 2\cos^2\frac{\theta}{2} + 1 = 0, -\pi < \theta < \pi$, then θ is equal to

(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{3}, \cos^{-1}\left(\frac{3}{5}\right)$

(c) $\cos^{-1}\left(\frac{3}{5}\right)$ (d) $\frac{\pi}{3}, \pi - \cos^{-1}\left(\frac{3}{5}\right)$

8. If $1 + \sin\theta + \sin^2\theta + \ldots\infty = 4 + 2\sqrt{3}, 0 < \theta < \pi, \theta \ne \frac{\pi}{2}$, then

(a) $\theta = \frac{\pi}{6}$ (b) $\theta = \frac{\pi}{3}$

(c) $\theta = \frac{\pi}{3}$ or $\frac{\pi}{6}$ (d) $\theta = \frac{\pi}{3}$ or $\frac{2\pi}{3}$

9. If $0 < \theta < 2\pi$, then the interval of values of θ for which $2\sin^2\theta - 5\sin\theta + 2 > 0$, is

(a) $\left(0, \frac{\pi}{6}\right) \cup \left(\frac{5\pi}{6}, 2\pi\right)$ (b) $\left(\frac{\pi}{8}, \frac{5\pi}{6}\right)$

(c) $\left(0, \frac{\pi}{8}\right) \cup \left(\frac{\pi}{6}, \frac{5\pi}{6}\right)$ (d) $\left(\frac{41\pi}{48}, \pi\right)$

10. If $2\sin x + 1 \ge 0$ and $x \in [0, 2\pi]$, then the solution set for x is

(a) $\left[0, \frac{7\pi}{6}\right]$ (b) $\left[0, \frac{7\pi}{6}\right] \cup \left[\frac{11\pi}{6}, 2\pi\right]$

(c) $\left[\frac{11\pi}{6}, 2\pi\right]$ (d) None of these

WORKED OUT
Examples

Example 1 *If* $\cos(\alpha+\beta)=\frac{4}{5}$ *and* $\sin(\alpha-\beta)=\frac{5}{13}$, *where* α *lies between* 0 *and* $\frac{\pi}{4}$, *find the value of* $\tan 2\alpha$. **[NCERT Exemplar]**

(*a*) $\frac{56}{33}$ (*b*) $\frac{54}{33}$

(*c*) $\frac{56}{29}$ (*d*) *None of these*

Solution (*a*) We have, $\cos(\alpha+\beta)=\frac{4}{5}$ and $\sin(\alpha-\beta)=\frac{5}{13}$

In $\Delta\, ABC$, by using Pythagoras theorem,

$$BC=\sqrt{(AC)^2+(AB)^2}=\sqrt{9+16}=5$$

$$\therefore \quad \tan(\alpha+\beta)=\frac{3}{4}$$

Similarly, in ΔDEF, by using Pythagoras theorem

$$EF=\sqrt{DF^2+DE^2}=\sqrt{5^2+12^2}=13$$

$$\therefore \quad \tan(\alpha-\beta)=\frac{5}{12}$$

$$\therefore \quad \tan 2\alpha=\tan[(\alpha+\beta)+(\alpha-\beta)]$$

$$=\frac{\tan(\alpha+\beta)+\tan(\alpha-\beta)}{1-\tan(\alpha+\beta)\tan(\alpha-\beta)}$$

$$\tan 2\alpha=\frac{\frac{3}{4}+\frac{5}{12}}{1-\frac{3}{4}\times\frac{5}{12}}=\frac{(36+20)}{12\times 4}\times\frac{12\times 4}{(48-15)}=\frac{56}{33}$$

Example 2 *If* $\sec x\cos 5x+1=0$, *where* $0<x\le\frac{\pi}{2}$, *then find the value of x.* **[NCERT Exemplar]**

(*a*) $\frac{\pi}{6},\frac{\pi}{4}$ (*b*) $\frac{\pi}{6},\frac{\pi}{4},\frac{\pi}{2}$

(*c*) $\frac{\pi}{3},\frac{\pi}{4},\frac{\pi}{2}$ (*d*) *None of these*

Solution (*b*) Given, $\sec x\cos 5x+1=0$

$$\Rightarrow \quad \frac{1}{\cos x}\times\cos 5x+\frac{1}{1}=0$$

$$\Rightarrow \quad \frac{\cos 5x+\cos x}{\cos x}=0$$

$$\Rightarrow \quad \cos 5x+\cos x=0$$

$$\Rightarrow \quad 2\cos\frac{5x+x}{2}\cos\frac{5x-x}{2}=0$$

$$\left(\because \cos C+\cos D=2\cos\frac{C+D}{2}\cos\frac{C-D}{2}\right)$$

$$\Rightarrow \quad 2\cos 3x\cos 2x=0$$

$$\Rightarrow \quad \cos 3x=0 \text{ or } \cos 2x=0$$

$$\Rightarrow \quad 3x=(2n+1)\frac{\pi}{2} \quad \text{or} \quad 2x=(2n+1)\frac{\pi}{2}$$

$$\Rightarrow \quad x=(2n+1)\frac{\pi}{6} \text{ or } x=(2n+1)\frac{\pi}{4}$$

If $n=0$, then $x=\frac{\pi}{6}$ or $x=\frac{\pi}{4}$

If $n=1$, then $x=3\times\frac{\pi}{6}=\frac{\pi}{2}$ or $x=\frac{3\pi}{4}>\frac{\pi}{2}$

Therefore, the values of x are $\frac{\pi}{6},\frac{\pi}{4}$ and $\frac{\pi}{2}$.

Example 3 *If* $\sin(\theta+\alpha)=a$ *and* $\sin(\theta+\beta)=b$, *then* $\cos 2(\alpha-\beta)-4ab\cos(\alpha-\beta)$ *is equal to* **[NCERT Exemplar]**

(*a*) $1-2a^2+2b^2$ (*b*) $1+2a^2+2b^2$

(*c*) $1-2a^2-2b^2$ (*d*) *None of these*

Solution (*c*) We can write $\cos(\alpha-\beta)=\cos[(\theta+\alpha)-(\theta+\beta)]$

$$=\cos(\theta+\alpha)\cos(\theta+\beta)+\sin(\theta+\alpha)\sin(\theta+\beta)$$

We have to find the value of $(\alpha-\beta)$ and we are given $(\theta+\alpha)$, so we write $(\alpha-\beta)$ in terms of $(\theta+\alpha)$ and $(\theta+\beta)$

$$[\because \cos(A-B)=\cos A\cos B+\sin A\sin B)]$$

$$=\sqrt{1-\sin^2(\theta+\alpha)}\sqrt{1-\sin^2(\theta+\beta)}+ab$$

$$[\because \sin(\theta+\alpha)=a \text{ and } \sin(\theta+\beta)=b]$$

$$\Rightarrow \quad \cos(\alpha-\beta)=\sqrt{1-a^2}\sqrt{1-b^2}+ab$$

Now, $\cos 2(\alpha-\beta)=2\cos^2(\alpha-\beta)-1$

$$=2(\sqrt{1-a^2}\sqrt{1-b^2}+ab)^2-1$$

$$\therefore \quad \cos 2(\alpha-\beta)-4ab\cos(\alpha-\beta)$$

$$= 2(\sqrt{1-a^2}\sqrt{1-b^2} + ab)^2 - 1 - 4ab(\sqrt{1-a^2}\sqrt{1-b^2} + ab)$$
$$= 2[(1-a^2)(1-b^2) + a^2b^2 + 2ab\sqrt{(1-a^2)(1-b^2)}]$$
$$-1 - 4ab[\sqrt{(1-a^2)(1-b^2)} + ab]$$
$$= 2(1 - a^2 - b^2 + a^2b^2) + 2a^2b^2 + 4ab\sqrt{(1-a^2)(1-b^2)}$$
$$-1 - 4ab\sqrt{(1-a^2)(1-b^2)} - 4a^2b^2$$
$$= 2 - 2a^2 - 2b^2 + 2a^2b^2 + 2a^2b^2 - 1 - 4a^2b^2$$
$$= 2 - 1 - 2a^2 - 2b^2 + 4a^2b^2 - 4a^2b^2 = 1 - 2a^2 - 2b^2$$

Example 4 *Find the value of the expression*

$$\cos^4\frac{\pi}{8} + \cos^4\frac{3\pi}{8} + \cos^4\frac{5\pi}{8} + \cos^4\frac{7\pi}{8}$$ [**NCERT Exemplar**]

(a) $\frac{2}{3}$ (b) $-\frac{3}{2}$

(c) $\frac{3}{2}$ (d) $-\frac{2}{3}$

Solution (c) $\cos^4\frac{\pi}{8} + \cos^4\frac{3\pi}{8} + \cos^4\frac{5\pi}{8} + \cos^4\frac{7\pi}{8}$

$$= \cos^4\frac{\pi}{8} + \cos^4\frac{3\pi}{8} + \cos^4\left(\frac{\pi}{2} + \frac{\pi}{8}\right) + \cos^4\left(\frac{\pi}{2} + \frac{3\pi}{8}\right)$$
$$= \cos^4\frac{\pi}{8} + \cos^4\frac{3\pi}{8} + \sin^4\frac{\pi}{8} + \sin^4\frac{3\pi}{8}$$
$$\left[\because \cos\left(\frac{\pi}{2} + \theta\right) = -\sin\theta\right]$$
$$= \left(\cos^4\frac{\pi}{8} + \sin^4\frac{\pi}{8}\right) + \left(\cos^4\frac{3\pi}{8} + \sin^4\frac{3\pi}{8}\right)$$
$$= \left(\cos^4\frac{\pi}{8} + \sin^4\frac{\pi}{8} + 2\sin^2\frac{\pi}{8}\cos^2\frac{\pi}{8} - 2\sin^2\frac{\pi}{8}\cos^2\frac{\pi}{8}\right)$$
$$+ \left(\cos^4\frac{3\pi}{8} + \sin^4\frac{3\pi}{8} + 2\sin^2\frac{3\pi}{8}\cos^2\frac{3\pi}{8} - 2\sin^2\frac{3\pi}{8}\cos^2\frac{3\pi}{8}\right)$$
$$= \left(\cos^2\frac{\pi}{8} + \sin^2\frac{\pi}{8}\right)^2 - 2\sin^2\frac{\pi}{8}\cos^2\frac{\pi}{8}$$
$$+ \left(\cos^2\frac{3\pi}{8} + \sin^2\frac{3\pi}{8}\right)^2 - 2\sin^2\frac{3\pi}{8}\cos^2\frac{3\pi}{8}$$
$$= 1 - \frac{1}{2}\left(2\sin\frac{\pi}{8}\cos\frac{\pi}{8}\right)^2 + 1 - \frac{1}{2}\left(2\sin\frac{3\pi}{8}\cos\frac{3\pi}{8}\right)^2$$
$$= 2 - \frac{1}{2}\left(\sin 2\times\frac{\pi}{8}\right)^2 - \frac{1}{2}\left(\sin 2\times\frac{3\pi}{8}\right)^2$$
$$= 2 - \frac{1}{2}\sin^2\frac{\pi}{4} - \frac{1}{2}\sin^2\frac{3\pi}{4} = 2 - \frac{1}{2}\times\left(\frac{1}{\sqrt{2}}\right)^2 - \frac{1}{2}\times\left(\frac{1}{\sqrt{2}}\right)^2$$
$$\left[\because \sin\frac{3\pi}{4} = \sin\left(\pi - \frac{\pi}{4}\right) = \sin\frac{\pi}{4}\right]$$
$$= 2 - \frac{1}{2}\times\frac{1}{2} - \frac{1}{2}\times\frac{1}{2} = 2 - \frac{1}{4} - \frac{1}{4} = 2 - \frac{1}{2} = \frac{3}{2}$$

Example 5 *The value of expression*

$$2\cos\frac{\pi}{3}\cos\frac{9\pi}{13} + \cos\frac{3\pi}{13} + \cos\frac{5\pi}{13}$$ *is equal to* [**NCERT**]

(a) -1 (b) 0

(c) 1 (d) 2

Solution (b) $2\cos\frac{\pi}{3}\cos\frac{9\pi}{13} + \cos\frac{3\pi}{13} + \cos\frac{5\pi}{13}$

$$= \cos\left(\frac{9\pi}{13} + \frac{\pi}{13}\right) + \cos\left(\frac{9\pi}{13} - \frac{\pi}{13}\right) + \cos\frac{5\pi}{13} + \cos\frac{3\pi}{13}$$
(by formulae)
$$= \cos\frac{10\pi}{13} + \cos\frac{8\pi}{13} + \cos\frac{5\pi}{13} + \cos\frac{3\pi}{13}$$
$$= \left(\cos\frac{10\pi}{13} + \cos\frac{3\pi}{13}\right) + \left(\cos\frac{8\pi}{13} + \cos\frac{5\pi}{13}\right)$$
$$= 2\cos\frac{\frac{10\pi}{13} + \frac{3\pi}{13}}{2}\cos\frac{\frac{10\pi}{13} - \frac{3\pi}{13}}{2}$$
$$+ 2\cos\frac{\frac{8\pi}{13} + \frac{5\pi}{13}}{2}\cos\frac{\frac{8\pi}{13} - \frac{5\pi}{13}}{2}$$ (by formulae)
$$= 2\cos\frac{\pi}{2}\cos\frac{7\pi}{26} + 2\cos\frac{\pi}{2}\cos\frac{3\pi}{26} = 0 + 0 = 0 \quad \left(\because \cos\frac{\pi}{2} = 0\right)$$

Example 6 *If* $\cos 5\theta = a_0 + a_1\cos\theta + a_2\cos^2\theta + a_3\cos^3\theta + a_4\cos^4\theta + a_5\cos^5\theta$, *then the value of* $a_0 + \sum_{i=1}^{5} a_i$ *is equal to*

(a) 0 (b) 1 (c) 2 (d) 3

Solution (b) $\cos 5\theta = \cos(3\theta + 2\theta)$

$$= \cos 3\theta\cos 2\theta - \sin 3\theta\sin 2\theta$$
$$= (4\cos^3\theta - 3\cos\theta)(2\cos^2\theta - 1)$$
$$-(3\sin\theta - 4\sin^3\theta)(2\sin\theta\cos\theta)$$
$$= 8\cos^5\theta - 10\cos^3\theta + 3\cos\theta - 2\cos\theta\sin^2\theta(3 - 4\sin^2\theta)$$
$$= 8\cos^5\theta - 10\cos^3\theta + 3\cos\theta$$
$$-2\cos\theta(1 - \cos^2\theta)\{3 - 4(1 - \cos^2\theta)\}$$
$$= 8\cos^5\theta - 10\cos^3\theta + 3\cos\theta - 2\cos\theta(1 - \cos^2\theta)(4\cos^2\theta - 1)$$
$$= 8\cos^5\theta - 10\cos^3\theta + 3\cos\theta - 2\cos\theta(5\cos^2\theta - 4\cos^4\theta - 1)$$
$$= 16\cos^5\theta - 20\cos^3\theta + 5\cos\theta$$

But $\cos 5\theta = a_0 + a_1\cos\theta + a_2\cos^2\theta + a_3\cos^3\theta + a_4\cos^4\theta + a_5\cos^5\theta$

Hence, $a_0 = 0$, $a_1 = 5$, $a_2 = 0$, $a_3 = -20$, $a_4 = 0$ and $a_5 = 16$

Thus, $a_0 + \sum_{i=1}^{5} a_i = a_0 + a_1 + a_2 + a_3 + a_4 + a_5$

$$= 0 + 5 + 0 - 20 + 0 + 16 = 21 - 20 = 1$$

Example 7 *If* $\cos^3\theta + \cos^3(120° + \theta) + \cos^3(240° + \theta) = a\cos 3\theta$, *then the value of a is*

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$ (c) $\frac{3}{4}$ (d) $\frac{7}{4}$

Solution (c) LHS $= \frac{1}{4}[4\cos^3\theta + 4\cos^3(120° + \theta)$
$+ 4\cos^3(240° + \theta)]$

$$= \frac{1}{4}[3\cos\theta + \cos 3\theta + 3\cos(120° + \theta)$$
$$+ \cos(360° + 3\theta) + \cos(240° + \theta) + \cos(720° + 3\theta)]$$
$$(\because 4\cos^3\theta = 3\cos\theta + \cos 3\theta)$$
$$= \frac{1}{4}[3\cos\theta + \cos 3\theta + \cos 3\theta + 3\{\cos(120° + \theta)$$
$$+ \cos(240° + \theta) + \cos 3\theta\}]$$
$$= \frac{1}{4}[3\cos\theta + 3\cos 3\theta + 3 \times 2\cos(180° + \theta)\cos 60°]$$
$$= \frac{1}{4}\left[3\cos\theta + 3\cos 3\theta + 3 \times 2\,(-\cos\theta)\frac{1}{2}\right]$$
$$= \frac{1}{4}[3\cos\theta + 3\cos 3\theta - 3\cos\theta]$$
$$= \frac{1}{4}[3\cos 3\theta] = \frac{3}{4}\cos 3\theta$$

and $\quad$ RHS $= a\cos 3\theta$

$\therefore \quad a = \frac{3}{4}$

Example 8 *If in any ΔABC, the value of $\angle A$ is obtained from the equation $3\cos A + 2 = 0$, then the equation whose roots are $\sin A$ and $\tan A$, is*

(a) $6x^2 + \sqrt{5}x - 5 = 0$ $\quad$ (b) $6x^2 + 5x - 5 = 0$

(c) $x^2 + \sqrt{5}x - 5 = 0$ $\quad$ (d) *None of these*

Solution (a) The given equation is

$$3\cos A + 2 = 0$$

$\therefore \quad \cos A = -\frac{2}{3}$

$\because$ A is angle of a triangle.

$\therefore \quad A < \pi \Rightarrow \sin A$ is positive.

$\therefore \quad \sin A = \sqrt{(1 - \cos^2 A)} = \frac{\sqrt{5}}{3}$

$\Rightarrow \quad \tan A = \frac{\sin A}{\cos A} = -\frac{\sqrt{5}}{2}$

$\therefore \quad \sin A + \tan A = -\frac{\sqrt{5}}{6}$

and $\quad \sin A \tan A = -\frac{5}{6}$

Hence, the equation whose roots are $\sin A$ and $\tan A$, is

$$x^2 - (\sin A + \tan A)x + \sin A \tan A = 0$$

$\Rightarrow \quad x^2 + \frac{\sqrt{5}}{6}x + \left(-\frac{5}{6}\right) = 0$

$\Rightarrow \quad 6x^2 + \sqrt{5}x - 5 = 0$

Example 9 *If $x + y + z = xyz$, then the value of $x(1 - y^2)(1 - z^2) + y(1 - z^2)(1 - x^2) + z(1 - x^2)(1 - y^2)$ is*

(a) xyz $\quad$ (b) $2xyz$

(c) $4xyz$ $\quad$ (d) *None of these*

Solution (c) Let $x = \tan A$, $y = \tan B$ and $z = \tan C$

Given, $\quad x + y + z = xyz$

$\Rightarrow \tan A + \tan B + \tan C = \tan A \tan B \tan C$

$\Rightarrow \quad \tan A + \tan B = -\tan C + \tan A \tan B \tan C$

$$= -\tan C(1 - \tan A \tan B)$$

$\Rightarrow \quad \frac{\tan A + \tan B}{1 - \tan A \tan B} = -\tan C$

$\Rightarrow \quad \tan(A + B) = \tan(-C)$

$\Rightarrow \quad A + B = n\pi - C$

$\Rightarrow \quad A + B + C = n\pi$

$\Rightarrow \quad 2A + 2B + 2C = 2n\pi$

$\Rightarrow \quad \tan(2A + 2B + 2C) = \tan 2n\pi = 0$

$$\Rightarrow \quad \frac{\left[\begin{array}{l}\tan 2A + \tan 2B + \tan 2C \\ \quad - \tan 2A \tan 2B \tan 2C\end{array}\right]}{\left[\begin{array}{l}1 - \tan 2A \tan 2B \\ \quad - \tan 2B \tan 2C - \tan 2C \tan 2A\end{array}\right]} = 0$$

$\Rightarrow \quad \tan 2A + \tan 2B + \tan 2C = \tan 2A \tan 2B \tan 2C$

$$\Rightarrow \quad \frac{2\tan A}{1 - \tan^2 A} + \frac{2\tan B}{1 - \tan^2 B} + \frac{2\tan C}{1 - \tan^2 C}$$
$$= \frac{2\tan A}{1 - \tan^2 A} \cdot \frac{2\tan B}{1 - \tan^2 B} \cdot \frac{2\tan C}{1 - \tan^2 C}$$

Hence, on putting $\tan A = x$, $\tan B = y$, $\tan C = z$, we get

$$\frac{2x}{1 - x^2} + \frac{2y}{1 - y^2} + \frac{2z}{1 - z^2} = \frac{2x}{1 - x^2} \cdot \frac{2y}{1 - y^2} \cdot \frac{2z}{1 - z^2}$$

On multiplying both sides by $\frac{1}{2}(1 - x^2)(1 - y^2)(1 - z^2)$, we get

$$x(1 - y^2)(1 - z^2) + y(1 - z^2)(1 - x^2) + z(1 - x^2)(1 - y^2) = 4xyz$$

Example 10 *If* $\operatorname{cosec}\theta = \frac{x^2 - y^2}{x^2 + y^2}$, *where x and y are two unequal non-zero real numbers, then the number of real values of θ is*

(a) 0 $\quad$ (b) 1

(c) 2 $\quad$ (d) *infinite*

Solution (a) $\because$ $x \neq y$ and they are real.

So, $\quad x^2 + y^2 > x^2 - y^2$

$\therefore \quad \operatorname{cosec}\theta < 1$, if $x > y$

and $\quad \operatorname{cosec}\theta > -1$, if $x < y$

$\therefore \quad -1 < \operatorname{cosec}\theta < 1$

which is not possible because we know that $\operatorname{cosec}\theta \geq 1$ or $\operatorname{cosec}\theta \leq -1$.

Hence, there is no real value of θ exist.

Example 11 *The maximum and minimum values of* $5\cos\theta + 3\cos\left(\theta + \frac{\pi}{3}\right)$ *are respectively*

(a) 10, 4 $\quad$ (b) 10, – 4

(c) –10, 4 $\quad$ (d) *None of these*

Solution (*b*) $5\cos\theta + 3\cos\left(\theta + \frac{\pi}{3}\right)$

$$= 5\cos\theta + 3\cos\theta\cos\frac{\pi}{3} - 3\sin\theta\sin\frac{\pi}{3}$$

$$= \frac{13}{2}\cos\theta - \frac{3\sqrt{3}}{2}\sin\theta$$

Here, $-\sqrt{\left(\frac{13}{2}\right)^2 + \left(\frac{-3\sqrt{3}}{2}\right)^2} \le \frac{13}{2}\cos\theta - \frac{3\sqrt{3}}{2}\sin\theta$

$$\le \sqrt{\left(\frac{13}{2}\right)^2 + \left(\frac{-3\sqrt{3}}{2}\right)^2}$$

$\Rightarrow \quad -7 \le \frac{13}{2}\cos\theta - \frac{3\sqrt{3}}{2}\sin\theta \le 7$

$\Rightarrow \quad -7 + 3 \le 5\cos\theta + 3\cos\left(\theta + \frac{\pi}{3}\right) + 3 \le 7 + 3, \forall\ \theta$

$\Rightarrow \quad -4 \le 5\cos\theta + 3\cos\left(\theta + \frac{\pi}{3}\right) + 3 \le 10, \forall\ \theta$

Example 12 *If* $2^{\sin x} + 2^{\cos x} \ge 2^{1-y}$, *then the value of y is*

(*a*) 1 (*b*) $\sqrt{2}$ (*c*) 1/2 (*d*) $1/\sqrt{2}$

Solution (*d*) We know that,

$$\text{AM} \ge \text{GM}$$

$\therefore \quad \frac{1}{2}(2^{\sin x} + 2^{\cos x}) \ge \sqrt{(2^{\sin x}\cdot 2^{\cos x})}$

$\Rightarrow \quad \frac{1}{2}(2^{\sin x} + 2^{\cos x}) \ge 2^{(\sin x + \cos x)/2}$

$\Rightarrow \quad 2^{\sin x} + 2^{\cos x} \ge 2^{1 + (\sin x + \cos x)/2}$

But $\sin x + \cos x = \sqrt{2}\sin\left(x + \frac{\pi}{4}\right) \ge -\sqrt{2}$

$\therefore \quad 2^{\sin x} + 2^{\cos x} \ge 2^{1-\sqrt{2}/2}$

$\Rightarrow \quad 2^{\sin x} + 2^{\cos x} \ge 2^{1-(1/\sqrt{2})}, \forall\ x \in R$

$\therefore \quad y = \frac{1}{\sqrt{2}}$

Example 13 *The solution set of* $\tan 2x \tan 3x = 1$ *is*

(*a*) $\left\{(2n+1)\frac{\pi}{10} : n \in I, n \ne 5k + 2, k \in I\right\}$

(*b*) $\left\{(2n+1)\frac{\pi}{10}, n \in I\right\}$

(*c*) $\{(2n+1)\pi, n \in I, n \ne 5k + 2, k \in I\}$

(*d*) *None of the above*

Solution (*a*) $\tan 2x \tan 3x = 1$

$\Rightarrow \quad \sin 2x \sin 3x = \cos 2x \cos 3x$

$\Rightarrow \quad \cos 3x \cos 2x - \sin 3x \sin 2x = 0$

$\Rightarrow \quad \cos(3x + 2x) = 0$

$\Rightarrow \quad 5x = (2n+1)\frac{\pi}{2}, n \in I$

For this x, $\cos 2x \ne 0$, $\cos 3x \ne 0$

$\therefore$ x is not odd multiple of $\frac{\pi}{2}$.

$\Rightarrow \quad (2n+1)\frac{\pi}{10} \ne (2k+1)\frac{\pi}{2}, k \in I$

$\Rightarrow \quad 2n + 1 \ne 10k + 5 \Rightarrow n \ne 5k + 2, k \in I$

Hence, required set of solution

$$= \left\{(2n+1)\frac{\pi}{10} : n \in I, n \ne 5k + 2, k \in I\right\}$$

Example 14 *If* $3\sin^2\theta + 2\sin^2\phi = 1$ *and* $3\sin 2\theta = 2\sin 2\phi, 0 < \theta < \frac{\pi}{2}$ *and* $0 < \phi < \frac{\pi}{2}$, *then the value of* $\theta + 2\phi$ *is*

(*a*) $\frac{\pi}{4}$ (*b*) $\frac{\pi}{2}$

(*c*) π (*d*) *None of these*

Solution (*b*) Given that,

$$3\sin^2\theta + 2\sin^2\phi = 1$$

$\Rightarrow \quad 3\sin^2\theta = \cos 2\phi$ ...(i)

and $\quad 3\sin\theta\cos\theta = \sin 2\phi$ ...(ii)

On squaring and adding Eqs. (i) and (ii), we get

$$9\sin^2\theta(\sin^2\theta + \cos^2\theta) = 1$$

$\Rightarrow \quad \sin\theta = \frac{1}{3}$ and $\cos\theta = \frac{2\sqrt{2}}{3}$

$\therefore \quad \cos 2\phi = 3 \times \frac{1}{9} = \frac{1}{3}$ and $\sin 2\phi = \frac{2\sqrt{2}}{3}$

$\therefore \quad \cos(\theta + 2\phi) = \cos\theta\cos 2\phi - \sin\theta\sin 2\phi$

$$= \frac{2\sqrt{2}}{3}\cdot\frac{1}{3} - \frac{1}{3}\cdot\frac{2\sqrt{2}}{3} = 0$$

and $\quad \theta + 2\phi < \frac{3\pi}{2} \quad \therefore\ \theta + 2\phi = \frac{\pi}{2}$

Example 15 *The number of solutions of*

$$|\cot x| = \cot x + \frac{1}{\sin x}, x \in [0, 3\pi] \text{ is}$$

(*a*) 1 (*b*) 0

(*c*) 2 (*d*) *None of these*

Solution (*c*) $|\cot x| = \cot x + \frac{1}{\sin x}, \quad x \in [0, 3\pi]$

Let $\quad \cot x > 0$

$\Rightarrow \cot x = \cot x + \frac{1}{\sin x} \Rightarrow \frac{1}{\sin x} = 0$ (which is not possible)

Let $\quad \cot x < 0$

$\Rightarrow \quad -\cot x = \cot x + \frac{1}{\sin x}$

$\Rightarrow \quad -2\cot x = \frac{1}{\sin x}$

$\Rightarrow \quad \cos x = -\frac{1}{2} \Rightarrow x = \frac{2\pi}{3}, \frac{8\pi}{3}$

$\therefore$ Number of solutions is 2.

Start Practice for JEE Main

Round I (Topically Divided Problems)

Trigonometric Ratio, Function and Identities

1. Find the radian measure corresponding to the degree – 47°30′. [NCERT]

(a) $\frac{-19\pi}{72}$ rad (b) $\frac{19\pi}{72}$ rad
(c) $\frac{13\pi}{72}$ rad (d) None of these

2. Find the degree measure corresponding to the radian $\frac{11}{16}$. [NCERT]

(a) 39°22′32″ (b) 39°22′30″
(c) 39°23′33″ (d) None of these

3. If in two circles, arcs of the same length subtend angles of 60° and 75° at the centre, find the ratio of their radii. [NCERT]

(a) 4 : 5 (b) 5 : 4 (c) 6 : 5 (d) 5 : 6

4. Find the length of an arc of a circle of radius 5 cm subtending a central angle measuring 15°.

(a) $\frac{5\pi}{13}$ cm (b) $\frac{5\pi}{12}$ cm
(c) $\frac{7\pi}{12}$ cm (d) None of these

5. If $\frac{2\sin\alpha}{1+\cos\alpha+\sin\alpha} = y$, then $\frac{1-\cos\alpha+\sin\alpha}{1+\sin\alpha}$ is equal to [NCERT Exemplar]

(a) y (b) $2y$
(c) y^2 (d) $\frac{y}{2}$

6. The value of the expression

$$1 - \frac{\sin^2 y}{1+\cos y} + \frac{1+\cos y}{\sin y} - \frac{\sin y}{1-\cos y} \text{ is equal to}$$

(a) 0 (b) 1
(c) $\sin y$ (d) $\cos y$

7. If $\sin\theta + \operatorname{cosec}\theta = 2$, then $\sin^2\theta + \operatorname{cosec}^2\theta$ is equal to [NCERT Exemplar]

(a) 1 (b) 4
(c) 2 (d) None of these

8. If $f(x) = \cos^2 x + \sec^2 x$, then [NCERT Exemplar]

(a) $f(x) < 1$ (b) $f(x) = 1$
(c) $2 < f(x) < 1$ (d) $f(x) \geq 2$

9. Which of the following number is rational ?

(a) $\sin 15°$ (b) $\cos 15°$
(c) $\sin 15° \cos 15°$ (d) $\sin 15° \cos 75°$

10. If θ lies in the second quadrant, then the value of $\sqrt{\frac{1-\sin\theta}{1+\sin\theta}} + \sqrt{\frac{1+\sin\theta}{1-\sin\theta}}$ is equal to

(a) $2\sec\theta$ (b) $-2\sec\theta$
(c) $2\operatorname{cosec}\theta$ (d) None of these

11. If $\sin\theta = -\frac{4}{5}$ and θ lies in the third quadrant, then $\cos\frac{\theta}{2}$ is equal to [NCERT Exemplar]

(a) $\frac{1}{\sqrt{5}}$ (b) $-\frac{1}{\sqrt{5}}$
(c) $\sqrt{\frac{2}{5}}$ (d) $-\sqrt{\frac{2}{5}}$

12. Which of the following is not correct? [NCERT Exemplar]

(a) $\sin\theta = -\frac{1}{5}$ (b) $\cos\theta = 1$
(c) $\sec\theta = \frac{1}{2}$ (d) $\tan\theta = 20$

13. The value of $\cos 1° \cos 2° \cos 3° \ldots \cos 179°$ is [NCERT Exemplar]

(a) $\frac{1}{\sqrt{2}}$ (b) 0
(c) 1 (d) – 1

14. If $\tan\theta = 3$ and θ lies in third quadrant, then the value of $\sin\theta$ is [NCERT Exemplar]

(a) $\frac{1}{\sqrt{10}}$ (b) $-\frac{1}{\sqrt{10}}$

(c) $\frac{-3}{\sqrt{10}}$ (d) $\frac{3}{\sqrt{10}}$

15. The value of $\tan 75° - \cot 75°$ is equal to [NCERT Exemplar]

(a) $2\sqrt{3}$ (b) $2 + \sqrt{3}$

(c) $2 - \sqrt{3}$ (d) 1

16. Which of the following is correct ? [NCERT Exemplar]

(a) $\sin 1° > \sin 1$ (b) $\sin 1° < \sin 1$

(c) $\sin 1° = \sin 1$ (d) $\sin 1° = \frac{\pi}{18°} \sin 1$

17. If $\tan\alpha = \frac{m}{m+1}$, $\tan\beta = \frac{1}{2m+1}$, then $\alpha + \beta$ is equal to [NCERT Exemplar]

(a) $\frac{\pi}{2}$ (b) $\frac{\pi}{3}$

(c) $\frac{\pi}{6}$ (d) $\frac{\pi}{4}$

18. If $\frac{3\pi}{4} < \alpha < \pi$, then $\sqrt{\operatorname{cosec}^2\alpha + 2\cot\alpha}$ is equal to

(a) $1 + \cot\alpha$ (b) $1 - \cot\alpha$

(c) $-1 - \cot\alpha$ (d) $-1 + \cot\alpha$

19. If $\tan A + \sin A = m$ and $\tan A - \sin A = n$, then $\frac{(m^2 - n^2)^2}{mn}$ is equal to

(a) 4 (b) 3

(c) 16 (d) 9

20. The value of $6(\sin^6\theta + \cos^6\theta) - 9(\sin^4\theta + \cos^4\theta) + 4$ is

(a) -3 (b) 0

(c) 1 (d) 3

21. If $\frac{2\sin\alpha}{1 + \cos\alpha + \sin\alpha} = x$, then $\frac{1 - \cos\alpha - \sin\alpha}{\cos\alpha}$ is equal to

(a) $\frac{1}{x}$ (b) x

(c) $1 - x$ (d) None of these

22. If $\sin\theta + \cos\theta = m$ and $\sec\theta + \operatorname{cosec}\theta = n$, then $n(m+1)(m-1)$ is equal to

(a) m (b) n

(c) $2m$ (d) $2n$

23. If $\frac{x}{\cos\theta} = \frac{y}{\cos\left(\theta - \frac{2\pi}{3}\right)} = \frac{z}{\cos\left(\theta + \frac{2\pi}{3}\right)}$, then $x + y + z$ is equal to

(a) 1 (b) 0

(c) -1 (d) None of these

24. If x lies in IInd quadrant, then $\frac{\sqrt{1+\sin x} + \sqrt{1-\sin x}}{\sqrt{1+\sin x} - \sqrt{1-\sin x}}$ is equal to

(a) $\sin\frac{x}{2}$ (b) $\tan\frac{x}{2}$

(c) $\sec\frac{x}{2}$ (d) $\operatorname{cosec}\frac{x}{2}$

25. If $\tan\theta, 2\tan\theta + 2$ and $3\tan\theta + 3$ are in GP, then the value of $\frac{7 - 5\cot\theta}{9 - 4\sqrt{\sec^2\theta - 1}}$ is

(a) $\frac{12}{5}$ (b) $-\frac{33}{28}$

(c) $\frac{33}{100}$ (d) $\frac{12}{13}$

26. If A, B, C and D are the angles of a cyclic quadrilateral, then $\cos A + \cos B + \cos C + \cos D$ is equal to

(a) $2(\cos A + \cos C)$ (b) $2(\cos A + \cos B)$

(c) $2(\cos A + \cos D)$ (d) 0

27. If $\frac{\sin A}{\sin B} = \frac{\sqrt{3}}{2}$ and $\frac{\cos A}{\cos B} = \frac{\sqrt{5}}{2}, 0 < A, B < \frac{\pi}{2}$, then

(a) $\tan A = \frac{\sqrt{3}}{\sqrt{5}}$ (b) $\tan A = \frac{\sqrt{5}}{\sqrt{3}}$

(c) $\tan A = 2$ (d) $\tan B = 2$

28. If $a\cos^3\alpha + 3a\cos\alpha\sin^2\alpha = m$ and $a\sin^3\alpha + 3a\cos^2\alpha\sin\alpha = n$, then $(m+n)^{2/3} + (m-n)^{2/3}$ is equal to

(a) $2a^2$ (b) $2a^{1/3}$

(c) $2a^{2/3}$ (d) $2a^3$

29. If $\cos\theta = \frac{1}{2}\left(x + \frac{1}{x}\right)$, then $\frac{1}{2}\left(x^2 + \frac{1}{x^2}\right)$ is equal to

(a) $\sin 2\theta$ (b) $\cos 2\theta$

(c) $\tan 2\theta$ (d) None of these

30. The value of $3\left[\sin^4\left(\frac{3\pi}{2} - \alpha\right) + \sin^4(3\pi + \alpha)\right] - 2\left[\sin^6\left(\frac{\pi}{2} + \alpha\right) + \sin^6(5\pi - \alpha)\right]$ is equal to [NCERT Exemplar]

(a) 0 (b) 1

(c) 3 (d) $\sin 4\alpha + \sin 6\alpha$

31. If $\tan x + \cot x = 2$, then $\sin^{2n} x + \cos^{2n} x$ is equal to

(a) 2^n (b) $-\frac{1}{2}$

(c) $\frac{1}{2}$ (d) None of these

32. If $-\pi \le x \le \pi$, $-\pi \le y \le \pi$ and $\cos x + \cos y = 2$, then the value of $\cos(x - y)$ is

(a) -1 (b) 0

(c) 1 (d) None of these

33. Let n be a positive integer such that $\sin\frac{\pi}{2n}+\cos\frac{\pi}{2n}=\frac{\sqrt{n}}{2}$. Then,

(a) $n = 6$ (b) $n = 1, 2, 3, \ldots, 8$
(c) $n = 5$ (d) None of these

Trigonometric Ratios of Sum and Difference of Two and Three Angles

34. If $m\sin\theta = n\sin(\theta+2\alpha)$, then $\tan(\theta+\alpha)\cot\alpha$ is equal to [NCERT Exemplar]

(a) $(m+n)(m-n)$ (b) $\frac{m-n}{m+n}$
(c) $\frac{m+n}{m-n}$ (d) $2(m+n)(m-n)$

35. The value of $\frac{\sin(B+A)+\cos(B-A)}{\sin(B-A)+\cos(B+A)}$ is equal to

(a) $\frac{\cos B+\sin B}{\cos B-\sin B}$ (b) $\frac{\cos A+\sin A}{\cos A-\sin A}$
(c) $\frac{\cos A-\sin A}{\cos A+\sin A}$ (d) None of these

36. The expression

$\cos^2(A-B)+\cos^2 B-2\cos(A-B)\cos A\cos B$ is

(a) dependent on B (b) dependent on A and B
(c) dependent on A (d) independent of A and B

37. If $\frac{\sin A-\sin C}{\cos C-\cos A}=\cot B$, then A, B and C are in

(a) AP (b) GP
(c) HP (d) None of these

38. If $\tan\theta=\frac{1}{2}$ and $\tan\phi=\frac{1}{3}$, then the value of $\theta+\phi$ is [NCERT Exemplar]

(a) $\frac{\pi}{6}$ (b) π (c) 0 (d) $\frac{\pi}{4}$

39. The value of $\frac{1-\tan^2 15^\circ}{1+\tan^2 15^\circ}$ is [NCERT Exemplar]

(a) 1 (b) $\sqrt{3}$ (c) $\frac{\sqrt{3}}{2}$ (d) 2

40. If $\cos(\alpha+\beta)=\frac{4}{5}$, $\sin(\alpha-\beta)=\frac{5}{13}$ and α,β lies between 0 and $\frac{\pi}{4}$, then $\tan 2\alpha$ is equal to

(a) $\frac{16}{63}$ (b) $\frac{56}{33}$
(c) $\frac{28}{33}$ (d) None of these

41. The value of $\left(\frac{\cos A+\cos B}{\sin A-\sin B}\right)^n+\left(\frac{\sin A+\sin B}{\cos A-\cos B}\right)^n$ (where, n is an even) is

(a) $2\tan^n\left(\frac{A-B}{2}\right)$ (b) $2\cot^n\left(\frac{A-B}{2}\right)$
(c) 0 (d) None of these

42. If $\frac{\pi}{2}<\alpha<\pi$, $\pi<\beta<\frac{3\pi}{2}$; $\sin\alpha=\frac{15}{17}$ and $\tan\beta=\frac{12}{5}$, then the value of $\sin(\beta-\alpha)$ is

(a) $-\frac{171}{221}$ (b) $-\frac{21}{221}$ (c) $\frac{21}{221}$ (d) $\frac{171}{221}$

43. If $\cos x+\cos y+\cos\alpha=0$ and $\sin x+\sin y+\sin\alpha=0$, then $\cot\left(\frac{x+y}{2}\right)$ is equal to

(a) $\sin\alpha$ (b) $\cos\alpha$
(c) $\cot\alpha$ (d) $\sin\left(\frac{x+y}{2}\right)$

44. If $\tan\alpha=(1+2^{-x})^{-1}$, $\tan\beta=(1+2^{x+1})^{-1}$, then $\alpha+\beta$ equals

(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

45. If $\cos(\theta-\alpha)=a$, $\cos(\theta-\beta)=b$, then $\sin^2(\alpha-\beta)+2ab\cos(\alpha-\beta)$ is equal to

(a) a^2+b^2 (b) a^2-b^2
(c) b^2-a^2 (d) $-a^2-b^2$

46. If $\cos A=m\cos B$ and $\cot\frac{A+B}{2}=\lambda\tan\frac{B-A}{2}$, then λ is

(a) $\frac{m}{m-1}$ (b) $\frac{m+1}{m}$
(c) $\frac{m+1}{m-1}$ (d) None of these

47. The value of $\sin(45^\circ+\theta)-\cos(45^\circ-\theta)$ is [NCERT Exemplar]

(a) $2\cos\theta$ (b) $2\sin\theta$
(c) 1 (d) 0

48. $\cos 2\theta\cos 2\phi+\sin^2(\theta-\phi)-\sin^2(\theta+\phi)$ is equal to [NCERT Exemplar]

(a) $\sin 2(\theta+\phi)$ (b) $\cos 2(\theta+\phi)$
(c) $\sin 2(\theta-\phi)$ (d) $\cos 2(\theta-\phi)$

49. The value of $\cos 12^\circ+\cos 84^\circ+\cos 156^\circ+\cos 132^\circ$ is [NCERT Exemplar]

(a) $\frac{1}{2}$ (b) 1 (c) $-\frac{1}{2}$ (d) $\frac{1}{8}$

50. The value of $\left(1+\cos\frac{\pi}{8}\right)\left(1+\cos\frac{3\pi}{8}\right)\left(1+\cos\frac{5\pi}{8}\right)\left(1+\cos\frac{7\pi}{8}\right)$ is equal to

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$ (c) $\frac{1}{8}$ (d) $\frac{1}{16}$

51. If $\cos\alpha + \cos\beta = 0 = \sin\alpha + \sin\beta$, then $\cos 2\alpha + \cos 2\beta$ is equal to [NCERT Exemplar]
(a) $2\cos(\alpha+\beta)$ (b) $-2\cos(\alpha+\beta)$
(c) $3\cos(\alpha+\beta)$ (d) None of these

52. If $\cos(\theta-\alpha) = a$, $\sin(\theta-\beta) = b$, then $\cos^2(\alpha-\beta) + 2ab\sin(\alpha-\beta)$ is equal to
(a) $4a^2b^2$ (b) $a^2 - b^2$
(c) $a^2 + b^2$ (d) $-a^2b^2$

Trigonometric Ratios of Multiple and Submultiple Angles

53. The value of $\sin 20° \sin 40° \sin 60° \sin 80°$ is equal to
(a) $-\frac{3}{16}$ (b) $\frac{5}{16}$
(c) $\frac{3}{16}$ (d) $-\frac{5}{16}$

54. The value of $\cos\frac{\pi}{5}\cos\frac{2\pi}{5}\cos\frac{4\pi}{5}\cos\frac{8\pi}{5}$ is equal to
(a) $\frac{1}{16}$ (b) 0
(c) $-\frac{1}{8}$ (d) $-\frac{1}{16}$

55. The value of $\cos^2 48° - \sin^2 12°$ is [NCERT Exemplar]
(a) $\frac{\sqrt{5}+1}{8}$ (b) $\frac{\sqrt{5}-1}{8}$
(c) $\frac{\sqrt{5}+1}{5}$ (d) $\frac{\sqrt{5}+1}{2\sqrt{2}}$

56. If $\alpha, \beta, \gamma \in \left(0, \frac{\pi}{2}\right)$, then the value of $\frac{\sin(\alpha+\beta+\gamma)}{\sin\alpha + \sin\beta + \sin\gamma}$ is
(a) < 1 (b) > 1
(c) 1 (d) None of these

57. If angle θ be divided into two parts such that the tangent of one part is k times the tangent of the other and ϕ is their difference, then $\sin\theta$ is equal to
(a) $\frac{k+1}{k-1}\sin\phi$ (b) $\frac{k-1}{k+1}\sin\phi$
(c) $\frac{2k-1}{2k+1}\sin\phi$ (d) None of these

58. If $A + B + C = \pi$ and $\cos A = \cos B \cos C$, then $\tan B \tan C$ is equal to
(a) $\frac{1}{2}$ (b) 2 (c) 1 (d) $-\frac{1}{2}$

59. If $\cos(\theta+\phi) = m\cos(\theta-\phi)$, then $\frac{1-m}{1+m}\cot\phi$ is equal to [NCERT Exemplar]
(a) $\tan\theta$ (b) $-\tan\theta$
(c) $2\tan\theta$ (d) None of these

60. The value of $\sin 12° \sin 48° \sin 54°$ is equal to
(a) $\frac{1}{16}$ (b) $\frac{1}{32}$
(c) $\frac{1}{8}$ (d) $\frac{1}{4}$

61. The value of $1 + \cos 56° + \cos 58° - \cos 66°$ is equal to
(a) $2\cos 28° \cos 29° \cos 33°$
(b) $4\cos 28° \cos 29° \sin 33°$
(c) $4\cos 28° \cos 29° \cos 33°$
(d) $2\cos 28° \cos 29° \sin 33°$

62. $\tan\frac{2\pi}{5} - \tan\frac{\pi}{15} - \sqrt{3}\tan\frac{2\pi}{5}\tan\frac{\pi}{15}$ is equal to
(a) $-\sqrt{3}$ (b) $\frac{1}{\sqrt{3}}$
(c) 1 (d) $\sqrt{3}$

63. The sum $S = \sin\theta + \sin 2\theta + \ldots + \sin n\theta$ equals
(a) $\sin\frac{1}{2}(n+1)\theta \sin\frac{n\theta}{2} / \sin\frac{\theta}{2}$
(b) $\cos\frac{1}{2}(n+1)\theta \sin\frac{n\theta}{2} / \sin\frac{\theta}{2}$
(c) $\sin\frac{1}{2}(n+1)\theta \cos\frac{n\theta}{2} / \sin\frac{\theta}{2}$
(d) $\cos\frac{1}{2}(n+1)\theta \cos\frac{n\theta}{2} / \sin\frac{\theta}{2}$

64. If $\sin^3 x \sin 3x = \sum_{m=0}^{n} c_m \cos mx$, where $c_0, c_1, c_2, \ldots, c_n$ are constants and $c_n \neq 0$, then the value of n is
(a) 15 (b) 6 (c) 1 (d) 0

65. If $x\cos\theta = y\cos\left(\theta + \frac{2\pi}{3}\right) = z\cos\left(\theta + \frac{4\pi}{3}\right)$, then the value of $\frac{1}{x} + \frac{1}{y} + \frac{1}{z}$ is equal to
(a) 1 (b) 2
(c) 0 (d) $3\cos\theta$

66. If $A + B + C = \frac{3\pi}{2}$, then $\cos 2A + \cos 2B + \cos 2C$ is equal to
(a) $1 - 4\cos A \cos B \cos C$ (b) $4\sin A \sin B \sin C$
(c) $1 + 2\cos A \cos B \cos C$ (d) $1 - 4\sin A \sin B \sin C$

67. If $\alpha + \beta - \gamma = \pi$, then $\sin^2\alpha + \sin^2\beta - \sin^2\gamma$ is equal to
(a) $2\sin\alpha \sin\beta \cos\gamma$ (b) $2\cos\alpha \cos\beta \cos\gamma$
(c) $2\sin\alpha \sin\beta \sin\gamma$ (d) None of these

68. If $\alpha + \beta + \gamma = 2\pi$, then
(a) $\tan\frac{\alpha}{2} + \tan\frac{\beta}{2} + \tan\frac{\gamma}{2} = \tan\frac{\alpha}{2}\tan\frac{\beta}{2}\tan\frac{\gamma}{2}$
(b) $\tan\frac{\alpha}{2}\tan\frac{\beta}{2} + \tan\frac{\beta}{2}\tan\frac{\gamma}{2} + \tan\frac{\gamma}{2}\tan\frac{\alpha}{2} = 1$
(c) $\tan\frac{\alpha}{2} + \tan\frac{\beta}{2} + \tan\frac{\gamma}{2} = -\tan\frac{\alpha}{2}\tan\frac{\beta}{2}\tan\frac{\gamma}{2}$
(d) None of the above

69. The value of $\frac{\cos 12° - \sin 12°}{\cos 12° + \sin 12°} + \frac{\sin 147°}{\cos 147°}$ is equal to

(a) 1 (b) −1
(c) 0 (d) None of these

70. If $\frac{\sin x}{\sin y} = \frac{1}{2}, \frac{\cos x}{\cos y} = \frac{3}{2}$, where $x, y \in \left(0, \frac{\pi}{2}\right)$, then the value of $\tan(x + y)$ is equal to

(a) $\sqrt{13}$ (b) $\sqrt{14}$
(c) $\sqrt{17}$ (d) $\sqrt{15}$

71. If $\sin\theta + \cos\theta = x$, then $\sin^6\theta + \cos^6\theta = \frac{1}{4}[4 - 3(x^2 - 1)^2]$ for

(a) all real x (b) $x^2 \le 2$
(c) $x^2 > 2$ (d) None of these

72. $3(\sin x - \cos x)^4 + 6(\sin x + \cos x)^2 + 4(\sin^6 x + \cos^6 x)$ is equal to

(a) 11 (b) 12 (c) 13 (d) 14

73. The value of $\tan 3A - \tan 2A - \tan A$ is equal to [NCERT Exemplar]

(a) $\tan 3A \tan 2A \tan A$
(b) $-\tan 3A \tan 2A \tan A$
(c) $\tan A \tan 2A - \tan 2A \tan 3A - \tan 3A \tan A$
(d) None of the above

74. The value of $\tan 20° \tan 40° \tan 60° \tan 80°$ is equal to

(a) 1 (b) 2
(c) 3 (d) $\sqrt{\frac{3}{2}}$

75. The value of $\sin 36° \sin 72° \sin 108° \sin 144°$ is equal to

(a) $\frac{1}{4}$ (b) $\frac{1}{16}$ (c) $\frac{3}{4}$ (d) $\frac{5}{16}$

76. If $\tan x = \frac{b}{a}$, then find the value of $\sqrt{\frac{a+b}{a-b}} + \sqrt{\frac{a-b}{a+b}}$. [NCERT Exemplar]

(a) $\frac{2\cos x}{\sqrt{\cos 2x}}$ (b) $\frac{\cos x}{\sqrt{\cos 2x}}$
(c) $\frac{2\cos 2x}{\sqrt{\cos x}}$ (d) None of these

77. If $(a - b)\sin(\theta + \phi) = (a + b)\sin(\theta - \phi)$ and $a\tan\frac{\theta}{2} - b\tan\frac{\phi}{2} = c$, then the value of $\sin\phi$ is equal to

(a) $\frac{2ab}{a^2 - b^2 - c^2}$ (b) $\frac{2bc}{a^2 - b^2 - c^2}$
(c) $\frac{2bc}{a^2 - b^2 + c^2}$ (d) $\frac{2ab}{a^2 - b^2 + c^2}$

78. The value of $2\cos x - \cos 3x - \cos 5x$ is equal to

(a) $16\cos^3 x \sin^2 x$ (b) $16\sin^3 x \cos^2 x$
(c) $4\cos^3 x \sin^2 x$ (d) $4\sin^3 x \cos^2 x$

79. Consider the following statements :

I. If $\sin A = \sin B$, then we have $\sin 2A = \sin 2B$ always.

II. The value of $\cos\frac{\pi}{7}\cos\frac{4\pi}{7}\cos\frac{5\pi}{7}$ is $\frac{1}{4}$.

Which of the statements given above is/are correct ?

(a) Only (I) (b) Only (II)
(c) Both (I) and (II) (d) Neither (I) nor (II)

80. The value of $\cos\frac{\pi}{65}\cos\frac{2\pi}{65}\cos\frac{4\pi}{65}\ldots\cos\frac{32\pi}{65}$ is

(a) $\frac{1}{32}$ (b) $\frac{1}{64}$ (c) $-\frac{1}{32}$ (d) $-\frac{1}{64}$

81. $\sin^4\frac{\pi}{8} + \sin^4\frac{3\pi}{8} + \sin^4\frac{5\pi}{8} + \sin^4\frac{7\pi}{8}$ is equal to

(a) 1 (b) 3/2 (c) 2 (d) 1/4

82. If $a\cos 2\theta + b\sin 2\theta = c$ has α and β as its roots, then $\tan\alpha + \tan\beta$ is equal to [NCERT Exemplar]

(a) $-\frac{2b}{a+c}$ (b) $\frac{2b}{a+c}$
(c) $\frac{3b}{a+c}$ (d) None of these

83. The value of

$$\cos^2 A(3 - 4\cos^2 A)^2 + \sin^2 A(3 - 4\sin^2 A)^2$$

is equal to

(a) $\cos 4A$ (b) $\sin 4A$
(c) 1 (d) None of these

84. If $4n\alpha = \pi$, then the value of

$$\tan\alpha \cdot \tan 2\alpha \cdot \tan 3\alpha \cdot \tan 4\alpha \ldots \tan(2n-2)\alpha \tan(2n-1)\alpha$$

is

(a) 0 (b) 1
(c) −1 (d) None of these

85. If $\frac{1 - \cos 2\theta}{1 + \cos 2\theta} = 3$, then the general value of θ is

(a) $2n\pi \pm \frac{\pi}{6}$ (b) $n\pi \pm \frac{\pi}{6}$
(c) $2n\pi \pm \frac{\pi}{3}$ (d) $n\pi \pm \frac{\pi}{3}$

Maximum and Minimum Value of Trigonometric Equation

86. If in a ΔABC, $\angle C = 90°$, then the maximum value of $\sin A \sin B$ is

(a) $\frac{1}{2}$ (b) 1
(c) 2 (d) None of these

87. If $A = \sin^2\theta + \cos^4\theta$, then for all real values of θ

(a) $1 \le A \le 2$ (b) $\frac{3}{4} \le A \le 1$

(c) $\frac{13}{16} \le A \le 1$ (d) $\frac{3}{4} \le A \le \frac{13}{16}$

88. If $y = 1 + 4\sin^2 x \cos^2 x$, then

(a) $1 \le y \le 2$ (b) $-1 \le y \le 1$

(c) $-3 \le y \le 3$ (d) None of these

89. The maximum value of $\cos^2\left(\frac{\pi}{3} - x\right) - \cos^2\left(\frac{\pi}{3} + x\right)$ is

(a) $-\frac{\sqrt{3}}{2}$ (b) $\frac{1}{2}$

(c) $\frac{\sqrt{3}}{2}$ (d) $\frac{3}{2}$

90. The maximum value of $\sin\left(x + \frac{\pi}{6}\right) + \cos\left(x + \frac{\pi}{6}\right)$ in the interval $\left(0, \frac{\pi}{2}\right)$ is attained at

(a) $x = \frac{\pi}{12}$ (b) $x = \frac{\pi}{6}$

(c) $x = \frac{\pi}{3}$ (d) $x = \frac{\pi}{2}$

91. The greatest and least value of $\sin x \cos x$ are respectively

(a) $1, -1$ (b) $\frac{1}{2}, -\frac{1}{2}$

(c) $\frac{1}{4}, -\frac{1}{4}$ (d) $2, -2$

92. The maximum value of

$$4\sin^2 x + 3\cos^2 x + \sin\frac{x}{2} + \cos\frac{x}{2} \text{ is}$$

(a) $4 + \sqrt{2}$ (b) $3 + \sqrt{2}$

(c) 9 (d) 4

93. $\cos 2\theta + 2\cos\theta$ is always

(a) greater than $-\frac{3}{2}$

(b) less than or equal to $\frac{3}{2}$

(c) greater than or equal to $-\frac{3}{2}$ and less than or equal to 3

(d) None of the above

94. The maximum value of $(\cos\alpha_1)(\cos\alpha_2)\ldots(\cos\alpha_n)$ under the restriction $0 \le \alpha_1, \alpha_2, \ldots, \alpha_n \le \frac{\pi}{2}$ and $(\cot\alpha_1)(\cot\alpha_2)\ldots(\cot\alpha_n) = 1$, is

(a) $\frac{1}{2^{n/2}}$ (b) $\frac{1}{2^n}$ (c) $\frac{1}{2n}$ (d) 1

95. The minimum value of $3\cos x + 4\sin x + 8$ is [NCERT Exemplar]

(a) 5 (b) 9 (c) 7 (d) 3

Solution of Trigonometric Equations

96. If $\sin\theta = \sqrt{3}\cos\theta$, $-\pi < \theta < 0$, then θ is equal to

(a) $-\frac{5\pi}{6}$ (b) $-\frac{4\pi}{6}$ (c) $\frac{4\pi}{6}$ (d) $\frac{5\pi}{6}$

97. Total number of solutions of $\cos x = \sqrt{1 - \sin 2x}$ in $[0, 2\pi]$ is equal to

(a) 2 (b) 3

(c) 5 (d) None of these

98. Total number of solutions of the equation $3x + 2\tan x = \frac{5\pi}{2}$ in $x \in [0, 2\pi]$, is equal to

(a) 1 (b) 2 (c) 3 (d) 4

99. Find the general solution of the equation $(\sqrt{3} - 1)\cos\theta + (\sqrt{3} + 1)\sin\theta = 2$ [NCERT Exemplar]

(a) $2n\pi \pm \frac{\pi}{4} - \frac{5\pi}{12}$ (b) $2n\pi \pm \frac{\pi}{4} + \frac{5\pi}{12}$

(c) $2n\pi \pm \pi - \frac{3\pi}{11}$ (d) None of these

100. The number of values of x in the interval $[0, 5\pi]$ satisfying the equation $3\sin^2 x - 7\sin x + 2 = 0$ is

(a) 0 (b) 5 (c) 6 (d) 10

101. The number of solutions of the equation $1 + \sin x \sin^2\frac{x}{2} = 0$ in $[-\pi, \pi]$ is

(a) zero (b) one (c) two (d) three

102. The number of values of x lying in the interval $(-\pi, \pi)$ which satisfy the equation

$$8^{(1 + |\cos x| + \cos^2 x + |\cos^3 x| + \ldots\infty)} = 4^3, \text{ is}$$

(a) 3 (b) 4 (c) 5 (d) 6

103. If $\cot\theta + \tan\theta = 2\operatorname{cosec}\theta$, then find the general value of θ. [NCERT Exemplar]

(a) $2n\pi \pm \frac{1}{4}$ (b) $2n\pi \pm \frac{\pi}{4}$

(c) $2n\pi \pm \frac{\pi}{3}$ (d) None of these

104. If $2\sin^2\theta = 3\cos\theta$, where $0 \le \theta \le 2\pi$, then find the value of θ. [NCERT Exemplar]

(a) $\frac{2\pi}{3}, \frac{5\pi}{3}$ (b) $\frac{\pi}{3}, \frac{5\pi}{3}$

(c) $\frac{5}{3}, \frac{4\pi}{3}$ (d) None of these

105. The equation $e^{\sin x} - e^{-\sin x} - 4 = 0$ has

(a) no solution (b) two solutions

(c) three solutions (d) None of these

106. The number of solutions of the equation $|\cos x| = 2[x]$, where $[\cdot]$ is the greatest integer, is

(a) one (b) two

(c) infinite (d) nil

107. The number of ordered pairs (x, y) satisfying $y = 2\sin x$ and $y = 5x^2 + 2x + 3$ is
(a) 0 (b) 1
(c) 2 (d) ∞

108. If $\tan 2x = \tan \frac{2}{x}$, then the value of x is
(a) $\frac{n\pi \pm \sqrt{n^2\pi^2 + 16}}{4}$ (b) $\frac{n\pi}{4}$
(c) $\frac{n\pi \pm \sqrt{n^2\pi^2 - 16}}{4}$ (d) None of these

109. The most general solutions of the equation $\sec x - 1 = (\sqrt{2} - 1)\tan x$ are given by
(a) $n\pi + \frac{\pi}{8}$ (b) $2n\pi, 2n\pi + \frac{\pi}{4}$
(c) $2n\pi$ (d) None of these

110. Find the general solution of the equation $5\cos^2\theta + 7\sin^2 - 6 = 0$. [NCERT Exemplar]
(a) $(2n + 1)\frac{\pi}{4}$ (b) $(2n - 1)\frac{\pi}{4}$
(c) $(2n + 3)\frac{\pi}{4}$ (d) None of these

111. The solution set of $(5 + 4\cos\theta)(2\cos\theta + 1) = 0$ in the interval $[0, 2\pi]$ is
(a) $\left\{\frac{\pi}{3}, \frac{2\pi}{3}\right\}$ (b) $\left\{\frac{\pi}{3}, \pi\right\}$
(c) $\left\{\frac{2\pi}{3}, \frac{4\pi}{3}\right\}$ (d) $\left\{\frac{2\pi}{3}, \frac{5\pi}{3}\right\}$

112. If $4\cos\theta - 3\sec\theta = 2\tan\theta$, then θ is equal to
(a) $n\pi + (-1)^n \frac{\pi}{10}$ (b) $n\pi + (-1)^n \frac{\pi}{6}$
(c) $n\pi + (-1)^n \frac{3\pi}{10}$ (d) $n\pi$

113. If the equation $\cos 3x + \cos 2x = \sin\frac{3x}{2} + \sin\frac{x}{2}$, $0 \le x \le 2\pi$, then the number of values of x is
(a) 6 (b) 7
(c) 4 (d) 5

114. If $\sec x \cos 5x + 1 = 0$, where $0 < x < 2\pi$, then x is equal to
(a) $\frac{\pi}{5}, \frac{\pi}{4}$ (b) $\frac{\pi}{5}$
(c) $\frac{\pi}{4}$ (d) None of these

115. The most general values of θ satisfying $\tan\theta + \tan\left(\frac{3\pi}{4} + \theta\right) = 2$ is/are
(a) $n\pi \pm \frac{\pi}{3}, n \in I$ (b) $2n\pi + \frac{\pi}{3}, n \in I$
(c) $2n\pi \pm \frac{\pi}{3}, n \in I$ (d) $2n\pi + (-1)^n \frac{\pi}{3}, n \in I$

116. The general value of θ satisfying $\sin^2\theta + \sin\theta = 2$ is
(a) $n\pi + (-1)^n \frac{\pi}{6}$ (b) $2n\pi + \frac{\pi}{4}$
(c) $n\pi + (-1)^n \frac{\pi}{2}$ (d) $n\pi + (-1)^n \frac{\pi}{3}$

117. The general solution of $\sin^2\theta \sec\theta + \sqrt{3}\tan\theta = 0$ is
(a) $\theta = n\pi + (-1)^{n+1}\frac{\pi}{3}, \ \theta = n\pi, n \in I$
(b) $\theta = n\pi, n \in I$
(c) $\theta = n\pi + (-1)^{n+1}\frac{\pi}{3}, n \in I$
(d) $\theta = \frac{n\pi}{2}, n \in I$

118. The general solution of
$\sin x - 3\sin 2x + \sin 3x = \cos x - 3\cos 2x + \cos 3x$
is [NCERT Exemplar]
(a) $n\pi + \frac{\pi}{8}$ (b) $\frac{n\pi}{2} + \frac{\pi}{8}$
(c) $(-1)^n \frac{n\pi}{2} + \frac{\pi}{8}$ (d) $2n\pi + \cos^{-1}\frac{3}{2}$

119. The equation $3\sin^2 x + 10\cos x - 6 = 0$ is satisfied, if
(a) $x = n\pi \pm \cos^{-1}\left(\frac{1}{3}\right)$ (b) $x = 2n\pi \pm \cos^{-1}\left(\frac{1}{3}\right)$
(c) $x = n\pi \pm \cos^{-1}\left(\frac{1}{6}\right)$ (d) $x = 2n\pi \pm \cos^{-1}\left(\frac{1}{6}\right)$

120. If the equation $\sin^2\theta - \cos\theta = \frac{1}{4}$, then the value of θ lying in the interval $0 \le \theta \le 2\pi$ is
(a) $\frac{\pi}{3}, \frac{5\pi}{3}$ (b) $\frac{\pi}{3}, \frac{2\pi}{3}$ (c) $\frac{4\pi}{3}, \frac{5\pi}{3}$ (d) $\frac{3\pi}{5}, \frac{\pi}{5}$

121. The smallest positive root of the equation $\tan x - x = 0$ is in
(a) $\left(0, \frac{\pi}{2}\right)$ (b) $\left(\pi, \frac{3\pi}{2}\right)$
(c) $\left(\frac{\pi}{2}, \pi\right)$ (d) $\left(\frac{3\pi}{2}, 2\pi\right)$

122. If $2\cos^2 x + 3\sin x - 3 = 0$, $0 \le x \le 180°$, then the value of x is
(a) 30°, 90°, 150° (b) 60°, 120°, 180°
(c) 0°, 30°, 150° (d) 45°, 90°, 135°

123. The most general value of θ satisfying the equation $(1 + 2\sin\theta)^2 + (\sqrt{3}\tan\theta - 1)^2 = 0$ are given by
(a) $n\pi \pm \frac{\pi}{6}$ (b) $n\pi + (-1)^n \frac{7\pi}{6}$
(c) $2n\pi + \frac{7\pi}{6}$ (d) $2n\pi + \frac{11\pi}{6}$

124. If the equation $\cos 3x \cos^3 x + \sin 3x \sin^3 x = 0$, then x is equal to
(a) $(2n + 1)\frac{\pi}{4}$ (b) $(2n - 1)\frac{\pi}{4}$
(c) $\frac{n\pi}{4}$ (d) None of these

125. If $\tan\theta + \tan 2\theta + \sqrt{3}\tan\theta\tan 2\theta = \sqrt{3}$, then
(a) $\theta = \frac{(6n+1)\pi}{18}, \forall n \in I$
(b) $\theta = \frac{(6n+1)\pi}{9}, \forall n \in I$
(c) $\theta = \frac{(3n+1)\pi}{9}, \forall n \in I$
(d) None of the above

126. If $\tan^2\theta - (1+\sqrt{3})\tan\theta + \sqrt{3} = 0$, then the general value of θ is
(a) $n\pi + \frac{\pi}{4}, n\pi + \frac{\pi}{3}$ (b) $n\pi - \frac{\pi}{4}, n\pi + \frac{\pi}{3}$
(c) $n\pi + \frac{\pi}{4}, n\pi - \frac{\pi}{3}$ (d) $n\pi - \frac{\pi}{4}, n\pi - \frac{\pi}{3}$

127. Total number of solutions of
$\sin^4 x + \cos^4 x = \sin x \cdot \cos x$ in $[0, 2\pi]$ is equal to
(a) 2 (b) 4
(c) 6 (d) 8

128. The general value of x for which $\cos 2x, \frac{1}{2}$ and $\sin 2x$ are in AP, are given by
(a) $n\pi, n\pi + \frac{\pi}{2}$ (b) $n\pi, n\pi + \frac{\pi}{4}$
(c) $n\pi + \frac{\pi}{4}, \frac{3n\pi}{4}$ (d) None of these

129. Set of values of x lying in $[0, 2\pi]$ satisfying the inequality $|\sin x| > 2\sin^2 x$ contains
(a) $\left(0, \frac{\pi}{6}\right) \cup \left(\pi, \frac{7\pi}{6}\right)$ (b) $\left(0, \frac{7\pi}{6}\right)$
(c) $\frac{\pi}{6}$ (d) None of these

130. The solution of the equation $\sin^{10} 2x = 1 + \cos^{10} x$ is
(a) $x = (2n+1)\frac{\pi}{2}$ (b) $x = n\pi$
(c) $x = (2n+1)\frac{\pi}{4}$ (d) None of these

131. The equation $\sin x + \sin y + \sin z = -3$ for $0 \le x \le 2\pi$, $0 \le y \le 2\pi, 0 \le z \le 2\pi$ has
(a) one solution (b) two sets of solutions
(c) four sets of solutions (d) no solution

132. The number of solutions of the equation $\sin^5 x - \cos^5 x = \frac{1}{\cos x} - \frac{1}{\sin x}$ $(\sin x \ne \cos x)$ is
(a) 0 (b) 1
(c) infinite (d) None of these

133. The number of ordered pairs (x, y), where $x, y \in [0, 10]$ satisfying $\left(\sqrt{\sin^2 x - \sin x + \frac{1}{2}}\right) \cdot 2^{\sec^2 y} \le 1$ is
(a) 0 (b) 16 (c) infinite (d) 12

134. The equation $2\cos^2\frac{x}{2}\sin^2 x = x^2 + x^{-2}, x < \frac{\pi}{9}$ has
(a) no real solution
(b) one real solution
(c) more than one real solutions
(d) None of the above

135. The general solution of $e^{-1/\sqrt{2}}(e^{\sin x} + e^{\cos x}) = 2$ is
(a) $x = m\pi$ (b) $x = \frac{(4m+1)\pi}{4}$
(c) $x = \frac{(4m+1)\pi}{2}$ (d) None of these

Round II (Mixed Bag)

Only One Correct Option

1. If $\tan\alpha$, $\tan\beta$ and $\tan\gamma$ are the roots of the equation $x^3 - px^2 - r = 0$, then the value of $(1+\tan^2\alpha)(1+\tan^2\beta)(1+\tan^2\gamma)$ is equal to
(a) $(p-r)^2$ (b) $1 + (p-r)^2$
(c) $1 - (p-r)^2$ (d) None of these

2. If α, β, γ and δ are four solutions of the equation $\tan\left(\theta + \frac{\pi}{4}\right) = 3\tan 3\theta$, then $\tan\alpha\tan\beta\tan\gamma\tan\delta$ equals
(a) 3 (b) 1/3
(c) $-\frac{1}{3}$ (d) None of these

3. The least value of $\operatorname{cosec}^2 x + 25\sec^2 x$ is
(a) 0 (b) 26 (c) 28 (d) 36

4. If $x\sin a + y\sin 2a + z\sin 3a = \sin 4a$
$x\sin b + y\sin 2b + z\sin 3b = \sin 4b$
$x\sin c + y\sin 2c + z\sin 3c = \sin 4c$
Then, the roots of the equation
$$t^3 - \left(\frac{z}{2}\right)t^2 - \left(\frac{y+2}{4}\right)t + \left(\frac{z-x}{8}\right) = 0, a, b, c \ne n\pi,$$
are
(a) $\sin a, \sin b, \sin c$
(b) $\cos a, \cos b, \cos c$
(c) $\sin 2a, \sin 2b, \sin 2c$
(d) $\cos 2a, \cos 2b, \cos 2c$

5. If $0° < \theta < 180°$, then $\sqrt{2 + \sqrt{2 + \sqrt{2 + \ldots + \sqrt{2(1+\cos\theta)}}}}$, then being n number of 2's, is equal to

(a) $2\cos\left(\frac{\theta}{2^n}\right)$ (b) $2\cos\left(\frac{\theta}{2^{n-1}}\right)$
(c) $2\cos\left(\frac{\theta}{2^{n+1}}\right)$ (d) None of these

6. If $\tan\alpha/2$ and $\tan\beta/2$ are the roots of the equation $8x^2 - 26x + 15 = 0$, then $\cos(\alpha + \beta)$ is equal to
(a) $-\frac{627}{725}$ (b) $\frac{627}{725}$
(c) -1 (d) None of these

7. Let n be an odd integer. If $\sin n\theta = \sum_{r=0}^{n} b_r \sin^r\theta$ for all real θ, then
(a) $b_0 = 1, b_1 = 3$ (b) $b_0 = 0, b_1 = n$
(c) $b_0 = -1, b_1 = n$ (d) $b_0 = 0, b_1 = n^2 - 3n - 3$

8. If θ is an acute angle and $\tan\theta = \frac{1}{\sqrt{7}}$, then the value of $\frac{\operatorname{cosec}^2\theta - \sec^2\theta}{\operatorname{cosec}^2\theta + \sec^2\theta}$ is
(a) 3/4 (b) 1/2 (c) 2 (d) 5/4

9. The number of values of θ in the interval $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ satisfying the equation $(\sqrt{3})^{\sec^2\theta} = \tan^4\theta + 2\tan^2\theta$ is
(a) 1 (b) 2
(c) 3 (d) None of these

10. If $\sin^4 x + \cos^4 y + 2 = 4\sin x\cos y$ and $0 \le x, y \le \frac{\pi}{2}$, then $\sin x + \cos y$ is equal to
(a) -2 (b) 0 (c) 2 (d) $\frac{3}{2}$

11. The equation $\cos^4 x - (\lambda + 2)\cos^2 x - (\lambda + 3) = 0$ possesses a solution, if
(a) $\lambda > -3$ (b) $\lambda < -2$
(c) $-3 \le \lambda \le -2$ (d) λ is any positive integer

12. The arithmetic mean of the roots of the equation
$$4\cos^3 x - 4\cos^2 x - \cos(315\pi + x) = 1$$
in the interval (0, 315) is equal to
(a) 50π (b) 51π (c) 100π (d) 315π

13. If $\frac{\sin\theta}{6}$, $\cos\theta$ and $\tan\theta$ are in GP, then the general value of θ is
(a) $2n\pi \pm \frac{\pi}{3}, n \in I$ (b) $2n\pi \pm \frac{\pi}{6}, n \in I$
(c) $2n\pi + (-1)^n\frac{\pi}{3}, n \in I$ (d) $n\pi + \frac{\pi}{3}, n \in I$

14. Set $a, b \in [-\pi, \pi]$ be such that $\cos(a - b) = 1$ and $\cos(a + b) = \frac{1}{e}$. The number of pairs of a and b satisfying the above system of equations is
(a) 0 (b) 1 (c) 2 (d) 4

15. The number of solutions of the equation $x^3 + x^2 + 4x + 2\sin x = 0$ in $0 \le x \le 2\pi$ is
(a) zero (b) one (c) two (d) four

16. Let α and β be any two positive values of x for which $2\cos x, |\cos x|$ and $1 - 3\cos^2 x$ are in GP. The minimum value of $|\alpha - \beta|$ is
(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{2}$ (d) None of these

More Than One Correct Option

17. If $\tan\theta = \frac{\sin\alpha - \cos\alpha}{\sin\alpha + \cos\alpha}$, then
(a) $\sin\alpha - \cos\alpha = \pm\sqrt{2}\sin\theta$
(b) $\sin\alpha + \cos\alpha = \pm\sqrt{2}\cos\theta$
(c) $\cos 2\theta = \sin 2\alpha$
(d) $\sin 2\theta + \cos 2\alpha = 0$

18. Let $0 \le \theta \le \pi/2$ and $x = X\cos\theta + Y\sin\theta$, $y = X\sin\theta - Y\cos\theta$ such that $x^2 + 4xy + y^2 = aX^2 + bY^2$, where a and b are constants. Then,
(a) $a = -1, b = 3$ (b) $\theta = \frac{\pi}{4}$
(c) $a = 3, b = -1$ (d) $\theta = \frac{\pi}{3}$

19. If $\cos x + \cos y - \cos(x + y) = \frac{3}{2}$, then
(a) $x + y = 0$ (b) $x = 2y$
(c) $x = y$ (d) $\cos^2\left(\frac{x - y}{2}\right) \ge 1$

20. $\tan|x| = |\tan x|$, if
(a) $x \in \{-\pi(2k + 1)/2, -\pi k\}, k \in I$
(b) $x \in [\pi k, \pi(2k + 1)/2], k \in I$
(c) $x \in \{-\pi k, -\pi(2k - 1)/2\}, k \in I$
(d) $x \in \{\pi(2k - 1)/2, \pi k\}, k \in I$

Comprehension Based Questions

Passage

Directions (Q. Nos. 21-23) *Whenever the terms on the two sides of the equation are of different nature, then equations are known as non-standard form, some of them are in the form of an ordinary equation but cannot be solved by standard procedures.*
Non-standard problems require high degree of logic, they also require the use of graphs, inverse properties of functions, inequalities.

21. The number of solutions of the equation $2\cos\left(\frac{x}{2}\right) = 3^x + 3^{-x}$ is
(a) 1 (b) 2 (c) 3 (d) 4

22. The equation $2\cos^2\left(\frac{x}{2}\right)\sin^2 x = x^2 + x^{-2}, 0 < x \le \frac{x}{2}$ has
(a) one real solution
(b) more than one real solutions
(c) no real solution
(d) None of the above

23. The number of real solutions of the equation $\sin(e^x) = 5^x + 5^{-x}$ is
(a) 0 (b) 1 (c) 2 (d) 3

Assertion and Reason

Directions (Q. Nos. 24-35) *Each of these question contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these question also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*) *and* (*d*) *given below*
(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true, Statement II is false.
(d) Statement I is false, Statement II is true.

24. **Statement I** $\tan\alpha + 2\tan 2\alpha + 4\tan 4\alpha + 8\tan 8\alpha + 16\cot 16\alpha = \cot\alpha$
Statement II $\cot\alpha - \tan\alpha = 2\cot 2\alpha$

25. **Statement I** $\cos^3\alpha + \cos^3\left(\alpha + \frac{2\pi}{3}\right) + \cos^3\left(\alpha + \frac{4\pi}{3}\right)$
$$= 3\cos\alpha\cos\left(\alpha + \frac{2\pi}{3}\right)\cos\left(\alpha + \frac{4\pi}{3}\right).$$
Statement II If $a + b + c = 0 \Leftrightarrow a^3 + b^3 + c^3 = 3abc$

26. **Statement I** If $xy + yz + zx = 1$, then
$$\Sigma\frac{x}{(1+x^2)} = \frac{2}{\sqrt{\prod(1+x^2)}}.$$
Statement II In a ΔABC
$\sin 2A + \sin 2B - \sin 2C = 4\cos A\cos B\sin C$

27. **Statement I** If α and β are two distinct solutions of the equatio $a\cos x + b\sin x = c$, then $\tan\left(\frac{\alpha+\beta}{2}\right)$ is independent of c.
Statement II Solution of $a\cos x + b\sin x = c$ is possible, if
$$-\sqrt{(a^2+b^2)} \le c \le \sqrt{(a^2+b^2)}$$

28. **Statement I** The number of real solutions of the equation $\cos(x) = 7^x + 7^{-x}$ is zero.
Statement II Since, $|\cos x| \le 1$

29. **Statement I** The equation $\sin x = x^2 + x + 1$ has no solution.
Statement II The curve $y = \sin x$ and $y = x^2 + x + 1$ do not intersect each other when graph is observed.

30. **Statement I** $\cos 36° > \sin 36°$
Statement II $\cos 36° > \tan 36°$

31. **Statement I** $\sin\left(\frac{2\pi}{7}\right) + \sin\left(\frac{4\pi}{7}\right) + \sin\left(\frac{8\pi}{7}\right) = -\frac{1}{2}$
Statement II $\cos\left(\frac{2\pi}{7}\right) + i\sin\left(\frac{2\pi}{7}\right)$ is complex 7th root of unity.

32. **Statement I** If $\sin x + \cos x = \sqrt{\left(y + \frac{1}{y}\right)}, x \in [0, \pi]$, then $x = \frac{\pi}{4}, y = 1$
Statement II AM $\ge$ GM

33. **Statement I** If $\tan\left(\frac{\pi}{2}\sin\theta\right) = \cot\left(\frac{\pi}{2}\cos\theta\right)$, then $\sin\theta + \cos\theta = \pm\sqrt{2}$
Statement II $-\sqrt{2} \le \sin\theta + \cos\theta \le \sqrt{2}$

34. **Statement I** The equation $\sin(\cos x) = \cos(\sin x)$ does not possess real roots.
Statement II If $\sin x > 0$, then $2n\pi < x < (2n+1), n \in I$

35. **Statement I** If $\sin^2 A = \sin^2 B$ and $\cos^2 A = \cos^2 B$, then $A = n\pi + B, n \in I$
Statement II If $\sin A = \sin B$ and $\cos A = \cos B$, then $A = n\pi + B, n \in I$

Previous Years' Questions

36. $ABCD$ is a trapezium such that AB and CD are parallel and $BC \perp CD$. If $\angle ADB = \theta, BC = p$ and $CD = q$, then AB is equal to **[JEE Main 2013]**
(a) $\frac{(p^2+q^2)\sin\theta}{p\cos\theta + q\sin\theta}$ (b) $\frac{p^2+q^2\cos\theta}{p\cos\theta + q\sin\theta}$
(c) $\frac{p^2+q^2}{p^2\cos\theta + q^2\sin\theta}$ (d) $\frac{(p^2+q^2)\sin\theta}{(p\cos\theta + q\sin\theta)^2}$

37. The expression $\frac{\tan A}{1-\cot A} + \frac{\cot A}{1-\tan A}$ can be written as **[JEE Main 2013]**
(a) $\sin A\cos A + 1$
(b) $\sec A\,\text{cosec}\,A + 1$
(c) $\tan A + \cot A$
(d) $\sec A + \text{cosec}\,A$

38. In a ΔPQR, if $3\sin P + 4\cos Q = 6$ and $4\sin Q + 3\cos P = 1$, then the $\angle R$ is equal to [AIEEE 2012]

(a) $\frac{5\pi}{6}$ (b) $\frac{\pi}{6}$
(c) $\frac{\pi}{4}$ (d) $\frac{3\pi}{4}$

39. The equation $e^{\sin x} - e^{-\sin x} - 4 = 0$ has [AIEEE 2012]
(a) infinite number of real roots
(b) no real roots
(c) exactly one real root
(d) exactly four real roots

40. If $A = \sin^2 x + \cos^4 x$, then for all real x [AIEEE 2011]
(a) $\frac{13}{16} \le A \le 1$ (b) $1 \le A \le 2$
(c) $\frac{3}{4} \le A \le \frac{13}{16}$ (d) $\frac{3}{4} \le A \le 1$

41. Let $\cos(\alpha + \beta) = \frac{4}{5}$ and let $\sin(\alpha - \beta) = \frac{5}{13}$, where $0 \le \alpha, \beta \le \frac{\pi}{4}$. Then, $\tan 2\alpha$ is equal to [AIEEE 2010]

(a) $\frac{25}{16}$ (b) $\frac{56}{33}$
(c) $\frac{19}{12}$ (d) $\frac{20}{7}$

42. Let A and B denote the statements

$$A : \cos\alpha + \cos\beta + \cos\gamma = 0$$
$$B : \sin\alpha + \sin\beta + \sin\gamma = 0$$

If $\cos(\beta - \gamma) + \cos(\gamma - \alpha) + \cos(\alpha - \beta) = -\frac{3}{2}$, then [AIEEE 2009]

(a) A is true and B is false (b) A is false and B is true
(c) both A and B are true (d) both A and B are false

43. The number of values of x in $[0, 3\pi]$ such that $2\sin^2 x + 5\sin x - 3 = 0$ is [AIEEE 2006]
(a) 1 (b) 2
(c) 4 (d) 6

44. If $0 < x < \pi$ and $\cos x + \sin x = \frac{1}{2}$, then $\tan x$ is equal to [AIEEE 2006]

(a) $\frac{-(4+\sqrt{7})}{3}$ (b) $\frac{1+\sqrt{7}}{4}$
(c) $\frac{1-\sqrt{7}}{4}$ (d) $\frac{4-\sqrt{7}}{3}$

45. In a ΔPQR, $\angle R = \frac{\pi}{2}$. If $\tan\left(\frac{P}{2}\right)$ and $\tan\left(\frac{Q}{2}\right)$ are the roots of $ax^2 + bx + c = 0, a \ne 0$, then [AIEEE 2005]

(a) $b = a + c$ (b) $b = c$
(c) $c = a + b$ (d) $a = b + c$

46. Let α and β such that $\pi < \alpha - \beta < 3\pi$. If $\sin\alpha + \sin\beta = -\frac{21}{65}$, $\cos\alpha + \cos\beta = -\frac{27}{65}$, then $\cos\left(\frac{\alpha - \beta}{2}\right)$ is [AIEEE 2004]

(a) $-\frac{3}{\sqrt{130}}$ (b) $\frac{3}{\sqrt{130}}$ (c) $\frac{6}{65}$ (d) $-\frac{6}{65}$

47. If $u = \sqrt{a^2\cos^2\theta + b^2\sin^2\theta} + \sqrt{a^2\sin^2\theta + b^2\cos^2\theta}$, then the difference between the maximum and minimum values of u^2 is given by [AIEEE 2004]

(a) $2(a^2 + b^2)$ (b) $2\sqrt{a^2 + b^2}$
(c) $(a + b)^2$ (d) $(a - b)^2$

48. In a ΔABC, medians AD and BE are drawn. If $AD = 4$, $\angle DAB = \frac{\pi}{6}$ and $\angle ABE = \frac{\pi}{3}$, then the area of the ΔABC is [AIEEE 2003]

(a) 8 / 3 sq units (b) 16 / 3 sq units
(c) $32/3\sqrt{3}$ sq units (d) 64 / 3 sq units

49. $\sin^2\theta = \frac{4xy}{(x+y)^2}$ is true, if and only if [AIEEE 2002]

(a) $x - y \ne 0$ (b) $x = -y$
(c) $x = y$ (d) $x \ne 0, y \ne 0$

50. The value of $\frac{1 - \tan^2 15^\circ}{1 + \tan^2 15^\circ}$ is [AIEEE 2002]

(a) 1 (b) $\sqrt{3}$ (c) $\sqrt{3}/2$ (d) 2

51. If $\tan\theta = -\frac{4}{3}$, then $\sin\theta$ is [AIEEE 2002]

(a) $-\frac{4}{5}$ but not $\frac{4}{5}$ (b) $-\frac{4}{5}$ or $\frac{4}{5}$
(c) $\frac{4}{5}$ but not $-\frac{4}{5}$ (d) None of these

52. If $\sin(\alpha + \beta) = 1$, $\sin(\alpha - \beta) = \frac{1}{2}$, then $\tan(\alpha + 2\beta)\tan(2\alpha + \beta)$ is equal to [AIEEE 2002]
(a) 1 (b) -1
(c) zero (d) None of these

53. If $y = \sin^2\theta + \operatorname{cosec}^2\theta, \theta \ne 0$, then [AIEEE 2002]
(a) $y = 0$ (b) $y \le 2$
(c) $y \ge -2$ (d) $y > 2$

54. If α is a root of $25\cos^2\theta + 5\cos\theta - 12 = 0$, $\frac{\pi}{2} < \alpha < \pi$, then $\sin 2\alpha$ is equal to [AIEEE 2002]

(a) $\frac{24}{25}$ (b) $-\frac{24}{25}$
(c) $\frac{13}{18}$ (d) $-\frac{13}{18}$

the **Guidance**

Round I

1. $-47^\circ\, 30' = -\left(47 + \frac{30}{60}\right)^\circ = -\left(47 + \frac{1}{2}\right)^\circ \qquad \left[\because 1' = \left(\frac{1}{60}\right)^\circ\right]$

$= -\left(\frac{94+1}{2}\right)^\circ = -\frac{95^\circ}{2}$

$= -\frac{95}{2} \times \frac{\pi}{180} = -\frac{19\pi}{72}$ rad

2. $\left(\frac{11}{16}\right)^c = \left(\frac{11}{16} \times \frac{180}{\pi}\right)^\circ = \left(\frac{11}{8} \times \frac{90}{22} \times 7\right)^\circ = \left(\frac{45 \times 7}{8}\right)^\circ$

$\left[\because 1^c = \left(\frac{180}{\pi}\right)^\circ\right]$

$= \left(\frac{315}{8}\right)^\circ = 39^\circ + \left(\frac{3}{8}\right)^\circ$

$= 39^\circ + \frac{3}{8} \times 60'$

$= 39^\circ + \left(\frac{45}{2}\right)' \qquad (\because 1^\circ = 60')$

$= 39^\circ + 22' + \frac{1''}{2}$

$= 39^\circ\, 22' + \frac{1 \times 60''}{2}$

$= 39^\circ\, 22'\, 30'' \qquad (\because 1' = 60'')$

3.

Using the formula, $\theta = \frac{l}{r}$

For first circle, $60° \times \frac{\pi}{180°} = \frac{l}{r_1}$ ...(i)

And for second circle, $75° \times \frac{\pi}{180°} = \frac{l}{r_2}$ ...(ii)

On dividing Eq. (i) by Eq. (ii), we get

$$\frac{60 \times \frac{\pi}{180}}{75 \times \frac{\pi}{180}} = \frac{\frac{l}{r_1}}{\frac{l}{r_2}} \Rightarrow \frac{r_2}{r_1} = \frac{4}{5}$$

$\Rightarrow$ $r_1 : r_2 = 5 : 4$

4. Let s be the length of the arc subtending an angle θ radian at the centre of a circle of radius r. Then, $\theta = \frac{s}{r}$

Here, $r = 5$ cm and $\theta = 15° = 15° \times \frac{\pi}{180°} = \frac{\pi}{12}$ rad

$\because$ $\theta = \frac{s}{r}$

$\Rightarrow$ $\frac{\pi}{12} = \frac{s}{5} \Rightarrow s = \frac{5\pi}{12}$ cm ($\because r = 5$ given)

5. $\therefore \frac{1 - \cos\alpha + \sin\alpha}{1 + \sin\alpha} \times \frac{1 + \cos\alpha + \sin\alpha}{1 + \cos\alpha + \sin\alpha}$

$$= \frac{(1 + \sin\alpha)^2 - \cos^2\alpha}{(1 + \sin\alpha)(1 + \cos\alpha + \sin\alpha)}$$

$$= \frac{1^2 + \sin^2\alpha + 2\sin\alpha - \cos^2\alpha}{(1 + \sin\alpha)(1 + \cos\alpha + \sin\alpha)}$$

$$= \frac{\sin^2\alpha + 2\sin\alpha + \sin^2\alpha}{(1 + \sin\alpha)(1 + \cos\alpha + \sin\alpha)}$$

$$= \frac{2\sin\alpha(1 + \sin\alpha)}{(1 + \sin\alpha)(1 + \cos\alpha + \sin\alpha)}$$

$$= \frac{2\sin\alpha}{1 + \cos\alpha + \sin\alpha} = y$$

6. The given expression can be written as

$$\frac{1 + \cos y - \sin^2 y}{1 + \cos y} + \frac{(1 - \cos^2 y) - \sin^2 y}{\sin y(1 - \cos y)}$$

$$= \frac{\cos y(1 + \cos y)}{1 + \cos y} + 0 = \cos y$$

7. Given, $\sin\theta + \operatorname{cosec}\theta = 2$

On squaring both sides, we get

$$\sin^2\theta + \operatorname{cosec}^2\theta + 2 = 4$$

$\Rightarrow$ $\sin^2\theta + \operatorname{cosec}^2\theta = 2$

8. Given, $f(x) = \cos^2 x + \sec^2 x$

Using AM $\geq$ GM

$\therefore$ $\frac{\cos^2 x + \sec^2 x}{2} \geq \sqrt{\cos^2 x \times \sec^2 x}$

$\Rightarrow$ $\cos^2 x + \sec^2 x \geq 2$ $\therefore$ $f(x) \geq 2$

9. Now, on taking option one by one, we get

(a) $\sin 15° = \sin(45° - 30°) = \frac{\sqrt{3} - 1}{2\sqrt{2}}$ = irrational

(b) $\cos 15° = \cos(45° - 30°) = \frac{\sqrt{3} + 1}{2\sqrt{2}}$ = irrational

(c) $\sin 15° \cos 15° = \frac{1}{2}(2\sin 15° \cos 15°)$

$= \frac{1}{2}\sin 30° = \frac{1}{4}$ = rational

(d) $\sin 15° \cos 75° = \sin 15° \sin 15° = \sin^2 15°$

$= \left(\frac{\sqrt{3} - 1}{2\sqrt{2}}\right)^2 = \frac{4 - 2\sqrt{3}}{8}$ = irrational

10. $\sqrt{\frac{1 - \sin\theta}{1 + \sin\theta}} + \sqrt{\frac{1 + \sin\theta}{1 - \sin\theta}} = \frac{1 - \sin\theta + 1 + \sin\theta}{\sqrt{1 - \sin^2\theta}}$

$$= \frac{2}{\sqrt{\cos^2\theta}} = \frac{2}{|\cos\theta|}$$

$$= \frac{2}{-\cos\theta} = -2\sec\theta \quad \left(\because \frac{\pi}{2} < \theta < \pi\right)$$

11. Given that, $\sin\theta = -\frac{4}{5}$ and θ lies in the IIIrd quadrant.

$\Rightarrow$ $\cos\theta = -\sqrt{1 - \frac{16}{25}} = -\frac{3}{5}$

Now, $\cos\frac{\theta}{2} = \pm\sqrt{\frac{1 + \cos\theta}{2}} = \pm\sqrt{\frac{1 - \frac{3}{5}}{2}} = \pm\sqrt{\frac{1}{5}}$

But we take $\cos\frac{\theta}{2} = -\frac{1}{\sqrt{5}}$. Since, if θ lies in IIIrd quadrant, then $\frac{\theta}{2}$ will be in IInd quadrant.

Hence, $\cos\frac{\theta}{2} = -\frac{1}{\sqrt{5}}$

12. Since, $\sec\theta \notin (-1, 1)$

$\therefore$ $\sec\theta \neq \frac{1}{2}$

13. $\cos 1° \cos 2° \cos 3° \ldots \cos 90° \ldots \cos 179°$

$= \cos 1° \cos 2° \cos 3° \ldots 0 \ldots \cos 179° = 0$

14. Given, $\tan\theta = \frac{3}{1}$ $\therefore$ $AC^2 = AB^2 + BC^2$

$= 1^2 + 3^2 = 1 + 9 = 10$

$AC = \sqrt{10}$

$\sin\theta = -\frac{3}{\sqrt{10}}$

($\because \theta$ lies in IIIrd quadrant, so $\sin\theta$ will be negative)

15. $\therefore \tan 75° - \cot 75°$

$$= \tan(45° + 30°) - \cot(45° + 30°)$$

$$= \frac{\tan 45° + \tan 30°}{1 - \tan 45° \tan 30°} - \frac{\cot 45° \cot 30° - 1}{\cot 45° + \cot 30°}$$

$$= \frac{1 + \frac{1}{\sqrt{3}}}{1 - \frac{1}{\sqrt{3}}} - \frac{\sqrt{3} - 1}{1 + \sqrt{3}} = \frac{(\sqrt{3} + 1)}{(\sqrt{3} - 1)} - \frac{\sqrt{3} - 1}{\sqrt{3} + 1}$$

$$= \frac{(3 + 1 + 2\sqrt{3})}{3 - 1} - (3 + 1 - 2\sqrt{3})$$

$$= \frac{4\sqrt{3}}{2} = 2\sqrt{3}$$

16. $\because 1 \text{ radian} = \frac{180°}{\pi} = 57°30' \text{ app}$

Since, $\sin\theta$ is increasing from 0 to 90°

$\therefore \quad \sin 1 > \sin 1°$

17. Given $\tan\alpha = \frac{m}{m+1}$, $\tan\beta = \frac{1}{2m+1}$

$$\therefore \quad \tan(\alpha + \beta) = \frac{\tan\alpha + \tan\beta}{1 - \tan\alpha \tan\beta}$$

$$= \frac{\frac{m}{m+1} + \frac{1}{2m+1}}{1 - \frac{m}{m+1} \times \frac{1}{2m+1}} = \frac{2m^2 + m + m + 1}{(m+1)(2m+1) - m}$$

$$= \frac{2m^2 + 2m + 1}{2m^2 + 3m + 1 - m} = \frac{2m^2 + 2m + 1}{2m^2 + 2m + 1} = 1$$

$\Rightarrow \quad \tan(\alpha + \beta) = 1$

$\Rightarrow \quad \alpha + \beta = \frac{\pi}{4}$

18. We have, $\sqrt{\operatorname{cosec}^2\alpha + 2\cot\alpha}$

$$= \sqrt{1 + \cot^2\alpha + 2\cot\alpha} = |1 + \cot\alpha|$$

But $\quad \frac{3\pi}{4} < \alpha < \pi$

$\Rightarrow \quad \cot\alpha < -1 \Rightarrow 1 + \cot\alpha < 0$

Hence, $\quad |1 + \cot\alpha| = -(1 + \cot\alpha)$

19. Since, $\quad \tan A + \sin A = m$

and $\quad \tan A - \sin A = n$

$\therefore \quad m + n = 2\tan A$

and $\quad m - n = 2\sin A$

Also, $\quad mn = (\tan A + \sin A)(\tan A - \sin A)$

$$= \tan^2 A - \sin^2 A$$

Now, $\quad \frac{(m^2 - n^2)^2}{mn} = \frac{(m+n)^2(m-n)^2}{mn} = \frac{(2\tan A)^2(2\sin A)^2}{\tan^2 A - \sin^2 A}$

$$= \frac{16\tan^2 A \sin^2 A}{\sin^2 A \tan^2 A} = 16$$

20. $6(\sin^6\theta + \cos^6\theta) - 9(\sin^4\theta + \cos^4\theta) + 4$

$$= 6[(\sin^2\theta + \cos^2\theta)^3 - 3\sin^2\theta\cos^2\theta(\sin^2\theta + \cos^2\theta)]$$
$$- 9[(\sin^2\theta + \cos^2\theta)^2 - 2\sin^2\theta\cos^2\theta] + 4$$

$$= 6[1 - 3\sin^2\theta\cos^2\theta] - 9(1 - 2\sin^2\theta\cos^2\theta) + 4$$

$$= 6 - 9 + 4 = 1$$

21. Given, $\quad \frac{2\sin\alpha}{1 + \cos\alpha + \sin\alpha} = x$

$\Rightarrow \quad \frac{2\sin\alpha(1 - \cos\alpha - \sin\alpha)}{(1 + \cos\alpha + \sin\alpha)(1 - \cos\alpha - \sin\alpha)} = x$

$\Rightarrow \quad \frac{2\sin\alpha(1 - \cos\alpha - \sin\alpha)}{1 - \sin^2\alpha - \cos^2\alpha - 2\sin\alpha\cos\alpha} = x$

$\Rightarrow \quad \frac{1 - \cos\alpha - \sin\alpha}{\cos\alpha} = -x$

22. Given that, $\quad \sin\theta + \cos\theta = m \quad$ ...(i)

and $\quad \sec\theta + \operatorname{cosec}\theta = n \quad$ ...(ii)

Now, $\quad n(m+1)(m-1) = n(m^2 - 1)$

$$= (\sec\theta + \operatorname{cosec}\theta)\, 2\sin\theta\cos\theta$$
$$(\because m^2 = 1 + 2\sin\theta\cos\theta)$$

$$= \frac{\sin\theta + \cos\theta}{\sin\theta\cos\theta} 2\sin\theta\cos\theta$$

$$= 2m \quad \text{[from Eq. (i)]}$$

23. We have, $\quad \frac{x}{\cos\theta} = \frac{y}{\cos\left(\theta - \frac{2\pi}{3}\right)} = \frac{z}{\cos\left(\theta + \frac{2\pi}{3}\right)}$

Therefore, each ratio is equal to

$$\frac{x + y + z}{\cos\theta + \cos\left(\theta - \frac{2\pi}{3}\right) + \cos\left(\theta + \frac{2\pi}{3}\right)}$$

$$= \frac{x + y + z}{\cos\theta + 2\cos\theta\cos\frac{2\pi}{3}} = \frac{x + y + z}{0}$$

$\Rightarrow \quad x + y + z = 0$

24. We have, $\quad \frac{\sqrt{1 + \sin x} + \sqrt{1 - \sin x}}{\sqrt{1 + \sin x} - \sqrt{1 - \sin x}}$

$$= \frac{\sqrt{\left(\sin\frac{x}{2} + \cos\frac{x}{2}\right)^2} + \sqrt{\left(\sin\frac{x}{2} - \cos\frac{x}{2}\right)^2}}{\sqrt{\left(\sin\frac{x}{2} + \cos\frac{x}{2}\right)^2} - \sqrt{\left(\sin\frac{x}{2} - \cos\frac{x}{2}\right)^2}}$$

$$= \frac{\cos\frac{x}{2} + \sin\frac{x}{2} + \sin\frac{x}{2} - \cos\frac{x}{2}}{\cos\frac{x}{2} + \sin\frac{x}{2} - \sin\frac{x}{2} + \cos\frac{x}{2}} = \tan\frac{x}{2}$$

25. Since, $\quad (2\tan\theta + 2)^2 = \tan\theta(3\tan\theta + 3)$

$\Rightarrow \quad 4\tan^2\theta + 8\tan\theta + 4 = 3\tan^2\theta + 3\tan\theta$

$\Rightarrow \quad \tan^2\theta + 5\tan\theta + 4 = 0$

$\Rightarrow \quad (\tan\theta + 4)(\tan\theta + 1) = 0$

$\Rightarrow \quad \tan\theta = -4 \quad (\because \tan\theta \neq -1)$

$$\therefore \quad \frac{7 - 5\cot\theta}{9 - 4\sqrt{\tan^2\theta}} = \frac{7 + \frac{5}{4}}{9 - 4(-4)} = \frac{33}{100}$$

26. Given that, $ABCD$ is a cyclic quadrilateral.

So, $A + C = 180° \Rightarrow A = 180° - C$

$\Rightarrow \cos A = \cos(180° - C) = -\cos C$

$\Rightarrow \cos A + \cos C = 0$ ...(i)

Similarly, $\cos B + \cos D = 0$ ...(ii)

On adding Eqs. (i) and (ii), we get

$$\cos A + \cos B + \cos C + \cos D = 0$$

27. Given that, $2 \sin A = \sqrt{3} \sin B$

$\Rightarrow 2\sqrt{5} \sin A = \sqrt{15} \sin B$ ...(i)

and $2 \cos A = \sqrt{5} \cos B$

$\Rightarrow 2\sqrt{3} \cos A = \sqrt{15} \cos B$ ...(ii)

On squaring and adding Eqs. (i) and (ii), we get

$$20 \sin^2 A + 12 \cos^2 A = 15$$

$\Rightarrow 8 \sin^2 A = 3 \Rightarrow \sin^2 A = \frac{3}{8}$

$\Rightarrow \cos^2 A = \frac{5}{8}$

$\therefore \frac{\sin^2 A}{\cos^2 A} = \frac{3}{5} \Rightarrow \tan A = \sqrt{\frac{3}{5}}$

28. Given, $a \cos^3 \alpha + 3a \cos \alpha \sin^2 \alpha = m$

and $a \sin^3 \alpha + 3a \cos^2 \alpha \sin \alpha = n$

$\therefore (m + n) = a \cos^3 \alpha + 3a \cos \alpha \sin^2 \alpha + 3a \cos^2 \alpha \sin \alpha + a \sin^3 \alpha$

$= a (\cos \alpha + \sin \alpha)^3$

and similarly, $(m - n) = a(\cos \alpha - \sin \alpha)^3$

$\therefore (m + n)^{2/3} + (m - n)^{2/3}$

$= a^{2/3} \{(\cos \alpha + \sin \alpha)^2 + (\cos \alpha - \sin \alpha)^2\}$

$= a^{2/3}\{2 (\cos^2 \alpha + \sin^2 \alpha)\} = 2 a^{2/3}$

29. Given that, $\cos \theta = \frac{1}{2}\left(x + \frac{1}{x}\right)$

$\Rightarrow x + \frac{1}{x} = 2 \cos \theta$ ...(i)

We know that,

$$x^2 + \frac{1}{x^2} = \left(x + \frac{1}{x}\right)^2 - 2$$

$= (2 \cos \theta)^2 - 2 = 4 \cos^2 \theta - 2$

$= 2 \cos 2\theta$ [from Eq. (i)]

$\therefore \frac{1}{2}\left(x^2 + \frac{1}{x^2}\right) = \frac{1}{2} \times 2 \cos 2\theta = \cos 2\theta$

30. We have, $3\left[\sin^4\left(\frac{3\pi}{2} - \alpha\right) + \sin^4(3\pi + \alpha)\right] - 2\left[\sin^6\left(\frac{\pi}{2} + \alpha\right) + \sin^6(5\pi - \alpha)\right]$

$= 3[(-\cos \alpha)^4 + (-\sin \alpha)^4] - 2 [\cos^6 \alpha + \sin^6 \alpha]$

$= 3[(\cos^2 \alpha + \sin^2 \alpha)^2 - 2 \sin^2 \alpha \cos^2 \alpha]$

$- 2[(\cos^2 \alpha + \sin^2 \alpha)^3 - 3 \cos^2 \alpha \sin^2 \alpha (\cos^2 \alpha + \sin^2 \alpha)]$

$= 3 - 6 \sin^2 \alpha \cos^2 \alpha - 2 + 6 \sin^2 \alpha \cos^2 \alpha = 3 - 2 = 1$

31. Since, $\tan x + \frac{1}{\tan x} = 2$

$\Rightarrow \tan x = 1 \Rightarrow x = \frac{\pi}{4}$

$\therefore \sin x = \frac{1}{\sqrt{2}}$

and $\cos x = \frac{1}{\sqrt{2}}$

Hence, $\sin^{2n} x + \cos^{2n} x = \frac{1}{2^n} + \frac{1}{2^n} = \frac{1}{2^{n-1}}$

32. Maximum value of $\cos \theta = 1$

So, the equation can have solution only when

$\cos x = 1, \quad \cos y = 1$

$\Rightarrow x = 0, \quad y = 0$

$\Rightarrow \cos (x - y) = \cos 0 = 1$

33. $\because \sin\left(\frac{\pi}{2n}\right) + \cos\left(\frac{\pi}{2n}\right) = \frac{\sqrt{n}}{2}$

On squaring both sides, we get

$$\sin^2\left(\frac{\pi}{2n}\right) + \cos^2\left(\frac{\pi}{2n}\right) + \sin\left(\frac{\pi}{n}\right) = \frac{n}{4}$$

$\Rightarrow \sin\left(\frac{\pi}{n}\right) = \frac{n}{4} - 1$

$\Rightarrow \sin\left(\frac{\pi}{n}\right) = \frac{n - 4}{4}$

$\Rightarrow n = 6$ only

34. Given, $m \sin \theta = n \sin (\theta + 2\alpha)$

$\Rightarrow \frac{m}{n} = \frac{\sin(\theta + 2\alpha)}{\sin \theta}$

Applying componendo and dividendo rule, we get

$$\frac{m + n}{m - n} = \frac{\sin(\theta + 2\alpha) + \sin \theta}{\sin (\theta + 2\alpha) - \sin \theta}$$

$= \frac{2 \sin(\theta + \alpha) \cos \alpha}{2 \cos (\theta + \alpha) \sin \alpha}$

$= \tan (\theta + \alpha) \cot \alpha$

35. $\frac{\sin (B + A) + \cos (B - A)}{\sin (B - A) + \cos (B + A)}$

$= \frac{\sin (B + A) + \sin (90° - \overline{B - A})}{\sin (B - A) + \sin (90° - \overline{A + B})}$

$= \frac{2 \sin (A + 45°) \cos (45° - B)}{2 \sin (45° - A) \cos (45° - B)}$

$= \frac{\sin (A + 45°)}{\sin (45° - A)} = \frac{\frac{1}{\sqrt{2}} \sin A + \frac{1}{\sqrt{2}} \cos A}{\frac{1}{\sqrt{2}} \cos A - \frac{1}{\sqrt{2}} \sin A}$

$= \frac{\cos A + \sin A}{\cos A - \sin A}$

36. We have,

$$\cos^2(A-B)+\cos^2 B-2\cos(A-B)\cos A\cos B$$
$$=\cos^2(A-B)+\cos^2 B-\cos(A-B)\times[\cos(A-B)+\cos(A+B)]$$
$$=\cos^2 B-\cos(A-B)\cos(A+B)$$
$$=\cos^2 B-(\cos^2 A-\sin^2 B)$$
$$=1-\cos^2 A=\sin^2 A$$

Hence, it depends on A.

37. Given, $\dfrac{\sin A-\sin C}{\cos C-\cos A}=\cot B$

$$\Rightarrow \quad \frac{2\cos\left(\frac{A+C}{2}\right)\sin\left(\frac{A-C}{2}\right)}{2\sin\left(\frac{A+C}{2}\right)\sin\left(\frac{A-C}{2}\right)}=\cot B$$

$$\Rightarrow \quad \cot\left(\frac{A+C}{2}\right)=\cot B$$

$$\Rightarrow \quad B=\frac{A+C}{2}$$

Hence, A, B and C will be in AP.

38. Given, $\tan\theta=\dfrac{1}{2}$ and $\tan\phi=\dfrac{1}{3}$

$$\therefore \quad \tan(\theta+\phi)=\frac{\tan\theta+\tan\phi}{1-\tan\theta\tan\phi}$$
$$=\frac{\frac{1}{2}+\frac{1}{3}}{1-\frac{1}{2}\times\frac{1}{3}}=\frac{\frac{5}{6}}{\frac{5}{6}}=1\Rightarrow \theta+\phi=\frac{\pi}{4}$$

39. $\dfrac{1-\tan^2 15^\circ}{1+\tan^2 15^\circ}=\dfrac{\cos^2 15^\circ-\sin^2 15^\circ}{\cos^2 15^\circ+\sin^2 15^\circ}$

$$=\frac{\cos 2\times 15^\circ}{1}=\cos 30^\circ=\frac{\sqrt{3}}{2}$$

40. We have, $\cos(\alpha+\beta)=\dfrac{4}{5}$ and $\sin(\alpha-\beta)=\dfrac{5}{13}$

$$\Rightarrow \quad \sin(\alpha+\beta)=\frac{3}{5} \quad \text{and} \quad \cos(\alpha-\beta)=\frac{12}{13}$$

$$\Rightarrow \quad (\alpha+\beta)=\sin^{-1}\frac{3}{5} \quad \text{and} \quad (\alpha-\beta)=\sin^{-1}\frac{5}{13}$$

$$\therefore \quad 2\alpha=\sin^{-1}\frac{3}{5}+\sin^{-1}\frac{5}{13}$$
$$=\sin^{-1}\left[\frac{3}{5}\sqrt{1-\frac{25}{169}}+\frac{5}{13}\sqrt{1-\frac{9}{25}}\right]$$
$$=\sin^{-1}\left(\frac{3}{5}\times\frac{12}{13}+\frac{5}{13}\times\frac{4}{5}\right)=\sin^{-1}\left(\frac{36}{65}+\frac{20}{65}\right)$$

$$\Rightarrow \quad \sin 2\alpha=\frac{56}{65}$$

$$\therefore \quad \tan 2\alpha=\frac{56}{33}$$

41. $\left(\dfrac{\cos A+\cos B}{\sin A-\sin B}\right)^n+\left(\dfrac{\sin A+\sin B}{\cos A-\cos B}\right)^n$

$$=\left[\frac{2\cos\left(\frac{A+B}{2}\right)\cos\left(\frac{A-B}{2}\right)}{2\cos\left(\frac{A+B}{2}\right)\sin\left(\frac{A-B}{2}\right)}\right]^n+\left[\frac{2\sin\left(\frac{A+B}{2}\right)\cos\left(\frac{A-B}{2}\right)}{2\sin\left(\frac{A+B}{2}\right)\sin\left(\frac{B-A}{2}\right)}\right]^n$$

$$=\cot^n\left(\frac{A-B}{2}\right)+\cot^n\left(\frac{B-A}{2}\right)$$
$$=\cot^n\left(\frac{A-B}{2}\right)+(-1)^n\cot\left(\frac{A-B}{2}\right)$$
$$=2\cot^n\left(\frac{A-B}{2}\right) \qquad (\because n \text{ is even})$$

42. Given, $\sin\alpha=\dfrac{15}{17}$, $\tan\beta=\dfrac{12}{5}$

Since, $\dfrac{\pi}{2}<\alpha<\pi, \quad \pi<\beta<\dfrac{3\pi}{2}$

$$\therefore \quad \cos\alpha=-\frac{8}{17}, \quad \sin\beta=-\frac{12}{13}$$

and $\cos\beta=-\dfrac{5}{13}$

Now, $\sin(\beta-\alpha)=\sin\beta\cos\alpha-\cos\beta\sin\alpha$

$$=-\frac{12}{13}\left(\frac{-8}{17}\right)-\left(\frac{-5}{13}\right)\left(\frac{15}{17}\right)$$
$$=\frac{96}{221}+\frac{75}{221}=\frac{171}{221}$$

43. Given equations may be written as

$\cos x+\cos y=-\cos\alpha$

and $\sin x+\sin y=-\sin\alpha$

$$\Rightarrow \quad 2\cos\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right)=-\cos\alpha \qquad \text{...(i)}$$

$$\text{and} \quad 2\sin\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right)=-\sin\alpha \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{2\cos\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right)}{2\sin\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right)}=\frac{\cos\alpha}{\sin\alpha}$$

$$\Rightarrow \quad \cot\left(\frac{x+y}{2}\right)=\cot\alpha$$

44. We have, $\tan(\alpha+\beta)=\dfrac{\tan\alpha+\tan\beta}{1-\tan\alpha\tan\beta}$

$$\because \quad \tan\alpha=\frac{1}{1+2^{-x}} \text{ and } \tan\beta=\frac{1}{1+2^{x+1}}$$

$$\therefore \quad \tan(\alpha+\beta) = \frac{\dfrac{1}{1+\dfrac{1}{2^x}} + \dfrac{1}{1+2^{x+1}}}{1 - \dfrac{1}{1+\dfrac{1}{2^x}} \cdot \dfrac{1}{1+2^{x+1}}}$$

$$\Rightarrow \quad \tan(\alpha+\beta) = \frac{2^x + 2\cdot 2^{2x} + 2^x + 1}{1 + 2^x + 2\cdot 2^x + 2\cdot 2^{2x} - 2^x}$$

$$\Rightarrow \quad \tan(\alpha+\beta) = 1$$

$$\Rightarrow \quad \alpha+\beta = \frac{\pi}{4}$$

45. We know that,

$$\alpha - \beta = (\theta-\beta) - (\theta-\alpha)$$

$$\therefore \quad \cos(\alpha-\beta) = \cos(\theta-\beta)\cos(\theta-\alpha) + \sin(\theta-\beta)\sin(\theta-\alpha)$$

$$= ab + \sqrt{1-a^2}\sqrt{1-b^2}$$

and $\quad \sin(\alpha-\beta) = \pm\,(a\sqrt{1-b^2} - b\sqrt{1-a^2})$

$$\Rightarrow \quad \sin^2(\alpha-\beta) = a^2 + b^2 - 2a^2b^2 - 2\,ab\sqrt{1-a^2}\sqrt{1-b^2}$$

$$\Rightarrow \quad \sin^2(\alpha-\beta) = a^2 + b^2 - 2\,a^2b^2 - 2\,ab[\cos(\alpha-\beta) - ab]$$

$$\therefore \quad \sin^2(\alpha-\beta) = a^2 + b^2 - 2\,ab\cos(\alpha-\beta)$$

$$\Rightarrow \quad \sin^2(\alpha-\beta) + 2\,ab\cos(\alpha-\beta) = a^2 + b^2$$

46. We have, $\quad \cos A = m\cos B$

$$\Rightarrow \quad \frac{\cos A}{\cos B} = \frac{m}{1}$$

$$\Rightarrow \quad \frac{\cos A + \cos B}{\cos A - \cos B} = \frac{m+1}{m-1}$$

$$\Rightarrow \quad \frac{2\cos\dfrac{A+B}{2}\cos\dfrac{B-A}{2}}{2\sin\dfrac{A+B}{2}\sin\dfrac{B-A}{2}} = \frac{m+1}{m-1}$$

$$\Rightarrow \quad \cot\frac{A+B}{2} = \left(\frac{m+1}{m-1}\right)\tan\frac{B-A}{2}$$

But $\quad \cot\dfrac{A+B}{2} = \lambda\tan\dfrac{B-A}{2}$

$$\therefore \quad \lambda = \frac{m+1}{m-1}$$

47. $\sin(45^\circ + \theta) - \cos(45^\circ - \theta)$

$$= \sin 45^\circ\cos\theta + \cos 45^\circ\sin\theta - [\cos 45^\circ\cos\theta + \sin 45^\circ\sin\theta]$$

$$= \frac{1}{\sqrt{2}}\cos\theta + \frac{1}{\sqrt{2}}\sin\theta - \left[\frac{1}{\sqrt{2}}\cos\theta + \frac{1}{\sqrt{2}}\sin\theta\right]$$

$$= 0$$

48. $\cos 2\theta\cos 2\phi + \sin^2(\theta-\phi) - \sin^2(\theta+\phi)$

$$= \cos 2\theta\cos 2\phi + \sin(\theta-\phi+\theta+\phi)\sin(\theta-\phi-(\theta+\phi))$$

$$(\because \sin^2 A - \sin^2 B = \sin(A+B)\sin(A-B))$$

$$= \cos 2\theta\cos 2\phi + \sin 2\theta\sin(-2\phi)$$

$$= \cos 2\theta\cos 2\phi - \sin 2\theta\sin 2\phi$$

$$= \cos(2\theta + 2\phi) = \cos 2(\theta+\phi)$$

49. $\cos 12^\circ + \cos 84^\circ + \cos 156^\circ + \cos 132^\circ$

$$= \cos 156^\circ + \cos 84^\circ + \cos 132^\circ + \cos 12^\circ$$

$$= 2\cos\left(\frac{156^\circ + 84^\circ}{2}\right)\cos\left(\frac{156^\circ - 84^\circ}{2}\right) + 2\cos\left(\frac{132^\circ + 12^\circ}{2}\right)\cos\left(\frac{132^\circ - 12^\circ}{2}\right)$$

$$= 2\cos 120^\circ\cos 36^\circ + 2\cos 72^\circ\cos 60^\circ$$

$$= 2\left(-\frac{1}{2}\right)\cos 36^\circ + 2\cos 72^\circ \times \frac{1}{2}$$

$$= -\cos 36^\circ + \cos 72^\circ$$

$$= -\frac{\sqrt{5}+1}{4} + \frac{\sqrt{5}-1}{4} = -\frac{1}{2}$$

50. Given equation can be written as

$$\left(1+\cos\frac{\pi}{8}\right)\left(1+\cos\frac{7\pi}{8}\right)\left(1+\cos\frac{3\pi}{8}\right)\left(1+\cos\frac{5\pi}{8}\right)$$

$$= \left(1+\cos\frac{\pi}{8} + \cos\frac{7\pi}{8} + \cos\frac{\pi}{8}\cos\frac{7\pi}{8}\right)\left(1+\cos\frac{3\pi}{8} + \cos\frac{5\pi}{8} + \cos\frac{3\pi}{8}\cos\frac{5\pi}{8}\right)$$

$$= \left(1+\cos\frac{\pi}{8} - \cos\frac{\pi}{8} + \cos\frac{\pi}{8}\cos\frac{7\pi}{8}\right)\left(1-\cos\frac{5\pi}{8} + \cos\frac{5\pi}{8} + \cos\frac{3\pi}{8}\cos\frac{5\pi}{8}\right)$$

$$= \left(1+\cos\frac{\pi}{8}\cos\frac{7\pi}{8}\right)\left(1+\cos\frac{3\pi}{8}\cos\frac{5\pi}{8}\right)$$

$$= \frac{1}{4}\left(2 + 2\cos\frac{\pi}{8}\cos\frac{7\pi}{8}\right)\left(2 + 2\cos\frac{3\pi}{8}\cos\frac{5\pi}{8}\right)$$

$$= \frac{1}{4}\left(2 + \cos\frac{3\pi}{4} + \cos\pi\right)\left(2 + \cos\frac{\pi}{4} + \cos\pi\right)$$

$$= \frac{1}{4}\left(1+\cos\frac{3\pi}{4}\right)\left(1+\cos\frac{\pi}{4}\right) = \frac{1}{4}\left(1-\cos\frac{\pi}{4}\right)\left(1+\cos\frac{\pi}{4}\right)$$

$$= \frac{1}{4}\left(1-\cos^2\frac{\pi}{4}\right) = \frac{1}{4}\left(1-\frac{1}{2}\right) = \frac{1}{8}$$

51. Given, $\cos\alpha + \cos\beta = 0$ and $\sin\alpha + \sin\beta = 0$

On squaring and subtracting both the equations, we get

$$(\cos\alpha + \cos\beta)^2 - (\sin\alpha + \sin\beta)^2 = 0$$

$$\Rightarrow \quad (\cos^2\alpha + \cos^2\beta + 2\cos\alpha\cos\beta) - (\sin^2\alpha + \sin^2\beta + 2\sin\alpha\sin\beta) = 0$$

$$\Rightarrow \quad (\cos^2\alpha - \sin^2\alpha) + (\cos^2\beta - \sin^2\beta) + 2[\cos\alpha\cos\beta - \sin\alpha\sin\beta] = 0$$

$$\Rightarrow \quad \cos 2\alpha + \cos 2\beta + 2\cos(\alpha+\beta) = 0$$

$$\Rightarrow \quad \cos 2\alpha + \cos 2\beta = -2\cos(\alpha+\beta)$$

52. Now, $\sin(\alpha-\beta) = \sin(\theta-\beta-(\theta-\alpha))$

$$= \sin(\theta-\beta)\cos(\theta-\alpha) - \cos(\theta-\beta)\sin(\theta-\alpha)$$

$$= ba - \sqrt{1-b^2}\sqrt{1-a^2}$$

and $\quad \cos(\alpha-\beta) = \cos(\theta-\beta-(\theta-\alpha))$

$= \cos(\theta-\beta)\cos(\theta-\alpha) + \sin(\theta-\beta)\sin(\theta-\alpha)$

$= a\sqrt{1-b^2} + b\sqrt{1-a^2}$

$\therefore\ \cos^2(\alpha-\beta) + 2\,ab\sin(\alpha-\beta)$

$= (a\sqrt{1-b^2} + b\sqrt{1-a^2})^2 + 2\,ab\,(ab - \sqrt{1-a^2}\,\sqrt{1-b^2})$

$= a^2 + b^2$

53. $\sin 20^\circ \sin 40^\circ \sin 60^\circ \sin 80^\circ$

$= \frac{1}{2}\sin 20^\circ \sin 60^\circ (2\sin 40^\circ \sin 80^\circ)$

$= \frac{1}{2}\sin 20^\circ \sin 60^\circ (\cos 40^\circ - \cos 120^\circ)$

$= \frac{1}{2}\cdot\frac{\sqrt{3}}{2}\sin 20^\circ\left(1 - 2\sin^2 20^\circ + \frac{1}{2}\right)$

$= \frac{\sqrt{3}}{4}\sin 20^\circ\left(\frac{3}{2} - 2\sin^2 20^\circ\right)$

$= \frac{\sqrt{3}}{8}(3\sin 20^\circ - 4\sin^3 20^\circ)$

$= \frac{\sqrt{3}}{8}\sin 60^\circ = \frac{\sqrt{3}}{8}\cdot\frac{\sqrt{3}}{2} = \frac{3}{16}$

54. $\cos\frac{\pi}{5}\cos\frac{2\pi}{5}\cos\frac{4\pi}{5}\cos\frac{8\pi}{5} = \frac{\sin 2^4\frac{\pi}{5}}{2^4\sin\frac{\pi}{5}}$

$\left(\because \cos x\cos 2x\cos 4x\ldots\cos 2nx = \frac{\sin 2^n x}{2^n\sin x}\right)$

$= \frac{\sin\frac{16\pi}{5}}{16\sin\frac{\pi}{5}} = \frac{\sin\left(3\pi + \frac{\pi}{5}\right)}{16\sin\frac{\pi}{5}}$

$= \frac{-\sin\frac{\pi}{5}}{16\sin\frac{\pi}{5}} = -\frac{1}{16}$

55. $\cos^2 48^\circ - \sin^2 12^\circ = \cos(48^\circ + 12^\circ)\cos(48^\circ - 12^\circ)$

$[\because \cos^2 A - \sin^2 B = \cos(A+B)\cos(A-B)]$

$= \cos 60^\circ \cos 36^\circ$

$= \frac{1}{2}\times\frac{\sqrt{5}+1}{4} = \frac{\sqrt{5}+1}{8}$

56. $\sin(\alpha+\beta+\gamma) = \sin\alpha\cos\beta\cos\gamma$

$+ \cos\alpha\sin\beta\cos\gamma + \cos\alpha\cos\beta\sin\gamma - \sin\alpha\sin\beta\sin\gamma$

$\Rightarrow \sin(\alpha+\beta+\gamma) - \sin\alpha - \sin\beta - \sin\gamma$

$= \sin\alpha(\cos\beta\cos\gamma - 1) + \sin\beta(\cos\alpha\cos\gamma - 1)$

$+ \sin\gamma(\cos\alpha\cos\beta - 1) - \sin\alpha\sin\beta\sin\gamma$

$\Rightarrow \sin(\alpha+\beta+\gamma) - \sin\alpha - \sin\beta - \sin\gamma < 0$

$\Rightarrow \sin(\alpha+\beta+\gamma) < \sin\alpha + \sin\beta + \sin\gamma$

$\Rightarrow \frac{\sin(\alpha+\beta+\gamma)}{\sin\alpha + \sin\beta + \sin\gamma} < 1$

57. Let $A + B = \theta$ and $A - B = \phi$

Then, $\tan A = k\tan B$

$\Rightarrow \frac{\tan A}{\tan B} = \frac{k}{1}$

$\Rightarrow \frac{k}{1} = \frac{\sin A\cos B}{\cos A\sin B}$

Applying componendo and dividendo rule, we get

$\frac{k+1}{k-1} = \frac{\sin A\cos B + \cos A\sin B}{\sin A\cos B - \cos A\sin B}$

$= \frac{\sin(A+B)}{\sin(A-B)} = \frac{\sin\theta}{\sin\phi}$

$\Rightarrow \sin\theta = \frac{k+1}{k-1}\sin\phi$

58. Since, $A + B + C = \pi$

$\Rightarrow A = \pi - (B + C)$

We have, $\cos A = \cos B\cos C$

$\Rightarrow \cos[\pi - (B+C)] = \cos B\cos C$

$\Rightarrow -\cos(B+C) = \cos B\cos C$

$\Rightarrow -[\cos B\cos C - \sin B\sin C] = \cos B\cos C$

$\Rightarrow \sin B\sin C = 2\cos B\cos C$

$\Rightarrow \tan B\tan C = 2$

59. $\frac{1}{m} = \frac{\cos(\theta-\phi)}{\cos(\theta+\phi)}$

Applying componendo and dividendo rule,

$\frac{1-m}{1+m} = \frac{\cos(\theta-\phi) - \cos(\theta+\phi)}{\cos(\theta-\phi) + \cos(\theta+\phi)}$

$= \frac{2\sin(\theta)\sin(\phi)}{2\cos(\theta)\cos(-\phi)} = \tan\theta\tan\phi$

$\therefore \left(\frac{1-m}{1+m}\cot\phi\right) = \tan\theta$

60. Now, $\sin 12^\circ \sin 48^\circ \sin 54^\circ$

$= \frac{1}{2}(\cos 36^\circ - \cos 60^\circ)\cos 36^\circ$

$= \frac{1}{2}\left[\frac{\sqrt{5}+1}{4} - \frac{1}{2}\right]\left[\frac{\sqrt{5}+1}{4}\right]$

$= \frac{1}{2}\left[\frac{\sqrt{5}-1}{4}\right]\left[\frac{\sqrt{5}+1}{4}\right]$

$= \frac{5-1}{32} = \frac{4}{32} = \frac{1}{8}$

61. $1 + \cos 56^\circ + \cos 58^\circ - \cos 66^\circ$

$= 2\cos^2 28^\circ + 2\sin 62^\circ \sin 4^\circ$

$= 2\cos^2 28^\circ + 2\cos 28^\circ\cos 86^\circ$

$= 2\cos 28^\circ(\cos 28^\circ + \cos 86^\circ)$

$= 2\cos 28^\circ(2\cos 57^\circ\cos 29^\circ)$

$= 4\cos 28^\circ\cos 29^\circ\sin 33^\circ$

62. Now, $\tan\frac{\pi}{3} = \tan\left(\frac{6\pi}{15} - \frac{\pi}{15}\right) = \dfrac{\tan\frac{6\pi}{15} - \tan\frac{\pi}{15}}{1 + \tan\frac{6\pi}{15}\tan\frac{\pi}{15}}$

$\Rightarrow \tan\frac{6\pi}{15} - \tan\frac{\pi}{15} = \sqrt{3} + \sqrt{3}\tan\frac{6\pi}{15}\tan\frac{\pi}{15}$

$\Rightarrow \tan\frac{6\pi}{15} - \tan\frac{\pi}{15} - \sqrt{3}\tan\frac{6\pi}{15}\tan\frac{\pi}{15} = \sqrt{3}$

$\Rightarrow \tan\frac{2\pi}{5} - \tan\frac{\pi}{15} - \sqrt{3}\tan\frac{2\pi}{5}\tan\frac{\pi}{15} = \sqrt{3}$

63. We have,

$$S = \sin\theta + \sin 2\theta + \sin 3\theta + \ldots + \sin n\theta$$

We know that,

$\sin\theta + \sin(\theta + \beta) + \sin(\theta + 2\beta) + \ldots n$ terms

$$= \frac{\sin\frac{n\beta}{2}}{\sin\frac{\beta}{2}}\sin\left[\frac{\theta + \theta + (n-1)\beta}{2}\right]$$

Put $\beta = \theta$,

$$\therefore \quad S = \frac{\sin\frac{n\theta}{2}\cdot\sin\frac{(n+1)\theta}{2}}{\sin\frac{\theta}{2}}$$

64. We have, $\sin^3 x\sin 3x = \sum_{m=0}^{n} c_m \cos mx$

Now, $\sin^3 x\sin 3x = \frac{1}{4}(3\sin x - \sin 3x)\sin 3x$

$= \frac{3}{8}\cdot 2\sin x\sin 3x - \frac{1}{8}\cdot 2\sin^2 3x$

$= \frac{3}{8}(\cos 2x - \cos 4x) - \frac{1}{8}(1 - \cos 6x)$

$= -\frac{1}{8} + \frac{3}{8}\cos 2x - \frac{3}{8}\cos 4x + \frac{1}{8}\cos 6x \quad \ldots(i)$

$$\text{RHS} = \sum_{m=0}^{n} c_m \cos mx = c_0 + c_1\cos x + c_2\cos 2x + c_3\cos 3x + \ldots + c_n\cos nx \ldots(ii)$$

On comparing Eqs. (i) and (ii), we get

$$n = 6$$

65. We have, $x\cos\theta = y\cos\left(\theta + \frac{2\pi}{3}\right)$

$= z\cos\left(\theta + \frac{4\pi}{3}\right) = k$ (say)

$\Rightarrow \cos\theta = \frac{k}{x}, \quad \cos\left(\theta + \frac{2\pi}{3}\right) = \frac{k}{y}$ and $\cos\left(\theta + \frac{4\pi}{3}\right) = \frac{k}{z}$

$\therefore \quad \frac{k}{x} + \frac{k}{y} + \frac{k}{z} = \cos\theta + \cos\left(\theta + \frac{2\pi}{3}\right) + \cos\left(\theta + \frac{4\pi}{3}\right)$

$= \cos\theta - \cos\left(\frac{\pi}{3} - \theta\right) - \cos\left(\frac{\pi}{3} + \theta\right)$

$= \cos\theta - 2\cos\frac{\pi}{3}\cos\theta = 0$

$\Rightarrow \quad \frac{1}{x} + \frac{1}{y} + \frac{1}{z} = 0$

66. Since, $A + B + C = \frac{3\pi}{2}$

$\therefore \cos 2A + \cos 2B + \cos 2C$

$= 2\cos(A + B)\cos(A - B) + \cos 2C$

$= 2\cos\left(\frac{3\pi}{2} - C\right)\cos(A - B) + 1 - 2\sin^2 C$

$= 1 - 2\sin C\left[\cos(A - B) + \sin\left(\frac{3\pi}{2} - (A + B)\right)\right]$

$= 1 - 2\sin C[\cos(A - B) - \cos(A + B)]$

$= 1 - 4\sin A\sin B\sin C$

67. We have, $\alpha + \beta - \gamma = \pi$

Now, $\sin^2\alpha + \sin^2\beta - \sin^2\gamma$

$= \sin^2\alpha + \sin(\beta - \gamma)\sin(\beta + \gamma)$

$= \sin^2\alpha + \sin(\pi - \alpha)\sin(\beta + \gamma) \quad (\because \alpha + \beta - \gamma = \pi)$

$= \sin^2\alpha + \sin\alpha\sin(\beta + \gamma)$

$= \sin\alpha[\sin\alpha + \sin(\beta + \gamma)]$

$= \sin\alpha[\sin(\pi - (\beta - \gamma)) + \sin(\beta + \gamma)]$

$= \sin\alpha[\sin(\beta - \gamma) + \sin(\beta + \gamma)]$

$= \sin\alpha[2\sin\beta\cos\gamma]$

$= 2\sin\alpha\sin\beta\cos\gamma$

68. We have, $\alpha + \beta + \gamma = 2\pi$

$\Rightarrow \quad \frac{\alpha}{2} + \frac{\beta}{2} + \frac{\gamma}{2} = \pi$

$\Rightarrow \quad \frac{\alpha}{2} + \frac{\beta}{2} = \pi - \frac{\gamma}{2}$

$\Rightarrow \quad \tan\left(\frac{\alpha}{2} + \frac{\beta}{2}\right) = \tan\left(\pi - \frac{\gamma}{2}\right)$

$\Rightarrow \quad \dfrac{\tan\frac{\alpha}{2} + \tan\frac{\beta}{2}}{1 - \tan\frac{\alpha}{2}\tan\frac{\beta}{2}} = -\tan\frac{\gamma}{2}$

$\Rightarrow \quad \tan\frac{\alpha}{2} + \tan\frac{\beta}{2} + \tan\frac{\gamma}{2} = \tan\frac{\alpha}{2}\tan\frac{\beta}{2}\tan\frac{\gamma}{2}$

69. $\dfrac{\cos 12^\circ - \sin 12^\circ}{\cos 12^\circ + \sin 12^\circ} + \dfrac{\sin 147^\circ}{\cos 147^\circ} = \dfrac{1 - \tan 12^\circ}{1 + \tan 12^\circ} + \tan 147^\circ$

$= \tan(45^\circ - 12^\circ) + \tan(180^\circ - 33^\circ)$

$= \tan 33^\circ - \tan 33^\circ = 0$

70. Given, $\frac{\sin x}{\sin y} = \frac{1}{2}, \quad \frac{\cos x}{\cos y} = \frac{3}{2}$

$\Rightarrow \quad \frac{\tan x}{\tan y} = \frac{1}{3}$

$\tan(x + y) = \dfrac{\tan x + \tan y}{1 - \tan x\tan y} = \dfrac{4\tan x}{1 - 3\tan^2 x}$

Also, $\sin y = 2\sin x, \quad \cos y = \frac{2}{3}\cos x$

$\Rightarrow \sin^2 y + \cos^2 y = 4\sin^2 x + \frac{4\cos^2 x}{9} = 1$

$\Rightarrow \quad 36\tan^2 x + 4 = 9\sec^2 x = 9(1 + \tan^2 x)$

$\Rightarrow \quad 27 \tan^2 x = 5$

$\Rightarrow \quad \tan x = \dfrac{\sqrt{5}}{3\sqrt{3}}$

$\Rightarrow \quad \tan(x+y) = \dfrac{\dfrac{4\sqrt{5}}{3\sqrt{3}}}{1-\dfrac{15}{27}} = \sqrt{15}$

71. Since, $\sin\theta + \cos\theta = x$ ...(i)

and $\sin^6\theta + \cos^6\theta = \dfrac{1}{4}[4 - 3(x^2-1)^2]$

On squaring Eq. (i), we get

$\sin 2\theta = x^2 - 1 \le 1 \quad (\because \sin 2\theta \le 1)$

$\Rightarrow \quad x^2 \le 2 \Rightarrow -\sqrt{2} \le x \le \sqrt{2}$

Now, $\sin^6\theta + \cos^6\theta = (\sin^2\theta + \cos^2\theta)^3$
$- 3\sin^2\theta\cos^2\theta(\sin^2\theta + \cos^2\theta)$

$= 1 - 3\sin^2\theta\cos^2\theta = 1 - \dfrac{3}{4}\sin^2 2\theta$

$= 1 - \dfrac{3}{4}(x^2-1)^2 = \dfrac{1}{4}[4 - 3(x^2-1)^2]$

Thus, the given result will hold true only when $x^2 \le 2$ and not for all real values of x.

72. $3(\sin x - \cos x)^4 + 6(\sin x + \cos x)^2 + 4(\sin^6 x + \cos^6 x)$

$= 3(1 - \sin 2x)^2 + 6(1 + \sin 2x) + 4\{(\sin^2 x + \cos^2 x)^3$
$- 3\sin^2 x\cos^2 x \cdot (\sin^2 x + \cos^2 x)\}$

$= 3(1 - 2\sin 2x + \sin^2 2x) + 6 + 6\sin 2x$
$+ 4\{1 - 3\sin^2 x\cos^2 x\}$

$= 3\{1 - 2\sin 2x + \sin^2 2x + 2 + 2\sin 2x\} + 4\left\{1 - \dfrac{3}{4}\sin^2 2x\right\}$

$= 13 + 3\sin^2 2x - 3\sin^2 2x = 13$

73. Now, $\tan 3A = \tan(2A + A)$

$\tan 3A = \dfrac{\tan 2A + \tan A}{1 - \tan 2A \tan A}$

$\Rightarrow \quad \tan 3A - \tan 3A \tan 2A \tan A = \tan 2A + \tan A$

$\Rightarrow \quad \tan 3A - \tan 2A - \tan A = \tan 3A \tan 2A \tan A$

74. We have, $\tan 20° \tan 40° \tan 60° \tan 80°$

$= \dfrac{\sin 20° \sin 40° \sin 80°}{\cos 20° \cos 40° \cos 80°} \tan 60°$

Here, numerator $= (\sin 20° \sin 40° \sin 80°)$

$= \dfrac{\sin 20°}{2}(2\sin 40° \sin 80°)$

$= \dfrac{\sin 20°}{2}(\cos 40° - \cos 120°)$

$= \dfrac{1}{2}\sin 20°\left(1 - 2\sin^2 20° + \dfrac{1}{2}\right)$

$= \dfrac{1}{2}\sin 20°\left(\dfrac{3}{2} - 2\sin^2 20°\right)$

$= \dfrac{1}{4}[3\sin 20° - 4\sin^3 20°] = \dfrac{\sin 60°}{4} = \dfrac{\sqrt{3}}{8}$

Now, denominator $= \cos 20° \cos 40° \cos 80°$

$= \dfrac{\sin 2^3 20°}{2^3 \sin 20°} = \dfrac{\sin 160°}{8\sin 20°}$

$= \dfrac{\sin 20°}{8\sin 20°} = \dfrac{1}{8}$

Hence, $\tan 20° \tan 40° \tan 80° = \dfrac{\dfrac{\sqrt{3}}{8}}{\dfrac{1}{8}} = \sqrt{3}$

$\Rightarrow \quad \tan 20° \tan 40° \tan 60° \tan 80° = \sqrt{3}\cdot\sqrt{3} = 3$

75. $\sin 36° \sin 72° \sin 108° \sin 144°$

$= \sin^2 36° \sin^2 72°$

$= \dfrac{1}{4}[(2\sin^2 36°)(2\sin^2 72°)]$

$= \dfrac{1}{4}[(1 - \cos 72°)(1 - \cos 144°)]$

$= \dfrac{1}{4}[(1 - \sin 18°)(1 + \cos 36°)]$

$= \dfrac{1}{4}\left[\left(1 - \dfrac{\sqrt{5}-1}{4}\right)\left(1 + \dfrac{\sqrt{5}+1}{4}\right)\right]$

$= \dfrac{1}{4}\left[1 + \left(\dfrac{\sqrt{5}+1}{4}\right) - \left(\dfrac{\sqrt{5}-1}{4}\right) - \left(\dfrac{4}{16}\right)\right]$

$= \dfrac{1}{4}\left[1 + \dfrac{1}{2} - \dfrac{1}{4}\right] = \dfrac{5}{16}$

76. $\sqrt{\dfrac{a+b}{a-b}} + \sqrt{\dfrac{a-b}{a+b}}$

$= \sqrt{\dfrac{1+\dfrac{b}{a}}{1-\dfrac{b}{a}}} + \sqrt{\dfrac{1-\dfrac{b}{a}}{1+\dfrac{b}{a}}} = \dfrac{1+\dfrac{b}{a}+1-\dfrac{b}{a}}{\sqrt{\left(1-\dfrac{b}{a}\right)\left(1+\dfrac{b}{a}\right)}}$

(dividing by a in Nr and Dr of both the terms)

$= \dfrac{2}{\sqrt{1-\dfrac{b^2}{a^2}}} = \dfrac{2}{\sqrt{1-\tan^2 x}} = \dfrac{2}{\sqrt{1-\dfrac{\sin^2 x}{\cos^2 x}}} \quad \left(\because \tan x = \dfrac{b}{a}\right)$

$= \dfrac{2\cos x}{\sqrt{\cos^2 x - \sin^2 x}} = \dfrac{2\cos x}{\sqrt{\cos 2x}} \quad (\because \cos^2 x - \sin^2 x = \cos 2x)$

77. Since, $(a-b)\sin(\theta+\phi) = (a+b)\sin(\theta-\phi)$

$\Rightarrow \quad a\{\sin(\theta+\phi) - \sin(\theta-\phi)\}$
$= b\{\sin(\theta-\phi) + \sin(\theta+\phi)\}$

$\Rightarrow \quad 2a\sin\phi\cos\theta = 2b\sin\theta\cos\phi$

$\Rightarrow \quad a\tan\phi = b\tan\theta$

$\Rightarrow \quad \dfrac{2a\tan\dfrac{\phi}{2}}{1-\tan^2\dfrac{\phi}{2}} = \dfrac{2b\tan\dfrac{\theta}{2}}{1-\tan^2\dfrac{\theta}{2}}$ ...(i)

Since, $a\tan\dfrac{\theta}{2} - b\tan\dfrac{\phi}{2} = c$ (given)

$$\Rightarrow \quad \tan\frac{\theta}{2} = \frac{b\tan\frac{\phi}{2} + c}{a} \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{a\tan\frac{\phi}{2}}{1-\tan^2\frac{\phi}{2}} = \frac{b\dfrac{\left(b\tan\frac{\phi}{2}+c\right)}{a}}{1-\dfrac{\left(b\tan\frac{\phi}{2}+c\right)^2}{a^2}}$$

$$\Rightarrow \quad \tan\frac{\phi}{2}(a^2-b^2-c^2) = bc\left(1+\tan^2\frac{\phi}{2}\right)$$

Now, $$\sin\phi = \frac{2\tan\frac{\phi}{2}}{1+\tan^2\frac{\phi}{2}} = \frac{2bc}{a^2-b^2-c^2}$$

78. $2\cos x - \cos 3x - \cos 5x = 2\cos x - 2\cos x\cos 4x$

$$= 2\cos x(1-\cos 4x)$$
$$= 2\cos x\, 2\sin^2 2x$$
$$= 4\cos x(2\sin x\cos x)^2$$
$$= 16\sin^2 x\cos^3 x$$

79. **Statement I** We have, $\sin A = \sin B$

$\Rightarrow \quad A = B$ or $A = \pi - B$

Now, $\sin 2A = \sin 2B$ is satisfied by $A = B$ but it is not satisfied by $A = \pi - B$.

Statement II

$$\cos\frac{\pi}{7}\cos\frac{4\pi}{7}\cos\frac{5\pi}{7} = \cos\frac{\pi}{7}\cos\frac{4\pi}{7}\cos\left(\pi-\frac{2\pi}{7}\right)$$
$$= -\cos\frac{\pi}{7}\cos\frac{2\pi}{7}\cos\frac{4\pi}{7}$$
$$= -\frac{\sin\left(2^3\frac{\pi}{7}\right)}{2^3\sin\frac{\pi}{7}} = -\frac{\sin\frac{8\pi}{7}}{8\sin\frac{\pi}{7}} = \frac{1}{8}$$

80. $$\cos\frac{\pi}{65}\cos\frac{2\pi}{65}\ldots\cos\frac{32\pi}{65} = \cos\frac{\pi}{65}\cdot\cos\frac{2\pi}{65}\ldots\cos\frac{2^5\pi}{65}$$
$$= \frac{\sin\frac{2^6\pi}{65}}{2^6\sin\frac{\pi}{65}} = \frac{\sin\frac{64\pi}{65}}{64\sin\frac{\pi}{65}}$$
$$= \frac{\sin\left(\pi-\frac{\pi}{65}\right)}{64\sin\frac{\pi}{65}} = \frac{1}{64}$$

81. $$\sin^4\frac{\pi}{8} + \sin^4\frac{3\pi}{8} + \sin^4\frac{5\pi}{8} + \sin^4\frac{7\pi}{8}$$
$$= \frac{1}{4}\left[\left(2\sin^2\frac{\pi}{8}\right)^2 + \left(2\sin^2\frac{3\pi}{8}\right)^2\right] + \frac{1}{4}\left[\left(2\sin^2\frac{\pi}{8}\right)^2 + \left(2\sin^2\frac{3\pi}{8}\right)^2\right]$$
$$= \frac{1}{4}\left[\left(1-\cos\frac{\pi}{4}\right)^2 + \left(1-\cos\frac{3\pi}{4}\right)^2\right] + \frac{1}{4}\left[\left(1-\cos\frac{\pi}{4}\right)^2 + \left(1-\cos\frac{3\pi}{4}\right)^2\right]$$
$$= \frac{1}{4}\left[\left(1-\frac{1}{\sqrt{2}}\right)^2 + \left(1+\frac{1}{\sqrt{2}}\right)^2\right] + \frac{1}{4}\left[\left(1-\frac{1}{\sqrt{2}}\right)^2 + \left(1+\frac{1}{\sqrt{2}}\right)^2\right]$$
$$= \frac{1}{4}(3) + \frac{1}{4}(3) = \frac{3}{2}$$

82. Given, $a\cos 2\theta + b\sin 2\theta = c$

$$\therefore \quad a\left(\frac{1-\tan^2\theta}{1+\tan^2\theta}\right) + b\left(\frac{2\tan\theta}{1+\tan^2\theta}\right) = c$$
$$\Rightarrow \quad a - a\tan^2\theta + 2b\tan\theta = c(1+\tan^2\theta)$$
$$\Rightarrow \quad \tan^2\theta(a+c) - 2b\tan\theta + c - a = 0$$

Since, α and β are the roots of the above equation.

$$\therefore \quad \tan\alpha + \tan\beta = \frac{2b}{a+c}$$

83. $\cos^2 A(3-4\cos^2 A)^2 + \sin^2 A(3-4\sin^2 A)^2$

$$= (3\cos A - 4\cos^3 A)^2 + (3\sin A - 4\sin^3 A)^2$$
$$= (-\cos 3A)^2 + (\sin 3A)^2 = 1$$

84. $\tan\alpha\tan 2\alpha\ldots\tan(2n-2)\alpha\tan(2n-1)\alpha$

$$= \{\tan\alpha\tan(2n-1)\alpha\}\{\tan 2\alpha\tan(2n-2)\alpha\}\ldots\{\tan(n-1)\alpha\tan(n+1)\alpha\}\tan n\alpha$$
$$= \left\{\tan\alpha\tan\left(\frac{\pi}{2}-\alpha\right)\right\}\left\{\tan 2\alpha\tan\left(\frac{\pi}{2}-2\alpha\right)\right\}\ldots\tan\frac{\pi}{4} \quad \left(\because n\alpha = \frac{\pi}{4}\right)$$
$$= 1$$

85. Given that, $$\frac{1-\cos 2\theta}{1+\cos 2\theta} = 3$$
$$\Rightarrow \quad \frac{2\sin^2\theta}{2\cos^2\theta} = 3$$
$$\Rightarrow \quad \tan^2\theta = (\sqrt{3})^2$$
$$\Rightarrow \quad \tan^2\theta = \tan^2\frac{\pi}{3}$$
$$\Rightarrow \quad \theta = n\pi \pm \frac{\pi}{3}$$

86. $\because \quad \sin A\sin B = \frac{1}{2}\times 2\sin A\sin B$

$$= \frac{1}{2}[\cos(A-B) - \cos(A+B)]$$
$$= \frac{1}{2}[\cos(A-B) - \cos 90^\circ]$$
$$(\because A+B+C = 180^\circ \text{ and } \angle C = 90^\circ, \text{ given})$$
$$= \frac{1}{2}\cos(A-B) \le \frac{1}{2}$$

$\therefore$ Maximum value of $\sin A\sin B = \frac{1}{2}$

87. We have, $A = \sin^2\theta + \cos^4\theta$

$= \sin^2\theta + \cos^2\theta\cos^2\theta$

$\le \sin^2\theta + \cos^2\theta$ (since, $\cos^2\theta \le 1$)

$\Rightarrow \sin^2\theta + \cos^4\theta \le 1 \Rightarrow A \le 1$

Again, $\sin^2\theta + \cos^4\theta = 1 - \cos^2\theta + \cos^4\theta$

$= \cos^4\theta - \cos^2\theta + 1$

$= \left(\cos^2\theta - \frac{1}{2}\right)^2 + \frac{3}{4} \ge \frac{3}{4}$

Hence, $\frac{3}{4} \le A \le 1$

88. Since, $y = 1 + 4\sin^2 x\cos^2 x$

$\Rightarrow y = 1 + \sin^2 2x$

We know that,

$0 \le \sin^2 2x \le 1$

$\Rightarrow 1 \le 1 + \sin^2 2x \le 2$

$\Rightarrow 1 \le y \le 2$

89. $\cos^2\left(\frac{\pi}{3} - x\right) - \cos^2\left(\frac{\pi}{3} + x\right)$

$= \left[\cos\left(\frac{\pi}{3} - x\right) + \cos\left(\frac{\pi}{3} + x\right)\right]\left[\cos\left(\frac{\pi}{3} - x\right) - \cos\left(\frac{\pi}{3} + x\right)\right]$

$= \left(2\cos\frac{\pi}{3}\cos x\right)\left(2\sin\frac{\pi}{3}\sin x\right)$

$= \sin\frac{2\pi}{3}\sin 2x = \frac{\sqrt{3}}{2}\sin 2x$

Hence, maximum value of given expression is $\frac{\sqrt{3}}{2}$.

90. We have, $\sin\left(x + \frac{\pi}{6}\right) + \cos\left(x + \frac{\pi}{6}\right)$

$= \sqrt{2}\left[\frac{1}{\sqrt{2}}\sin\left(x + \frac{\pi}{6}\right) + \frac{1}{\sqrt{2}}\cos\left(x + \frac{\pi}{6}\right)\right]$

$= \sqrt{2}\cos\left[x + \frac{\pi}{6} - \frac{\pi}{4}\right]$

$= \sqrt{2}\cos\left(x - \frac{\pi}{12}\right)$

Hence, maximum value will be at $x = \frac{\pi}{12}$.

91. Let $f(x) = \sin x\cos x = \frac{1}{2}\sin 2x$

We know that, $-1 \le \sin 2x \le 1$

$\Rightarrow -\frac{1}{2} \le \frac{1}{2}\sin 2x \le \frac{1}{2}$

Thus, the greatest and least value of $f(x)$ are $\frac{1}{2}$ and $-\frac{1}{2}$ respectively.

92. Maximum value of $4\sin^2 x + 3\cos^2 x$ *i.e.*, $\sin^2 x + 3$ is 4 and that of $\sin\frac{x}{2} + \cos\frac{x}{2}$ is $\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} = \sqrt{2}$, both attained at $x = \frac{\pi}{2}$.

Hence, the given function has maximum value $4 + \sqrt{2}$.

93. $\cos 2\theta + 2\cos\theta = 2\cos^2\theta - 1 + 2\cos\theta$

$= 2\left(\cos\theta + \frac{1}{2}\right)^2 - \frac{3}{2}$

$\ge -\frac{3}{2}$ $\left[\because 2\left(\cos\theta + \frac{1}{2}\right)^2 \ge 0, \forall\theta\right]$

Then, maximum value of $\cos 2\theta + 2\cos\theta$ is 3.

94. Since, $(\cot\alpha_1)(\cot\alpha_2)\ldots(\cot\alpha_n) = 1$

$\Rightarrow (\cos\alpha_1)(\cos\alpha_2)\ldots(\cos\alpha_n) = (\sin\alpha_1)(\sin\alpha_2)\ldots(\sin\alpha_n)$

$\Rightarrow \cos^2\alpha_1\cos^2\alpha_2\ldots\cos^2\alpha_n$

$= \frac{\sin 2\alpha_1\sin 2\alpha_2\ldots\sin 2\alpha_n}{2^n}$

$\Rightarrow \cos\alpha_1\cos\alpha_2\ldots\cos\alpha_n$

$= \left(\frac{\sin 2\alpha_1\sin 2\alpha_2\ldots\sin 2\alpha_n}{2^n}\right)^{1/2}$

Since, maximum value of $\sin\alpha = 1$

$\therefore$ Maximum value of $\cos\alpha_1\ldots\cos\alpha_n = \frac{1}{2^{n/2}}$

95. We know that, $-\sqrt{3^2 + 4^2} \le 3\cos x + 4\sin x \le \sqrt{3^2 + 4^2}$

$\Rightarrow -\sqrt{25} \le 3\cos x + 4\sin x \le \sqrt{25}$

$\Rightarrow -5 \le 3\cos x + 4\sin x \le 5$

$\Rightarrow -5 + 8 \le 3\cos x + 4\sin x + 8 \le 5 + 3$

$\Rightarrow 3 \le 3\cos x + 4\sin x + 8 \le 8$

Hence, minimum value of given expression is 3.

96. Given that, $\tan\theta = \sqrt{3} = \tan\frac{\pi}{3} \Rightarrow \theta = n\pi + \frac{\pi}{3}$

For $-\pi < \theta < 0$ put $n = -1$, we get

$\theta = -\pi + \frac{\pi}{3} = \frac{-2\pi}{3}$ or $\frac{-4\pi}{6}$

97. $\because \cos x = \sqrt{1 - \sin 2x}$

$\Rightarrow \cos x = |\sin x - \cos x|$

There are two cases arise.

***Case* I** $\sin x \le \cos x$

$\Rightarrow \cos x = \cos x - \sin x$

$\Rightarrow \sin x = 0$

where, $x \in \left[0, \frac{\pi}{4}\right) \cup \left(\frac{5\pi}{4}, 2\pi\right]$

$\Rightarrow x = 2\pi$, neglecting $x = \pi$

***Case* II** $\sin x > \cos x$

$\Rightarrow \tan x = 2$

where, $x \in \left(\frac{\pi}{4}, \frac{5\pi}{4}\right)$

$\because \tan x = 2$

$\Rightarrow x = \tan^{-1}(2)$

Thus, the given equation has two solutions.

98. We have, $3x + 2\tan x = \frac{5\pi}{2}$

$\Rightarrow \quad \tan x = \frac{5\pi}{4} - \frac{3x}{2}$

Let $\quad \frac{5\pi}{4} - \frac{3x}{2} = y$

and $\quad y = \tan x$

$\therefore$ Graph of $y = \frac{5\pi}{4} - \frac{3x}{2}$ and $y = \tan x$ meet exactly three times in $[0, 2\pi]$. Thus, the number of solutions of given equation is 3.

99. Given $(\sqrt{3} - 1)\cos\theta + (\sqrt{3} + 1)\sin\theta = 2$ ...(i)

Let $\quad (\sqrt{3} - 1) = r\cos\alpha$ and $(\sqrt{3} + 1) = r\sin\alpha$

$\therefore \quad r^2(\cos^2 + \sin^2\alpha) = (\sqrt{3} - 1)^2 + (\sqrt{3} + 1)^2$

$\Rightarrow \quad r^2 = 3 + 1 - 2\sqrt{3} + 3 + 1 + 2\sqrt{3}$

$\Rightarrow \quad r^2 = 8 \Rightarrow r = 2\sqrt{2}$

And $\quad \frac{r\sin\alpha}{r\cos\alpha} = \frac{\sqrt{3}+1}{\sqrt{3}-1} = -\frac{\sqrt{3}+1}{(1-\sqrt{3})}$

$= -\tan\left(\frac{\pi}{6} + \frac{\pi}{4}\right)$

$\Rightarrow \quad \tan\alpha = -\tan\left(\frac{7\pi}{12}\right)$

$\Rightarrow \quad \alpha = -\frac{5\pi}{12}$

$\therefore$ From Eq. (i) becomes,

$r(\cos\alpha\cos\theta + \sin\alpha\sin\theta) = 2$

$\Rightarrow \quad 2\sqrt{2}\cos(\alpha - \theta = 2)$

$\Rightarrow \quad \cos(\theta - \alpha) = \frac{1}{\sqrt{2}}$

$\Rightarrow \quad \theta - \alpha = 2n\pi \pm \frac{\pi}{4}$

$\Rightarrow \quad \theta = 2n\pi \pm \frac{\pi}{4} - \frac{5\pi}{12}$

100. $3\sin^2 x - 7\sin x + 2 = 0$

$\Rightarrow \quad 3\sin^2 x - 6\sin x - \sin x + 2 = 0$

$\Rightarrow \quad 3\sin x(\sin x - 2) - 1(\sin x - 2) = 0$

$\Rightarrow \quad (3\sin x - 1)(\sin x - 2) = 0$

$\Rightarrow \quad \sin x = \frac{1}{2}$ or 2

$\Rightarrow \quad \sin x = \frac{1}{3} \quad (\because \sin x \neq 2)$

Let $\quad \sin^{-1}\frac{1}{3} = \alpha, 0 < \alpha < \frac{\pi}{2}$

Then, $\alpha, \pi - \alpha, 2\pi + \alpha, 3\pi - \alpha, 4\pi + \alpha, 5\pi - \alpha$ are the solutions in $[0, 5\pi]$.

$\therefore$ Required number of solutions = 6

101. Since, $\quad 1 + \sin x\sin^2\frac{x}{2} = 0$

$\therefore \quad 1 + \sin x\left(\frac{1 - \cos x}{2}\right) = 0$

$\Rightarrow \quad 2 + \sin x - \sin x\cos x = 0$

$\Rightarrow \quad \sin 2x - 2\sin x = 4$

which is not possible for any x in $[-\pi, \pi]$.

102. Now, $1 + |\cos x| + \cos^2 x + |\cos^3 x| + \ldots\infty = \frac{1}{1 - |\cos x|}$

$\therefore \quad 8^{\frac{1}{1-|\cos x|}} = 4^3$

$\Rightarrow \quad 2^{\frac{3}{1-|\cos x|}} = 2^6 \Rightarrow 1 = 2 - 2|\cos x|$

$\Rightarrow \quad |\cos x| = \frac{1}{2}$

$\Rightarrow \quad \cos x = \pm\frac{1}{2}$

$\Rightarrow \quad x = \frac{\pi}{3}, -\frac{\pi}{3}, \frac{2\pi}{3}, -\frac{2\pi}{3}$

$\therefore$ Number of solutions = 4

103. Given, $\cot\theta + \tan\theta = 2\operatorname{cosec}\theta$

$\therefore \quad \frac{\cos\theta}{\sin\theta} + \frac{\sin\theta}{\cos\theta} = \frac{2}{\sin\theta}$

$\Rightarrow \quad \cos^2\theta + \sin^2\theta = 2\cos\theta, \sin\theta \neq 0$

$\Rightarrow \quad 1 = 2\cos\theta$

$\Rightarrow \quad \cos\theta = \frac{1}{2}$

$\Rightarrow \quad \theta = 2n\pi \pm \frac{\pi}{3}$

104. Given, $\quad 2\sin^2\theta = 3\cos\theta$

$\therefore \quad 2(1 - \cos^2\theta) = 3\cos\theta$

$\Rightarrow \quad 2\cos^2\theta + 3\cos\theta - 2 = 0$

$\Rightarrow \quad (\cos\theta + 2)(2\cos\theta - 1) = 0$

$\Rightarrow \quad \cos\theta = -2, \cos\theta = \frac{1}{2}$

But $\cos\theta \in [-1, 1]$

$\therefore \quad \cos\theta \neq -2$

Now, $\quad \cos\theta = \frac{1}{2}$

As $\quad \theta \in [0, 2\pi]$

$\therefore \quad \theta = \frac{\pi}{3}, \frac{5\pi}{3}$

105. Given, $e^{\sin x} - e^{-\sin x} - 4 = 0$

$\Rightarrow \quad e^{2\sin x} - 4e^{\sin x} - 1 = 0$

$\Rightarrow \quad e^{\sin x} = \dfrac{4 \pm \sqrt{16+4}}{2} = 2 + \sqrt{5}$

$\Rightarrow \quad \sin x = \log(2+\sqrt{5}) \quad [\because \log(2-\sqrt{5})$ is not defined$]$

Since, $2+\sqrt{5} > e \Rightarrow \log(2+\sqrt{5}) > 1$

$\Rightarrow \sin x > 1$, which is not possible.

Hence, no solution exist.

106. From graph $|\cos x|$ and $2[x]$ does not cut each other for any real value of x. Hence, number of solution is nil.

107. $2\sin x = 5x^2 + 2x + 3$

$\Rightarrow \quad 2\sin x = 4x^2 + (x+1)^2 + 2$

But $\quad 2\sin x \le 2$

and $4x^2 + (x+1)^2 + 2 > 2$, so it has no solution.

108. Since, $\tan 2x = \tan\dfrac{2}{x}$

$\Rightarrow \quad 2x = n\pi + \dfrac{2}{x} \Rightarrow 2x^2 - n\pi x - 2 = 0$

$\Rightarrow \quad x = \dfrac{n\pi \pm \sqrt{n^2\pi^2 + 16}}{4}$

109. $\because \sec x - 1 = (\sqrt{2}-1)\tan x$

$\Rightarrow \quad 1 - \cos x = (\sqrt{2}-1)\sin x$

$\Rightarrow \quad \sin\dfrac{x}{2}\left\{\sin\dfrac{x}{2} - (\sqrt{2}-1)\cos\dfrac{x}{2}\right\} = 0$

$\Rightarrow \quad \sin\dfrac{x}{2} = 0$ or $\tan\dfrac{x}{2} = \sqrt{2}-1 = \tan\dfrac{\pi}{8}$

$\Rightarrow \quad \dfrac{x}{2} = n\pi$ or $\dfrac{x}{2} = n\pi + \dfrac{\pi}{8}$

$\therefore \quad x = 2n\pi, 2n\pi + \dfrac{\pi}{4}$

110. $5\cos^2\theta + 7\sin^2\theta - 6 = 0$

$\Rightarrow \quad 5\cos^2\theta + 7(1-\cos^2\theta) - 6 = 0$

$\Rightarrow \quad 5\cos^2\theta + 7 - 7\cos^2\theta - 6 = 0$

$\Rightarrow \quad -2\cos^2\theta + 1 = 0$

$\Rightarrow \quad -(2\cos^2\theta - 1) = 0$

$\Rightarrow \quad \cos 2\theta = 0 \quad (\because \cos 2\theta = 2\cos^2\theta - 1)$

$\Rightarrow \quad 2\theta = (2n+1)\dfrac{\pi}{2}$

$\Rightarrow \quad \theta = (2n+1)\dfrac{\pi}{4}$

111. We have, $(5 + 4\cos\theta)(2\cos\theta + 1) = 0$

$\Rightarrow \cos\theta = -\dfrac{5}{4}$ which is not possible.

$\therefore \quad 2\cos\theta + 1 = 0 \Rightarrow \cos\theta = -\dfrac{1}{2}$

$\Rightarrow \quad \theta = \dfrac{2\pi}{3}, \dfrac{4\pi}{3}$

$\therefore$ Solution set is $\left\{\dfrac{2\pi}{3}, \dfrac{4\pi}{3}\right\} \in [0, 2\pi]$.

112. Since, $\quad 4\cos\theta - 3\sec\theta = 2\tan\theta$

$\Rightarrow \quad 4\cos\theta - \dfrac{3}{\cos\theta} = 2\dfrac{\sin\theta}{\cos\theta}$

$\Rightarrow \quad 4\cos^2\theta - 3 = 2\sin\theta$

$\Rightarrow \quad 4 - 4\sin^2\theta - 3 = 2\sin\theta$

$\Rightarrow \quad 4\sin^2\theta + 2\sin\theta - 1 = 0$

$\Rightarrow \quad \sin\theta = \dfrac{-1 \pm \sqrt{5}}{4}$

Either $\sin\theta = \dfrac{-1+\sqrt{5}}{4}$ or $\sin\theta = \dfrac{-1-\sqrt{5}}{4}$

$\Rightarrow \quad \sin\theta = \sin\dfrac{\pi}{10}$ or $\sin\theta = \sin\left(-\dfrac{3\pi}{10}\right)$

$\Rightarrow \quad \theta = n\pi + (-1)^n\dfrac{\pi}{10}$ or $\theta = n\pi + (-1)^n\left(-\dfrac{3\pi}{10}\right)$

113. We have, $\cos 3x + \cos 2x = \sin\dfrac{3x}{2} + \sin\dfrac{x}{2}$

$\Rightarrow \quad 2\cos\dfrac{5x}{2}\cos\dfrac{x}{2} = 2\sin x\cos\dfrac{x}{2}$

Either $\quad \cos\dfrac{x}{2} = 0 \Rightarrow \dfrac{x}{2} = (2n+1)\dfrac{\pi}{2}$

$\Rightarrow \quad x = (2n+1)\pi$ or $\cos\dfrac{5x}{2} = \sin x$

$\Rightarrow \quad \cos\dfrac{5x}{2} = \cos\left(\dfrac{\pi}{2} - x\right)$

$\Rightarrow \quad \dfrac{5x}{2} = 2n\pi \pm \left(\dfrac{\pi}{2} - x\right)$

Taking the +ve sign $\dfrac{7x}{2} = 2n\pi + \dfrac{\pi}{2} \Rightarrow x = \dfrac{4n\pi}{7} + \dfrac{\pi}{7}$

Taking –ve sign

$\dfrac{3x}{2} = 2n\pi - \dfrac{\pi}{2} \Rightarrow x = \dfrac{4n\pi}{3} - \dfrac{\pi}{3}$

For $0 \le x \le 2\pi$

$x = \dfrac{\pi}{7}, \dfrac{5\pi}{7}, \dfrac{9\pi}{7}, \dfrac{13\pi}{7}, \pi$

Thus, number of solutions = 5

114. $\sec x \cos 5x = -1$

$\Rightarrow \quad \cos 5x = -\cos x$

$\Rightarrow \quad 5x = 2n\pi \pm (\pi - x)$

$\Rightarrow \quad x = \dfrac{(2n+1)\pi}{6}$ or $\dfrac{(2n-1)\pi}{4}$

The possible values of x which lies in the interval $(0, 2\pi)$ are $\dfrac{\pi}{4}, \dfrac{\pi}{6}, \dfrac{\pi}{2}, \dfrac{3\pi}{4}, \dfrac{5\pi}{6}, \dfrac{5\pi}{4}, \dfrac{7\pi}{6}, \dfrac{7\pi}{4}, \dfrac{9\pi}{6}$ and $\dfrac{11\pi}{6}$.

115. Since, $\tan\theta + \tan\left(\dfrac{3\pi}{4} + \theta\right) = 2$

$\therefore \quad \tan\theta + \dfrac{-1 + \tan\theta}{1 + \tan\theta} = 2$

$\Rightarrow \quad \tan\theta + \tan^2\theta - 1 + \tan\theta = 2 + 2\tan\theta$

$\Rightarrow \quad \tan^2\theta = 3$

$\Rightarrow \quad \tan^2\theta = (\sqrt{3})^2 = \tan^2\dfrac{\pi}{3}$

$\Rightarrow \quad \theta = n\pi \pm \dfrac{\pi}{3}, n \in I$

116. We have, $\sin^2\theta + \sin\theta - 2 = 0$

$\Rightarrow \quad (\sin\theta - 1)(\sin\theta + 2) = 0$

$\Rightarrow \quad \sin\theta = 1, \quad \sin\theta = -2$

But $\quad \sin\theta \neq -2$

$\therefore \quad \sin\theta = 1 = \sin\dfrac{\pi}{2}$

$\Rightarrow \quad \theta = n\pi + (-1)^n \dfrac{\pi}{2}$

117. The given equation can be rewritten as

$\tan\theta(\sin\theta + \sqrt{3}) = 0$

$\Rightarrow \quad \tan\theta = 0$ but $\sin\theta + \sqrt{3} \neq 0$

$\Rightarrow \quad \tan\theta = 0$

$\Rightarrow \quad \theta = n\pi, n \in I$

118. We have,

$\sin x - 3\sin 2x + \sin 3x = \cos x - 3\cos 2x + \cos 3x$

$\Rightarrow \sin x + \sin 3x - 3\sin 2x = \cos x + \cos 3x - 3\cos 2x$

$\Rightarrow 2\sin 2x\cos x - 3\sin 2x - 2\cos 2x\cos x + 3\cos 2x = 0$

$\Rightarrow \quad \sin 2x(2\cos x - 3) - \cos 2x(2\cos x - 3) = 0$

$\Rightarrow \quad (\sin 2x - \cos 2x)(2\cos x - 3) = 0$

$\Rightarrow \quad \sin 2x = \cos 2x \qquad \left(\because \cos x \neq \dfrac{3}{2}\right)$

$\Rightarrow \quad 2x = 2n\pi \pm \left(\dfrac{\pi}{2} - 2x\right)$

Taking +ve sign

$$x = \frac{n\pi}{2} + \frac{\pi}{8}$$

119. We have,

$3\sin^2 x + 10\cos x - 6 = 0$

$\Rightarrow \quad (\cos x - 3)(3\cos x - 1) = 0$

$\Rightarrow \quad \cos x \neq 3$ or $\cos x = \dfrac{1}{3}$

$\Rightarrow \quad x = 2n\pi \pm \cos^{-1}\left(\dfrac{1}{3}\right)$

120. The given equation can be rewritten as

$1 - \cos^2\theta - \cos\theta = \dfrac{1}{4}$

$\Rightarrow \quad \cos^2\theta + \cos\theta - \dfrac{3}{4} = 0$

$\Rightarrow \quad 4\cos^2\theta + 4\cos\theta - 3 = 0$

$\Rightarrow \quad \cos\theta = \dfrac{-4 \pm \sqrt{16 + 48}}{8} = \dfrac{1}{2}, -\dfrac{3}{2}$

Since, $\cos\theta = -\dfrac{3}{2}$ is not possible, so we take

$\cos\theta = \dfrac{1}{2} = \cos\dfrac{\pi}{3}$

$\Rightarrow \quad \theta = 2n\pi \pm \dfrac{\pi}{3} \qquad \ldots(i)$

For the given interval, put $n = 0$ and $n = 1$ in Eq. (i) we get

$$\theta = \frac{\pi}{3}, \frac{5\pi}{3}$$

121.

It is clear from the figure that, the smallest positive root of a given equation is in $\left(\pi, \dfrac{3\pi}{2}\right)$.

122. We have, $2\cos^2 x + 3\sin x - 3 = 0$

$\Rightarrow \quad 2 - 2\sin^2 x + 3\sin x - 3 = 0$

$\Rightarrow \quad (2\sin x - 1)(\sin x - 1) = 0$

$\Rightarrow \quad \sin x = \dfrac{1}{2}$ or $\sin x = 1$

$\Rightarrow \quad x = 30°, 150°, 90°$

123. $(1 + 2\sin\theta)^2 + (\sqrt{3}\tan\theta - 1)^2 = 0$

$\Rightarrow \quad 1 + 2\sin\theta = 0$

and $\quad \sqrt{3}\tan\theta - 1 = 0$

$\therefore \quad \sin\theta = -\frac{1}{2} \Rightarrow \theta = m\pi + (-1)^m\left(-\frac{\pi}{6}\right)$

and $\quad \tan\theta = \frac{1}{\sqrt{3}} \Rightarrow \theta = m\pi + \frac{\pi}{6}$

For common values, m must be odd.

i.e., $\quad m = 2n+1 \Rightarrow \theta = 2n\pi + \frac{7\pi}{6}$

124. $\because \quad \sin 3x = 3\sin x - 4\sin^3 x$

$\therefore \quad \sin^3 x = \frac{1}{4}(3\sin x - \sin 3x)$

and $\quad \cos 3x = 4\cos^3 x - 3\cos x$

$\Rightarrow \quad \cos^3 x = \frac{1}{4}(\cos 3x + 3\cos x)$

$\therefore \quad \cos 3x\cos^3 x + \sin 3x \sin^3 x$

$= \frac{1}{4}[\cos^2 3x + 3\cos x\cos 3x + 3\sin x\sin 3x - \sin^2 3x]$

$= \frac{1}{4}[3\cos 2x + \cos 6x] = \cos^3 2x$

$\Rightarrow \quad \cos 2x = 0 \Rightarrow 2x = (2n+1)\frac{\pi}{2}$

$\Rightarrow \quad x = (2n+1)\frac{\pi}{4}$

125. $\because \quad \tan\theta + \tan 2\theta + \sqrt{3}\tan\theta\tan 2\theta = \sqrt{3}$

$\Rightarrow \quad \tan\theta + \tan 2\theta = \sqrt{3}(1 - \tan\theta\tan 2\theta)$

$\Rightarrow \quad \frac{\tan\theta + \tan 2\theta}{1 - \tan\theta\tan 2\theta} = \sqrt{3} \Rightarrow \tan 3\theta = \tan\frac{\pi}{3}$

$\Rightarrow \quad 3\theta = n\pi + \frac{\pi}{3} \Rightarrow \theta = \frac{(3n+1)\pi}{9}, n \in I$

126. Given that,

$\tan^2\theta - \tan\theta - \sqrt{3}\tan\theta + \sqrt{3} = 0$

$\Rightarrow \quad \tan\theta(\tan\theta - 1) - \sqrt{3}(\tan\theta - 1) = 0$

$\Rightarrow \quad (\tan\theta - \sqrt{3})(\tan\theta - 1) = 0$

$\Rightarrow \quad \theta = n\pi + \frac{\pi}{3}, n\pi + \frac{\pi}{4}$

127. Given, $\quad \sin^4 x + \cos^4 x = \sin x \cdot \cos x$

$\Rightarrow \quad (\sin^2 x + \cos^2 x)^2 - 2\sin^2 x \cdot \cos^2 x = \sin x \cdot \cos x$

$\Rightarrow \quad 1 - \frac{\sin^2 2x}{2} = \frac{\sin 2x}{2}$

$\Rightarrow \quad \sin^2 2x + \sin 2x - 2 = 0$

$\Rightarrow \quad (\sin 2x + 2)(\sin 2x - 1) = 0$

$\Rightarrow \quad \sin 2x = 1 \qquad (\because \sin 2x \geq -1)$

$\therefore \quad 2x = (4n+1)\frac{\pi}{2}$

$\Rightarrow \quad x = (4n+1)\frac{\pi}{4}$

$\Rightarrow \quad x = \frac{\pi}{4}, \frac{5\pi}{4}$

Hence, two solutions exist.

128. Since, $\cos 2x, \frac{1}{2}, \sin 2x$ are in AP.

$\Rightarrow \quad \cos 2x + \sin 2x = 1$

$\Rightarrow \quad \sin 2x = 1 - \cos 2x = 2\sin^2 x$

$\Rightarrow \quad 2\sin x(\cos x - \sin x) = 0$

$\Rightarrow \quad \sin x = 0$ or $\cos x - \sin x = 0$

$\Rightarrow \quad x = n\pi$ or $\tan x = 1$

$\Rightarrow \quad x = n\pi$ or $x = n\pi + \frac{\pi}{4}$

Thus, required values of x are $n\pi$ and $n\pi + \frac{\pi}{4}$.

129. $|\sin x| > 2\sin^2 x$

$\Rightarrow \quad |\sin x|(2|\sin x| - 1) < 0$

$\Rightarrow \quad 0 < |\sin x| < \frac{1}{2}$

$\Rightarrow \quad x \in \left(0, \frac{\pi}{6}\right) \cup \left(\frac{5\pi}{6}, \pi\right) \cup \left(\pi, \frac{7\pi}{6}\right) \cup \left(\frac{11\pi}{6}, 2\pi\right)$

130. We have, $\sin^{10} 2x = 1 + \cos^{10} x$

Minimum value of RHS $= 1$ and maximum value of LHS $= 1$. Therefore, solution is possible only when $\sin^{10} 2x = 1$ and $\cos^{10} x = 0$. But this is not possible. Therefore, it has no solution.

131. Given equation, $\sin x + \sin y + \sin z = -3$ is satisfied only when $x = y = z = \frac{3\pi}{2}$, for $x, y, z \in [0, 2\pi]$.

132. $\because \quad \sin^5 x - \cos^5 x = \frac{\sin x - \cos x}{\sin x\cos x}$

$\Rightarrow \quad \sin x\cos x\left[\frac{\sin^5 x - \cos^5 x}{\sin x - \cos x}\right] = 1$

$\Rightarrow \quad \frac{1}{2}\sin 2x[\sin^4 x + \sin^3 x\cos x + \sin^2 x\cos^2 x$

$+ \sin x\cos^2 x + \cos^4 x] = 1$

$\Rightarrow \quad \sin 2x[(\sin^2 x + \cos^2 x)^2 - 2\sin^2 x\cos^2 x$

$+ \sin x\cos x(\sin^2 x + \cos^2 x) + \sin^2 x\cos^2 x] = 2$

$\Rightarrow \quad \sin 2x[1 - \sin^2 x\cos^2 x + \sin x\cos x] = 2$

$\Rightarrow \quad \sin^3 2x - 2\sin^2 2x - 4\sin 2x + 8 = 0$

$\Rightarrow \quad (\sin 2x - 2)^2(\sin 2x + 2) = 0$

$\Rightarrow \quad \sin 2x = \pm 2$, which is not possible for any x.

133. $\sqrt{\sin^2 x - \sin x + \frac{1}{2}} = \sqrt{\left(\sin x - \frac{1}{2}\right)^2 + \frac{1}{4}} \geq \frac{1}{2}, \forall x$

and $\sec^2 y \geq 1, \forall y$, so $2^{\sec^2 y} \geq 2$. Hence, the above inequality holds only for those values of x and y for which $\sin x = \frac{1}{2}$ and $\sec^2 y = 1$. Hence, $x = \frac{\pi}{6}, \frac{5\pi}{6}, \frac{13\pi}{6}, \frac{17\pi}{6}$ and $y = 0, \pi, 2\pi, 3\pi$. Hence, required number of ordered pairs are 16.

134. Since, $2\cos^2\frac{x}{2}\sin^2 x < 2$

But $x^2 + \frac{1}{x^2} \geq 2$

Thus, the equation has no solution.

135. $e^{\sin x} + e^{\cos x} = 2e^{1/\sqrt{2}}$ ...(i)

$\Rightarrow$ $e^{\sin x} > 0$ and $e^{\cos x} > 0$

$\therefore$ $e^{\sin x} + e^{\cos x} \geq 2\sqrt{e^{\sin x + \cos x}}$ ($\because$ AM $\geq$ GM)

$\Rightarrow$ $e^{\sin x} + e^{\cos x} \geq 2\, e^{1/\sqrt{2}}$ ...(ii)

Since, equality holds

$\Rightarrow$ $e^{\sin x} = e^{\cos x}$

$\Rightarrow$ $\sin x = \cos x$

$\Rightarrow$ $\tan x = 1 \Rightarrow x = m\pi + \frac{\pi}{4}$

$\Rightarrow$ $x = (4m+1)\frac{\pi}{4}$

Round II

1. From the given equations, we have $\Sigma \tan\alpha = p$

$$\Sigma \tan\alpha \tan\beta = 0$$

and $\tan\alpha\tan\beta\tan\gamma = r$

$\therefore$ $(1+\tan^2\alpha)(1+\tan^2\beta)(1+\tan^2\gamma)$

$= 1 + \Sigma\tan^2\alpha + \Sigma\tan^2\alpha\tan^2\beta + \tan^2\alpha\tan^2\beta\tan^2\gamma$

$= 1 + (\Sigma\tan\alpha)^2 - 2\Sigma\tan\alpha\tan\beta + (\Sigma\tan\alpha\tan\beta)^2$

$- 2\tan\alpha\tan\beta\tan\gamma\,\Sigma\tan\alpha + \tan^2\alpha\tan^2\beta\tan^2\gamma$

$= 1 + p^2 - 2pr + r^2 = 1 + (p-r)^2$

2. $\frac{1+\tan\theta}{1-\tan\theta} = 3\left(\frac{3\tan\theta - \tan^3\theta}{1-3\tan^2\theta}\right)$

On simplification, we get

$$3\tan^4\theta - 6\tan^2\theta + 8\tan\theta - 1 = 0$$

$\therefore$ Product of roots

$$= \tan\alpha\cdot\tan\beta\cdot\tan\gamma\cdot\tan\delta = -\frac{1}{3}$$

3. $\operatorname{cosec}^2 x + 25\sec^2 x = 26 + \cot^2 x + 25\tan^2 x$

$$= 26 + 10 + (\cot x - 5\tan x)^2 \geq 36$$

4. Equation first can be written as

$x\sin a + y \times 2\sin a\cos a + z \times \sin a(3 - 4\sin^2 a)$

$= 2 \times 2\sin a\cos a\cos 2a$

$\Rightarrow$ $x + 2y\cos a + z(3 + 4\cos^2 a - 4)$

$= 4\cos a(2\cos^2 a - 1)$ as $\sin a \neq 0$

$\Rightarrow$ $8\cos^3 a - 4z\cos^2 a - (2y+4)\cos a + (z - x) = 0$

$\Rightarrow$ $\cos^3 a - \left(\frac{z}{2}\right)\cos^2 a - \left(\frac{y+2}{4}\right)\cos a + \left(\frac{z-x}{8}\right) = 0$

which shows that $\cos a$ is a root of the equation

$$t^3 - \left(\frac{z}{2}\right)t^2 - \left(\frac{y+2}{4}\right)t + \left(\frac{z-x}{8}\right) = 0$$

Similarly, from second and third equation we can verify that $\cos b$ and $\cos c$ are the roots of the given equation.

5. $\sqrt{2+\sqrt{2+\sqrt{2+\ldots+\sqrt{2(1+\cos\theta)}}}}$ (n numbers of 2's)

$= \sqrt{2+\sqrt{2+\sqrt{2+\ldots+\sqrt{\left(2+2\cos\frac{\theta}{2}\right)}}}}$

[$(n-1)$ numbers of 2's]

... ...

... ...

$= \sqrt{2 + 2\cos(\theta/2^{n-1})}$

$= \sqrt{2\{1 + 2\cos^2(\theta/2^n) - 1\}} = 2\cos(\theta/2^n)$

6. $\because$ $\tan\alpha/2 + \tan\beta/2 = \frac{26}{8} = \frac{13}{4}$

and $\tan\alpha/2\tan\beta/2 = \frac{15}{8}$

$\therefore$ $\tan\left(\frac{\alpha+\beta}{2}\right) = \frac{\tan\alpha/2 + \tan\beta/2}{1 - \tan\alpha/2\tan\beta/2}$

$$= \frac{\frac{13}{4}}{1 - \frac{15}{8}} = -\frac{26}{7}$$

Now, $\cos(\alpha+\beta) = \frac{1 - \tan^2\left(\frac{\alpha+\beta}{2}\right)}{1 + \tan^2\left(\frac{\alpha+\beta}{2}\right)}$

$$= \frac{1 - \left(-\frac{26}{7}\right)^2}{1 + \left(-\frac{26}{7}\right)^2} = \frac{49 - 676}{49 + 676} = -\frac{627}{725}$$

7. Given, $\sin n\theta = \sum_{r=0}^{n} b_r \sin^r\theta = b_0 + b_1\sin\theta + b_2\sin^2\theta + \ldots + b_n\sin^n\theta$ ...(i)

Putting $\theta = 0$ in Eq. (i), we get $0 = b_0$

Again, Eq. (i) can be written as $\sin n\theta = \sum_{r=0}^{n} b_r \sin^r\theta$

$$\frac{\sin n\theta}{\sin\theta} = \sum_{r=1}^{n} b_r \sin^{r-1}\theta$$

On taking limit as $\theta \to 0$, we get

$$\lim_{\theta \to 0} \frac{\sin n\theta}{\sin \theta} = b_1$$

$$\Rightarrow \quad \lim_{\theta \to 0} n\left(\frac{\sin n\theta}{n\theta}\right)\left(\frac{\theta}{\sin \theta}\right) = b_1$$

$$\Rightarrow \quad n = b_1$$

Hence, $\quad b_0 = 0;\ b_1 = n$

8. Given, $\quad \tan\theta = \frac{1}{\sqrt{7}}$

$$\therefore \quad \frac{\operatorname{cosec}^2\theta - \sec^2\theta}{\operatorname{cosec}^2\theta + \sec^2\theta} = \frac{(1+\cot^2\theta) - (1+\tan^2\theta)}{(1+\cot^2\theta) + (1+\tan^2\theta)}$$

$$= \frac{(\cot^2\theta - \tan^2\theta)}{2 + \tan^2\theta + \cot^2\theta}$$

$$= \frac{7 - \frac{1}{7}}{2 + \frac{1}{7} + 7} = \frac{48}{64} = \frac{3}{4}$$

9. $(\sqrt{3})^{\sec^2\theta} = (\tan^2\theta + 1)^2 - 1$

$$= (\sec^2\theta)^2 - 1$$

Put $\quad \sec^2\theta = x \quad (\because x \geq 1)$

Then, $\quad (\sqrt{3})^x = x^2 - 1$

Let $\quad y = (\sqrt{3})^x = (x^2 - 1) \quad (x > 1)$

Now, graphs of $y = (\sqrt{3})^x$ and $y = x^2 - 1$ intersect at one point

i.e., $x = 2$, then $y = 3$

Then, $\quad \sec^2\theta = 2$

$$\Rightarrow \quad \sec\theta = \pm\sqrt{2}$$

Therefore, there are two values of θ in $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$.

10. The given equation is

$\sin^4 x + \cos^4 y + 2 = 4 \sin x \cos y$

$$\Rightarrow \quad (\sin^2 x - 1)^2 + (\cos^2 y - 1)^2 + 2\sin^2 x + 2\cos^2 y - 4\sin x \cos y = 0$$

$$\Rightarrow \quad (\sin^2 x - 1)^2 + (\cos^2 y - 1)^2 + 2(\sin x - \cos y)^2 = 0$$

which is possible only when

$$\sin^2 x - 1 = 0, \quad \cos^2 y - 1 = 0, \quad \sin x - \cos y = 0$$

$$\Rightarrow \quad \sin^2 x = 1, \quad \cos^2 y = 1, \quad \sin x = \cos y$$

As $0 \leq x, y \leq \frac{\pi}{2}$

We get $\quad \sin x = \cos y = 1$

$$\therefore \quad \sin x + \cos y = 1 + 1 = 2$$

11. $\cos^4 x - (\lambda + 2)\cos^2 x - (\lambda + 3) = 0$

$$\Rightarrow \quad (\cos^2 x)^2 - (\lambda + 2)\cos^2 x - (\lambda + 3) = 0$$

$$\therefore \quad \cos^2 x = \frac{(\lambda + 2) \pm \sqrt{(\lambda + 2)^2 + 4(\lambda + 3)}}{2}$$

$$= \frac{(\lambda + 2) \pm (\lambda + 4)}{2} = \lambda + 3, -1$$

$$\Rightarrow \quad \cos^2 x = \lambda + 3 \quad (\because \cos^2 x \neq -1)$$

But $\quad 0 \leq \cos^2 x \leq 1$

$$\Rightarrow \quad 0 \leq \lambda + 3 \leq 1$$

$$\Rightarrow \quad -3 \leq \lambda \leq -2$$

12. $\because \cos(315\pi + x) = (-1)^{315}\cos x = -\cos x$

$$\therefore \quad 4\cos^3 x - 4\cos^2 x - \cos(315\pi + x) = 1$$

$$\Rightarrow \quad 4\cos^3 x - 4\cos^2 x + \cos x - 1 = 0$$

$$\Rightarrow \quad (4\cos^2 x + 1)(\cos x - 1) = 0$$

$$\Rightarrow \quad \cos x = 1,\ 4\cos^2 x + 1 \neq 0$$

$$\Rightarrow \quad \cos x = \cos 0$$

$$\Rightarrow x = 2n\pi, n \in I$$

$$\therefore x = 2\pi, 4\pi, 6\pi, 8\pi, \ldots, 100\pi \quad (\because 0 < x < 315)$$

(*i.e.*, $100\pi < 315 < 101\pi$)

Required arithmetic mean

$$= \frac{2\pi + 4\pi + 6\pi + 8\pi + \ldots + 100\pi}{50}$$

$$= \frac{2\pi(1 + 2 + 3 + 4 + \ldots + 50)}{50} = \frac{2\pi \cdot \frac{50}{2} \cdot 51}{50} = 51\pi$$

13. Since, $\cos^2\theta = \frac{1}{6}\sin\theta \cdot \tan\theta$

$$\Rightarrow \quad 6\cos^3\theta + \cos^2\theta - 1 = 0$$

As $\cos\theta = \frac{1}{2}$ satisfied the equation.

$$\therefore \quad (2\cos\theta - 1)(3\cos^2\theta + 2\cos\theta + 1) = 0$$

$$\Rightarrow \quad \cos\theta = \frac{1}{2} \text{ (other values of } \cos\theta \text{ are imaginary)}$$

$$\therefore \quad \theta = 2n\pi \pm \frac{\pi}{3}, n \in I$$

14. Given, $\quad \cos(a - b) = \cos 0$

$$\therefore \quad a - b = 2n\pi, n \in I$$

$$\Rightarrow \quad a - b = -2\pi, 0, 2\pi$$

$$\therefore \quad a + b = 2\pi + 2a, 2a, 2a - 2\pi$$

$$\Rightarrow \quad \cos(a + b) = \cos 2a, \cos 2a, \cos 2a = \frac{1}{e}$$

$$y = \cos 2a = \frac{1}{e}$$

Hence, number of solutions is 4.

15. $\because \quad x^3 + x^2 + 4x + 2\sin x = 0$

$\Rightarrow \quad x^3 + (x+2)^2 + 2\sin x = 4$

$x = 0$, satisfies this equation.

Now, in $0 < x \le \pi$, $x^3 + (x+2)^2 + 2\sin x > 4$

and in $\pi < x \le 2\pi$, $x^3 + (x+2)^2 + 2\sin x > 27 + 25 - 2 = 50$

Hence, $x = 0$ is the only solution.

16. $\because$ $2\cos x, |\cos x|, 1 - 3\cos^2 x$ are in GP.

$\therefore \quad \cos^2 x = 2\cos x \cdot (1 - 3\cos^2 x)$

$\Rightarrow \quad 6\cos^3 x + \cos^2 x - 2\cos x = 0$

$\therefore \quad \cos x = 0, \frac{1}{2}, -\frac{2}{3}$

$\therefore \quad x = \frac{\pi}{2}, \frac{\pi}{3}, \cos^{-1}\left(-\frac{2}{3}\right) \qquad (\because \alpha, \beta$ are positive)

If $\alpha = \frac{\pi}{2}, \beta = \frac{\pi}{3}$

Then, $\quad |\alpha - \beta| = \frac{\pi}{6}$

17. $\tan\theta = \frac{\sin\alpha - \cos\alpha}{\sin\alpha + \cos\alpha} = \frac{\tan\alpha - 1}{\tan\alpha + 1}$

$\Rightarrow \quad \tan\theta = \tan\left(\alpha - \frac{\pi}{4}\right)$

$\Rightarrow \quad \theta = n\pi + \alpha - \left(\frac{\pi}{4}\right), n \in I$

$\Rightarrow \quad 2\theta = 2n\pi + 2\alpha - \frac{\pi}{2}$

$\therefore \quad \sin 2\theta = \sin\left(2\alpha - \frac{\pi}{2}\right) = -\cos 2\alpha$

and $\quad \cos 2\theta = \cos\left(2\alpha - \frac{\pi}{2}\right) = \sin 2\alpha$

and $\quad \sin\alpha - \cos\alpha = \sqrt{2}\sin\left(\alpha - \frac{\pi}{4}\right)$

$= \sqrt{2}\sin\{\theta - n\pi\}$

$= \pm\sqrt{2}\sin\theta$

and $\quad \sin\alpha + \cos\alpha = \sqrt{2}\sin\left(\alpha + \frac{\pi}{4}\right)$

$= \sqrt{2}\sin\left\{\frac{\pi}{2} + \theta - n\pi\right\}$

$= \sqrt{2}\cos(\theta - n\pi)$

$= \pm\sqrt{2}\cos\theta$

18. $x^2 + 4xy + y^2 = aX^2 + bY^2$

$\Rightarrow \quad (X\cos\theta + Y\sin\theta)^2$

$+ 4(X\cos\theta + Y\sin\theta)(X\sin\theta - Y\cos\theta)$

$+ (X\sin\theta - Y\cos\theta)^2 = aX^2 + bY^2$

$\Rightarrow \quad X^2(1 + 4\sin\theta\cos\theta) + Y^2(1 - 4\sin\theta\cos\theta)$

$+ 4XY(\sin^2\theta - \cos^2\theta)$

$= aX^2 + bY^2$

On comparing both sides, we get

$1 + 4\sin\theta\cos\theta = a, \quad 1 - 4\sin\theta\cos\theta = b$

and $\quad \sin^2\theta - \cos^2\theta = 0$

$\therefore \quad \theta = \frac{\pi}{4}$, then $a = 3, b = -1$

19. Given, $\cos x + \cos y - \cos(x+y) = \frac{3}{2}$

$\Rightarrow \quad 2\cos\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right) - 2\cos^2\left(\frac{x+y}{2}\right) + 1 = \frac{3}{2}$

$\Rightarrow \quad 2\cos^2\left(\frac{x+y}{2}\right) - 2\cos\left(\frac{x+y}{2}\right)\cos\left(\frac{x-y}{2}\right) + \frac{1}{2} = 0$

Now, $\cos\left(\frac{x+y}{2}\right)$ is always real, then discriminant ≥ 0

$\Rightarrow \quad 4\cos^2\left(\frac{x-y}{2}\right) - 4 \ge 0$

$\Rightarrow \quad \cos^2\left(\frac{x-y}{2}\right) \ge 1$

$\Rightarrow \quad \cos^2\left(\frac{x-y}{2}\right) = 1$

$\Rightarrow \quad \frac{x-y}{2} = 0$

$\Rightarrow \quad x = y$

20. $\tan|x| = |\tan x|$

Let $\quad y = \tan|x|$ and $y = |\tan x|$

It is clear that

$-\frac{3\pi}{2} < x \le -\pi, \; -\frac{\pi}{2} < x < \frac{\pi}{2}, \pi \le x < \frac{3\pi}{2}$

$\therefore \quad x \in \left(-\frac{\pi(2k+1)}{2}, -\pi k\right]$

and $\quad x \in \left[\pi k, \frac{\pi(2k+1)}{2}\right), k \in I$

21. $\because$ AM $\geq$ GM

$\therefore \quad 3^x + 3^x \geq 2$

$\Rightarrow \quad 2\cos\left(\frac{x}{2}\right) \geq 2$

$\Rightarrow \quad \cos\left(\frac{x}{2}\right) \geq 1$

$\therefore \quad \cos\left(\frac{x}{2}\right) = 1 \quad \left(\because \cos\frac{x}{2} \text{ is never} > 1\right)$

$\Rightarrow \quad \frac{x}{2} = 2n\pi, n \in I$

$\therefore \quad x = 4n\pi$

At $n = 0$ it satisfies the given equation but other values of n do not satisfy the equation.

22. Let $\quad y = 2\cos^2\left(\frac{x}{2}\right)\sin^2 x = x^2 + x^{-2}$

$\therefore \quad y = x^2 + x^{-2} \geq 2 \quad (\because \text{AM} \geq \text{GM})$

$\Rightarrow \quad y \geq 2 \quad \ldots(\text{i})$

and $\quad y = 2\cos^2\left(\frac{x}{2}\right)\sin^2 x$

$= (1 + \cos x) \cdot \sin^2 x$

$= (\text{ a number} < 2) \cdot (\text{a number} \leq 1) < 2$

i.e., $\quad y < 2 \quad \ldots(\text{ii})$

No value of y can be obtained by the relations (i) and (ii).

$\Rightarrow$ No real solution of the equation exists.

23. $\because \quad$ AM $\geq$ GM

$\therefore \quad 5^x + 5^{-x} \geq 2$

$\Rightarrow \quad \sin e^x \geq 2 \quad (\because \sin e^x = 5^x + 5^{-x})$

But the value of $\sin(e^x)$ can never be > 1.

Hence, the given equation has no solution.

24. LHS

$= \tan\alpha + 2\tan 2\alpha + 4\tan 4\alpha + 8\tan 8\alpha + 16\cot 16\alpha$

$= \cot\alpha - (\cot\alpha - \tan\alpha) + 2\tan 2\alpha + 4\tan 4\alpha + 8\tan 8\alpha + 16\cot 16\alpha$

$= \cot\alpha - 2(\cot 2\alpha - \tan 2\alpha) + 4\tan 4\alpha + 8\tan 8\alpha + 16\cot 16\alpha$

$(\because \cot\alpha - \tan\alpha = 2\cot 2\alpha)$

$= \cot\alpha - 4(\cot 4\alpha - \tan 4\alpha) + 8\tan 8\alpha + 16\cot 16\alpha$

$(\because \cot 2\alpha - \tan 2\alpha = 2\cot 4\alpha)$

$= \cot\alpha - 8(\cot 8\alpha - \tan 8\alpha) + 16\cot 16\alpha$

$= \cot\alpha - 16\cot 16\alpha + 16\cot 16\alpha$

$(\because \cot 8\alpha - \tan 8\alpha = 2\cot 16\alpha)$

$= \cot\alpha = \text{RHS}$

25. $\because \quad \cos\alpha + \cos\left(\alpha + \frac{2\pi}{3}\right) + \cos\left(\alpha + \frac{4\pi}{3}\right)$

$= \cos\alpha + 2\cos(\alpha + \pi)\cos\frac{\pi}{3}$

$= \cos\alpha + (-2\cos\alpha)\left(\frac{1}{2}\right) = 0$

$\therefore \quad \cos^3\alpha + \cos^3\left(\alpha + \frac{2\pi}{3}\right) + \cos^3\left(\alpha + \frac{4\pi}{3}\right)$

$= 3\cos\alpha\cos\left(\alpha + \frac{2\pi}{3}\right)\cos\left(\alpha + \frac{4\pi}{3}\right)$

26. Let $\quad x = \cot A, \quad y = \cot B, \quad z = \cot C$

$\therefore \quad \cot A\cot B + \cot B\cot C + \cot C\cot A = 1$

$\because \quad A + B + C = 180°$

$\therefore \quad \Sigma\frac{x}{(1 + x^2)} = \Sigma\frac{\cot A}{(1 + \cot^2 A)}$

$= \frac{1}{2}\Sigma\frac{2\tan A}{(1 + \tan^2 A)} = \frac{1}{2}\Sigma\sin 2A$

$= \frac{1}{2}(\sin 2A + \sin 2B + \sin 2C)$

$= \frac{1}{2}(4\sin A\sin B\sin C) = 2\sin A\sin B\sin C$

$= \frac{2}{\sqrt{(1 + \cot^2 A)(1 + \cot^2 B)(1 + \cot^2 C)}}$

$= \frac{2}{\sqrt{(1 + x^2)(1 + y^2)(1 + z^2)}} = \frac{2}{\sqrt{\prod(1 + x^2)}}$

and $\sin 2A + \sin 2B - \sin 2C$

$= 2\sin(A + B)\cos(A - B) - 2\sin C\cos C$

$= 2\sin C\{\cos(A - B) - \cos C\}$

$= 2\sin C\{\cos(A - B) + \cos(A + B)\}$

$= 2\sin C(2\cos A\cos B)$

$= 4\cos A\cos B\sin C$

27. $\because \quad a\cos x + b\sin x = c$

$\Rightarrow \quad a\left\{\frac{1 - \tan^2(x/2)}{1 + \tan^2(x/2)}\right\} + b\left\{\frac{2\tan(x/2)}{1 + \tan^2(x/2)}\right\} = c$

$\Rightarrow \quad (a + c)\tan^2\left(\frac{x}{2}\right) - 2b\tan\left(\frac{x}{2}\right) + (c - a) = 0$

$\therefore \quad \tan\left(\frac{\alpha}{2}\right) + \tan\left(\frac{\beta}{2}\right) = \frac{2b}{(a + c)}$

and $\quad \tan\left(\frac{\alpha}{2}\right)\tan\left(\frac{\beta}{2}\right) = \frac{c - a}{a + c}$

Now, $\quad \tan\left(\frac{\alpha + \beta}{2}\right) = \frac{\tan\left(\frac{\alpha}{2}\right) + \tan\left(\frac{\beta}{2}\right)}{1 - \tan\left(\frac{\alpha}{2}\right)\tan\left(\frac{\beta}{2}\right)}$

$= \frac{\frac{2b}{a + c}}{1 - \left(\frac{c - a}{a + c}\right)} = \frac{b}{a} = \text{independent of } c$

Also, $\quad -\sqrt{(a^2 + b^2)} \leq a\cos x + b\sin x \leq \sqrt{(a^2 + b^2)}$

$\therefore \quad -\sqrt{(a^2 + b^2)} \leq c \leq \sqrt{(a^2 + b^2)}$

28. Since, $7^x + 7^{-x} \geq 2$

But $\cos x \leq 1$

Hence, no real solution exist.

Hence, option (a) is correct.

29. Let $y = \sin x$ and $y = x^2 + x + 1$

Since, $-1 \leq \sin x \leq 1$ and $y = \left(x + \frac{1}{2}\right)^2 + \frac{3}{4}$

It is clear from the graph that no two curves intersect.

30. Since, $\cos\theta > \sin\theta$ for $0 \leq \theta \leq \frac{\pi}{4}$

So, statement I is true.

Now, $\cos 36° > \sin 36°$

$\Rightarrow \cos^2 36° > \sin 36°$

$\Rightarrow 1 + \cos 72° > 2 \sin 36° = 2 \sin (30° + 6°)$

$\Rightarrow 1 + \sin 18° > 2(\sin 30° \cos 6° + \cos 30° \sin 6°)$

$\Rightarrow 1 + 2 \sin 9° \cos 9° > \cos 6° + 2 \cos 30° \sin 6°$

which is true.

31. Let $S = \sin\left(\frac{2\pi}{7}\right) + \sin\left(\frac{4\pi}{7}\right) + \sin\left(\frac{8\pi}{7}\right)$

and $C = \cos\left(\frac{2\pi}{7}\right) + \cos\left(\frac{4\pi}{7}\right) + \cos\left(\frac{8\pi}{7}\right)$

$\therefore \quad C + iS = \alpha + \alpha^2 + \alpha^4$ ...(i)

where, $\alpha = \cos\left(\frac{2\pi}{7}\right) + i \sin\left(\frac{2\pi}{7}\right)$

is complex 7th root of unity.

Then, $C - iS = \bar{\alpha} + \bar{\alpha}^2 + \bar{\alpha}^4 = \alpha^6 + \alpha^5 + \alpha^3$ ...(ii)

On adding Eqs. (i) and (ii), we get

$$2C = \alpha + \alpha^2 + \alpha^4 + \alpha^6 + \alpha^5 + \alpha^3 = -1$$

$\Rightarrow C = -\frac{1}{2}$ and $C^2 + S^2 = 2$

$\Rightarrow S^2 = 2 - \left(\frac{1}{2}\right)^2 = \frac{7}{4}$

$\Rightarrow S = \frac{\sqrt{7}}{2}$

32. $\because \quad y + \frac{1}{y} \geq 2$ (AM $\geq$ GM)

$\Rightarrow \sqrt{\left(y + \frac{1}{y}\right)} \geq \sqrt{2}$

or $\sin x + \cos x \geq \sqrt{2}$

and $|\sin x + \cos x| \leq \sqrt{2}$

Hence, $y + \frac{1}{y} = 2$ and $\sin x + \cos x = \sqrt{2}$

which is possible for $y = 1, x = \frac{\pi}{4}$.

33. $\because \quad \tan\left(\frac{\pi}{2}\sin\theta\right) = \cot\left(\frac{\pi}{2}\cos\theta\right)$

$= \tan\left(\frac{\pi}{2} - \frac{\pi}{2}\cos\theta\right)$

$\therefore \quad \frac{\pi}{2}\sin\theta = n\pi + \frac{\pi}{2} - \frac{\pi}{2}\cos\theta$

$\Rightarrow \sin\theta + \cos\theta = 2n + 1, n \in I$

$\because \quad -\sqrt{2} \leq \sin\theta + \cos\theta \leq \sqrt{2}$

$\therefore n = 0; -1$

Then, $\sin\theta + \cos\theta = 1, -1$

34. $\sin(\cos x) = \cos(\sin x)$

$\Rightarrow \cos(\sin x) = \cos\left(\frac{\pi}{2} - \cos x\right)$

$\Rightarrow \sin x = 2n\pi \pm \left(\frac{\pi}{2} - \cos x\right), n \in I$

$\Rightarrow \sin x \pm \cos x = \left(2n \pm \frac{1}{2}\right)\pi$

On squaring, we get

$$1 \pm \sin 2x = \left(2n \pm \frac{1}{2}\right)^2 \pi^2$$

$\Rightarrow |\sin 2x| = \left(2n \pm \frac{1}{2}\right)^2 \pi^2 - 1$

But $\left(2n \pm \frac{1}{2}\right)^2 \pi^2 > 2$ for all $n \in I$

$\therefore |\sin 2x| > 1$, which is imposible.

Hence, the given equation does not possess real roots.

$\because \quad \sin x > 0$

(x lies in I and II quadrant)

$\therefore \quad 2n\pi < x < (2n + 1)\pi, n \in I$

35. $\because \quad \sin^2 A = \sin^2 B$ and $\cos^2 A = \cos^2 B$

$\therefore \quad \cos 2A = \cos 2B$

$\Rightarrow 2A = 2n\pi \pm B, n \in I$

$\Rightarrow A = n\pi \pm B$

$\Rightarrow A = n\pi + B, n \in I$

($\because$ given equation in square form)

Now, $\sin A = \sin B$

$\Rightarrow A = n\pi + (-1)^n B, n \in I$

If n is even, then

$$A = n\pi + B$$

and $\cos A = \cos B$

$\Rightarrow$ $A = 2n\pi \pm B, n \in I$

Hence, statement I is true but statement II is false.

36. Let $AB = x$

In ΔDAM, $\tan(\pi - \theta - \alpha) = \dfrac{p}{x-q}$

$\Rightarrow$ $\tan(\theta + \alpha) = \dfrac{p}{q-x}$

$\Rightarrow$ $q - x = p \cot(\theta + \alpha)$

$\Rightarrow$ $x = q - p\cot(\theta + \alpha)$

$$= q - p\left(\frac{\cot\theta\cot\alpha - 1}{\cot\alpha + \cot\theta}\right) \qquad \left(\because \cot\alpha = \frac{q}{p}\right)$$

$$= q - p\left(\frac{\frac{q}{p}\cot\theta - 1}{\frac{q}{p} + \cot\theta}\right)$$

$$= q - p\left(\frac{q\cot\theta - p}{q + p\cot\theta}\right)$$

$$= q - p\left(\frac{q\cos\theta - p\sin\theta}{q\sin\theta + p\cos\theta}\right)$$

$\Rightarrow$ $x = \dfrac{q^2\sin\theta + pq\cos\theta - pq\cos\theta + p^2\sin\theta}{p\cos\theta + q\sin\theta}$

$\Rightarrow$ $AB = \dfrac{(p^2+q^2)\sin\theta}{p\cos\theta + q\sin\theta}$

37. Given expression is

$$\frac{\tan A}{1-\cot A} + \frac{\cot A}{1-\tan A} = \frac{\sin A}{\cos A} \times \frac{\sin A}{\sin A - \cos A} + \frac{\cos A}{\sin A} \times \frac{\cos A}{\cos A - \sin A}$$

$$= \frac{1}{\sin A - \cos A}\left\{\frac{\sin^3 A - \cos^3 A}{\cos A \sin A}\right\}$$

$$= \frac{\sin^2 A + \sin A\cos A + \cos^2 A}{\sin A\cos A}$$

$$= \frac{1 + \sin A\cos A}{\sin A\cos A} = 1 + \sec A \operatorname{cosec} A$$

38. Given, $3\sin P + 4\cos Q = 6$ ...(i)

and $4\sin Q + 3\cos P = 1$ ...(ii)

On squaring and adding the Eqs. (i) and (ii), we get

and $9(\sin^2 P + \cos^2 P) + 16(\sin^2 Q + \cos^2 Q)$

$+ 2 \times 3 \times 4(\sin P\cos Q + \sin Q\cos P) = 37$

$\Rightarrow$ $24\{\sin(P+Q)\} = 37 - 25$

$\therefore$ $\sin(P+Q) = \dfrac{1}{2}$

Since, P and Q are angles of ΔPQR, hence $0° < P, Q < 180°$

$\therefore$ $P + Q = 30°$ or $150°$

$\Rightarrow$ $R = 150°$ or $30°$ (respectively)

Hence, two cases arise here.

***Case* I** When $R = 150°$

$P + Q = 30° \Rightarrow 0 < P, Q < 30°$

$\Rightarrow$ $\sin P < \dfrac{1}{2}, \cos Q < 1$

$\Rightarrow$ $3\sin P + 4\cos Q < \dfrac{3}{2} + 4$

$\Rightarrow$ $3\sin P + 4\cos Q < \dfrac{11}{2} < 6$

$\therefore 3\sin P + 4\cos Q = 6$ is not possible.

***Case* II** When $R = 30°$

Hence, $R = 30°$ is the only possibility.

39. Given equation is

$$e^{\sin x} - e^{-\sin x} = 4 \Rightarrow e^{\sin x} - \frac{1}{e^{\sin x}} = 4$$

Now, let $y = e^{\sin x}$

Hence, we get

$$y - \frac{1}{y} = 4$$

$\Rightarrow$ $y^2 - 4y - 1 = 0$

$\therefore$ $y = \dfrac{4 \pm \sqrt{16+4}}{2}$

$\Rightarrow$ $y = 2 \pm \sqrt{5}$

$\therefore$ $e^{\sin x} = 2 \pm \sqrt{5}$

Since, sine is a bounded function *i.e.*, $-1 \le \sin x \le 1$. Hence, we get

$$e^{-1} \le e^{\sin x} \le e \Rightarrow e^{\sin x} \in \left[\frac{1}{e}, e\right]$$

Also, it is obvious that $2 + \sqrt{5} > e$

and $2 - \sqrt{5} < \dfrac{1}{e} \Rightarrow 2 \pm \sqrt{5} \in \left[\dfrac{1}{e}, e\right]$

$\therefore e^{\sin x} = 2 + \sqrt{5}$ is not possible for any $x \in R$ and

$e^{\sin x} = 2 - \sqrt{5}$ is also not possible for any $x \in R$

Hence, we can say that the given equation has no solution.

40. $A = \sin^2 x + \cos^4 x = \cos^4 x - \cos^2 x + \dfrac{1}{4} + \dfrac{3}{4}$

$$= \left(\cos^2 x - \frac{1}{2}\right)^2 + \frac{3}{4}$$

where, $0 \le \left(\cos^2 x - \frac{1}{2}\right)^2 \le \frac{1}{4}$

$\therefore \quad \frac{3}{4} \le A \le 1$

41. $\cos(\alpha+\beta) = \frac{4}{5} \Rightarrow \alpha+\beta \in$ 1st quadrant

$\sin(\alpha-\beta) = \frac{5}{13} \Rightarrow (\alpha-\beta) \in$ 1st quadrant

$\Rightarrow \quad 2\alpha = (\alpha+\beta)+(\alpha-\beta)$

$\therefore \quad \tan 2\alpha = \frac{\tan(\alpha+\beta)+\tan(\alpha-\beta)}{1-\tan(\alpha+\beta)\tan(\alpha-\beta)}$

$$= \frac{\frac{3}{4}+\frac{5}{12}}{1-\frac{3}{4}\cdot\frac{5}{12}} = \frac{56}{33}$$

42. $\cos(\beta-\gamma)+\cos(\gamma-\alpha)+\cos(\alpha-\beta) = -\frac{3}{2}$

$\Rightarrow \quad 2[\cos(\beta-\gamma)+\cos(\gamma-\alpha)+\cos(\alpha-\beta)]+3=0$

$\Rightarrow \quad 2[\cos(\beta-\gamma)+\cos(\gamma-\alpha)+\cos(\alpha-\beta)]$
$+\sin^2\alpha+\cos^2\alpha+\sin^2\beta+\cos^2\beta+\sin^2\gamma$
$+\cos^2\gamma = 0$

$\therefore \quad (\sin\alpha+\sin\beta+\sin\gamma)^2+(\cos\alpha+\cos\beta+\cos\gamma)^2 = 0$

43. $(2\sin x-1)(\sin x+3)=0$

$\Rightarrow \quad \sin x = \frac{1}{2} \qquad (\because \sin x \ne -3)$

$\therefore \quad x = \frac{\pi}{6}, \frac{5\pi}{6}, \frac{13\pi}{6}, \frac{17\pi}{6}$

44. Since, $\cos\left(x-\frac{\pi}{4}\right) = \frac{1}{2\sqrt{2}} \Rightarrow \tan\left(x-\frac{\pi}{4}\right) = \sqrt{7}$

$\Rightarrow \quad \frac{\tan x-1}{\tan x+1} = \sqrt{7}$

$\therefore \quad \tan x = \frac{\sqrt{7}+1}{1-\sqrt{7}} = \frac{-(4+\sqrt{7})}{3}$

45. Since, $\tan\frac{P}{2}+\tan\frac{Q}{2} = -\frac{b}{a}$ and $\tan\frac{P}{2}\tan\frac{Q}{2} = \frac{c}{a}$

Also, $\frac{P}{2}+\frac{Q}{2}+\frac{R}{2} = \frac{\pi}{2}$

$\Rightarrow \quad \frac{P+Q}{2} = \frac{\pi}{4} \qquad \left(\because \angle R = \frac{\pi}{2}\right)$

$\Rightarrow \quad \frac{\tan\frac{P}{2}+\tan\frac{Q}{2}}{1-\tan\frac{P}{2}\tan\frac{Q}{2}} = 1$

$\Rightarrow \quad \frac{-\frac{b}{a}}{1-\frac{c}{a}} = 1$

$\therefore \quad c = a+b$

46. $2\sin\left(\frac{\alpha+\beta}{2}\right)\cos\left(\frac{\alpha-\beta}{2}\right) = -\frac{21}{65}$

$2\cos\left(\frac{\alpha+\beta}{2}\right)\cdot\cos\left(\frac{\alpha-\beta}{2}\right) = -\frac{27}{65}$

On squaring and adding, we get

$4\cos^2\left(\frac{\alpha-\beta}{2}\right) = \frac{1170}{(65)^2}$

$\Rightarrow \quad \cos\left(\frac{\alpha-\beta}{2}\right) = \frac{-3\sqrt{130}}{130}$

$\therefore \quad \cos\left(\frac{\alpha-\beta}{2}\right) = \frac{-3}{\sqrt{130}} \quad \left(\because \frac{\pi}{2} < \frac{\alpha-\beta}{2} < \frac{3\pi}{2}\right)$

47. $u = \sqrt{a^2\cos^2\theta+b^2\sin^2\theta}+\sqrt{a^2\sin^2\theta+b^2\cos^2\theta}$

$u^2 = a^2\cos^2\theta+b^2\sin^2\theta+a^2\sin^2\theta+b^2\cos^2\theta$
$+2\sqrt{(a^2\cos^2\theta+b^2\sin^2\theta)}\times\sqrt{(a^2\sin^2\theta+b^2\cos^2\theta)}$

$\Rightarrow \quad u^2 = (a^2+b^2)+2\sqrt{\{a^2+(b^2-a^2)\sin^2\theta\}\times\{a^2+(b^2-a^2)\cos^2\theta\}}$

$\Rightarrow \quad u^2 = (a^2+b^2)+2\sqrt{a^4+a^2(b^2-a^2)+(b^2-a^2)^2\sin^2\theta\cos^2\theta}$

$\Rightarrow \quad u^2 = (a^2+b^2)+2\sqrt{a^2b^2+\left(\frac{b^2-a^2}{2}\right)^2\sin^2 2\theta}$

$\therefore \quad \min(u^2) = a^2+b^2+2ab = (a+b)^2$

and $\quad \max(u^2) = a^2+b^2+(a^2+b^2) = 2(a^2+b^2)$

Now, $\quad \max(u^2)-\min(u^2) = (a-b)^2$

48. Since, the centroid G divides the line AD in the ratio 2 : 1.

$\therefore \quad AG = \frac{8}{3}$ and $DG = \frac{4}{3}$

In ΔABG, $\quad \tan\frac{\pi}{3} = \frac{AG}{BG}$

$\Rightarrow \quad BG = AG\cot\frac{\pi}{3}$

$\therefore \quad BG = \frac{8}{3}\times\frac{1}{\sqrt{3}} = \frac{8}{3\sqrt{3}}$

Area of $\Delta ADB = \frac{1}{2}\times AD\times BG = \frac{1}{2}\times 4\times\frac{8}{3\sqrt{3}} = \frac{16}{3\sqrt{3}}$

$\therefore$ Area of $\Delta ABC = 2\times$ Area of ΔADB

$= 2\times\frac{16}{3\sqrt{3}} = \frac{32}{3\sqrt{3}}$ sq units

49. Since, $\sin^2\theta \le 1$

$\Rightarrow \quad \dfrac{4xy}{(x+y)^2} \le 1$

$\Rightarrow \quad (x-y)^2 \ge 0$

which is true for all real values of x and y provided $x + y \ne 0$, otherwise $\dfrac{4xy}{(x+y)^2}$ will be meaningless.

50. $\because \quad \cos 2\theta = \dfrac{1-\tan^2\theta}{1+\tan^2\theta}$

$\therefore \quad \dfrac{1-\tan^2 15°}{1+\tan^2 15°} = \cos 30° = \dfrac{\sqrt{3}}{2}$

51. Since, $\tan\theta = -\dfrac{4}{3}$

$\therefore \quad h = \sqrt{16+9} = \sqrt{25} \Rightarrow h = 5$

$\therefore \quad \sin\theta = \dfrac{4}{5}$

But $\tan\theta$ is negative which is possible only if θ lie in second and fourth quadrants.

$\therefore \quad \sin\theta$ may be $\dfrac{4}{5}$ or $-\dfrac{4}{5}$.

52. Since, $\sin(\alpha+\beta) = 1$

$\Rightarrow \quad \sin(\alpha+\beta) = \sin\dfrac{\pi}{2}$

$\Rightarrow \quad \alpha + \beta = \dfrac{\pi}{2} \quad \ldots(i)$

and $\quad \sin(\alpha-\beta) = \dfrac{1}{2}$

$\Rightarrow \quad \alpha - \beta = \dfrac{\pi}{6} \quad \ldots(ii)$

On solving Eqs. (i) and (ii), we get

$$\alpha = \frac{\pi}{3}, \quad \beta = \frac{\pi}{6}$$

$\therefore \quad \tan(\alpha+2\beta)\tan(2\alpha+\beta) = \tan\left(\dfrac{2\pi}{3}\right)\tan\left(\dfrac{5\pi}{6}\right)$

$= \left(-\cot\dfrac{\pi}{6}\right)\left(-\cot\dfrac{\pi}{3}\right)$

$= \sqrt{3} \times \dfrac{1}{\sqrt{3}} = 1$

53. Since, $\quad y = \sin^2\theta + \operatorname{cosec}^2\theta = (\sin\theta - \operatorname{cosec}\theta)^2 + 2$

$\Rightarrow \quad y \ge 2$

But $\theta \ne 0$, then

$$y > 2$$

54. Since, α is a root of $25\cos^2\theta + 5\cos\theta - 12 = 0$

$\therefore \quad 25\cos^2\alpha + 5\cos\alpha - 12 = 0$

$\Rightarrow \quad (5\cos\alpha + 4)(5\cos\alpha - 3) = 0$

$\Rightarrow \quad \cos\alpha = -\dfrac{4}{5}, \dfrac{3}{5}$

But $\dfrac{\pi}{2} < \alpha < \pi$

$\therefore \quad$ We take $\cos\alpha = -\dfrac{4}{5} \quad (\because \cos\alpha < 0)$

$\Rightarrow \quad \sin\alpha = \dfrac{3}{5}$

$\therefore \quad \sin 2\alpha = 2\sin\alpha\cos\alpha = -2 \times \dfrac{3}{5} \times \dfrac{4}{5} = -\dfrac{24}{25}$

10 Properties of Triangles, Heights and Distances

JEE Main MILESTONE

- Relation between the Sides and Angles of Triangle
- Trigonometric Ratios of Half Angles of a Triangle
- Area of Triangles
- Different Types of Circle Connected with Triangle
- Regular Polygon
- Angle of Elevation
- Angle of Depression
- Bearing

10.1 Relation between the Sides and Angles of Triangle

In a ΔABC, angles are denoted by A, B and C and the lengths of corresponding sides opposite to these angles are denoted by a, b and c, respectively. Area and perimeter of a triangle are denoted by Δ and $2s$, respectively. Also,

Semi-perimeter of the triangle is $s = \dfrac{a+b+c}{2}$.

The sum of all angles of a triangle is $180°$ *i.e.*, $\angle A + \angle B + \angle C = 180°$.

Note

- The longest side of a triangle have corresponding largest angle and *vice-versa*.
- The smallest side of a triangle have corresponding smallest angle and *vice-versa*.

Properties of triangle is a part of trigonometry which is a branch of Mathematics. In which we study about triangles and relationship between their sides and angles. Height and distance is an application of trigonometry. Here with the help of trigonometry, we find the height of any object or distance of an object from any point/object which cannot measured directly.

Sine Rule

In any ΔABC, the sines of the angles are proportional to the lengths of the opposite sides, *i.e.*,

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$$

It can also be written as

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = k \text{ (say)}$$

Then, $a = k \sin A, b = k \sin B, c = k \sin C$

Cosine Rule

In any ΔABC, cosine of an angle can express in terms of sides.

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}, \cos B = \frac{c^2 + a^2 - b^2}{2ac}$$

and $$\cos C = \frac{a^2 + b^2 - c^2}{2ab}$$

Projection Rule

In any ΔABC,

$$a = b\cos C + c\cos B$$
$$b = a\cos C + c\cos A$$
$$c = a\cos B + b\cos A$$

Napier's Analogy

In any ΔABC,

$$\tan\frac{C-A}{2} = \frac{c-a}{c+a}\cot\frac{B}{2}, \tan\frac{A-B}{2} = \frac{a-b}{a+b}\cot\frac{C}{2}$$

and $$\tan\frac{B-C}{2} = \frac{b-c}{b+c}\cot\frac{A}{2}$$

***Sample* Problem 1** *In a ΔABC, if $\angle A = 60°$, $a = 5$, $b = 4$, then c is a root of the equation*

(a) $c^2 - 5c - 9 = 0$ (b) $c^2 - 4c - 9 = 0$
(c) $c^2 - 10c + 25 = 0$ (d) $c^2 - 5c - 41 = 0$

Interpret (b) Given, $\angle A = 60°$, $a = 5, b = 4$

$$\because \quad \cos A = \frac{b^2 + c^2 - a^2}{2bc}$$

$$\therefore \quad \cos 60° = \frac{(4)^2 + (c)^2 - (5)^2}{2 \times 4 \times c}$$

$$\Rightarrow \quad \frac{1}{2} = \frac{16 + c^2 - 25}{8c} \Rightarrow 4c = c^2 - 9$$

$$\Rightarrow \quad c^2 - 4c - 9 = 0$$

***Sample* Problem 2** *In a ΔABC,*

$$\Sigma (b + c)\tan\frac{A}{2}\tan\left(\frac{B-C}{2}\right)$$

is equal to

(a) a (b) b (c) c (d) 0

Interpret (d) Now, $(b + c)\tan\frac{A}{2}\tan\left(\frac{B-C}{2}\right)$

$$= (b + c)\tan\frac{A}{2} \times \frac{b-c}{b+c}\cot\frac{A}{2} = b - c$$

$$\therefore \quad \Sigma (b + c)\tan\left(\frac{B-C}{2}\right)\tan\frac{A}{2} = b - c + c - a + a - b$$

$$= 0$$

10.2 Trigonometric Ratios of Half Angles of a Triangle

In a ΔABC, if the sides of the triangle are a, b, c and corresponding angles are A, B and C respectively and s is the semi-perimeter, then

(i) $\sin\frac{A}{2} = \sqrt{\frac{(s-b)(s-c)}{bc}}$ (ii) $\sin\frac{B}{2} = \sqrt{\frac{(s-c)(s-a)}{ca}}$

(iii) $\sin\frac{C}{2} = \sqrt{\frac{(s-a)(s-b)}{ab}}$ (iv) $\cos\frac{A}{2} = \sqrt{\frac{s(s-a)}{bc}}$

(v) $\cos\frac{B}{2} = \sqrt{\frac{s(s-b)}{ca}}$ (vi) $\cos\frac{C}{2} = \sqrt{\frac{s(s-c)}{ab}}$

(vii) $\tan\frac{A}{2} = \sqrt{\frac{(s-b)(s-c)}{s(s-a)}}$ (viii) $\tan\frac{B}{2} = \sqrt{\frac{(s-a)(s-c)}{s(s-b)}}$

(ix) $\tan\frac{C}{2} = \sqrt{\frac{(s-a)(s-b)}{s(s-c)}}$

***Sample* Problem 3** *If in ΔABC, $\sin\frac{A}{2}, \sin\frac{C}{2} = \sin\frac{B}{2}$ and $2s$ is the perimeter of the triangle, then s is*

(a) $2b$ (b) b
(c) $3b$ (d) $4b$

Interpret (a) Given, $\sin\frac{A}{2}, \sin\frac{C}{2} = \sin\frac{B}{2}$

$$\therefore \quad \sqrt{\frac{(s-b)(s-c)}{bc}}\sqrt{\frac{(s-a)(s-b)}{ab}} = \sqrt{\frac{(s-a)(s-c)}{ac}}$$

$$\Rightarrow \quad \frac{s-b}{b} = 1$$

$$\Rightarrow \quad s = 2b$$

10.3 Area of Triangles

In a ΔABC, if the sides of the triangle are a, b, c and corresponding angles are A, B and C respectively, then area of triangle

(i) **When two sides and angle between them is known**

$$\Delta = \frac{1}{2}ab\sin C, \Delta = \frac{1}{2}bc\sin A,$$

$$\Delta = \frac{1}{2}ca\sin B$$

(ii) **When one side and corresponding angles are known**

$$\Delta = \frac{c^2\sin A\sin B}{2\sin C}$$

$$\Delta = \frac{a^2\sin B\sin C}{2\sin A}$$

$$\Delta = \frac{b^2\sin C\sin A}{2\sin B}$$

(iii) **When all the three sides are known**

$$\Delta = \sqrt{s(s-a)(s-b)(s-c)}$$

It is known as **Hero's formula.**

***Sample* Problem 4** *The area of the ΔABC, in which $a = 1$, $b = 2$, $\angle c = 60°$, is*

(a) 4 *sq units* (b) $\frac{1}{2}$ *sq unit* (c) $\frac{\sqrt{3}}{2}$ *sq unit* (d) $\sqrt{3}$ *sq units*

Interpret (c) Given, $a = 1, b = 2, \angle C = 60°$

$$\therefore \text{Area of triangle} = \frac{1}{2}ab\sin C = \frac{1}{2}\times 1\times 2\times \sin 60°$$

$$= \sin 60° = \frac{\sqrt{3}}{2} \text{ sq unit}$$

***Sample* Problem 5** *If the angles of a triangle are 30° and 45° and the inclined side is $(\sqrt{3}+1)$ cm. Then, area of triangle is*

(a) $\frac{1}{2}\sqrt{3}$ *cm*^{2} (b) $\frac{1}{2}(\sqrt{3}+1)$ *cm*^{2}

(c) $(\sqrt{3}+1)$ *cm*^{2} (d) *None of these*

Interpret (b) We know that,

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$$

$$\Rightarrow \quad \frac{\sin 105°}{\sqrt{3}+1} = \frac{\sin 30°}{b} = \frac{\sin 45°}{c}$$

$$\Rightarrow \quad b = \frac{\sqrt{3}+1}{2\sin 105°}, \quad c = \frac{\sqrt{3}+1}{\sqrt{2}\sin 105°}$$

$$\therefore \text{ Area of } \Delta ABC = \frac{1}{2}bc\sin A$$

$$= \frac{1}{2}\cdot\frac{(\sqrt{3}+1)^2}{2\sqrt{2}\sin 105°}$$

$$= \frac{1}{2}\cdot\frac{(\sqrt{3}+1)^2}{(\sqrt{3}+1)}$$

$$= \frac{1}{2}(\sqrt{3}+1) \text{ cm}^2$$

10.4 Different Types of Circle Connected with Triangle

(i) Circumcircle of a Triangle

The circle passing through the vertices of a ΔABC is called circumcircle (circumscribed). Its radius R is called the circumradius and its centre is known as circumcentre. Circumcentre is the point of intersection of perpendicular bisectors of the sides.

(a) $R = \frac{a}{2\sin A} = \frac{c}{2\sin C}$ (b) $R = \frac{abc}{4\Delta}$

***Sample* Problem 6** *In any ΔABC,*

$a\cos A + b\cos B + c\cos C$ is equal to

(a) $4R$

(b) $\sin A \sin B \sin C$

(c) $R\sin A\sin B\sin C$

(d) $4R\sin A\sin B\sin C$

Interpret (d) $a\cos A + b\cos B + c\cos C$

$$= 2R\sin A\cos A + 2R\sin B\cos B + 2R\sin C\cos C$$

$$(\because a = 2R\sin A, b = 2R\sin B \text{ and } c = 2R\sin C)$$

$$= R(\sin 2A + \sin 2B + \sin 2C)$$

$$= R[2\sin(A+B)\cos(A-B) + 2\sin C\cos C]$$

$$= 2R[\sin(\pi - C)\cos(A-B) + \sin C\cos\{\pi - (A+B)\}]$$

$$= 2R[\sin C\{\cos(A-B) - \cos(A+B)\}]$$

$$= 4R\sin A\sin B\sin C$$

(ii) Incircle of a Triangle

The circle touching all the sides of a triangle internally is known as an incircle (inscribed) of the triangle. Its centre is called incentre and its radius r is called the inradius of the circle. Incentre is the point of intersection of bisectors of the angles of the triangle.

(a) $r = \frac{\Delta}{s}$

(b) $r = (s-a)\tan\frac{A}{2} = (s-b)\tan\frac{B}{2} = (s-c)\tan\frac{C}{2}$

(c) $r = \dfrac{a\sin\frac{B}{2}\sin\frac{C}{2}}{\cos\frac{A}{2}} = \dfrac{b\sin\frac{A}{2}\sin\frac{C}{2}}{\cos\frac{B}{2}} = \dfrac{c\sin\frac{B}{2}\sin\frac{A}{2}}{\cos\frac{C}{2}}$

(d) $r = 4R\sin\frac{A}{2}\sin\frac{B}{2}\sin\frac{C}{2}$

***Sample* Problem 7** *In a ΔABC, $\cos A + \cos B + \cos C$ is equal to*

(a) $\frac{r}{R}$ (b) $1 - \frac{r}{R}$

(c) $\frac{R}{r}$ (d) $1 + \frac{r}{R}$

Interpret (d) $\cos A + \cos B + \cos C$

$$= 2\cos\left(\frac{A+B}{2}\right)\cos\left(\frac{A-B}{2}\right) + \cos C$$

$$= 2\cos\left(\frac{\pi}{2} - \frac{C}{2}\right)\cos\left(\frac{A-B}{2}\right) + 1 - 2\sin^2\frac{C}{2}$$

$$= 1 + 2\sin\frac{C}{2}\cos\left(\frac{A-B}{2}\right) - 2\sin^2\frac{C}{2}$$

$$= 1 + 2\sin\frac{C}{2}\left[\cos\left(\frac{A-B}{2}\right) - \sin\frac{C}{2}\right]$$

$$= 1 + 2\sin\frac{C}{2}\left[\cos\left(\frac{A-B}{2}\right) - \cos\left(\frac{A+B}{2}\right)\right]$$

$$= 1 + 4\sin\frac{A}{2}\sin\frac{B}{2}\sin\frac{C}{2}$$

$$= \left(1 + \frac{r}{R}\right) \qquad \left(\because r = 4R\sin\frac{A}{2}\sin\frac{B}{2}\sin\frac{C}{2}\right)$$

(iii) Escribed Circles of a Triangle

The circle touching BC and the two sides AB and AC produced of ΔABC externally is called the escribed circle opposite to A. Its radius is denoted by r_1. The centre of this circle is known as excentre and denoted by I. It is the point, where the external bisectors of the $\angle B$ and $\angle C$ and the interval bisector of the $\angle A$ meet.

Similarly, r_2 and r_3 denote the radii of the escribed circles opposite to the angles B and C respectively and excentres are denoted by I_2 and I_3. r_1, r_2 and r_3 are called the exradii of ΔABC. Here,

(a) $r_1 = \dfrac{\Delta}{s-a} = s\tan\dfrac{A}{2} = 4R\sin\dfrac{A}{2}\cos\dfrac{B}{2}\cos\dfrac{C}{2}$

$$= \frac{a\cos\frac{B}{2}\cos\frac{C}{2}}{\cos\frac{A}{2}}$$

(b) $r_2 = \dfrac{\Delta}{s-b} = s\tan\dfrac{B}{2} = 4R\sin\dfrac{B}{2}\cos\dfrac{C}{2}\cos\dfrac{A}{2}$

$$= \frac{b\cos\frac{A}{2}\cos\frac{C}{2}}{\cos\frac{B}{2}}$$

(c) $r_3 = \dfrac{\Delta}{s-c} = s\tan\dfrac{C}{2} = 4R\sin\dfrac{C}{2}\cos\dfrac{A}{2}\cos\dfrac{B}{2}$

$$= \frac{c\cos\frac{A}{2}\cos\frac{B}{2}}{\cos\frac{C}{2}}$$

Note

- $r_1 + r_2 + r_3 = 4R + r$
- $r_1r_2 + r_2r_3 + r_3r_1 = s^2 = \dfrac{r_1r_2r_3}{r}$.
- $\dfrac{1}{r_1} + \dfrac{1}{r_2} + \dfrac{1}{r_3} = \dfrac{s}{\Delta} = \dfrac{1}{r}$

and $\quad r_1r_2r_3 = r^2\left(\cot\dfrac{A}{2}\cot\dfrac{B}{2}\cot\dfrac{C}{2}\right)^2$

***Sample* Problem 8** *If $r_1 = r_2 + r_3 + r$, then triangle is*

(a) *right angled* (b) *obtuse angled*
(c) *equilateral* (d) *None of these*

Interpret (a) $\because\ r_1 - r = r_2 + r_3$

$$\Rightarrow \quad \frac{\Delta}{s-a} - \frac{\Delta}{s} = \frac{\Delta}{s-b} + \frac{\Delta}{s-c}$$

$$\Rightarrow \quad \frac{s-s+a}{s(s-a)} = \frac{s-c+s-b}{(s-b)(s-c)}$$

$$\Rightarrow \quad \frac{a}{s(s-a)} = \frac{a}{(s-b)(s-c)}$$

$$\Rightarrow \quad s^2 - (b+c)s + bc = s^2 - as$$

$$\Rightarrow \quad s(-a+b+c) = bc$$

$$\Rightarrow \quad \frac{(b+c+a)(b+c-a)}{2} = bc$$

$$\Rightarrow \quad (b+c)^2 - a^2 = 2bc$$

$$\Rightarrow \quad b^2 + c^2 + 2bc - a^2 = 2bc \Rightarrow b^2 + c^2 = a^2$$

$$\therefore \quad \angle A = 90°$$

Thus, the triangle is right angled triangle.

(iv) Orthocentre of a Triangle

In a ΔABC, AD, BE and CF are perpendiculars from the vertices A, B and C respectively to the opposite sides. These three perpendiculars are concurrent at the point P which is called the orthocentre of the ΔABC. The ΔDEF is called the pedal triangle of ΔABC.

(a) $PA = 2R\cos A$, $PB = 2R\cos B$, $PC = 2R\cos C$

(b) $PD = 2R\cos B\cos C$, $PE = 2R\cos C\cos A$,
$PF = 2R\cos A\cos B$

Note If p_1, p_2 and p_3 are perpendicular's drawn from the vertices to opposite side of the triangle, then

- $\Delta = \dfrac{1}{2}ap_1, \Delta = \dfrac{1}{2}bp_2, \Delta = \dfrac{1}{2}cp_3$.
- $\dfrac{1}{p_1} + \dfrac{1}{p_2} + \dfrac{1}{p_3} = \dfrac{1}{r}$
- $p_1p_2p_3 = \dfrac{(abc)^2}{8R^2}$
- $\dfrac{\cos A}{p_1} + \dfrac{\cos B}{p_2} + \dfrac{\cos C}{p_3} = \dfrac{1}{R}$

***Sample* Problem 9** *If p_1, p_2 and p_3 are respectively the perpendiculars from the vertices of a triangle to the opposite sides, then p_1, p_2 and p_3 is equal to*

(a) $a^2b^2c^2$ (b) $2a^2b^2c^2$

(c) $\frac{4a^2b^2c^2}{R^2}$ (d) $\frac{a^2b^2c^2}{8R^2}$

Interpret (*d*) Since, $\Delta = \frac{1}{2}ap_1 = \frac{1}{2}bp_2 = \frac{1}{2}cp_3$

$$\therefore \quad p_1 = \frac{2\Delta}{a}, p_2 = \frac{2\Delta}{b}, p_3 = \frac{2\Delta}{c}$$

$$\therefore \quad p_1p_2p_3 = \frac{8\Delta^3}{abc} = \frac{8}{abc}\left(\frac{abc}{4R}\right)^3 = \frac{a^2b^2c^2}{8R^2}$$

10.5 Regular Polygon

A regular polygon is a polygon which has all its sides as well as all its angles are equal. The circle passing through all the vertices of a regular polygon is called its circumscribed circle and the circle which touches all the sides of a regular polygon is called its inscribed circle.

Radius of circumcircle, $R = \frac{a}{2}\operatorname{cosec}\frac{\pi}{n}$

and **radius of incircle**, $r = \frac{a}{2}\cot\frac{\pi}{n}$

where, a is the length of the side of a regular polygon.

$$\text{Area of a regular polygon} = \frac{1}{4}na^2\cot\frac{\pi}{n}$$

$$= nr^2\tan\frac{\pi}{n} = \frac{n}{2}R^2\sin\frac{2\pi}{n}$$

Note If the polygon has n sides, then sum of the internal angles is $(n-2)\pi$ and each angle is $\frac{(n-2)\pi}{n}$.

***Sample* Problem 10** *If the area of circle is A_1 and area of regular pentagon inscribed in the circle is A_2. Then, $\frac{A_1}{A_2}$ is equal to*

(a) $\frac{2\pi}{5}$ (b) $\frac{2\pi}{5}\sec\frac{\pi}{10}$

(c) $\sec\frac{\pi}{10}$ (d) *None of these*

Interpret (*b*) In $\Delta OAB, OA = OB = r$

and $\angle AOB = 72°$

$$\therefore \text{ Area of } \Delta AOB = \frac{1}{2}r\cdot r\sin 72°$$

$$= \frac{1}{2}r^2\cos 18°$$

Area of pentagon = 5 (Area of ΔAOB)

$$\Rightarrow \quad A_2 = \frac{5}{2}r^2\cos 18° \quad \text{...(i)}$$

Also we know that,

area of circle $= \pi r^2$

$$\Rightarrow \quad A_1 = \pi r^2 \quad \text{...(ii)}$$

$$\text{Thus,} \quad \frac{A_1}{A_2} = \frac{\pi r^2}{\frac{5}{2}r^2\cos 18°} = \frac{2\pi}{5}\sec\frac{\pi}{10}$$

Check Point 1

1. If in a ΔABC, $3a = b + c$, then $\cot\frac{B}{2}\cot\frac{C}{2}$ is equal to

(a) 1 (b) $\sqrt{3}$

(c) 2 (d) None of these

2. If in a ΔABC, $\sin A : \sin B : \sin C = 1 : 2 : 3$, if $b = 4$ cm, then perimeter of the triangle is

(a) 6 cm (b) 24 cm (c) 12 cm (d) 8 cm

3. If in a ΔABC, $a\tan A + b\tan B = (a+b)\tan\left(\frac{A+B}{2}\right)$, then

(a) $A = B$ (b) $A = -B$ (c) $A = 2B$ (d) $B = 2A$

4. If in a ΔABC, $\frac{b+c}{11} = \frac{c+a}{12} = \frac{a+b}{13}$, then $\cos A$ is equal to

(a) $\frac{1}{5}$ (b) $\frac{5}{7}$

(c) $\frac{19}{35}$ (d) None of these

5. In a ΔABC, $2ca\sin\frac{A-B+C}{2}$ is equal to

(a) $a^2 + b^2 - c^2$ (b) $c^2 + a^2 - b^2$

(c) $b^2 - c^2 - a^2$ (d) $c^2 - a^2 - b^2$

6. If the angles of a triangle be in the ratio 1 : 2 : 7, then the ratio of its greatest side to the least side is

(a) 1 : 2 (b) 2 : 1

(c) $(\sqrt{5}+1) : (\sqrt{5}-1)$ (d) $(\sqrt{5}-1) : (\sqrt{5}+1)$

7. The area of the circle and the area of a regular polygon of n sides and of perimeter equal to that of the circle are in the ratio of

(a) $\tan\frac{\pi}{n} : \frac{\pi}{n}$ (b) $\cos\frac{\pi}{n} : \frac{\pi}{n}$

(c) $\sin\frac{\pi}{n} : \frac{\pi}{n}$ (d) $\cot\frac{\pi}{n} : \frac{\pi}{n}$

8. The circumradius of an equilateral triangle of side $2\sqrt{3}$ cm, is
(a) 1 cm (b) $\sqrt{3}$ cm (c) 2 cm (d) $2\sqrt{3}$ cm

9. If the sides of a triangle are 13, 14, 15, then inradius of this triangle is
(a) $\frac{67}{4}$ (b) $\frac{65}{4}$ (c) 4 (d) 24

10. $\frac{a\cos A + b\cos B + c\cos C}{a+b+c}$ is equal to
(a) 1/r (b) r/R
(c) R/r (d) 1/R

11. If in a ΔABC, $8R^2 = a^2 + b^2 + c^2$, then the triangle is
(a) right angled (b) isosceles
(c) equilateral (d) None of these

12. If r, r_1, r_2, r_3 have their usual meanings, then value of $\frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3}$ is
(a) 1
(b) 0
(c) $\frac{1}{r}$
(d) None of the above\

10.6 Angle of Elevation

If '*O*' be the observer's eye and *OX* be the horizontal line through *O*. If object *P* is at a higher level than eye, then $\angle POX$ is called the angle of elevation.

10.7 Angle of Depression

If '*O*' be the observer's eye and *OX* is a horizontal line. If object *P* is at a lower level than *O*, then the $\angle POX$ is called the angle of depression.

Note
- Angle of elevation and depression are always acute angle.
- Angle of elevation of an object from an observer is same as angle of depression of an observer from the object.

Hot Spot

Height and Distance

In these types of problems, certain information like angles, distances, heights etc. are given and on the basis of these, figure is drawn and required information is calculated.

These types of problems are directly asked in various years in AIEEE (JEE Main) 2008, 2007, 2004, 2003. *To solve such types of problem following steps are given.*

Step I Draw a possible figure, showing all distances and angles.

Step II In the problem, there is a right angled triangle in which one of active angle and one side is given. First find the other side using a proper trigonometric ratio.

Step III In the problem, if there is not a right angled triangle, then sine rule should be applied.

Step IV Find the length of a particular side from two different triangles containing that side common and then equate the two values thus obtained.

Sample Problem 11 *The angle of elevation of the top of an incomplete vertical pillar at a horizontal distance of 100 m from its base is 45°. If the angle of elevation of the top of the complete pillar at the same point is to be 60°. Then, find the height of the incomplete pillar is to be increased.*
(a) $100(\sqrt{3}+1)$ *m* (b) $100(\sqrt{3}-1)$ *m*
(c) $50(\sqrt{3}-1)$ *m* (d) *None of these*

Interpret (*b*) **Step I** Draw a figure.

Let *OP* be the incomplete and *OQ* be the complete pillar. Let *A* be a point on the horizontal plane, such that $OA = 100$ m. Then, $\angle OAP = 45°$ and $\angle OAQ = 60°$.

Step II Find the other sides

In ΔOAP, $\tan 45° = \frac{OP}{OA}$

$\therefore$ $OP = OA = 100$ m ...(i)

In ΔOAQ, $\tan 60° = \frac{OQ}{OA}$

$\Rightarrow$ $\sqrt{3} = \frac{OQ}{OA} = \frac{OP + x}{OA}$ ...(ii)

Step III Since, it is a right angled, so there is no need to use a sine rule.

Step IV Equating two triangles.

On equating Eqs. (i) and (ii), we get

$$\sqrt{3} = \frac{100 + x}{100} \Rightarrow 100\sqrt{3} = 100 + x$$

$$\Rightarrow \quad x = 100(\sqrt{3} - 1) \text{ m}$$

***Sample* Problem 12** *The angle of elevation of the top of a tower at a point on the ground is 30°. If on walking 20 m toward the tower, the angle of elevation becomes 60°, then the height of the tower is*

(a) 10 *m* (b) $\frac{10}{\sqrt{3}}$ *m*

(c) $10\sqrt{3}$ *m* (d) *None of these*

Interpret (c) Let height of the tower *AB* is *h* m.

In ΔABD,

$$\tan 60° = \frac{h}{x} \Rightarrow \sqrt{3} = \frac{h}{x}$$

$$\Rightarrow \quad x = \frac{h}{\sqrt{3}} \quad \text{...(i)}$$

In ΔABC, $\tan 30° = \frac{h}{20 + x} \Rightarrow \frac{1}{\sqrt{3}} = \frac{h}{20 + x}$

$$\Rightarrow \quad \sqrt{3}h = 20 + \frac{h}{\sqrt{3}} \quad \text{[from Eq. (i)]}$$

$$\Rightarrow \quad \left(\sqrt{3} - \frac{1}{\sqrt{3}}\right)h = 20 \Rightarrow h = 20 \times \frac{\sqrt{3}}{2} = 10\sqrt{3} \text{ m}$$

10.8 Bearing

If the observer and the object are *O* and *P* be on the same level respectively, then bearing is defined. To measure the bearing the four standard directions East, West, North and South are taken as the cardinal directions. Angle between the line of observations. *i.e.*, *OP* and any one standard direction is measured.

Thus, $\angle POE$ is called the bearing of the point *P* with respect to *O* measured from East to North.

In other words the bearing of *P* as seen from *O* is the direction in which *P* is seen from *O*.

Note North-East means equally inclined to North and East. ENE means equally inclined to East and North-East.

***Sample* Problem 13** *A man standing 30 m South of a tower of height h walks 60 m to the East and finds the angle of elevation of the top of the tower to be 30°. Then, the height of tower is equal to*

(a) $15\sqrt{10}$ *m* (b) $15\sqrt{3}$ *m*

(c) $10\sqrt{15}$ *m* (d) *None of these*

Interpret (c) Let the lines East-West and North-South meet at the foot of the tower *T*.

Let the man be standing at *P*, 30 m South of the tower. The man walks 60 m to *Q* parallel to the line *WE*. The angle of elevation of the tower at *Q* is 30°.

Hence, $TQ = h \cot 30° = \sqrt{3}h$

From the ΔPQT,

$$QT^2 = PT^2 + PQ^2$$

$$\Rightarrow \quad 3h^2 = (30)^2 + (60)^2 = 4500$$

$$\Rightarrow \quad h = 10\sqrt{15} \text{ m}$$

Some Important Facts

(i) In an isosceles triangle, the median is perpendicular to the base. ΔABC is isosceles and $AD \perp BC$.

(ii) In similar triangle, the corresponding sides are proportional.

(iii) The exterior angle of a triangle is equal to the sum of interior opposite angles.

In ΔABC, $\theta = \theta_1 + \theta_2$

(iv) In a triangle, the internal bisector of an angle divides the opposite side in the ratio of the arms of the angle.

In ΔABC, *AD* is bisector of $\angle A$.

$$\therefore \quad \frac{BD}{DC} = \frac{c}{b}$$

(v) In a ΔABC, if $DE \| AB$, then $\frac{AB}{DE} = \frac{BC}{DC} = \frac{AC}{EC}$

(vi) In a right angled ΔABC, the mid-point *D* of hypotenuse *AC* is equidistant from its vertices *A*, *B* and *C*.

i.e., $AD = BD = CD$

(vii) ***m-n* Theorem**

In a ΔABC, *D* divides *BC* in the ratio *m*:*n*, then

(a) $(m + n)\cot\theta = n\cot B - m\cot C$

(b) $(m + n)\cot\theta = m\cot\alpha - n\cot\beta$

(viii) **Appolonius Theorem**

If in ΔABC, *AD* is median, then

$$AB^2 + AC^2 = 2(AD^2 + BD^2)$$

(ix) Angles in the same segment of a circle are equal.

(x) The angle subtended at the centre by an arc is double of the angle subtended at any point of the remaining arc by the same arc.

(xi) **Ptolemy's Theorem**

Incyclic quadrilateral *ABCD*,

$$AB \cdot CD + AD \cdot BC = AC \cdot BD$$

***Sample* Problem 14** *A train travelling on one of two intersecting railway lines, subtends at a certain station on the other line, an angle α when the front of the carriage reaches the junction and an angle β when the end of the carriage reaches it. Then, the two lines are inclined to each other at an angle θ determined by $2\cot\theta$ is equal to*

(a) $\tan\alpha - \tan\beta$
(b) $\cot\beta - \cot\alpha$
(c) $\cot\alpha - \cot\beta$
(d) $\cot\alpha + \cot\beta$

Interpret (c) l_1 and l_2 are two intersecting lines.

In ΔABC, by m-n theorem, we have

$$(x + x)\cot\theta = x\cot\alpha - x\cot\beta \Rightarrow 2\cot\theta = \cot\alpha - \cot\beta$$

Check Point **2**

1. The angle of elevation of the top of an incomplete vertical pillar at a horizontal distance of 100 m from its base is 45°. If the angle of elevation of the top of the complete pillar at the same point is 60°, then the difference in the height of complete and incomplete pillar is
(a) $50\sqrt{2}$ m (b) 100 m
(c) $100(\sqrt{3}-1)$ m (d) $100(\sqrt{3}+1)$ m

2. A balloon is coming down at the rate of 4 m/min and its angle of elevation is 45° from a point on the ground which has been reduced to 30° after 10 min. Balloon will be on the ground at a distance of how many metres from the observer?
(a) $20\sqrt{3}$ (b) $20(3+\sqrt{3})$
(c) $10(3+\sqrt{3})$ (d) None of these

3. From an aeroplane vertically over a straight horizontal road, the angles of depression of two consecutive milestones on opposite sides of the aeroplane are observed to be α and β. The height in miles of the aeroplane above the road is
(a) $\dfrac{\tan\alpha + \tan\beta}{\tan\alpha\ \tan\beta}$ (b) $\dfrac{\tan\alpha\tan\beta}{\tan\alpha + \tan\beta}$
(c) $\dfrac{\cot\alpha\cot\beta}{\cot\alpha + \cot\beta}$ (d) None of these

4. A tree is broken by wind, its upper part touches the ground at a point 10 m from the foot of the tree and makes an angle 45° with the ground. The entire length of tree is
(a) 15 m (b) 20 m
(c) $10(1+\sqrt{2})$ m (d) $10\left(1+\dfrac{\sqrt{3}}{2}\right)$ m

5. Each side of a square subtends an angle of 60° at the top of a tower h metres high standing in the centre of the square. If a is the length of each side of the square, then
(a) $2a^2 = h^2$ (b) $2h^2 = a^2$
(c) $3a^2 = 2h^2$ (d) $2h^2 = 3a^2$

6. From a station A due West of a tower the angle of elevation of the top of the tower is seen to be 45°. From a station B, 10 metre from A and in the direction 45° South of East the angle of elevation is 30°, the height of the tower is
(a) $5\sqrt{2}(\sqrt{5}+1)$ m (b) $\dfrac{5\sqrt{2}(\sqrt{5}+1)}{2}$ m
(c) $\dfrac{5(\sqrt{5}+1)}{2}$ m (d) None of these

7. A vertical lamp-post 6 m high, stands at a distance of 2 m from a wall, 4 m high. A 1.5 m tall man starts to walk away from the wall on the other side of the wall, in line with the lamp-post. The maximum distance to which the man can walk remaining in the shadow is
(a) 5/2 m (b) 3/2 m
(c) 4 m (d) None of these

WORKED OUT

Examples

Example 1 *In* ΔABC, $\dfrac{\cos^2\frac{A}{2}}{a}+\dfrac{\cos^2\frac{B}{2}}{b}+\dfrac{\cos^2\frac{C}{2}}{c}$ *is equal to*

(a) $\dfrac{s^2}{2abc}$ (b) $\dfrac{s^2}{abc}$

(c) $\dfrac{s^2}{3abc}$ (d) *None of these*

Solution (b) We have, $\dfrac{\cos^2\frac{A}{2}}{a}+\dfrac{\cos^2\frac{B}{2}}{b}+\dfrac{\cos^2\frac{C}{2}}{c}$

$$=\left\{\frac{\frac{s(s-a)}{bc}}{a}\right\}+\left\{\frac{\frac{s(s-b)}{ca}}{b}\right\}+\left\{\frac{\frac{s(s-c)}{ab}}{c}\right\}$$

$$=\frac{s(s-a+s-b+s-c)}{abc}$$

$$=\frac{s[3s-(a+b+c)]}{abc}=\frac{s(3s-2s)}{abc}=\frac{s^2}{abc}$$

Example 2 *If in a triangle* $\dfrac{b+c}{11}=\dfrac{c+a}{12}=\dfrac{a+b}{13}$, *then* $\cos A:\cos B:\cos C$ *is equal to*

(a) $7:12:95$ (b) $7:19:25$

(c) $7:91:52$ (d) $71:92:5$

Solution (b) Let $\dfrac{b+c}{11}=\dfrac{c+a}{12}=\dfrac{a+b}{13}=k$

$\Rightarrow$ $b+c=11k,\quad c+a=12k,\quad a+b=13k$ ...(i)

and $2(a+b+c)=36k$ ...(ii)

On solving Eqs. (i) and (ii), we get

$$a=7k,\quad b=6k,\quad c=5k$$

Now, $\cos A=\dfrac{b^2+c^2-a^2}{2bc}$

$$=\frac{36k^2+25k^2-49k^2}{60k^2}=\frac{1}{5}=\frac{7}{35}$$

$$\cos B=\frac{a^2+c^2-b^2}{2ac}$$

$$=\frac{25k^2+49k^2-36k^2}{70k^2}=\frac{38}{70}=\frac{19}{35}$$

and $\cos C=\dfrac{a^2+b^2-c^2}{2ab}$

$$=\frac{49k^2+36k^2-25k^2}{84k^2}=\frac{60}{84}=\frac{25}{35}$$

$\Rightarrow$ $\cos A:\cos B:\cos C=7:19:25$

Example 3 *In* ΔABC, $a=2b$ *and* $|A-B|=\dfrac{\pi}{3}$, *then* $\angle C$ *is equal to*

(a) $\dfrac{\pi}{2}$ (b) $\dfrac{\pi}{3}$

(c) $\dfrac{\pi}{4}$ (d) *None of these*

Solution (b) Since, $a=2b$ ...(i)

$\Rightarrow$ $\angle A>\angle B$

and $|A-B|=\dfrac{\pi}{3}\Rightarrow A-B=\dfrac{\pi}{3}$ ...(ii)

By Napier's analogy ($\because \angle A>\angle B$)

$$\tan\left(\frac{A-B}{2}\right)=\frac{a-b}{a+b}\cot\frac{C}{2}$$

$\Rightarrow$ $\tan\dfrac{\pi}{6}=\dfrac{2b-b}{2b+b}\cot\dfrac{C}{2}\Rightarrow\dfrac{1}{\sqrt{3}}=\dfrac{1}{3}\cot\dfrac{C}{2}$

$\Rightarrow$ $\cot\dfrac{C}{2}=\sqrt{3}$

$\Rightarrow$ $\dfrac{\angle C}{2}=\dfrac{\pi}{6}\Rightarrow\angle C=\dfrac{\pi}{3}$

Example 4 *In a* ΔABC, $a=1$ *and the sum of perimeter is six times the AM of the sines of the angles, then* $\angle A$ *is equal to*

(a) $\dfrac{\pi}{3}$ (b) $\dfrac{\pi}{2}$

(c) $\dfrac{\pi}{6}$ (d) *None of these*

Solution (c) Since, $1+b+c=6\cdot\dfrac{\sin A+\sin B+\sin C}{3}$

$$=2\left(\frac{1}{2R}+\frac{b}{2R}+\frac{c}{2R}\right)=\frac{1}{R}(1+b+c)$$

$\therefore$ $R=1$

$\Rightarrow$ $\dfrac{1}{\sin A}=2R=2$

$\Rightarrow$ $\angle A=\dfrac{\pi}{6}$

Example 5 *If in a ΔABC,*

$$\sin^3 A + \sin^3 B + \sin^3 C = 3 \sin A \sin B \sin C,$$

then the value of determinant $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$ *is equal to*

(a) 0 (b) 1 (c) 2 (d) 3

Solution (a) $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = (a+b+c)\begin{vmatrix} 1 & 1 & 1 \\ b & c & a \\ c & a & b \end{vmatrix}$

$= (a+b+c)(bc + ca + ab - a^2 - b^2 - c^2)$

$= -(a^3 + b^3 + c^3 - 3abc)$

$= -8R^3(\sin^3 A + \sin^3 B + \sin^3 C - 3 \sin A \sin B \sin C)$

$= -8R^3(3 \sin A \sin B \sin C - 3 \sin A \sin B \sin C) = 0$

Example 6 *If in a ΔABC, $a^2 + b^2 + c^2 = 8R^2$, where* R = circumradius, then the triangle is

(a) *equilateral* (b) *isosceles*
(c) *right angled* (d) *None of these*

Solution (c) $a^2 + b^2 + c^2 = 8R^2$

$\Rightarrow \quad \sin^2 A + \sin^2 B + \sin^2 C = 2$

$\Rightarrow \quad \cos 2A + \cos 2B + \cos 2C + 1 = 0$

$\therefore \quad -4 \cos A \cdot \cos B \cdot \cos C = 0 \Rightarrow A$ or B or $C = \frac{\pi}{2}$

Example 7 *In any ΔABC, $16R^2 rr_1 r_2 r_3$ is equal to*

(a) $2a^2b^2c^2$ (b) $a^2b^2c^2$
(c) $3a^2b^2c^2$ (d) *None of these*

Solution (b) We have, $16R^2 rr_1 r_2 r_3$

$$= 16 \cdot \frac{a^2b^2c^2}{16\Delta^2} \cdot \frac{\Delta}{s} \cdot \frac{\Delta}{s-a} \cdot \frac{\Delta}{s-b} \cdot \frac{\Delta}{s-c}$$

$$= \frac{a^2b^2c^2\Delta^2}{s(s-a)(s-b)(s-c)}$$

$$= \frac{a^2b^2c^2\Delta^2}{\Delta^2} = a^2b^2c^2$$

Example 8 *The area of a circle is A_1 and the area of a regular pentagon inscribed in the circle is A_2. Then, $A_1 : A_2$ is*

(a) $\frac{\pi}{5} \cos \frac{\pi}{10}$ (b) $\frac{2\pi}{5} \sec \frac{\pi}{10}$
(c) $\frac{2\pi}{5} \operatorname{cosec} \frac{\pi}{10}$ (d) *None of these*

Solution (b) In the ΔOAB, $OA = OB = r$ and

$\angle AOB = \frac{360°}{5} = 72°$

$\therefore \quad \text{ar}(\Delta AOB) = \frac{1}{2} \cdot 6r \cdot r \cdot \sin 72° = \frac{1}{2} r^2 \cos 18°$

$\Rightarrow \quad \text{ar (pentagon)} = \frac{5}{2} r^2 \cos 18°$

$\therefore \quad A_1 : A_2 = \frac{2\pi r^2}{5r^2 \cos 18°} = \frac{2\pi}{5} \sec \frac{\pi}{10}$

Example 9 *The height of the chimney when it is found that on walking towards it 50 m in the horizontal line through its base, the angle of elevation of its top changes from 30° to 60°, is*

(a) 25 *m* (b) $25\sqrt{2}$ *m*
(c) $25\sqrt{3}$ *m* (d) *None of these*

Solution (c) Let PQ be the chimney whose height is h metres.

In ΔBPQ, $\tan 60° = \frac{PQ}{BP}$

$\Rightarrow \quad \sqrt{3} = \frac{h}{x}$

$\Rightarrow \quad h = \sqrt{3}\, x$ ...(i)

and in ΔAPQ, $\tan 30° = \frac{PQ}{AP}$

$\Rightarrow \quad \frac{1}{\sqrt{3}} = \frac{h}{50 + x}$

$\Rightarrow \quad 50 + x = h\sqrt{3}$

$\Rightarrow \quad 50 + x = 3x$ [using Eq. (i)]

$\Rightarrow \quad x = 25$

$\therefore$ Height of the chimney $= 25\sqrt{3}$ m

Start Practice for JEE Main

Round I (Topically Divided Problems)

Relation between the Sides and Angles of a Triangle

1. In a ΔABC, $\operatorname{cosec} A(\sin B \cos C + \cos B \sin C)$ is equal to

(a) $\frac{c}{a}$ (b) $\frac{a}{c}$

(c) 1 (d) $\frac{c}{ab}$

2. If in a ΔABC, $2b^2 = a^2 + c^2$, then $\frac{\sin 3B}{\sin B}$ is equal to

(a) $\frac{c^2 - a^2}{2ca}$ (b) $\frac{c^2 - a^2}{ca}$

(c) $\left(\frac{c^2 - a^2}{ca}\right)^2$ (d) $\left(\frac{c^2 - a^2}{2ca}\right)^2$

3. $\sin A : \sin C = \sin(A - B) : \sin(B - C)$, then a^2, b^2 and c^2 are in

(a) AP (b) GP

(c) HP (d) None of these

4. If a, b and c are sides of a triangle, then

(a) $\sqrt{a} + \sqrt{b} > \sqrt{c}$

(b) $\left|\sqrt{a} - \sqrt{b}\right| > \sqrt{c}$ (if c is smallest)

(c) $\sqrt{a} + \sqrt{b} < \sqrt{c}$

(d) None of the above

5. In a ΔABC, if $2s = a + b + c$ and $(s - b)(s - c) = x \sin^2 \frac{A}{2}$, then the value of x is

(a) bc (b) ca (c) ab (d) abc

6. If the angles of a triangle are in the ratio 4 : 1 : 1, then the ratio of the longest side to the perimeter is

(a) $\sqrt{3} : (2 + \sqrt{3})$ (b) 1 : 6

(c) $1 : (2 + \sqrt{3})$ (d) 2 : 3

7. In a ΔABC, $\angle C = 60°$, then $\frac{1}{a + c} + \frac{1}{b + c}$ is equal to

(a) $\frac{1}{a + b + c}$ (b) $\frac{2}{a + b + c}$

(c) $\frac{3}{a + b + c}$ (d) None of these

8. In a ΔABC, if a, b and c are in AP, then the value of $\frac{\sin \frac{A}{2} \sin \frac{C}{2}}{\sin \frac{B}{2}}$ is

(a) 1 (b) $\frac{1}{2}$ (c) 2 (d) -1

9. In a triangle, the lengths of the two larger sides are 10 cm and 9 cm, respectively. If the angles of the triangle are in AP, then the length of the third side in cm can be

(a) $5 - \sqrt{6}$ only (b) $5 + \sqrt{6}$ only

(c) $5 - \sqrt{6}$ or $5 + \sqrt{6}$ (d) neither $5 - \sqrt{6}$ nor $5 + \sqrt{6}$

10. Points D, E are taken on the side BC of a ΔABC such that $BD = DE = EC$. If $\angle BAD = x$, $\angle DAE = y$, $\angle EAC = z$, then the value of $\frac{\sin(x + y)\sin(y + z)}{\sin x \sin z}$ is equal to

(a) 1 (b) 2

(c) 4 (d) None of these

11. In a ΔABC, if $a = 2x$, $b = 2y$ and $\angle C = 120°$, then the area of the triangle is

(a) xy sq unit (b) $xy\sqrt{3}$ sq unit

(c) $3xy$ sq unit (d) $2xy$ sq unit

12. In ΔABC, if $\tan \frac{A}{2} \tan \frac{C}{2} = \frac{1}{2}$, then a, b and c are in

(a) AP (b) GP

(c) HP (d) None of these

13. In a ΔABC, if $2s = a + b + c$, then the value of the $\frac{s(s-a)}{bc} - \frac{(s-b)(s-c)}{bc}$ is equal to

(a) $\sin A$ (b) $\cos A$
(c) $\tan A$ (d) None of these

14. In a ΔABC, $(b + c - a) \tan \frac{A}{2}$ is equal to

(a) $\frac{2\Delta}{s}$ (b) $\frac{\Delta}{s}$
(c) $\frac{\Delta s}{bc}$ (d) $\frac{s}{a}R$

15. In a ΔPQR as shown in figure given that $x : y : z :: 2 : 3 : 6$, then the value of $\angle QPR$ is

(a) $\frac{\pi}{6}$
(b) $\frac{\pi}{4}$
(c) $\frac{\pi}{3}$
(d) None of the above

16. In ΔABC, AD is median and $\angle A = 60°$, then $4AD^2$ is equal to

(a) $b^2 + c^2 - bc$ (b) $2b^2 + c^2 - 2bc$
(c) $b^2 + c^2 + 2bc$ (d) None of these

17. If $\cos^2 A + \cos^2 C = \sin^2 B$, then ΔABC is

(a) equilateral (b) right angled
(c) isosceles (d) None of these

18. In a ΔABC, $a = 5$, $b = 7$ and $\sin A = \frac{3}{4}$, then the number of possible triangles are

(a) 1 (b) 0
(c) 2 (d) infinite

19. If p_1, p_2 and p_3 are altitudes of a ΔABC drawn from the vertices A, B and C and Δ the area of the triangle, then $p_1^{-2} + p_2^{-2} + p_3^{-2}$ is equal to

(a) $\frac{a+b+c}{\Delta}$ (b) $\frac{a^2+b^2+c^2}{4\Delta^2}$
(c) $\frac{a^2+b^2+c^2}{\Delta^2}$ (d) None of these

20. If x, y and z are perpendicular drawn from the vertices of triangle having sides a, b and c, then the value of $\frac{bx}{c} + \frac{cy}{a} + \frac{az}{b}$ will be

(a) $\frac{a^2+b^2+c^2}{2R}$ (b) $\frac{a^2+b^2+c^2}{R}$
(c) $\frac{a^2+b^2+c^2}{4R}$ (d) $\frac{2(a^2+b^2+c^2)}{R}$

21. If in a ΔABC, CD is the angular bisector of the $\angle ACB$, then CD is equal to

(a) $\frac{a+b}{2ab}\cos\frac{C}{2}$ (b) $\frac{a+b}{ab}\cos\frac{C}{2}$
(c) $\frac{2ab}{a+b}\cos\frac{C}{2}$ (d) None of these

22. In ΔABC, $(a-b)^2 \cos^2 \frac{C}{2} + (a+b)^2 \sin^2 \frac{C}{2}$ is equal to

(a) a^2 (b) b^2
(c) c^2 (d) None of these

23. In a ΔABC, $a : b : c = 4 : 5 : 6$. The ratio of the radius of the circumcircle to that of the incircle is

(a) $\frac{16}{9}$ (b) $\frac{16}{7}$ (c) $\frac{11}{7}$ (d) $\frac{7}{16}$

24. If two adjacent sides of a cyclic quadrilateral are 2 and 5 and the angle between them is 60°. If the third side is 3, then the remaining fourth side is

(a) 2 (b) 3 (c) 4 (d) 5

Circle Connected with Triangle

25. The inradius of the triangle whose sides are 3, 5, 6, is

(a) $\sqrt{\frac{8}{7}}$ (b) $\sqrt{8}$
(c) $\sqrt{7}$ (d) $\sqrt{\frac{7}{8}}$

26. In a ΔABC, $\cos A + \cos B + \cos C$ is equal to

(a) $1 + \frac{r}{R}$ (b) $1 - \frac{r}{R}$
(c) $1 - \frac{R}{r}$ (d) $1 + \frac{R}{r}$

27. In a triangle $\left(1 - \frac{r_1}{r_2}\right)\left(1 - \frac{r_1}{r_3}\right) = 2$, then the triangle is

(a) right angled (b) equilateral
(c) isosceles (d) None of these

28. If the sides of a triangle are in the ratio 3 : 7 : 8, then $R : r$ is equal to

(a) 2 : 7 (b) 7 : 2
(c) 3 : 7 (d) 7 : 3

29. In a triangle $r_1 > r_2 > r_3$, then

(a) $a > b > c$ (b) $a < b < c$
(c) $a > b$ and $b < c$ (d) $a < b$ and $b > c$

30. Consider the following statements

I. If in a ΔABC, $\frac{\sin A}{\sin C} = \frac{\sin (A - B)}{\sin (B - C)}$, then a^2, b^2 and c^2 are in AP.

II. If exradius r_1, r_2 and r_3 of a ΔABC are in HP, then the sides a, b and c are in AP.

Which of these is/are correct ?

(a) Only (I) (b) Only (II)
(c) Both (I) and (II) (d) None of these

31. In a ΔABC, $a \cot A + b \cot B + c \cot C$ is equal to

(a) $r + R$ (b) $r - R$
(c) $2(r + R)$ (d) $2(r - R)$

32. The value of $\frac{1}{r_1^2} + \frac{1}{r_2^2} + \frac{1}{r_3^2} + \frac{1}{r^2}$ is

(a) 0 (b) $\frac{a^2 + b^2 + c^2}{\Delta^2}$
(c) $\frac{\Delta^2}{a^2 + b^2 + c^2}$ (d) $\frac{a^2 + b^2 + c^2}{\Delta}$

33. In an equilateral triangle, the ratio of the inradius, circumradius and exradius are

(a) 1 : 3 : 2 (b) 1 : 1 : 1
(c) 2 : 3 : 4 (d) 1 : 2 : 3

34. If r_1, r_2 and r_3 are exradii of any triangle, then $r_1r_2 + r_2r_3 + r_3r_1$ is equal to

(a) $\frac{\Delta}{r}$ (b) $\frac{\Delta^2}{r^2}$
(c) $\frac{r}{\Delta}$ (d) $\frac{r^2}{\Delta^2}$

35. If a flag staff of 6 m high placed on the top of a tower throws a shadow of $2\sqrt{3}$ m along the ground, then the angle (in degrees) that the sun makes with the ground is

(a) 60° (b) 80°
(c) 75° (d) None of these

Heights and Distances

36. When the elevation of sun changes from 45° to 30°, the shadow of a tower increases by 60 m, then the height of the tower is

(a) $30\sqrt{3}$ m (b) $30(\sqrt{2} + 1)$ m
(c) $30(\sqrt{3} - 1)$ m (d) $30(\sqrt{3} + 1)$ m

37. A flag staff 20 m long standing on a wall 10 m high subtends an angle whose tangent is 0.5 at a point on the ground. If θ is the angle subtended by the wall at this point, then

(a) $\tan \theta = 1$ (b) $\tan \theta = 3$
(c) $\tan \theta = \frac{1}{2}$ (d) None of these

38. A ladder rests against a wall making an angle α with the horizontal. The foot of the ladder is pulled away from the wall through a distance x, so that it slides a distance y down the wall making an angle β with the horizontal. The correct relation is

(a) $x = y \tan\left(\frac{\alpha + \beta}{2}\right)$ (b) $y = x \tan\left(\frac{\alpha + \beta}{2}\right)$
(c) $x = y \tan(\alpha + \beta)$ (d) $y = x \tan(\alpha + \beta)$

39. At a distance $2h$ m from the foot of a tower of height h m the top of the tower and a pole at the top of the tower subtend equal angles. Height of the pole should be

(a) $\frac{5h}{3}$ m (b) $\frac{4h}{3}$ m
(c) $\frac{7h}{5}$ m (d) $\frac{3h}{2}$ m

40. A house of height 100 m subtends a right angle at the window of an opposite house. If the height of the window be 64 m, then the distance between the two houses is

(a) 48 m (b) 36 m
(c) 54 m (d) 72 m

41. An observer standing on a 300 m high tower observes two boats in the same direction their angles of depression are 60° and 30°, respectively. The distance between boats is

(a) 173.2 m (b) 346.4 m
(c) 25 m (d) 72 m

42. An observer on the top of tree, finds the angle of depression of a car moving towards the tree to be 30°. After 3 min this angle becomes 60°. After how much more time, the car will reach the tree ?

(a) 4 min (b) 4.5 min
(c) 1.5 min (d) 2 min

43. The horizontal distance between two towers is 60 m and the angle of depression of the top of the first tower as seen from the top of the second is 30°. If the height of the second tower be 150 m, then the height of the first tower is

(a) $(150 - 60\sqrt{3})$ m (b) 90 m
(c) $(150 - 20\sqrt{3})$ m (d) None of these

44. An aeroplane flying horizontally 1 km above the ground is observed at an elevation of 60° and after 10 s the elevation is observed to be 30°. The uniform speed of the aeroplane (in km/h) is

(a) 240
(b) $240\sqrt{3}$
(c) $60\sqrt{3}$
(d) None of the above

45. A flag staff is upon the top of a building. If at a distance of 40 m from the base of building the angles of elevation of the topes of the flag staff and building are 60° and 30° respectively, then the height of the flag staff is

(a) 46.19 m (b) 50 m
(c) 25 m (d) None of these

46. At a point on the ground the angle of elevation of a tower is such that its cotangent is $\frac{3}{5}$. On walking 32 m towards the tower the cotangent of the angle of elevation is $\frac{2}{5}$. The height of the tower is

(a) 160 m (b) 120 m
(c) 64 m (d) None of these

47. From the bottom of a pole of height h the angle of elevation of the top of a tower is α and the pole subtends an angle β at the top of the tower. The height of the tower is

(a) $\frac{h\tan(\alpha-\beta)}{\tan(\alpha-\beta)-\tan\alpha}$ (b) $\frac{h\cot(\alpha-\beta)}{\cot(\alpha-\beta)-\cot\alpha}$
(c) $\frac{\cot(\alpha-\beta)}{\cot(\alpha-\beta)-\cot\alpha}$ (d) None of these

48. The top of a hill observed from the top and bottom of a building h is at angles of elevation p and q, respectively. The height of hill is

(a) $\frac{h\cot q}{\cot q-\cot p}$ (b) $\frac{h\cot p}{\cot p-\cot q}$
(c) $\frac{h\tan p}{\tan p-\tan q}$ (d) None of these

49. From the top of a cliff of height a, the angle of depression of the foot of a certain tower is found to be double the angle of elevation of the top of the tower of height h. If θ be the angle of elevation, then its value is

(a) $\cos^{-1}\sqrt{\frac{2h}{a}}$ (b) $\sin^{-1}\sqrt{\frac{2h}{a}}$
(c) $\sin^{-1}\sqrt{\frac{a}{2-h}}$ (d) $\tan^{-1}\sqrt{3-\frac{2h}{a}}$

50. From a point a metres above a lake the angle of elevation of a cloud is α and the angle of depression of its reflection is β. The height of the cloud is

(a) $\frac{a\sin(\alpha+\beta)}{\sin(\alpha-\beta)}$ m (b) $\frac{a\sin(\alpha+\beta)}{\sin(\beta-\alpha)}$ m
(c) $\frac{a\sin(\beta-\alpha)}{\sin(\alpha+\beta)}$ (d) None of these

51. A flag staff of 5 m high stands on a building of 25 m high. At an observer at a height of 30 m, the flag staff and the building subtend equal angles. The distance of the observer from the top of the flag staff is

(a) $\frac{5\sqrt{3}}{2}$ m (b) $5\sqrt{\frac{3}{2}}$ m
(c) $5\sqrt{\frac{2}{3}}$ m (d) None of these

52. The angles of depression of the top and the foot of a chimney as seen from the top of a second chimney, which is 150 m high and standing on the same level as the first are θ and ϕ respectively, then the distance between their tops when $\tan\theta = \frac{4}{3}$ and $\tan\phi = \frac{5}{2}$, is

(a) $\frac{150}{\sqrt{3}}$ m (b) $100\sqrt{3}$ m
(c) 150 m (d) 100 m

53. From the tower 60 m high angles of depression of the top and bottom of a house are α and β, respectively. If the height of the house is $\frac{60\sin(\beta-\alpha)}{x}$, then x is equal to

(a) $\sin\alpha\sin\beta$ (b) $\cos\alpha\cos\beta$
(c) $\sin\alpha\cos\beta$ (d) $\cos\alpha\sin\beta$

54. The angle of elevation of the top of the tower observed from each of the three points A, B, C on the ground forming a triangle is the same $\angle\alpha$. If R is the circumradius of the ΔABC, then the height of the tower is

(a) $R\sin\alpha$ (b) $R\cos\alpha$
(c) $R\cot\alpha$ (d) $R\tan\alpha$

55. A spherical balloon of radius r subtends an $\angle\alpha$ at the eye of an observer. If the angle of elevation of the centre of the balloon be β, then height of the centre of the balloon is

(a) $r\,\text{cosec}\left(\frac{\alpha}{2}\right)\sin\beta$ (b) $r\,\text{cosec}\,\alpha\sin\left(\frac{\beta}{2}\right)$
(c) $r\sin\left(\frac{\alpha}{2}\right)\text{cosec}\,\beta$ (d) $r\sin\alpha\,\text{cosec}\left(\frac{\beta}{2}\right)$

56. A ladder leaves again a wall at an $\angle\alpha$ to the horizontal. Its foot is pulled away through a distance a_1, so that it slides a distance b_1 down the wall and rests inclined at $\angle\beta$ with the horizontal. It foot is further pulled aways through a_2, so that it slides a further distance b_2 down the wall and is now, inclined at an $\angle\gamma$. If $a_1 a_2 = b_1 b_2$, then

(a) $\alpha+\beta+\gamma$ is greater than π
(b) $\alpha+\beta+\gamma$ is equal to π
(c) $\alpha+\beta+\gamma$ is less than π
(d) nothing can be said about $\alpha+\beta+\gamma$

57. ABC is a triangular park with $AB = AC = 100$ m. A clock tower is situated at the mid-point of BC. The angles of elevation of the top of the tower at A and B are $\cot^{-1} 3.2$ and $\operatorname{cosec}^{-1} 2.6$, respectively. The height of the tower is

(a) 50 m (b) 25 m
(c) 40 m (d) None of these

58. The angle of elevation of the top of a tower from a point A due South of the tower is α and from a point B due East of the tower is β. If $AB = d$, then the height of the tower is

(a) $\dfrac{d}{\sqrt{\tan^2\alpha - \tan^2\beta}}$ (b) $\dfrac{d}{\sqrt{\tan^2\alpha + \tan^2\beta}}$
(c) $\dfrac{d}{\sqrt{\cot^2\alpha + \cot^2\beta}}$ (d) $\dfrac{d}{\sqrt{\cot^2\alpha - \cot^2\beta}}$

59. $ABCD$ is a square plot. The angle of elevation of the top of a pole standing at D from A or C is 30° and that from B is θ, then $\tan\theta$ is equal to

(a) $\sqrt{6}$ (b) $1/\sqrt{6}$ (c) $\sqrt{3}/2$ (d) $\sqrt{2/3}$

60. A vertical tower stands on a declivity which is inclined at 15° to the horizon. From the foot of the tower a man ascends the declivity for 80 ft and then, finds that the tower subtends an angle of 30°. The height of tower is

(a) $20(\sqrt{6} - \sqrt{2})$ ft (b) $40(\sqrt{6} - \sqrt{2})$ ft
(c) $40(\sqrt{6} + \sqrt{2})$ ft (d) None of these

61. If A and B are two points on one bank of a straight river and C, D are two other points on the other bank of river. If direction from A to B is same as that from C to D and $AB = a$, $\angle CAD = \alpha$, $\angle DAB = \beta$, $\angle CBA = \gamma$, then CD is equal to

(a) $\dfrac{a\sin\beta\sin\gamma}{\sin\alpha\sin(\alpha+\beta+\gamma)}$ (b) $\dfrac{a\sin\alpha\sin\gamma}{\sin\beta\sin(\alpha+\beta+\gamma)}$
(c) $\dfrac{a\sin\alpha\sin\beta}{\sin\gamma\sin(\alpha+\beta+\gamma)}$ (d) None of these

62. The angle of elevation of the top of a hill from a point is α. After walking b m towards the top up a slope inclined at an $\angle\beta$ to the horizon, the angle of elevation of the top becomes γ. Then, the height of the hill is

(a) $\dfrac{b\sin\alpha\sin(\gamma-\beta)}{\sin(\gamma-\alpha)}$ (b) $\dfrac{b\sin\alpha\sin(\gamma-\alpha)}{\sin(\gamma-\beta)}$
(c) $\dfrac{b\sin(\gamma-\beta)}{\sin(\gamma-\alpha)}$ (d) $\dfrac{\sin(\gamma-\beta)}{b\sin\alpha\sin(\gamma-\alpha)}$

63. The angle of elevation of a cloud at a point 2500 m high above a lake is 15° and the angle of depression of its image in the lake is 45°, the height of the cloud above the surface of the lake is

(a) $2500\sqrt{3}$ m (b) 2500 m
(c) $500\sqrt{3}$ m (d) 500 m

Round II (Mixed Bag)

Only One Correct Option

1. In an ambiguous case of solving a triangle when $a = \sqrt{5}$, $b = 2$, $\angle A = \dfrac{\pi}{6}$, the two possible values of third side are c_1 and c_2, then

(a) $|c_1 - c_2| = 2\sqrt{6}$ (b) $|c_1 - c_2| = 4\sqrt{6}$
(c) $|c_1 - c_2| = 4$ (d) $|c_1 - c_2| = 6$

2. In an isosceles ΔABC, $AB = AC$. If vertical $\angle A$ is 20°, then $a^3 + b^3$ is equal to

(a) $3a^2b$ (b) $3b^2c$
(c) $3c^2a$ (d) abc

3. If A, B, C, D are the angles of a quadrilateral, then $\dfrac{\Sigma\tan A}{\Sigma\cot A}$ is equal to

(a) $\Pi\tan A$ (b) $\Pi\cot A$
(c) $\Sigma\tan^2 A$ (d) $\Sigma\cot^2 A$

4. In a ΔABC, $(a+b+c)(b+c-a) = kbc$, if

(a) $k < 0$ (b) $k > 6$
(c) $0 < k < 4$ (d) $k > 4$

5. In an acute angled ΔABC, $r + r_1 = r_2 + r_3$ and $\angle B > \dfrac{\pi}{3}$, then

(a) $b + 2c < 2a < 2b + 2c$ (b) $b + 4c < 4a < 2b + 4c$
(c) $b + 4c < 4a < 4b + 4c$ (d) $b + 3c < 3a < 3b + 3c$

6. For a ΔABC, $R = \dfrac{5}{2}$ and $r = 1$. Let I be the incentre of the triangle and D, E and F be the feet of the perpendiculars from I to BC, CA and AB, respectively. The value of $\dfrac{ID \times IE \times IF}{IA \times IB \times IC}$ is equal to

(a) $\dfrac{5}{2}$ (b) $\dfrac{5}{4}$ (c) $\dfrac{1}{10}$ (d) $\dfrac{1}{5}$

7. The area of the circle and the area of a regular polygon of n sides and of perimeter equal to that of the circle are in the ratio of

(a) $\tan\left(\dfrac{\pi}{n}\right) : \dfrac{\pi}{n}$ (b) $\cos\left(\dfrac{\pi}{n}\right) : \dfrac{\pi}{n}$
(c) $\sin\left(\dfrac{\pi}{n}\right) : \dfrac{\pi}{n}$ (d) $\cot\left(\dfrac{\pi}{n}\right) : \dfrac{\pi}{n}$

8. The radii r_1, r_2, r_3 of the described circles of the ΔABC are in HP. If the area of the triangle is 24 cm^2 and its perimeter is 24 cm, then the length of its largest side is

(a) 10 (b) 9 (c) 8 (d) 7

9. If PQ be a vertical tower subtending angles α, β and γ at the points A, B and C respectively on the line in the horizontal plane through the foot D of tower and on the same side of it, then $BC \cot\alpha - CA \cot\beta + AB \cot\gamma$ is equal to

(a) 0 (b) 1
(c) 2 (d) None of these

10. A flag staff stands in the centre of a rectangular field whose diagonal is 1200 m and subtends angles 15° and 45° at the mid-points of the sides of the field. The height of the flag staff is

(a) 200 m (b) $300\sqrt{2+\sqrt{3}}$ m
(c) $300\sqrt{2-\sqrt{3}}$ m (d) 400 m

11. At each end of a horizontal line of length $2a$, the angular elevation of the peak of a vertical tower is θ and that at its middle point it is ϕ. The height of the peak is

(a) $a \sin\theta \sin\phi$
(b) $\dfrac{a \sin\theta \sin\phi}{\sqrt{\sin(\theta+\phi)\sin(\phi-\theta)}}$
(c) $\dfrac{a \cos\theta \cos\phi}{\sqrt{\cos(\phi+\theta)\cos(\phi-\theta)}}$
(d) None of the above

12. In a cubical hall $ABCDPQRS$ with each side 10 m, G is the centre of the wall $BCRQ$ and T is the mid-point of the side AB. The angle of elevation of G at the point T is

(a) $\sin^{-1}(1/\sqrt{3})$ (b) $\cos^{-1}(1/\sqrt{3})$
(c) $\cot^{-1}(1/\sqrt{3})$ (d) None of these

13. Two vertical poles 20 m and 80 m stands apart on a horizontal plane. The height of the point of intersection of the lines joining the top of each pole to the foot of the other is

(a) 15 m (b) 16 m (c) 18 m (d) 50 m

More Than One Correct Option

14. Let ABC be an isosceles triangle with base BC. If r is the radius of the circle inscribed in the ΔABC and r_1 be the radius of the circle escribed opposite to the angle A, then the product $r_1 r$ can be equal to

(a) $R^2 \sin^2 A$ (b) $R^2 \sin^2 2B$
(c) $\frac{1}{2}a^2$ (d) $\frac{a^2}{4}$

where R is the radius of the circumcircle of the ΔABC.

15. The area of a regular polygon of n sides is (where, r is inradius, R is circumradius and a is side of the triangle)

(a) $\frac{nR^2}{2}\sin\left(\frac{2\pi}{n}\right)$ (b) $nr^2 \tan\left(\frac{\pi}{n}\right)$
(c) $\frac{na^2}{4}\cot\frac{\pi}{n}$ (d) $nR^2 \tan\left(\frac{\pi}{n}\right)$

Comprehension Based Questions

Passage

Directions (Q. Nos. 16-18) *Given that*

$$\Delta = 6,\ r_1 = 2,\ r_2 = 3,\ r_3 = 6.$$

16. Circumradius R is equal to

(a) 2.5 (b) 3.5 (c) 1.5 (d) 4.2

17. Inradius is equal to

(a) 2 (b) 1 (c) 1.5 (d) 2.5

18. Difference between the greatest and the least angle is

(a) $\cos^{-1}\frac{4}{5}$ (b) $\tan^{-1}\frac{3}{4}$
(c) $\cos^{-1}\frac{3}{5}$ (d) None of these

Assertion and Reason

Directions (Q. Nos. 19-21) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*) *and* (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

19. **Statement I** In any right angled triangle $\dfrac{a^2+b^2+c^2}{R^2}$ is always equal to 8.

Statement II $a^2 = b^2 + c^2$

20. In acute angled ΔABC, $a > b > c$

Statement I $r_1 > r_2 > r_3$

Statement II $\cos A < \cos B < \cos C$

21. **Statement I** If I is incentre of ΔABC and I_1 excentre opposite to A and P is the intersection of II_1 and BC, then $IP \cdot I_1P = BP \cdot PC$.

Statement II In a ΔABC, I is incentre and I_1 is excentre opposite to A, then IBI_1C must be square.

Previous Years' Questions

22. For a regular polygon, let r and R be the radii of the inscribed and the circumscribed circles. A false statement among the following is **[AIEEE 2010]**

(a) there is a regular polygon with $\frac{r}{R} = \frac{1}{2}$

(b) there is a regular polygon with $\frac{r}{R} = \frac{1}{\sqrt{2}}$

(c) there is a regular polygon with $\frac{r}{R} = \frac{2}{3}$

(d) there is a regular polygon with $\frac{r}{R} = \frac{\sqrt{3}}{2}$

23. AB is a vertical pole with B at the ground level and A at the top. A man finds that the angle of elevation of the point A from a certain point C on the ground is 60°. He moves away from the pole along the line BC to a point D such that $CD = 7$m. From D the angle of elevation of the point A is 45°. Then, the height of the pole is **[AIEEE 2008]**

(a) $\frac{7\sqrt{3}}{2}\left(\frac{1}{\sqrt{3}+1}\right)$ m (b) $\frac{7\sqrt{3}}{2}\left(\frac{1}{\sqrt{3}-1}\right)$ m

(c) $\frac{7\sqrt{3}}{2}(\sqrt{3}+1)$ m (d) $\frac{7\sqrt{3}}{2}(\sqrt{3}-1)$ m

24. A tower stands at the centre of a circular park. A and B are two points on the boundary of the park such that $AB (= a)$ subtends an angle of 60° at the foot of the tower and the angle of elevation of the top of the tower from A or B is 30°. The height of the tower is **[AIEEE 2007]**

(a) $\frac{2a}{\sqrt{3}}$ (b) $2a\sqrt{3}$

(c) $\frac{a}{\sqrt{3}}$ (d) $\sqrt{3}$

the Guidance

Round I

1. We have, cosec A (sin B cos C + cos B sin C)

$$= \left(\frac{\sin B}{\sin A}\cos C + \frac{\sin C}{\sin A}\cos B\right)$$

$$= \left(\frac{b}{a}\cos C + \frac{c}{a}\cos B\right) = 1$$

$$(\because\ a = b\cos C + c\cos B)$$

2. $\dfrac{\sin 3B}{\sin B} = \dfrac{3\sin B - 4\sin^3 B}{\sin B} = 3 - 4\sin^2 B$

$$= 3 - 4(1 - \cos^2 B)$$

$$= -1 + \frac{4(a^2 + c^2 - b^2)^2}{4(ac)^2} = -1 + \frac{\left(\dfrac{a^2 + c^2}{2}\right)^2}{(ac)^2}$$

$$= -1 + \frac{(a^2 + c^2)^2}{4(ac)^2} \qquad [\because 2b^2 = a^2 + c^2 \text{ (given)}]$$

$$= \frac{(a^2 + c^2)^2 - 4a^2c^2}{4(ac)^2} = \left(\frac{c^2 - a^2}{2ac}\right)^2$$

3. $\because\ \dfrac{\sin A}{\sin C} = \dfrac{\sin(A - B)}{\sin(B - C)}$

$$\Rightarrow \frac{\sin A}{\sin C} = \frac{\sin A\cos B - \cos A\sin B}{\sin B\cos C - \cos B\sin C}$$

$$\Rightarrow \frac{a}{c} = \frac{a\cos B - b\cos A}{b\cos C - c\cos B}$$

$$\Rightarrow ab\cos C + bc\cos A = 2ac\cos B$$

$$\Rightarrow \frac{a^2 + b^2 - c^2}{2} + \frac{b^2 + c^2 - a^2}{2} = 2\,\frac{c^2 + a^2 - b^2}{2}$$

$$\Rightarrow a^2 + c^2 = 2b^2$$

$\Rightarrow$ a^2, b^2 and c^2 are in AP.

4. $\because\ (\sqrt{a} + \sqrt{b} + \sqrt{c})(\sqrt{a} + \sqrt{b} - \sqrt{c})$

$$= (\sqrt{a} + \sqrt{b})^2 - c$$

$$= a + b - c + 2\sqrt{ab} > 0$$

$$\therefore \quad \sqrt{a} + \sqrt{b} > \sqrt{c}$$

5. We have, $\sin\dfrac{A}{2} = \sqrt{\dfrac{(s - b)(s - c)}{bc}}$

$$\Rightarrow bc\sin^2\frac{A}{2} = (s - b)(s - c)$$

On comparing with $x\sin^2\dfrac{A}{2} = (s - b)(s - c)$,

we get $x = bc$

6. Here, ratio of angles are 4 : 1 : 1.

$$\Rightarrow 4x + x + x = 180°$$

$$\Rightarrow x = 30°$$

$$\therefore \angle A = 120°,\ \angle B = \angle C = 30°$$

Thus, the ratio of longest side to the perimeter $= \dfrac{a}{a + b + c}$

Let $b = c = x$

$$\therefore a^2 = b^2 + c^2 - 2bc\cos A$$

$$\Rightarrow a^2 = 2x^2 - 2x^2\cos A = 2x^2(1 - \cos A)$$

$$\Rightarrow a^2 = 4x^2\sin^2\frac{A}{2}$$

$$\Rightarrow a = 2x\sin\frac{A}{2}$$

$$\Rightarrow a = 2x\sin 60° = \sqrt{3}x$$

Thus, required ratio is

$$\frac{a}{a + b + c} = \frac{\sqrt{3}x}{x + x + \sqrt{3}x} = \frac{\sqrt{3}}{2 + \sqrt{3}}$$

7. We have, $\cos C = \dfrac{a^2 + b^2 - c^2}{2ab}$

$$\Rightarrow \cos 60° = \frac{a^2 + b^2 - c^2}{2ab}$$

$$\Rightarrow a^2 + b^2 - c^2 = ab$$

$$\Rightarrow b^2 + bc + a^2 + ac = ab + ac + bc + c^2$$

$$\Rightarrow b(b + c) + a(a + c) = (a + c)(b + c)$$

On dividing by $(a + c)(b + c)$ and add 2 on both sides, we get

$$1 + \frac{b}{a + c} + 1 + \frac{a}{b + c} = 3$$

$$\Rightarrow \frac{1}{a + c} + \frac{1}{b + c} = \frac{3}{a + b + c}$$

8. Since a, b and c are in AP.

$$\Rightarrow 2b = a + c$$

$$\Rightarrow 3b = 2s \Rightarrow s = \frac{3b}{2}$$

Now, $\dfrac{\sin\frac{A}{2}\sin\frac{C}{2}}{\sin\frac{B}{2}} = \sqrt{\dfrac{ac\,(s-b)(s-c)(s-b)(s-a)}{(s-a)(s-c)\times bc\times ab}}$

$$= \frac{s-b}{b} = \frac{\frac{3b}{2}-b}{b} = \frac{1}{2}$$

9. We know that, in triangle larger side has an larger angle opposite to it. Since, $\angle A$, $\angle B$ and $\angle C$ are in AP.

$\Rightarrow \quad 2B = A + C$

$\because \quad A + B + C = \pi$

$\Rightarrow \quad B = 60°$

$\therefore \quad \cos B = \dfrac{a^2 + c^2 - b^2}{2\,ac}$

$\Rightarrow \quad \cos 60° = \dfrac{1}{2} = \dfrac{100 + a^2 - 81}{20a}$

$\Rightarrow \quad a^2 + 19 = 10a$

$\Rightarrow \quad a^2 - 10a + 19 = 0$

$\therefore \quad a = \dfrac{10 \pm \sqrt{100-76}}{2} = 5 \pm \sqrt{6}$

10. From ΔABC, $\dfrac{\sin(y+z)}{DC} = \dfrac{\sin C}{AD}$

From ΔABD, $\dfrac{\sin x}{BD} = \dfrac{\sin B}{AD}$

From ΔAEC, $\dfrac{\sin z}{EC} = \dfrac{\sin C}{AE}$

From ΔABE, $\dfrac{\sin(x+y)}{BE} = \dfrac{\sin B}{AE}$

$$\therefore \quad \frac{\sin(x+y)\sin(y+z)}{\sin x \sin z} = \frac{\dfrac{BE\sin B}{AE}\times\dfrac{DC\sin C}{AD}}{\dfrac{BD\sin B}{AD}\times\dfrac{EC\sin C}{AE}}$$

$$= \frac{BE}{AE}\times\frac{DC}{AD}\times\frac{AD}{BD}\times\frac{AE}{EC}$$

$$= \frac{2BD\times 2EC}{BD\times EC} = 4$$

11. We have, $a = 2x$, $b = 2y$ and $\angle C = 120°$

Area of triangle, $\Delta = \dfrac{1}{2}ab\sin C$

$$= \frac{1}{2}\times 2x\times 2y\sin 120°$$

$$= xy\sqrt{3} \text{ sq units}$$

12. We have, $\tan\frac{A}{2}\tan\frac{C}{2} = \frac{1}{2}$

$\Rightarrow \quad \sqrt{\dfrac{(s-b)(s-c)}{s(s-a)}}\sqrt{\dfrac{(s-a)(s-b)}{s(s-c)}} = \dfrac{1}{2}$

$\Rightarrow \quad \dfrac{s-b}{s} = \dfrac{1}{2} \Rightarrow 2s - 2b - s = 0$

$\Rightarrow \quad a + c - 3b = 0$

13. We have, $\dfrac{s(s-a)}{bc} - \dfrac{(s-b)(s-c)}{bc}$

$$= \cos^2\frac{A}{2} - \sin^2\frac{A}{2} = \frac{\cos 2A}{2}$$

$$= \cos A$$

14. $(b + c - a)\tan\frac{A}{2} = (2s - 2a)\tan\frac{A}{2}$

$$= 2(s-a)\sqrt{\frac{(s-b)(s-c)}{s(s-a)}}$$

$$= 2\,\frac{\sqrt{s(s-a)(s-b)(s-c)}}{s} = \frac{2\Delta}{s}$$

15. $\tan(\alpha+\beta) = \dfrac{\tan\alpha + \tan\beta}{1 - \tan\alpha\tan\beta}$

$$= \frac{\frac{y}{z}+\frac{x}{z}}{1-\frac{y}{z}\times\frac{x}{z}}$$

$$= \frac{\frac{3}{6}+\frac{2}{6}}{1-\frac{3}{6}\times\frac{2}{6}} = 1$$

$\Rightarrow \quad \alpha + \beta = \angle QPR = \dfrac{\pi}{4}$

16. $\because \angle A = 60°$, $\cos 60° = \dfrac{b^2 + c^2 - a^2}{2\,bc}$

$\Rightarrow \quad b^2 + c^2 - a^2 = bc$

Now, $AB^2 + AC^2 = 2(AD^2 + BD^2)$

$\Rightarrow \quad c^2 + b^2 = 2AD^2 + 2\left(\dfrac{a}{2}\right)^2$

$\Rightarrow \quad 2b^2 + 2c^2 - a^2 = 4AD^2$

$\Rightarrow \quad b^2 + c^2 + bc = 4AD^2 \quad (\because b^2 + c^2 - a^2 = bc)$

17. Given that, $\cos^2 A + \cos^2 C = \sin^2 B$

Obviously it is not an equilateral triangle because $A = B = C = 60°$ does not satisfy the given condition. But $B = 90°$, then $\sin^2 B = 1$ and

$$\cos^2 A + \cos^2 C = \cos^2 A + \cos^2\left(\frac{\pi}{2} - A\right)$$

$$= \cos^2 A + \sin^2 A = 1$$

Hence, this satisfies the condition, so it is a right angled triangle but not necessarily isosceles triangle.

18. Given that, $a = 5, b = 7$ and $\sin A = \dfrac{3}{4}$

As we know, $\dfrac{\sin A}{a} = \dfrac{\sin B}{b}$

$\Rightarrow \quad \dfrac{3}{4\times 5} = \dfrac{\sin B}{7} \Rightarrow \sin B = \dfrac{21}{20}$

which is not possible because its value is greater than one.

19. We have, $\frac{1}{2}ap_1 = \Delta,\ \frac{1}{2}bp_2 = \Delta,\ \frac{1}{2}cp_3 = \Delta$

where a, b and c are the sides of a triangle.

$\Rightarrow \quad p_1 = \frac{2\Delta}{a},\ p_2 = \frac{2\Delta}{b},\ p_3 = \frac{2\Delta}{c}$

$\therefore \quad \frac{1}{p_1^2} + \frac{1}{p_2^2} + \frac{1}{p_3^2} = \frac{a^2}{4\Delta^2} + \frac{b^2}{4\Delta^2} + \frac{c^2}{4\Delta^2} = \frac{a^2+b^2+c^2}{4\Delta^2}$

20. Let area of triangle be Δ, then according to the question

$$\Delta = \frac{1}{2}ax = \frac{1}{2}by = \frac{1}{2}cz$$

$$\therefore \quad \frac{bx}{c} + \frac{cy}{a} + \frac{az}{b} = \frac{b}{c}\left(\frac{2\Delta}{a}\right) + \frac{c}{a}\left(\frac{2\Delta}{b}\right) + \frac{a}{b}\left(\frac{2\Delta}{c}\right)$$

$$= \frac{2\Delta(b^2+c^2+a^2)}{abc}$$

$$= \frac{2(a^2+b^2+c^2)}{abc}\cdot\frac{abc}{4R} \qquad \left(\because \Delta = \frac{abc}{4R}\right)$$

$$= \frac{a^2+b^2+c^2}{2R}$$

21. Area of ΔCAB = area of ΔCAD + area of ΔCDB

$\Rightarrow \quad \frac{1}{2}ba\sin C = \frac{1}{2}b\cdot CD\sin\frac{C}{2} + \frac{1}{2}a\cdot CD\sin\frac{C}{2}$

$\Rightarrow \quad CD = \frac{2ab}{a+b}\cos\frac{C}{2}$

22. $(a-b)^2\cos^2\frac{C}{2} + (a+b)^2\sin^2\frac{C}{2}$

$$= (a^2+b^2-2ab)\cos^2\frac{C}{2} + (a^2+b^2+2ab)\sin^2\frac{C}{2}$$

$$= a^2+b^2+2ab\left(\sin^2\frac{C}{2} - \cos^2\frac{C}{2}\right)$$

$$= a^2+b^2-2ab\cos C$$

$$= a^2+b^2-(a^2+b^2-c^2)$$

$$= c^2 \qquad \left(\because \cos C = \frac{a^2+b^2-c^2}{2ab}\right)$$

23. We have, $R = \frac{abc}{4\Delta}$ and $r = \frac{\Delta}{s}$

$\therefore \quad \frac{R}{r} = \frac{abc}{4\Delta}\cdot\frac{s}{\Delta} = \frac{abc}{4(s-a)(s-b)(s-c)}$

Since, $a:b:c = 4:5:6$

$\Rightarrow \quad \frac{a}{4} = \frac{b}{5} = \frac{c}{6} = k$ (say)

Thus, $\frac{R}{r} = \frac{(4k)(5k)(6k)}{4\left(\frac{15k}{2}-4k\right)\left(\frac{15k}{2}-5k\right)\left(\frac{15k}{2}-6k\right)}$

$$= \frac{120k^3\cdot 2}{k^3\cdot 7\cdot 5\cdot 3} = \frac{16}{7}$$

24. In ΔABD,

$$\cos 60° = \frac{2^2+5^2-BD^2}{2(2)(5)}$$

$\Rightarrow \quad BD^2 = 19$

Now, in ΔBCD,

$$\cos 120° = \frac{CD^2+9-19}{(2)(3)(CD)}$$

$\Rightarrow \quad CD^2 + 3CD - 10 = 0$

$\Rightarrow \quad CD = -5, 2$

$\Rightarrow \quad CD = 2 \qquad (\because CD \neq -5)$

25. Given that, $a = 3, b = 5, c = 6$

Now, $s = \frac{a+b+c}{2} = 7$

$\therefore \quad \Delta = \sqrt{s(s-a)(s-b)(s-c)}$

$$= \sqrt{7(7-3)(7-5)(7-6)}$$

$$= \sqrt{7\cdot 4\cdot 2\cdot 1} = 2\sqrt{14}$$

$\therefore \quad r = \frac{\Delta}{s} = \frac{2\sqrt{14}}{7} = \sqrt{\frac{8}{7}}$

26. We know that, in any ΔABC,

$$\cos A + \cos B + \cos C = 1 + 4\sin\frac{A}{2}\sin\frac{B}{2}\sin\frac{C}{2}$$

and $r = 4R\sin\frac{A}{2}\sin\frac{B}{2}\sin\frac{C}{2}$

$\therefore \quad \cos A + \cos B + \cos C = 1 + \frac{r}{R}$

27. Since, $\left(1-\frac{r_1}{r_2}\right)\left(1-\frac{r_1}{r_3}\right) = 2$

$\therefore \quad \left(1-\frac{s-b}{s-a}\right)\left(1-\frac{s-c}{s-a}\right) = 2$

$\Rightarrow \quad \frac{(b-a)(c-a)}{(s-a)^2} = 2$

$\Rightarrow 2bc - 2ab - 2ac + 2a^2 = b^2 + c^2 + a^2 + 2bc - 2ab - 2ac$

$\Rightarrow \quad a^2 = b^2 + c^2$

So, triangle is right angled.

28. Let the sides be $a = 3x$, $b = 7x$, $c = -8x$. Then,

$2s = a + b + c \Rightarrow s = 9x$

$\therefore \quad \Delta = \sqrt{s(s-a)(s-b)(s-c)}$

$$= \sqrt{9x\times 6x\times 2x\times x} = 6\sqrt{3}x^2$$

Now, $R = \frac{abc}{4\Delta}$ and $r = \frac{\Delta}{s}$

$\therefore \quad \frac{R}{r} = \frac{sabc}{4\Delta^2} = \frac{9x\times 3x\times 7x\times 8x}{4\times 108\times x^4} = \frac{7}{2}$

29. We know that, $r_1 = \frac{\Delta}{s-a}$, $r_2 = \frac{\Delta}{s-b}$, $r_3 = \frac{\Delta}{s-c}$

Given that, $r_1 > r_2 > r_3$

$\Rightarrow \frac{\Delta}{s-a} > \frac{\Delta}{s-b} > \frac{\Delta}{s-c}$

$\Rightarrow \frac{1}{s-a} > \frac{1}{s-b} > \frac{1}{s-c}$

$\Rightarrow s-a < s-b < s-c$

($s-a$, $s-b$, $s-c$ are positive)

$\Rightarrow -a < -b < -c$

$\Rightarrow a > b > c$

30. **Statement I** $\frac{\sin A}{\sin C} = \frac{\sin(A-B)}{\sin(B-C)}$

$\Rightarrow \sin(B+C)\sin(B-C) = \sin(A+B)\sin(A-B)$

$\Rightarrow \sin^2 B - \sin^2 C = \sin^2 A - \sin^2 B$

$\Rightarrow b^2 - c^2 = a^2 - b^2$

$\Rightarrow 2b^2 = a^2 + c^2$

$\Rightarrow a^2, b^2$ and c^2 are in AP.

Statement II r_1, r_2 and r_3 are in HP.

$\Rightarrow \frac{1}{r_1}, \frac{1}{r_2}$ and $\frac{1}{r_3}$ are in AP.

$\Rightarrow \frac{2}{r_2} = \frac{1}{r_1} + \frac{1}{r_3}$

$\Rightarrow 2(s-b) = s-a+s-c$

$\Rightarrow 2b = (a+c)$

$\Rightarrow a, b$ and c are in AP.

Hence, both of these statements are correct.

31. $a\cot A + b\cot B + c\cot C$

$= \frac{a}{\sin A}\cos A + \frac{b}{\sin B}\cos B + \frac{c}{\sin C}\cos C$

$= 2R(\cos A + \cos B + \cos C)$

$= 2R\left(1 + \frac{r}{R}\right) = 2(r+R)$

32. Since, $\frac{1}{r_1^2} = \frac{(s-a)^2}{\Delta^2}, \frac{1}{r_2^2} = \frac{(s-b)^2}{\Delta^2}, \frac{1}{r_3^2} = \frac{(s-c)^2}{\Delta^2}$

and $\frac{1}{r^2} = \frac{s^2}{\Delta^2}$

$\therefore \frac{1}{r_1^2} + \frac{1}{r_2^2} + \frac{1}{r_3^2} + \frac{1}{r^2}$

$= \frac{s^2 + (s-a)^2 + (s-b)^2 + (s-c)^2}{\Delta^2}$

$= \frac{4s^2 + a^2 + b^2 + c^2 - 2s(a+b+c)}{\Delta^2}$

$= \frac{a^2 + b^2 + c^2}{\Delta^2}$

33. The area of an equilateral triangle $= \frac{\sqrt{3}}{4}a^2$, where a is side.

Also, $s = \frac{a+a+a}{2} = \frac{3a}{2}$

$\therefore$ Inradius, $r = \frac{\Delta}{s} = \frac{\sqrt{3}a^2 \times 2}{4 \times 3a} = \frac{a}{2\sqrt{3}}$ ...(i)

Circumradius, $R = \frac{abc}{4\Delta} = \frac{a^3}{\sqrt{3}a^2} = \frac{a}{\sqrt{3}}$ ...(ii)

and exradius, $r_1 = \frac{\Delta}{s-a} = \frac{(\sqrt{3}/4)a^2}{a/2} = \frac{\sqrt{3}}{2}a$

Hence, $r : R : r_1 = \frac{a}{2\sqrt{3}} : \frac{a}{\sqrt{3}} : \frac{\sqrt{3}}{2}a = 1:2:3$

34. $\therefore r_1r_2 + r_2r_3 + r_3r_1$

$= \frac{\Delta}{(s-a)} \times \frac{\Delta}{(s-b)} + \frac{\Delta}{s-b} \times \frac{\Delta}{s-c} + \frac{\Delta}{s-c} \times \frac{\Delta}{s-a}$

$= \frac{\Delta^2}{(s-b)(s-a)} + \frac{\Delta^2}{(s-b)(s-c)} + \frac{\Delta^2}{(s-a)(s-c)}$

$= \frac{\Delta^2[(s-c)+(s-a)+(s-b)]}{(s-a)(s-b)(s-c)}$

$= \frac{\Delta^2[3s-(a+b+c)]}{(s-a)(s-b)(s-c)} \times \frac{s}{s} = \frac{\Delta^2 s^2}{\Delta^2} = s^2 = \frac{\Delta^2}{r^2}$

35. In ΔDCB, $\tan\theta = \frac{h}{x}$ ...(i)

and in ΔECA, $\tan\theta = \frac{h+6}{2\sqrt{3}+x}$

$\Rightarrow \frac{h}{x} = \frac{h+6}{2\sqrt{3}+x}$ [from Eq. (i)]

$\Rightarrow 2\sqrt{3}h + hx = hx + 6x$

$\Rightarrow 2\sqrt{3}h = 6x$

$\Rightarrow h = \frac{6x}{2\sqrt{3}}$

From Eq. (i), we get

$\tan\theta = \frac{6x}{2\sqrt{3}x} = \sqrt{3} \Rightarrow \theta = 60°$

36. Let the height of the tower be h metres.

In ΔBCD, $\tan 45° = \frac{h}{BC}$

$\Rightarrow BC = h$ ...(i)

In ΔACD, $\tan 30° = \dfrac{h}{AC}$

$\Rightarrow$ $AC = \dfrac{h}{\tan 30°}$

$\Rightarrow$ $AB + BC = \sqrt{3}\,h$

$\Rightarrow$ $60 + h = \sqrt{3}\,h$ [from Eq. (i)]

$\Rightarrow$ $h = \dfrac{60}{\sqrt{3}-1}$

$\Rightarrow$ $h = \dfrac{60(\sqrt{3}+1)}{2}$

$\Rightarrow$ $h = 30(\sqrt{3}+1)$ m

37. Given, $\tan\phi = 0.5 = \dfrac{1}{2}$

In ΔABC, $\tan\theta = \dfrac{10}{AB}$

$\Rightarrow$ $AB = \dfrac{10}{\tan\theta}$

In ΔABD,

$\tan(\theta+\phi) = \dfrac{30}{AB}$

$\Rightarrow$ $\dfrac{\tan\theta + \tan\phi}{1-\tan\theta\tan\phi} = \dfrac{30\tan\theta}{10}$

$\Rightarrow$ $\tan\theta + \dfrac{1}{2} = 3\tan\theta - \dfrac{3}{2}\tan^2\theta$

$\Rightarrow$ $3\tan^2\theta - 4\tan\theta + 1 = 0$

$\Rightarrow$ $(3\tan\theta - 1)(\tan\theta - 1) = 0$

$\Rightarrow$ $\tan\theta = \dfrac{1}{3}, 1$

$\therefore$ $\tan\theta = 1$

38. Let l be the length of the ladder

i.e., $BP = CQ = 1$

In ΔPAB, $\cos\alpha = \dfrac{PA}{PB}$ and $\sin\alpha = \dfrac{AB}{PB}$

$\Rightarrow$ $PA = l\cos\alpha$ and $AB = l\sin\alpha$ ...(i)

In ΔQAC, $\cos\beta = \dfrac{AQ}{QC}$

$\Rightarrow$ $AQ = l\cos\beta$

and $AC = l\sin\beta$ ...(ii)

Now, $CB = AB - CA$

$= l\sin\alpha - l\sin\beta$ [from Eqs. (i) and (ii)]

$= l(\sin\alpha - \sin\beta)$

and $QP = AQ - PA$

$= l\cos\beta - l\cos\alpha$

$= l(\cos\beta - \cos\alpha)$

$\therefore$ $\dfrac{CB}{QP} = \dfrac{l(\sin\alpha - \sin\beta)}{l(\cos\beta - \cos\alpha)}$

$\Rightarrow$ $\dfrac{y}{x} = \dfrac{2\sin\left(\dfrac{\alpha-\beta}{2}\right)\cos\left(\dfrac{\alpha+\beta}{2}\right)}{2\sin\left(\dfrac{\alpha+\beta}{2}\right)\cos\left(\dfrac{\alpha-\beta}{2}\right)}$

$\Rightarrow$ $\dfrac{y}{x} = \cot\left(\dfrac{\alpha+\beta}{2}\right)$

$\Rightarrow$ $x = y\tan\left(\dfrac{\alpha+\beta}{2}\right)$

39. In ΔABD, $\tan\alpha = \dfrac{h}{2h}$

$\Rightarrow$ $\tan\alpha = \dfrac{1}{2}$ ...(i)

In ΔABC, $\tan 2\alpha = \dfrac{h+p}{2h}$

$\Rightarrow$ $\dfrac{2\tan\alpha}{1-\tan^2\alpha} = \dfrac{h+p}{2h}$

$\Rightarrow$ $\dfrac{2\left(\dfrac{1}{2}\right)}{1-\left(\dfrac{1}{2}\right)^2} = \dfrac{h+p}{2h}$

$\Rightarrow$ $\dfrac{4}{3} = \dfrac{h+p}{2h}$

$\Rightarrow$ $8h = 3h + 3p$

$\Rightarrow$ $5h = 3p \Rightarrow p = \dfrac{5h}{3}$ m

40. In ΔDAB, $\tan\theta = \frac{64}{d}$

$\Rightarrow \quad d = 64\cot\theta$ ...(i)

In ΔCDE, $\tan(90° - \theta) = \frac{(100-64)}{d}$

$\Rightarrow \quad d = 36\tan\theta$ ...(ii)

From Eqs. (i) and (ii), we get

$d^2 = 36 \times 64 \Rightarrow d = 48$ m

41. In ΔBCD, $\cot 60° = \frac{BC}{300}$

$\Rightarrow \quad BC = 300 \times \frac{1}{\sqrt{3}}$ ...(i)

In ΔACD, $\cot 30° = \frac{AC}{300}$

$\Rightarrow \quad AC = 300\sqrt{3}$ ...(ii)

$\therefore$ Distance between two boats = AB

$= AC - BC = 300\sqrt{3} - \frac{300}{\sqrt{3}}$ [using Eqs. (i) and (ii)]

$= 300\frac{(3-1)}{\sqrt{3}} = \frac{600 \times \sqrt{3}}{3} = 346.4$ m

42. In ΔABC, $\tan 60° = \frac{h}{BC}$

$\Rightarrow \quad BC = h\cot 60°$ ...(i)

In ΔABD, $\tan 30° = \frac{h}{BD}$

$\Rightarrow \quad BD = h\cot 30°$

$\Rightarrow \quad BC + CD = h\cot 30°$

$\Rightarrow \quad CD = h\cot 30° - BC$

$\Rightarrow \quad d = h\cot 30° - h\cot 60°$ [from Eq. (i)]

$\therefore$ Speed of car = $\frac{\text{Distance from } D \text{ to } C}{\text{Time taken}}$

$= \frac{d}{3} = \frac{h\cot 30° - h\cot 60°}{3}$

$\therefore$ Time taken from C to B = $\frac{\text{distance}}{\text{speed}} = \frac{h\cot 60°}{\frac{h(\cot 30° - \cot 60°)}{3}}$

$= \frac{\frac{1}{\sqrt{3}} \times 3}{\left(\sqrt{3} - \frac{1}{\sqrt{3}}\right)} = \frac{3}{2} = 1.5$ min

43. In ΔABC, $\tan 30° = \frac{BC}{AC}$

$\Rightarrow \quad \frac{1}{\sqrt{3}} = \frac{h-150}{60}$

$\Rightarrow \quad h - 150 = \frac{60}{\sqrt{3}}$

$\Rightarrow \quad h = (150 + 20\sqrt{3})$ m

44. In ΔADF, $\tan 60° = \frac{1}{AF}$

$\Rightarrow \quad AF = \cot 60° = \frac{1}{\sqrt{3}}$ ...(i)

In ΔABC, $\quad \tan 30° = \frac{1}{AB}$

$\Rightarrow \quad AB = \cot 30°$

$\Rightarrow \quad AF + FB = \sqrt{3}$

$\Rightarrow \quad d = \sqrt{3} - \frac{1}{\sqrt{3}} = \frac{2}{\sqrt{3}}$ [using Eq. (i)]

$\therefore$ Speed of aeroplane $= \frac{\text{Distance from } D \text{ to } C}{\text{Time taken}}$

$$= \frac{\frac{2}{\sqrt{3}}}{10} \times 60 \times 60 = 240\sqrt{3} \text{ km/h}$$

45. In ΔABC,

$$\tan 30° = \frac{BC}{40}$$

$\Rightarrow \quad BC = \frac{40}{\sqrt{3}}$ ...(i)

In ΔDAB, $\quad \tan 60° = \frac{BD}{40}$

$\Rightarrow \quad BD = 40\sqrt{3}$

$\Rightarrow \quad DC + BC = 40\sqrt{3}$

$\Rightarrow \quad DC + \frac{40}{\sqrt{3}} = 40\sqrt{3}$ [from Eq. (i)]

$\Rightarrow \quad DC = 40\left(\sqrt{3} - \frac{1}{\sqrt{3}}\right) = \frac{80}{\sqrt{3}}$

$\Rightarrow \quad DC = 46.19$ m

46. Given that, $\cot\alpha = \frac{3}{5}$ and $\cot\beta = \frac{2}{5}$

In ΔBCD, $\quad \tan\beta = \frac{h}{BC}$

$\Rightarrow \quad BC = h\cot\beta$

$\Rightarrow \quad BC = \frac{2h}{5}$ ...(i)

and in ΔACD, $\quad \tan\alpha = \frac{h}{32 + BC}$

$\Rightarrow \quad h = \left(32 + \frac{2h}{5}\right)\frac{5}{3}$ [using Eq. (i)]

$\Rightarrow \quad 3h = 160 + 2h$

$\Rightarrow \quad h = 160$ m

47. In ΔABD, $\quad \tan\alpha = \frac{H}{d}$

$\Rightarrow \quad d = H\cot\alpha$ ...(i)

In ΔECD, $\quad \tan(\alpha - \beta) = \frac{H - h}{d}$

$\Rightarrow \quad \tan(\alpha - \beta) = \frac{H - h}{H\cot\alpha}$ [from Eq. (i)]

$\Rightarrow \quad H[1 - \cot\alpha\tan(\alpha - \beta)] = h$

$\Rightarrow \quad H = \frac{h\cot(\alpha - \beta)}{\cot(\alpha - \beta) - \cot\alpha}$

48. Let AD be the building of height h and BP be the hill. Then,

$\tan q = \frac{h + x}{y}$ ...(i)

and $\quad \tan p = \frac{x}{y}$

$\Rightarrow \quad y = x\cot p$ ...(ii)

From Eqs. (i) and (ii), we get

$$\tan q = \frac{h + x}{x\cot p}$$

$\Rightarrow \quad x\cot p = (h + x)\cot q$

$\Rightarrow \quad x = \frac{h\cot q}{\cot p - \cot q}$

$\Rightarrow \quad h + x = \dfrac{h \cot q}{\cot p - \cot q} + h$

$\therefore \quad$ Height of hill $= \dfrac{h \cot p}{\cot p - \cot q}$

49. In $\Delta\, DEC$, $\quad \tan\theta = \dfrac{DE}{CE}$

$\Rightarrow \quad \tan\theta = \dfrac{h-a}{CE}$

$\Rightarrow \quad CE = \dfrac{h-a}{\tan\theta}$ ...(i)

In ΔABC,

$\tan 2\theta = \dfrac{a}{AB} = \dfrac{a}{CE}$ $\quad (\because CE = AB)$

$\Rightarrow \quad \dfrac{2\tan\theta}{1-\tan^2\theta} = \dfrac{a}{\dfrac{h-a}{\tan\theta}}$ [from Eq. (i)]

$\Rightarrow \quad a\tan\theta = (h-a) \times \dfrac{2\tan\theta}{1-\tan^2\theta}$

$\Rightarrow \quad a\tan\theta(1-\tan^2\theta) - 2(h-a)\tan\theta = 0$

$\Rightarrow \quad \tan\theta(a - a\tan^2\theta - 2h + 2a) = 0$

$\because \quad \tan\theta \neq 0$

$\therefore \quad \tan^2\theta = \dfrac{-2h+3a}{a}$

$\Rightarrow \quad \theta = \tan^{-1}\sqrt{\dfrac{-2h+3a}{a}}$

$= \tan^{-1}\sqrt{3 - \dfrac{2h}{a}}$

50. In ΔPMC, $\quad \tan\alpha = \dfrac{h-a}{PM}$

$\Rightarrow \quad PM = (h-a)\cot\alpha$ ...(i)

In $\Delta PMC'$, $\quad \tan\beta = \dfrac{h+a}{PM}$

$\Rightarrow \quad h + a = PM\tan\beta$

$\Rightarrow \quad h = (h-a)\cot\alpha\tan\beta - a$

$\Rightarrow \quad h(1-\cot\alpha\tan\beta) = -a(1+\cot\alpha\tan\beta)$

$\Rightarrow \quad h = \dfrac{a(\sin\alpha\cos\beta + \cos\alpha\sin\beta)}{\sin\beta\cos\alpha - \sin\alpha\cos\beta}$

$= \dfrac{a\sin(\alpha+\beta)}{\sin(\beta-\alpha)}$ m

51. In ΔDBC, $\quad \tan\alpha = \dfrac{5}{x}$ ...(i)

and in ΔDAC,

$\tan 2\alpha = \dfrac{30}{x}$

$\Rightarrow \quad \dfrac{2\tan\alpha}{1-\tan^2\alpha} = \dfrac{30}{x}$

$\Rightarrow \quad \dfrac{2\left(\dfrac{5}{x}\right)}{1-\dfrac{25}{x^2}} = \dfrac{30}{x}$

$\Rightarrow \quad \dfrac{10x}{x^2-25} = \dfrac{30}{x}$

$\Rightarrow \quad 10x^2 = 30x^2 - 750$

$\Rightarrow \quad 20x^2 = 750$

$\Rightarrow \quad x^2 = \dfrac{75}{2}$

$\Rightarrow \quad x = 5\sqrt{\dfrac{3}{2}}$ m

52. Given that,

$\tan\theta = \dfrac{4}{3}$ and $\tan\phi = \dfrac{5}{2}$ ...(i)

In ΔABE, $\quad \tan\phi = \dfrac{150}{d}$

$\Rightarrow \quad d = 150 \cot \phi$

$= 150 \times \frac{2}{5} = 60$ m ...(ii)

In ΔDCE, $\tan\theta = \frac{h}{d}$

$\Rightarrow \quad \frac{4}{3} = \frac{h}{d}$ [from Eq. (i)]

$\Rightarrow \quad h = \frac{4}{3}(60)$ [from Eq. (ii)]

$\Rightarrow \quad h = 80$ m

Now, in ΔDCE, $DE^2 = DC^2 + CE^2$

$\Rightarrow \quad x^2 = 60^2 + 80^2 = 10000$

$\Rightarrow \quad x = 100$ m

53. In ΔABD, $\tan\beta = \frac{60}{d}$

$\Rightarrow \quad d = 60 \cot\beta$ ...(i)

In ΔDEC, $\tan\alpha = \frac{DC}{EC}$

$\Rightarrow \quad DC = d \tan\alpha$

$\Rightarrow \quad 60 - h = d \tan\alpha$ $(\because BC = EA = h)$

$\Rightarrow \quad 60 - h = 60 \cot\beta \tan\alpha$ [from Eq. (i)]

$\Rightarrow \quad h = 60\left(1 - \frac{\cos\beta}{\sin\beta} \cdot \frac{\sin\alpha}{\cos\alpha}\right)$

$\Rightarrow \quad h = \frac{60 \sin(\beta - \alpha)}{\cos\alpha \sin\beta}$

$\Rightarrow \quad \frac{60 \sin(\beta - \alpha)}{x} = \frac{60 \sin(\beta - \alpha)}{\cos\alpha \sin\beta}$ (given)

$\Rightarrow \quad x = \cos\alpha \sin\beta$

54. Let OP be the tower. Since, the tower make equal angles at the vertices of the triangle, therefore foot of tower is at the circumcentre.

In ΔOAP, $\tan\alpha = \frac{OP}{OA}$

$\Rightarrow \quad OP = OA \tan\alpha$

$\Rightarrow \quad OP = R \tan\alpha$ $(\because OA = R$, given)

55. Since, $\angle QPC = \alpha$

$\therefore \quad \angle QPB = \angle BPC = \frac{\alpha}{2}$

In ΔPQB, $\sin\frac{\alpha}{2} = \frac{r}{l}$

$\Rightarrow \quad l = r \sec\frac{\alpha}{2}$ ...(i)

and in ΔPOB, $\sin\beta = \frac{h}{l}$

$\Rightarrow \quad h = l \sin\beta$

$\Rightarrow \quad h = r \operatorname{cosec}\frac{\alpha}{2} \sin\beta$ [from Eq. (i)]

56. $\because \quad \frac{a_1}{b_1} = \tan\left(\frac{\alpha + \beta}{2}\right)$ ...(i)

and $\frac{a_2}{b_2} = \tan\left(\frac{\beta + \gamma}{2}\right)$ ...(ii)

Since, $a_1 a_2 = b_1 b_2$

$\Rightarrow \quad \frac{a_1}{b_1} = \frac{b_2}{a_2}$

$\Rightarrow \quad \tan\left(\frac{\alpha + \beta}{2}\right) = \frac{1}{\tan\left(\frac{\beta + \gamma}{2}\right)}$

$\Rightarrow \quad \tan\left(\frac{\alpha + \beta}{2}\right) \tan\left(\frac{\beta + \gamma}{2}\right) = 1$

$\therefore \quad \frac{\alpha + \beta}{2} + \frac{\beta + \gamma}{2} = \frac{\pi}{2}$

$\Rightarrow \quad \alpha + \beta + \gamma = \pi - \beta < \pi$

57. Let DP is clock tower standing at the middle point D of BC.

Let $\angle PAD = \alpha = \cot^{-1} 3.2 \Rightarrow \cot\alpha = 3.2$

and $\angle PBD = \beta = \text{cosec}^{-1} 2.6 \Rightarrow \text{cosec}\,\beta = 2.6$

$\therefore \quad \cot\beta = \sqrt{(\text{cosec}^2\beta - 1)} = \sqrt{5.76} = 2.4$

In ΔPAD and ΔPBD,

$AD = h\cot\alpha = 3.2\,h$ and $BD = h\cot\beta = 2.4\,h$

In ΔABD, $\quad AB^2 = AD^2 + BD^2$

$\Rightarrow \quad 100^2 = [(3.2)^2 + (2.4)^2]h^2 = 16h^2$

$\Rightarrow \quad h = \dfrac{100}{4} \Rightarrow h = 25$ m

58. Let OP be the tower whose height is h metres.

In ΔOAP, $\quad \tan\alpha = \dfrac{OP}{OA}$

$\Rightarrow \quad OA = h\cot\alpha \quad$ ...(i)

In ΔOBP, $\quad \tan\beta = \dfrac{OP}{OB}$

$\Rightarrow \quad OB = h\cot\beta \quad$ ...(ii)

Now, in ΔOAB, $\quad AB^2 = OA^2 + OB^2$

$\Rightarrow \quad d^2 = h^2(\cot^2\alpha + \cot^2\beta)$

[from Eqs. (i) and (ii)]

$\Rightarrow \quad h = \dfrac{d}{\sqrt{\cot^2\alpha + \cot^2\beta}}$

59. Let PD be a pole.

In ΔDAP, $\quad \tan 30° = \dfrac{DP}{AD}$

$\Rightarrow \quad DP = \dfrac{a}{\sqrt{3}}$

In ΔPDB, $\quad \tan\theta = \dfrac{DP}{BD}$

$\Rightarrow \quad \tan\theta = \dfrac{a/\sqrt{3}}{\sqrt{2}a} = \dfrac{1}{\sqrt{6}}$

60. Let BC be the declivity and BA be the tower.

$\therefore$ In ΔABC, on applying sine rule

$\dfrac{BC}{\sin 75°} = \dfrac{AB}{\sin 30°}$

$\Rightarrow \quad AB = \dfrac{80\sin 30°}{\sin 75°}$

$= \dfrac{40 \times 2\sqrt{2}}{\sqrt{3}+1}$

$= 40(\sqrt{6} - \sqrt{2})$ ft

61. $\because \quad \angle CDA = \beta, \quad \angle DCB = \gamma,$

and $\quad \angle ACB = \pi - (\alpha + \beta + \gamma)$

In ΔABC, on applying sine rule, we get

$\dfrac{AB}{\sin[\pi - (\alpha + \beta + \gamma)]} = \dfrac{CA}{\sin\gamma}$

$\Rightarrow \quad CA = \dfrac{a\sin\gamma}{\sin(\alpha + \beta + \gamma)}$

Now, in ΔCAD, on applying sine rule

$\dfrac{CA}{\sin\beta} = \dfrac{CD}{\sin\alpha}$

$\Rightarrow \quad CD = \dfrac{CA \cdot \sin\alpha}{\sin\beta}$

$= \dfrac{a\sin\gamma\sin\alpha}{\sin\beta\sin(\alpha + \beta + \gamma)}$

62. In ΔABE,

$\sin\beta = \dfrac{BE}{b}$

$\Rightarrow \quad BE = h_1 = b\sin\beta$

Using sine rule, in $\Delta\, AED$

$\dfrac{\sin(\alpha - \beta)}{ED} = \dfrac{\sin(\gamma - \alpha)}{b}$

$\Rightarrow \quad ED = \dfrac{b\sin(\alpha - \beta)}{\sin(\gamma - \alpha)}$

Now, in ΔFED,

$$\sin\gamma = \frac{h_2}{ED} \Rightarrow \eta_2 = \frac{\beta\sin(\alpha-\beta)\sin\gamma}{\sin(\gamma-\alpha)}$$

$\therefore$ Total height of the hill $= CD = h_1 + h_2$

$$= b\sin\beta + \frac{b\sin(\alpha-\beta)\sin\gamma}{\sin(\gamma-\alpha)}$$

$$= \frac{b[\sin\beta\sin(\gamma-\alpha) + \sin(\alpha-\beta)\sin\gamma]}{\sin(\gamma-\alpha)} = \frac{b\sin\alpha\sin(\gamma-\beta)}{\sin(\gamma-\alpha)}$$

63. Let h be the height of the cloud above the surface of the lake. The arrangement(s) given in the problem is/are shown in the figure.

Now, in $\Delta AMC'$, we have

$$\tan 45° = \frac{AM}{MC'}$$

$\Rightarrow$ $AM = MC'$

$\Rightarrow$ $AM = (h + 2500)$ ...(i)

Also, in ΔAMC, we have

$$\tan 15° = \frac{MC}{AM}$$

$\Rightarrow$ $MC = AM\tan 15°$

On substituting respective values, we get

$$(h - 2500) = (h + 2500)\left(\frac{\sqrt{3}-1}{\sqrt{3}+1}\right)$$

$$\Rightarrow \frac{h-2500}{h+2500} = \frac{\sqrt{3}-1}{\sqrt{3}+1}$$

Using componendo and dividendo, we have

$$\frac{h}{-2500} = \frac{\sqrt{3}}{-1}$$

$\Rightarrow$ $h = 2500\sqrt{3}$

Round II

1. We have, $\cos A = \dfrac{b^2 + c^2 - a^2}{2bc}$

or $c^2 - 2bc\cos A + b^2 - a^2 = 0$

$\therefore$ $c_1 + c_2 = 2b\cos A = 2 \times 2 \times \dfrac{\sqrt{3}}{2} = 2\sqrt{3}$

and $c_1c_2 = b^2 - a^2 = 4 - 5 = -1$

$\therefore$ $|c_1 - c_2| = \sqrt{(c_1 + c_2)^2 - 4c_1c_2}$

$= \sqrt{12 + 4} = \sqrt{16} = 4$

2. Given, $\angle A = 20°$

$\therefore$ $\angle B = \angle C = 80°$

Then, $b = c$

$\therefore$ $\dfrac{a}{\sin 20°} = \dfrac{b}{\sin 80°} = \dfrac{c}{\sin 80°}$

$\Rightarrow$ $\dfrac{a}{\sin 20°} = \dfrac{b}{\cos 10°}$

$\Rightarrow$ $a = 2b\sin 10°$ ...(i)

$\therefore$ $a^3 + b^3 = 8b^3\sin^3 10° + b^3$

$= b^3\{2(4\sin^3 10°) + 1\}$

$= b^3\{2(3\sin 10° - \sin 30°) + 1\}$

$= b^3\{6\sin 10°\} = 3b^2(2b\sin 10°)$

$= 3b^2a$ [from Eq.(i)]

$= 3ac^2$ ($\because b = c$)

3. $\because$ $A + B + C + D = 2\pi$

$\Rightarrow$ $\tan(A + B + C + D) = 0$

$\Rightarrow$ $\dfrac{\Sigma\tan A - \Sigma\tan A\tan B\tan C}{1 - \Sigma\tan A\tan B + \tan A\tan B\tan C\tan D} = 0$

$\Rightarrow$ $\Sigma\tan A - \Sigma\tan A\tan B\tan C = 0$

$\Rightarrow$ $\Sigma\tan A = \tan A\tan B\tan C\tan D\,\Sigma\cot A$

$\Rightarrow$ $\dfrac{\Sigma\tan A}{\Sigma\cot A} = \prod\tan A$

4. $(a + b + c)(b + c - a) = kbc$

$\Rightarrow$ $2s(2s - 2a) = kbc \Rightarrow \dfrac{s(s-a)}{bc} = \dfrac{k}{4}$

$\Rightarrow$ $\cos^2\left(\dfrac{A}{2}\right) = \dfrac{k}{4}$

$\because$ $0 < \cos^2\left(\dfrac{A}{2}\right) < 1$

$\therefore$ $0 < \dfrac{k}{4} < 1 \Rightarrow 0 < k < 4$

5. $r - r_2 = r_3 - r_1$

$\Rightarrow$ $\dfrac{\Delta}{s} - \dfrac{\Delta}{s-b} = \dfrac{\Delta}{s-c} - \dfrac{\Delta}{s-a}$

$\Rightarrow$ $\dfrac{-b}{s(s-b)} = \dfrac{c-a}{(s-a)(s-c)}$

$\dfrac{(s-a)(s-c)}{s(s-b)} = \dfrac{a-c}{b} \Rightarrow \tan^2\dfrac{B}{2} = \dfrac{a-c}{b}$

But $\frac{B}{2} \in \left(\frac{\pi}{6}, \frac{\pi}{4}\right)$

$\Rightarrow \quad \tan^2 \frac{B}{2} \in \left(\frac{1}{3}, 1\right)$

$\Rightarrow \quad \frac{1}{3} < \frac{a-c}{b} < 1$

$\Rightarrow \quad b < 3a - 3c < 3b$

$\Rightarrow \quad b + 3c < 3a < 3b + 3c$

6. In ΔAIF and AIE,

$$\frac{IF}{\sin A/2} = AI = \frac{IE}{\sin A/2}$$

$\Rightarrow \quad AI^2 = \frac{IE \cdot IF}{\sin^2 A/2}$

$\Rightarrow \quad \frac{ID \times IE \times IF}{IA \times IB \times IC} = \sin\frac{A}{2}\sin\frac{B}{2}\sin\frac{C}{2} = \frac{r}{4R} = \frac{1}{10}$

7. Let r be the radius of the circle and A_1 be its area.

Then, $A_1 = \pi r^2$

Since, the perimeter of the circle is same as the perimeter of a regular polygon of n sides, therefore $2\pi r = na$, where a is the length of one side of the regular polygon.

$\Rightarrow \quad a = \frac{2\pi r}{n}$

Let A_2 be the area of the polygon.

Then, $A_2 = \frac{1}{4}\pi a^2 \cot\left(\frac{\pi}{n}\right) = \frac{\pi^2 r^2}{n}\cot\left(\frac{\pi}{n}\right)$

$\therefore \quad A_1 : A_2 = \pi r^2 : \frac{\pi^2 r^2}{n}\cot\left(\frac{\pi}{n}\right) = \tan\left(\frac{\pi}{n}\right) : \frac{\pi}{n}$

8. Given, r_1, r_2 and r_3 are in HP.

$\because$ a, b and c are in AP.

$\therefore \quad a + b + c = 24 = 2s$

$\Rightarrow \quad 2b + b = 24 \Rightarrow b = 8 \Rightarrow c = 16 - a$

Also, given $\sqrt{s(s-a)(s-b)(s-c)} = 24$

$\Rightarrow \quad \sqrt{12(12-a)(12-8)(a-4)} = 24$

$\Rightarrow \quad (12-a)(a-4) = 12$

$\Rightarrow \quad a^2 - 16 + 60 = 0$

$\Rightarrow \quad a = 6, 10$

9. Let h be the height of the tower, then

$h = AQ \tan\alpha = BQ \tan\beta = CQ \tan\gamma$

$\Rightarrow \quad BC = BQ - CQ = h(\cot\beta - \cot\gamma)$

$\Rightarrow \quad CA = h(\cot\alpha - \cot\gamma)$

and $AB = h(\cot\alpha - \cot\beta)$

Now, $BC \cot\alpha - CA \cot\beta + AB \cot\gamma$

$= h[\cot\alpha(\cot\beta - \cot\gamma) - \cot\beta(\cot\alpha - \cot\gamma) + \cot\gamma(\cot\alpha - \cot\beta)]$

$= 0$

10. Let OP be the flag staff of height h standing at the centre O of the field.

In ΔOEP, $OE = h\cot 15° = h(2 + \sqrt{3})$

and in ΔOFP, $OF = h\cot 45° = h$

$\therefore \quad EF = h\sqrt{1 + (2+\sqrt{3})^2}$

$= 2h\sqrt{2+\sqrt{3}}$

Since, $AC = 1200$

$\Rightarrow \quad 2EF = 4h\sqrt{(2+\sqrt{3})}$

$\Rightarrow \quad h = \frac{300}{\sqrt{2+\sqrt{3}}}$

$= 300\sqrt{2-\sqrt{3}}$ m

11. Let the height of the vertical tower $PQ = h$, C is the middle point of line segment AB. Since, PQ is perpendicular to the plane QAB. $\therefore \angle PQA = \angle PQC = \angle PQB = 90°$, we get

$\frac{PQ}{QA} = \tan\theta \Rightarrow QA = h\cot\theta$

Similarly, $QB = h\cot\theta$ and $QC = h\cot\phi$

Since, $QA = QB$, the ΔQAB is an isosceles triangle.

Here, QCA is a right angled triangle in which $\angle QCA = 90°$.

$\therefore \quad QC^2 + AC^2 = QA^2$

$\Rightarrow \quad h^2 \cot^2 \phi + a^2 = h^2 \cot^2 \theta$

$\Rightarrow \quad h^2 (\cot^2 \theta - \cot^2 \phi) = a^2$

or $\quad h^2 = \dfrac{a^2}{\cot^2 \theta - \cot^2 \phi}$

$$\Rightarrow \quad h^2 = \frac{a^2}{(\text{cosec}^2 \theta - 1) - (\text{cosec}^2 \phi - 1)}$$

$$= \frac{a^2}{\text{cosec}^2 \theta - \text{cosec}^2 \phi}$$

$$= \frac{a^2}{\dfrac{1}{\sin^2 \theta} - \dfrac{1}{\sin^2 \phi}}$$

$$\Rightarrow \quad h^2 = \frac{a^2 \sin^2 \theta \sin^2 \phi}{\sin^2 \phi - \sin^2 \theta} = \frac{a^2 \sin^2 \theta \sin^2 \phi}{\sin(\phi - \theta) \sin(\phi - \theta)}$$

Hence, the required height h of the peak

$$= \frac{a \sin \theta \sin \phi}{\sqrt{\sin(\phi + \theta) \sin(\phi - \theta)}}$$

12. Let H be the mid-point of BC. Since, $\angle TBH = 90°$, then $TH^2 = BT^2 + BH^2 = 5^2 + 5^2 = 50$

Also since,

$\angle THG = 90°$, $TG^2 = TH^2 + GH^2$

$= 50 + 25 = 75$

Let θ be the required angle of elevation of G at T.

Then, $\quad \sin \theta = \dfrac{GH}{TG} = \dfrac{5}{5\sqrt{3}} = \dfrac{1}{\sqrt{3}}$

$\Rightarrow \quad \theta = \sin^{-1}(1/\sqrt{3})$

13. Let PQ and RS be the poles of height 20 m and 80 m subtending angles α and β at R and P, respectively. Let h be the height of the point T, the intersection of QR and PS.

Then, $\quad PR = h \cot \alpha + h \cot \beta$

$= 20 \cot \alpha = 80 \cot \beta$

$\Rightarrow \quad \cot \alpha = 4 \cot \beta$

$\Rightarrow \quad \dfrac{\cot \alpha}{\cot \beta} = 4$

Again, $\quad h \cot \alpha + h \cot \beta = 20 \cot \alpha$

$\Rightarrow \quad (h - 20) \cot \alpha = -h \cot \beta$

$\Rightarrow \quad \dfrac{\cot \alpha}{\cot \beta} = \dfrac{h}{20 - h} = 4$

$\Rightarrow \quad h = 80 - 4h \Rightarrow h = 16$ m

14. $\quad r = \dfrac{\Delta}{s}, r_1 = \dfrac{\Delta}{s - a}$

$$r_1 r = \frac{\Delta^2}{s(s-a)} = \frac{s(s-a)(s-b)(s-c)}{s(s-a)}$$

$$= (s-b)(s-c) = (s-b)^2 \qquad (\because b = c)$$

$$= \frac{(2s - 2b)^2}{4} = \frac{(a + b + c - 2b)^2}{4} \qquad (\because b = c)$$

$$= \frac{a^2}{4} = \frac{4R^2 \sin^2 A}{4} = R^2 \sin^2 A$$

Also, if $\quad \angle B = \theta \Rightarrow \angle A = \pi - 2\theta$

$\therefore \quad r_1 r = R^2 \sin^2(\pi - 2\theta) = R^2 \sin^2 2\theta = R^2 \sin^2 2B$

15. Area of polygon,

$\Delta = n$ times the area of the ΔOBC

$$= \frac{na^2}{4} \cot \frac{\pi}{n} \qquad \text{...(i)}$$

Now, $\quad a = 2r \tan \dfrac{\pi}{n}$

$\Rightarrow \quad \Delta = nr^2 \tan\left(\dfrac{\pi}{n}\right)$ [from Eq. (i)]

Also, $\quad a = 2R \sin \dfrac{\pi}{n}$

$\Rightarrow \quad \Delta = \dfrac{nR^2}{2} \sin\left(\dfrac{2\pi}{n}\right)$ [from Eq.(i)]

Solutions (Q. Nos. 16-18)

We have,

$r_1 = \dfrac{\Delta}{s - a} = 2, r_2 = \dfrac{\Delta}{s - b} = 3, r_3 = \dfrac{\Delta}{s - c} = 6$

Given $\Delta = 6$,

$\therefore \quad s - a = 3 \qquad$ ...(i)

$s - b = 2 \qquad$ ...(ii)

$s - c = 1 \qquad$ ...(iii)

On adding Eqs. (i) and (ii), $2s - a - b = 5$

$\Rightarrow \quad a + b + c - a - b = 5 \Rightarrow c = 5$

On adding Eqs. (i) and (iii), $2s - a - c = 4 \Rightarrow b = 4$ and adding Eqs (ii) and (iii), $2s - b - c = 3$

$\therefore \quad a = 3$

Hence, the sides of the triangle are $a = 3$, $b = 4$, $c = 5$.

16. Also, $R = \frac{abc}{4\Delta} = \frac{60}{24} = 2.5$

17. $r = \frac{\Delta}{5} = \frac{6}{6} = 1$

18. Since, the triangle is right angled, greatest angle is 90°. Also, the least angle is opposite to side a, which is $\sin^{-1}\frac{3}{5}$.

$$\Rightarrow \quad 90° - \sin^{-1}\frac{3}{5} = \cos^{-1}\frac{3}{5}$$

19. $\because \; a^2 = b^2 + c^2$, then $\angle A = \frac{\pi}{2}$

$$\therefore \quad a = 2R \sin A = 2R$$

$$\Rightarrow \quad \frac{a^2 + b^2 + c^2}{R^2} = \frac{a^2 + a^2}{R^2} = \frac{2a^2}{R^2} = \frac{2(2R)^2}{R^2} = 8$$

20. $a > b > c$

$$\Rightarrow \quad s - a > s - b > s - c$$

$$\Rightarrow \quad \frac{\Delta}{s-a} > \frac{\Delta}{s-b} > \frac{\Delta}{s-c}$$

$$\Rightarrow \quad r_1 > r_2 > r_3$$

Also, cosine is a decreasing function for $x \in [0, (\pi/2)]$

For $a > b > c \Rightarrow A > B > C \Rightarrow \cos A < \cos B < \cos C$

Hence, both statements are true, but statements II does not explain statement I.

21. $\angle ICI_1 = \frac{\pi}{2}$, $\angle IBI_1 = \frac{\pi}{2}$

$\therefore BICI_1$ is a cyclic quadrilateral.

$$\Rightarrow \quad BP \cdot PC = IP \cdot I_1P$$

22. $\therefore \quad \frac{a}{2R} = \sin\frac{\pi}{n}$ and $\frac{a}{2r} = \tan\frac{\pi}{n}$

$$\therefore \quad \frac{r}{R} = \cos\frac{\pi}{n}$$

$n = 3$ gives, $\quad \frac{r}{R} = \frac{1}{2}$

$n = 4$ gives, $\quad \frac{r}{R} = \frac{1}{\sqrt{2}}$

$n = 6$ gives, $\quad \frac{r}{R} = \frac{\sqrt{3}}{2}$

23. In ΔABC, $\quad BC = h \cot 60°$

and in ΔABD, $\quad BD = h \cot 45°$

Since, $\quad BD - BC = DC$

$$\Rightarrow \quad h \cot 45° - h \cot 60° = 7$$

$$h = \frac{7}{\cot 45° - \cot 60°} = \frac{7}{\left(1 - \frac{1}{\sqrt{3}}\right)}$$

$$= \frac{7\sqrt{3}}{\sqrt{3} - 1} \times \frac{\sqrt{3} + 1}{\sqrt{3} + 1}$$

$$= \frac{7\sqrt{3}}{2}(\sqrt{3} + 1) \text{ m}$$

24. Let h be the height of a tower

Since, $\quad \angle AOB = 60°$

$\therefore \Delta OAB$ is an equilateral.

$$\therefore \quad OA = OB = AB = a$$

In ΔOAC, $\quad \tan 30° = \frac{h}{a}$

$$\Rightarrow \quad h = \frac{a}{\sqrt{3}}$$

11 Cartesian Coordinate System

JEE Main MILESTONE

- Cartesian System of Rectangular Axes
- Cartesian Coordinates in a Plane Point
- Distance Formula
- Area of Some Geometrical Figures
- Different Points Related to a Triangle
- Translation of Axes
- Slope of a Line
- Parallel and Perpendicular Line on the Coordinate Axes
- Intercepts of a Line on the Coordinate Axes

11.1 Cartesian System of Rectangular Axes

The position of a point in a plane is determined with reference to two intersecting straight lines called the **coordinate axes** and their point of intersection is called the **origin**. If these two axes of reference (generally, we call them x and y-axes) cut each other at right angle, then they are called rectangular axes otherwise they are called oblique axes.

The French Mathematician Rene Descartes invented the cartesian system. In a cartesian coordinates form we have a point, which shows the particular place in a segment for representation. Cartesian coordinates system consist of many coordinates which are polar, rectangular etc. In a cartesian coordinates we have collinear point coordinates, mid-point coordinates and the equidistant point coordinates.

The horizontal axes, OX and OX' are called positive and negative directions respectively of x-axis and OY and OY' are called positive and negative directions respectively of y-axis.

Quadrants

Let $X'OX$ and $Y'OY$ be the coordinate axes. We observe that the two axes divide the Euclidean plane into four regions called quadrants. The regions XOY, $X'OY$, $X'OY'$ and XOY' are respectively known as first, second, third and fourth quadrants. The ray OX is taken as positive x-axis, OX' as negative x-axis. Also, the ray OY is called positive y-axis and OY' as negative y-axis.

Sign of Coordinates in a Quadrant

Quadrant		x	y
I.	XOY	>0	>0
II.	$X'OY$	<0	>0
III.	$X'OY'$	<0	<0
IV.	XOY'	>0	<0

11.2 Cartesian Coordinates in a Plane Point

Let $X'OX$ and $Y'OY$ be two perpendicular axes in the plane paper intersecting at O and P be any point in the plane.

Draw PM perpendicular to OX. Let $OM = x$, $PM = y$. Then, the position of the point P in the plane with respect to coordinate axes is represented by the ordered pair (x, y). The order pair (x, y) is called the coordinates of point P, *i.e.*,

$OM = x = x$-coordinate or abscissa of the point P.

and $PM = y = y$-coordinate or ordinate of the point P.

Note

- The ordinate of every point on x-axis is 0.
- The abscissa of every point on y-axis is 0.
- The abscissa and ordinate of the origin O are both zero.

11.3 Distance Formula

The distance between any two points in the plane is the length of the line segment joining them.

$$D = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

or
$$D = \sqrt{\begin{matrix}(\text{difference of abscissa})^2 \\ + (\text{difference of ordinates})^2\end{matrix}}$$

If O is the origin and $P(x_1, y_1)$ is any point, then from the distance formula, we have

$$OP = \sqrt{(x - 0)^2 + (y - 0)^2}$$
$$= \sqrt{x^2 + y^2}$$

Note

- If the line PQ is parallel to y-axis, then $PQ = |y_2 - y_1|$.
- If the line PQ is parallel to x-axis, then $PQ = |x_2 - x_1|$.

Properties of Quadrilaterals

Rectangle

(a) Opposite sides are equal
(b) Diagonals are unequal
(c) Diagonals bisect each other

Parallelogram

(a) Opposite sides are equal
(b) Diagonals are equal
(c) Diagonals bisect each other

Rhombus

(a) All four sides are equal
(b) Diagonals are unequal
(c) Diagonals bisect each other at right angle

Square

(a) All four sides are equal
(b) Diagonals are equal
(c) Diagonals bisect each other at right angles

Inferences

(a) Every parallelogram is not a rectangle but every rectangle is a parallelogram.
(b) Even rhombus is not a square but every square is a rhombus.
(c) Every parallelogram is not a rhombus but every rhombus is a parallelogram.
(d) Every rectangle is not a square but every square is a rectangle.

***Sample* Problem 1** *Find a point on the X-axis which is equidistant from the points* (7, 6) *and* (3, 4). **[NCERT]**

(a) $\left(\frac{15}{2}, 0\right)$ (b) $\left(\frac{7}{2}, 0\right)$

(c) $\left(-\frac{15}{2}, 0\right)$ (d) *None of these*

Interpret (a) Let any point P on the X-axis is $(x, 0)$ as for a point on X-axis, y-coordinate is zero and the given points are $A(7, 6)$ and $B(3, 4)$.

Given, $PA = PB \Rightarrow PA^2 = PB^2$

$\Rightarrow \quad (x_1 - x_2)^2 + (y_1 - y_2)^2 = (x_1 - x_3)^2 + (y_1 - y_3)^2$

where, $x_1 = x, x_2 = 7, y_1 = 0, y_2 = 6, x_3 = 3, y_3 = 4$

$\Rightarrow \quad (x - 7)^2 + (0 - 6)^2 = (x - 3)^2 + (0 - 4)^2$

[$\because$ distance between two points $= \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}$]

$\Rightarrow \quad x^2 + 49 - 14x + 36 = x^2 - 9 - 6x + 16$

$\Rightarrow \quad -14x + 6x = 25 - 36 - 49$

$\Rightarrow \quad -8x = 25 - 85 \Rightarrow -8x = -60$

$\Rightarrow \quad x = \frac{60}{8} \Rightarrow x = \frac{15}{2}$

$\therefore$ Point P on X-axis $= \left(\frac{15}{2}, 0\right)$

***Sample* Problem 2** *The figure formed by four points* (1, – 2), (3, 6), (5, 10) *and* (3, 2) *is a*

(a) *square* (b) *rectangle*

(c) *rhombus* (d) *parallelogram*

Interpret (d) Let $A \equiv (1, -2), B \equiv (3, 6), C \equiv (5, 10)$ and $D \equiv (3, 2)$

Then, $AB = \sqrt{(1-3)^2 + (-2-6)^2} = 2\sqrt{17}$

$BC = \sqrt{(3-5)^2 + (6-10)^2} = 2\sqrt{5}$

$CD = \sqrt{(5-3)^2 + (10-2)^2} = 2\sqrt{17}$

$AD = \sqrt{(1-3)^2 + (-2-2)^2} = 2\sqrt{5}$

$AC = \sqrt{(1-5)^2 + (-2-10)^2} = 4\sqrt{10}$

and $BD = \sqrt{(3-3)^2 + (6-2)^2} = 4$

Clearly, $AB = CD, BC = AD$ and $AC \neq BD$.

Hence, $ABCD$ is a parallelogram.

Section Formula

If a point $P(x, y)$ divides the line segment joining two points $A(x_1, y_1)$ and $B(x_2, y_2)$ in the ratio $m : n$, then coordinates of point P are

(i) when it divides AB internally

$$x = \frac{mx_2 + nx_1}{m + n}, y = \frac{my_2 + ny_1}{m + n}$$

(ii) when it divides AB externally

$$x = \frac{mx_2 - nx_1}{m - n}, y = \frac{my_2 - ny_1}{m - n}$$

Note

- The coordinates of the points of trisection P and Q of the line segment joining $A(x_1, y_1)$ and $B(x_2, y_2)$ are $\left(\frac{2x_1 + x_2}{3}, \frac{2y_1 + y_2}{3}\right)$ and $\left(\frac{x_1 + 2x_2}{3}, \frac{y_1 + 2y_2}{3}\right)$, respectively.
- x-axis divides the line joining $(x_1, y_1), (x_2, y_2)$ in the ratio $y_1 : y_2$ and y-axis divides the same line segment in the ratio $x_1 : x_2$.
- The mid-point of the line joining $P(x_1, y_1)$ and $Q(x_2, y_2)$ is $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$.
- Straight line $ax + by + c = 0$ divides the join of points $P(x_1, y_1)$ and $Q(x_2, y_2)$ in the ratio $-\frac{ax_1 + by_1 + c_1}{ax_2 + by_2 + c_2}$.

  If ratio is negative, then line divides externally and if ratio is positive, then lines divides internally.

***Sample* Problem 3** *The ratio in which* $y - x + 2 = 0$ *divides the line joining* (3, – 1) *and* (8, 9) *is*

(a) 2 : 3 *(externally)* (b) 2 : 3 *(internally)*

(c) 3 : 2 *(externally)* (d) 3 : 2 *(internally)*

Interpret (b) Let the required ratio be $\lambda : 1$, then point of division is $\left(\frac{8\lambda + 3}{\lambda + 1}, \frac{9\lambda - 1}{\lambda + 1}\right)$. Now, this point must satisfy the equation of the line $y - x + 2 = 0$.

$$\Rightarrow \quad \left(\frac{9\lambda - 1}{\lambda + 1}\right) - \left(\frac{8\lambda + 3}{\lambda + 1}\right) + 2 = 0 \Rightarrow \lambda = \frac{2}{3}$$

So, the required ratio is $\frac{2}{3} : 1$ *i.e.*, 2 : 3 (internally) since, λ is positive.

Alternative

$\therefore$ Required ratio $= -\left(\frac{-1 - 3 + 2}{9 - 8 + 2}\right) = \frac{2}{3} \quad \left(\because \frac{-ax_1 + by_1 + c_1}{ax_2 + by_2 + c_2}\right)$

***Sample* Problem 4** *Suppose* $A(1, 1)$ *and* $B(2, -3)$ *are two points and D is a point on AB produced such that* $AD = 3AB$. *Then, coordinates of D are*

(a) (3, –12) (b) (4, –11) (c) (11, 4) (d) (–11, 7)

Interpret (b) Given, $AD = 3AB$

$\therefore \quad BD = 2AB$

Thus, D divides AB externally in the ratio $AD : BD = 3 : 2$.

$\therefore$ The coordinates of D are $\left[\frac{3(2) - 2(1)}{3 - 2}, \frac{3(-3) - 2(1)}{3 - 2}\right]$

$$= \left(\frac{6 - 2}{1}, \frac{-9 - 2}{1}\right) = (4, -11)$$

Check Point 1

1. The ratio in which the line joining the points (2, 3) and (4, 1) divides the segment joining the points (1, 2) and (4, 3) is
   (a) 1 : 2 (b) (3 : 1)
   (c) (1 : 4) (d) 1 : 1
2. The coordinates of three vertices of a rectangle are (2, –2), (8, 4) and (5, 7), the 4th vertex is
   (a) (1,1) (b) (1, –1)
   (c) (–1, 1) (d) (–1, –1)
3. The points $\left(0, \frac{8}{3}\right)$, (1, 3) and (82, 30) are vertices of
   (a) an isosceles triangle (b) equilateral triangle
   (c) a right angled triangle (d) None of these
4. x-axis divides line segment joining points (2, – 3) and (5, 6) in the ratio
   (a) 1: 2 (b) 2 : 1 (c) 2 : – 1 (d) –1: 2
5. Let P and Q be points in the line joining A(–2, 5) and B(3, 1) such that AP = PQ = QB. Then, the mid-point of PQ is
   (a) $\left(\frac{1}{2}, 3\right)$ (b) $\left(-\frac{1}{2}, 4\right)$
   (c) (2, 3) (d) (–1, 4)
6. If the points (1, 1), (–1, – 1) and $(-\sqrt{3}, k)$ are vertices of an equilateral triangle, then the value of k will be
   (a) 1 (b) –1 (c) $\sqrt{3}$ (d) $-\sqrt{3}$
7. The points which trisect the line segment joining the points (0, 0) and (9, 12) are
   (a) (3, 4), (6, 8) (b) (4, 3), (6, 8)
   (c) (4, 3), (8, 6) (d) (3, 4), (8, 6)
8. The points (–2, – 1), (1, 0), (4, 3) and (1, 2) are the vertices of a
   (a) parallelogram (b) rectangle
   (c) square (d) None of these

11.4 Area of Some Geometrical Figures

Area of Triangle

Let $A(x_1, y_1), B(x_2, y_2)$ and $C(x_3, y_3)$ are the coordinates of the vertices of ΔABC.

$\therefore$ Area of ΔABC

$$= \frac{1}{2}\left\|\begin{matrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{matrix}\right\|$$

$$= \frac{1}{2}\left|[x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)]\right|$$

By Stair Method

$$\text{Area of triangle} = \frac{1}{2}\left\|\begin{matrix} x_1 & y_1 \\ x_2 & y_2 \\ x_3 & y_3 \\ x_1 & y_1 \end{matrix}\right\|$$

$$= \frac{1}{2}\left|[(x_1y_2 + x_2y_3 + x_3y_1) - (y_1x_2 + y_2x_3 + y_3x_1)]\right|$$

Condition of Collinearity

Three points are said to be collinear, if area of triangle is zero.

i.e., $$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Area of Triangle, when Three Lines are Given

If three sides of a triangle are

$$a_1x + b_1y + c_1 = 0,\ a_2x + b_2y + c_2 = 0 \text{ and } a_3x + b_3y + c_3 = 0,$$

then the area of triangle is given by

$$\Delta = \left|\frac{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}}{\begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix}\begin{vmatrix} c_2 & a_2 \\ c_3 & a_3 \end{vmatrix}\begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix}}\right|$$

Area of Trapezium

If $A(x_1, y_1), B(x_2, y_2), C(x_3, y_3)$ and $D(x_4, y_4)$ are the vertices of a trapezium, then

Area of trapezium

$$= \frac{1}{2}\text{(Sum of parallel sides)} \times \text{(Distance between parallel sides)}$$

$$= \frac{1}{2}\left|[(y_2 + y_1)(x_1 - x_2) + (y_1 + y_3)(x_3 - x_1) - (y_2 + y_3)(x_3 - x_2)]\right|$$

Area of Quadrilateral

If $A(x_1, y_1), B(x_2, y_2), C(x_3, y_3)$ and $D(x_4, y_4)$ are the vertices of a quadrilateral $ABCD$, then

$$\text{Area of quadrilateral} = \frac{1}{2}\left\|\begin{matrix} x_1 & y_1 \\ x_2 & y_2 \\ x_3 & y_3 \\ x_4 & y_4 \\ x_1 & y_1 \end{matrix}\right\|$$

$$= \frac{1}{2}\left|\{(x_1y_2 + x_2y_3 + x_3y_4 + x_4y_1) - (y_1x_2 + y_2x_3 + y_3x_4 + y_4x_1)\}\right|$$

Note

The area of polygon whose vertices are (x_1, y_1), $(x_2, y_2), (x_3, y_3), \ldots, (x_n, y_n)$ is given by

$$\frac{1}{2}\left|\begin{matrix} x_1 & y_1 \\ x_2 & y_2 \\ x_3 & y_3 \\ \vdots & \vdots \\ x_n & y_n \\ x_1 & y_1 \end{matrix}\right| = \frac{1}{2}\left|\{(x_1y_2 + x_2y_3 + \ldots + x_ny_1) - (y_1x_2 + y_2x_3 + \ldots + y_nx_1)\}\right|$$

***Sample* Problem 5** *The coordinates of A, B and C are $(0, 3), (-3, 5)$ and $(4, -2)$ respectively and P is any point (x, y). Then, the ratio of the area of ΔPBC and ΔABC is*

(a) $\left|\frac{x + y + 2}{7}\right|$ (b) $\left|\frac{x + y - 2}{49}\right|$

(c) $\left|\frac{x + y - 2}{7}\right|$ (d) *None of these*

Interpret (c) We have,

$$\frac{\text{Area of } \Delta PBC}{\text{Area of } \Delta ABC} = \frac{\frac{1}{2}\left|[x(5 + 2) - 3(-2 - y) + 4(y - 5)]\right|}{\frac{1}{2}\left|[6(5 + 2) - 3(-2 - 3) + 4(3 - 5)]\right|}$$

$$= \frac{|7x + 7y - 14|}{|42 + 15 - 8|}$$

$$= \frac{7|x + y - 2|}{|49|} = \left|\frac{x + y - 2}{7}\right|$$

***Sample* Problem 6** *The area of the pentagon whose vertices are $A(1, 1)$, $B(7, 21)$, $C(7, -3)$, $D(12, 2)$ and $E(0, -3)$, is*

(a) $\frac{137}{2}$ *sq units* (b) $\frac{137}{3}$ *sq units*

(c) $\frac{137}{4}$ *sq units* (d) *None of these*

Interpret (a) The required area $= \frac{1}{2}\left\|\begin{matrix} x_1 & y_1 \\ x_2 & y_2 \\ x_3 & y_3 \\ x_4 & y_4 \\ x_5 & y_5 \\ x_1 & y_1 \end{matrix}\right\| = \frac{1}{2}\left\|\begin{matrix} 1 & 1 \\ 7 & 21 \\ 7 & -3 \\ 12 & 2 \\ 0 & -3 \\ 1 & 1 \end{matrix}\right\|$

$$= \frac{1}{2}\left|[(21 - 21 + 14 - 36 + 0) - (7 + 147 - 36 + 0 - 3)]\right|$$

$$= \frac{137}{2} \text{ sq units}$$

***Sample* Problem 7** *If points $(k, 2 - 2k), (-k + 1, 2k), (-4 - k, 6 - 2k)$ are collinear, then k is equal to*

(a) 2, 3 (b) 1, 0

(c) $\frac{1}{2}, -1$ (d) 1, 2

Interpret (c) Since, points are collinear

$$\therefore \quad \Delta = \frac{1}{2}\left|[x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)]\right| = 0$$

$$\therefore \quad \frac{1}{2}[k\{2k - (6 - 2k)\} + (1 - k)\{6 - 2k - (2 - 2k)\} + (-4 - k)\{2 - 2k - 2k\}] = 0$$

$$\Rightarrow \quad k(4k - 6) + (1 - k)4 + (k + 4)(4k - 2) = 0$$

$$\Rightarrow \quad 8k^2 + 4k - 4 = 0$$

$$\Rightarrow \quad 2k^2 + k - 1 = 0$$

$$\Rightarrow \quad (k + 1)(2k - 1) = 0$$

$$\Rightarrow \quad k = -1, \frac{1}{2}$$

11.5 Different Points Related to a Triangle

Centroid of a Triangle

The point of intersection of the medians of a triangle is called the centroid of the triangle.

Let $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ are the vertices of a ΔABC, then coordinates of centroid are given by $\left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3}\right)$.

Incentre of a Triangle

The point of intersection of internal angle bisectors of triangle is called the incentre of the triangle. If we draw a perpendicular on each side of a triangle through the incentre I, then they all will be of equal lengths, these are called in radius of inscribed circle.

Let $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ are the vertices of ΔABC, then coordinates of incentre of triangle are given by $\left(\frac{ax_1 + bx_2 + cx_3}{a + b + c}, \frac{ay_1 + by_2 + cy_3}{a + b + c}\right)$

where a, b and c be the sides of the triangle.

Circumcentre of a Triangle

The circumcentre of a triangle is the point of intersection of the perpendicular bisectors of the sides of a triangle. The distance between the circumcentre and any vertex of triangle is called the **circumradius** of the circumscribed circle.

Let $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ are the vertices of ΔABC, then the coordinates of circumcentre of triangle is given by using $OB = OA = OC$

or $C\left(\frac{ax_1 \cos A + bx_2 \cos B + cx_3 \cos C}{a \cos A + b \cos B + c \cos C}, \frac{ay_1 \cos A + by_2 \cos B + cy_3 \cos C}{a \cos A + b \cos B + c \cos C}\right)$

or $C\left(\frac{x_1 \sin 2A + x_2 \sin 2B + x_3 \sin 2C}{\sin 2A + \sin 2B + \sin 2C}, \frac{y_1 \sin 2A + y_2 \sin 2B + y_3 \sin 2C}{\sin 2A + \sin 2B + \sin 2C}\right)$

where a, b and c be the sides of a triangle.

Orthocentre of a Triangle

The orthocentre of a triangle is the point of intersection of altitudes (*i.e.,* the lines through the vertices and perpendicular to opposite sides. The coordinates of orthocentre of a triangle whose vertices are $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ are given as

$O\left(\frac{x_1 \tan A + x_2 \tan B + x_3 \tan C}{\tan A + \tan B + \tan C}, \frac{y_1 \tan A + y_2 \tan B + y_3 \tan C}{\tan A + \tan B + \tan C}\right)$

If equation of lines are given, then firstly determine the two altitudes of a triangle

Equation for an AP

$$\frac{a_1x + b_1y + c_1}{a_1a_3 + b_1b_3} = \frac{a_2x + b_2y + c_2}{a_2a_3 + b_2b_3}$$

and for a BM

$$\frac{a_1x + b_1y + c_1}{a_1a_2 + b_1b_2} = \frac{a_3x + b_3y + c_3}{a_2a_3 + b_2b_3}$$

After solving AP and BM, we get the orthocentre.

Note

- The centroid of a triangle divides median in the ratio 2 : 1.
- For the right angled triangle, the coordinates of vertex containing the right angle are actually the coordinates of orthocentre.
- The orthocentre (O), centroid (G) and circumcentre (C), of any triangle lie in a same straight line and G divides the join of O and C in the ratio of 2 : 1.
- The circumcentre of a right angled triangle is the mid-point of hypotenuse.
- In an equilateral triangle orthocentre, centroid, circumcentre, incentre coincide.

Excentre of a Triangle

Let $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ be the vertices of a ΔABC. Let a, b, c be the lengths of the sides BC, CA and AB or a, b and c be the lengths of the sides opposite to $\angle A$, $\angle B$ and $\angle C$ respectively, then the circle which touches the side BC and two sides AB and AC produced is called the escribed circle opposite to the $\angle A$. The bisector of the external angles B and C meet at E_1 (which is the centre of the escribed circle) such that

$$E_1\left(\frac{-ax_1 + bx_2 + cx_3}{-a + b + c}, \frac{-ay_1 + by_2 + cy_3}{-a + b + c}\right)$$

Similarly, $E_2\left(\frac{ax_1 - bx_2 + cx_3}{a - b + c}, \frac{ay_1 - by_2 + cy_3}{a - b + c}\right)$

and $E_3\left(\frac{ax_1 + bx_2 - cx_3}{a + b - c}, \frac{ay_1 + by_2 - cy_3}{a + b - c}\right)$

Sample **Problem 8** *The coordinates of the circumcentre of triangle whose vertices are $A(5, -1)$, $B(-1, 5)$ and $C(6, 6)$ are*

(a) $\left(\frac{23}{8}, -\frac{23}{8}\right)$ (b) $\left(\frac{23}{8}, \frac{23}{8}\right)$

(c) $(5, 6)$ (d) *None of these*

Interpret (b) Let circumcentre be $O(x, y)$, then

$$(OA)^2 = (OB)^2 = (OC)^2 = (\text{Radius})^2 = R^2 \quad \ldots(i)$$

$$\Rightarrow \quad (x-5)^2 + (y+1)^2 = (x+1)^2 + (y-5)^2 = (x-6)^2 + (y-6)^2$$

Taking first two relations

$$(x-5)^2 + (y+1)^2 = (x+1)^2 + (y-5)^2$$

$$\Rightarrow \quad (x-5)^2 - (x+1)^2 = (y-5)^2 - (y+1)^2$$

$$\Rightarrow \quad (x-2)(-12) = (y-2)(-12)$$

$$\Rightarrow \quad x - 2 = y - 2$$

$$\therefore \quad x = y \quad \ldots(ii)$$

Taking last two relations

$$(x+1)^2 + (y-5)^2 = (x-6)^2 + (y-6)^2$$

$$\Rightarrow \quad (x+1)^2 + (x-5)^2 = (x-6)^2 + (x-6)^2 \quad \text{[from Eq. (ii)]}$$

$$\Rightarrow \quad 2x^2 - 8x + 26 = 2x^2 - 24x + 72$$

$$\Rightarrow \quad 16x = 46$$

$$\Rightarrow \quad x = y = \frac{23}{8}$$

$$\therefore \quad \text{Circumcentre} = \left(\frac{23}{8}, \frac{23}{8}\right)$$

Sample **Problem 9** *If G be the centroid and I be the incentre of the triangle with vertices $A(-36, 7)$, $B(20, 7)$ and $C(0, -8)$ and $GI = \frac{25}{3}\sqrt{205}\,\lambda$, then the value of λ is*

(a) 1/25
(b) 1/5
(c) 1/125
(d) *None of the above*

Interpret (a) Coordinates of centroid are

$$G \equiv \left(\frac{-36 + 20 + 0}{3}, \frac{7 + 7 - 8}{3}\right)$$

i.e., $G \equiv \left(-\frac{16}{3}, 2\right)$

and $a = BC = \sqrt{(0-20)^2 + (-8-7)^2} = 25$

$b = AC = \sqrt{(0+36)^2 + (-8-7)^2} = 39$

and $c = BA = \sqrt{(-36-20)^2 + (7-7)^2} = 56$

Therefore, the coordinates of I are

$$\left[\frac{25 \times (-36) + 39 \times 20 + 56 \times 0}{25 + 39 + 56}, \frac{25 \times 7 + 39 \times 7 + 56 \times (-8)}{25 + 39 + 56}\right]$$

$$\therefore \quad I \equiv (-1, 0)$$

$$GI = \sqrt{\left(-1 + \frac{16}{3}\right)^2 + (0-2)^2} = \frac{1}{3}\sqrt{205}$$

But given, $GI = \frac{25}{3}\sqrt{205}\,\lambda$

$$\therefore \quad \frac{1}{3}\sqrt{205} = \frac{25}{3}\sqrt{205}\,\lambda$$

$$\Rightarrow \quad \lambda = \frac{1}{25}$$

Hot Spot

Locus

The curve described by any point which moves under given conditions is called locus of the point.

Equation of Locus

A relation $f(x, y) = 0$ between x and y which is satisfied by each point on the locus and such that each point satisfying the equation is on the locus is called the equation of the locus.

Locus of a point types of problem are directly or indirectly asked in various years in AIEEE (JEE Main) 2011, 2004, 2003.

To solve such types of problem following steps are given below.

Step I Assume (h, k) be the coordinates of any moving point say P.

Step II Mathematically or geometrically apply the given conditions on $P(h, k)$.

Step III Eliminate the variable term, if any in the expression obtained in step II with the help of given conditions.

Step IV Replace h by x and k by y. After replacement, a general equation of the locus is obtained.

Sample **Problem 10** *The sum of the squares of the distances of a moving point from two fixed points $(a, 0)$ and $(-a, 0)$ is equal to a constant quantity $2c^2$. Find the equation of its locus.*

Interpret **Step I** Firstly consider the moving point.

Let $P(h, k)$ be any position of the moving point and let $A(a, 0)$, $B(-a, 0)$ be the given point.

Step II Applying mathematically condition,

$$\therefore \quad PA^2 + PB^2 = 2c^2 \quad \text{(given)}$$

$$\Rightarrow \quad (h-a)^2 + (k-0)^2 + (h+a)^2 + (k-0)^2 = 2c^2$$

$$\Rightarrow \quad h^2 - 2ah + a^2 + k^2 + h^2 + 2ah + a^2 + k^2 = 2c^2$$

$$\Rightarrow \quad h^2 + k^2 = c^2 - a^2$$

Step III Eliminate the variable terms. Here, there is no variable terms left.

Step IV Replace h by x and k by y.

$$\therefore \quad x^2 + y^2 = c^2 - a^2$$

Sample **Problem 11** *The equation of the locus of a point which moves so that the difference of its distances from the points $(3, 0)$ and $(-3, 0)$ is 4 units, is*

(a) *an ellipse* (b) *a parabola*
(c) *a hyperbola* (d) *a circle*

Interpret (c) Let $P(x_1, y_1)$ be the moving point whose locus is required. Here,

$PB > PA$

By hypothesis,

$$PB - PA = 4$$

$$\Rightarrow \sqrt{(x_1+3)^2 + y_1^2} - \sqrt{(x_1-3)^2 + y_1^2} = 4$$

$$\Rightarrow \sqrt{(x_1+3)^2 + y_1^2} = 4 + \sqrt{(x_1-3)^2 + y_1^2}$$

On squaring both sides, we get

$$(x_1+3)^2 + y_1^2 = 16 + (x_1-3)^2 + y_1^2 + 8\sqrt{(x_1-3)^2 + y_1^2}$$

$$\Rightarrow \quad (x_1+3)^2 - (x_1-3)^2 = 16 + 8\sqrt{(x_1-3)^2 + y_1^2}$$

$$\Rightarrow \quad 12x_1 = 16 + 8\sqrt{x_1^2 + y_1^2 - 6x_1 + 9}$$

$$\Rightarrow \quad 3x_1 = 4 + 2\sqrt{x_1^2 + y_1^2 - 6x_1 + 9}$$

$$\Rightarrow \quad (3x_1 - 4) = 2\sqrt{x_1^2 + y_1^2 - 6x_1 + 9}$$

Again, on squaring both sides, we get

$$9x_1^2 - 24x_1 + 16 = 4x_1^2 + 4y_1^2 - 24x_1 + 36$$

$$\Rightarrow \quad 5x_1^2 - 4y_1^2 = 20 \Rightarrow \frac{x_1^2}{4} - \frac{y_1^2}{5} = 1$$

Changing (x_1, y_1) by (x, y), then $\frac{x^2}{4} - \frac{y^2}{5} = 1$

which is the required locus of P.

This equation represents a hyperbola.

11.6 Translation of Axes

Shifting of Origin

Let $P(x, y)$ is the point with respect to the origin O. Now, the origin $O(0, 0)$ is shifted to a new point say $O'(h, k)$, then the coordinates of same point P with respect to the new origin O' be $P'(x', y')$ in such a way that

$$x = x' + h, \; y = y' + k$$

Hence, if the origin is shifted to (h, k) without rotation of axes, then the new equation of the curve can be obtained by putting $(x + h)$ and $(y + k)$ in place of x and y, respectively.

Rotation of Axes without Changing Origin

Let OX and OY be the original system of coordinate axes. Let OX' and OY' be the new axes are obtained by rotating the original axes through an angle θ.

Let P be a point in the plane whose coordinates are (x, y) and (X, Y) referred to old and new axes, respectively.

Now, $\quad x = OL - ML = X\cos\theta - Y\sin\theta$

and $\quad y = PQ + NL = Y\cos\theta + X\sin\theta$

If it is required to shift the new coordinates axes back, then replace X by $x\cos\theta + y\sin\theta$ and Y by $-x\sin\theta + y\cos\theta$.

Note

- These relations can also obtained from the table

	$x\downarrow$	$y\downarrow$
$X\rightarrow$	$\cos\theta$	$\sin\theta$
$Y\rightarrow$	$-\sin\theta$	$\cos\theta$

Sample Problem 12 *If the axes be turned through an angle* $\tan^{-1}2$. *What does the equation* $4xy - 3x^2 = a^2$ *become ?*

(a) $X^2 - 4Y^2 = a^2$

(b) $X^2 + 4Y^2 = a^2$

(c) $X^2 + 4Y^2 = -a^2$

(d) *None of the above*

Interpret (a) $\theta = \tan^{-1}2 \Rightarrow \tan\theta = 2$

So, $\quad \cos\theta = \frac{1}{\sqrt{5}}, \sin\theta = \frac{2}{\sqrt{5}}$

$$x = X\cos\theta - Y\sin\theta = \frac{X-2Y}{\sqrt{5}}$$

and $\quad y = X\sin\theta + Y\cos\theta = \frac{2X+Y}{\sqrt{5}}$

The equation $4xy - 3x^2 = a^2$ reduces to

$$\frac{4(X-2Y)}{\sqrt{5}}\cdot\frac{(2X+Y)}{\sqrt{5}} - 3\left(\frac{X-2Y}{\sqrt{5}}\right)^2 = a^2$$

$\Rightarrow \quad 4(2X^2 - 2Y^2 - 3XY) - 3(X^2 - 4XY + 4Y^2) = 5a^2$

$\Rightarrow \quad 5X^2 - 20Y^2 = 5a^2$

$\Rightarrow \quad X^2 - 4Y^2 = a^2$

Double Translation

(Origin Shifted and Axes Rotated)

If origin is shifted to the point $O'(h, k)$ and at the same time the directions of axes are rotated through an angle θ in the anti-clockwise sense such that new coordinates of $P(x, y)$ become (X, Y). Then,

$$x = h + X\cos\theta - Y\sin\theta$$

and $\quad y = k + X\sin\theta + Y\cos\theta$

or above can be written in matrix form as

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix}\begin{bmatrix} X \\ Y \end{bmatrix} + \begin{bmatrix} h \\ k \end{bmatrix}$$

If it is required to shift to coordinate axes back to their original positions, then replace X by

$$(x-h)\cos\theta + (y-k)\sin\theta \text{ and } Y \text{ by}$$
$$-(x-h)\sin\theta + (y-k)\cos\theta.$$

Sample Problem 13 *If the axes are shifted to the point* $(-2, -3)$ *and then they are rotated through an angle of* $45°$ *in anti-clockwise sense, then the equation* $2x^2 + 4xy - 5y^2 + 20x - 22y - 24 = 0$ *becomes*

(a) $X^2 - 14XY - 7Y^2 - 12 = 0$

(b) $X^2 - 10XY - 2Y^2 - 12 = 0$

(c) $X^2 + 14XY + 7Y^2 - 12 = 0$

(d) *None of the above*

Interpret (a) Let (X, Y) be the coordinates of a point with respect to the new axes. Then,

$$x = -2 + X\cos\frac{\pi}{4} - Y\sin\frac{\pi}{4} = -2 + \frac{X-Y}{\sqrt{2}}$$

and $\quad y = -3 + X\sin\frac{\pi}{4} + Y\cos\frac{\pi}{4} = -3 + \frac{X+Y}{\sqrt{2}}$

On substituting these value of x and y in the equation, we get

$$2x^2 + 4xy - 5y^2 + 20x - 22y - 24 = 0$$

$$2\left\{-2 + \frac{X-Y}{\sqrt{2}}\right\}^2 + 4\left\{\left(-2 + \frac{X-Y}{\sqrt{2}}\right)\left(-3 + \frac{X+Y}{\sqrt{2}}\right)\right\}$$
$$-5\left\{-3 + \frac{X+Y}{\sqrt{2}}\right\}^2 + 20\left\{-2 + \frac{X-Y}{\sqrt{2}}\right\}$$
$$-22\left\{-3 + \frac{X+Y}{\sqrt{2}}\right\} - 24 = 0$$

$\Rightarrow \quad X^2 - 14XY - 7Y^2 - 12 = 0$

Hence, the given equation reduces to

$$X^2 - 14XY - 7Y^2 - 12 = 0$$

11.7 Slope of a Line

The trigonometrical tangent of the angle that a line makes with the positive direction of the x-axis in anti-clockwise sense is called the slope or gradient of the line. The slope of a line is generally denoted by m. Thus, $m = \tan\theta$.

Note The angle of inclination of the line lies between 0° and 180°, *i.e.*, $0 < \theta \le \pi$ and $\theta \ne \frac{\pi}{2}$.

Slope of a Line in Terms of Coordinates

Let $P(x_1, y_1)$ and $Q(x_2, y_2)$ be two points on a line making an angle θ with the positive direction of x-axis. Then, its slope m is given by

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{\text{Difference of ordinates}}{\text{Difference of abscissa}}$$

Sample **Problem 14** *Consider the following population and year graph (in figure), find the slope of the line AB and using it, find what will be the population in the year 2010?* **[NCERT]**

(a) 104.8 *crore* (b) 104.5 *crore*
(c) 105 *crore* (d) *None of these*

Interpret (b) Let the population in the year 2010 will be k crore. Since, A, B and C are collinear.

$\therefore$ Slope of AB = Slope of BC

$$\Rightarrow \quad \frac{y_2 - y_1}{x_2 - x_1} = \frac{y_3 - y_2}{x_3 - x_2}$$

$$\Rightarrow \quad \frac{97 - 92}{1995 - 1985} = \frac{k - 97}{2010 - 1995}$$

$$(\because x_1 = 1985, x_2 = 1995, x_3 = 2010, y_1 = 92, y_2 = 97, y_3 = k)$$

$$\Rightarrow \quad \frac{5}{10} = \frac{k - 97}{15}$$

$$\Rightarrow \quad \frac{1}{2} = \frac{k - 97}{15} \Rightarrow k - 97 = \frac{15}{2}$$

$$\Rightarrow \quad k = 97 + \frac{15}{2} = 97 + 7.5 = 104.5$$

Hence, slope of $AB = \frac{1}{2}$ and population in the year 2010 = 104.5 crore.

11.8 Parallel and Perpendicular Line on the Coordinate Axes

A line parallel to x-axis makes an angle of 0° with x-axis. Therefore, its slope is tan 0° = 0. A line parallel to y-axis *i.e.*, perpendicular to x-axis makes an angle of 90° with x-axis, so its slope is $\tan\frac{\pi}{2} = \infty$. Also, the slope of a line equally inclined with axes is 1 or −1 as it makes an angle of 45° or 135° with x-axis.

Line Parallel to x-axis

Let AB be a straight line parallel to x-axis at a distance b from it. Then, clearly the ordinate of each point on AB is b. Thus, AB can be considered at the locus of a point at a distance b from x-axis. Thus, if $P(x, y)$ is any point on AB, then $y = b$.

Line Parallel to y-axis

Let AB be a line parallel to y-axis and at a distance a from it. Then, the abscissa of every point on AB is a. So, it can be treated as the locus of a point at a distance a from y-axis. Thus, if $P(x, y)$ is any point on AB, then $x = a$.

11.9 Intercepts of a Line on the Coordinate Axes

The equation of a line which cuts off intercepts a and b respectively, from the x and y axes is

$$\frac{x}{a} + \frac{y}{b} = 1.$$

The intercept made by a line on x-axis can also be obtained by putting $y = 0$ in its equation. Similarly, y-intercept is the value of y obtained from the line when x is replaced by zero.

Sample Problem 15 *If three points* $(h, 0)$, (a, b) *and* $(0, k)$ *lie on a line, then* $\frac{a}{h} + \frac{b}{k}$ *is equal to* **[NCERT]**

(a) –1 (b) 1
(c) 2 (d) –2

Interpret (b) Given points are $A(h, 0)$, $B(a, b)$ and $C(0, k)$. If A, B and C are collinear, then

slope of AB = slope of BC = slope of CA

Let $(x_1, y_1) \to A(h, 0), (x_2, y_2) \to B(a, b), (x_3, y_3) \to C(0, k)$

Now, slope of AB = slope of BC = slope of CA

$$\therefore \quad \frac{y_2 - y_1}{x_2 - x_1} = \frac{y_3 - y_2}{x_3 - x_2} = \frac{y_1 - y_3}{x_1 - x_3}$$

$$= \frac{b-0}{a-h} = \frac{k-b}{0-a} = \frac{0-k}{h-0}$$

Taking first two terms,

$$\Rightarrow \quad \frac{b}{a-h} = \frac{k-b}{-a}$$

$$\Rightarrow \quad -ab = (a-h)(k-b)$$

$$\Rightarrow \quad -ab = ak - ab - hk + bh$$

$$\Rightarrow \quad ak + bh = hk$$

Dividing each term by (hk),

$$\Rightarrow \quad \frac{ak}{hk} + \frac{bh}{hk} = \frac{hk}{hk} \Rightarrow \frac{a}{h} + \frac{b}{k} = 1$$

Check Point 2

1. If $A(\cos\alpha, \sin\alpha)$, $B(\sin\alpha, -\cos\alpha)$, $C(1, 2)$ are the vertices of a ΔABC, then the locus of centroid of triangle is
   (a) $x^2 + y^2 - 2x - 4y + 1 = 0$
   (b) $3(x^2 + y^2) - 2x - 4y + 1 = 0$
   (c) $x^2 + y^2 - 2x - 4y + 3 = 0$
   (d) None of the above
2. If the vertices of a triangle are $(am_1^2, 2am_1)$, $(am_2^2, 2am_2)$, $(am_3^2, 2am_3)$, then its area is
   (a) $a(m_2 - m_3)(m_3 - m_1)(m_1 - m_2)$
   (b) $(m_2 - m_3)(m_3 - m_1)(m_1 - m_2)$
   (c) $a^2(m_2 - m_3)(m_3 - m_1)(m_1 - m_2)$
   (d) $a(m_2 + m_3)(m_3 + m_1)(m_1 + m_2)$
3. The area of the triangle with vertices at the point $(a, b + c)$, $(b, c + a)$, $(c, a + b)$ is
   (a) 0 (b) $a + b + c$
   (c) $ab + bc + ca$ (d) None of these
4. The points $(-a, -b)$, $(0, 0)$, (a, b) and (a^2, ab) are
   (a) collinear
   (b) vertices of a parallelogram
   (c) vertices of a rectangle
   (d) None of the above
5. If the vertices of a triangle be $(a, b - c)$, $(b, c - a)$ and $(c, a - b)$, then the centroid of the triangle lies
   (a) at origin (b) on x-axis
   (c) on y-axis (d) None of these
6. The incentre of the triangle with vertices $(1, \sqrt{3})$, $(0, 0)$ and $(2, 0)$ is
   (a) $\left(1, \frac{\sqrt{3}}{2}\right)$ (b) $\left(\frac{2}{3}, \frac{1}{\sqrt{3}}\right)$
   (c) $\left(\frac{2}{3}, \frac{\sqrt{3}}{2}\right)$ (d) $\left(1, \frac{1}{\sqrt{3}}\right)$
7. If $A(-a, 0)$ and $B(a, 0)$ are two fixed points, then the locus of the point at which AB subtends a right angle is
   (a) $x^2 + y^2 = 2a^2$ (b) $x^2 - y^2 = a^2$
   (c) $x^2 + y^2 + a^2 = 0$ (d) $x^2 + y^2 = a^2$
8. The equation of the locus of all points equidistant from the point $(4, 2)$ and x-axis is
   (a) $x^2 + 8x + 4y - 20 = 0$
   (b) $x^2 - 8x - 4y + 20 = 0$
   (c) $y^2 - 4y - 8x + 20 = 0$
   (d) None of the above
9. By rotating the axes through 180°, the equation $x - 2y + 3 = 0$ changes to
   (a) $x + 2y - 3 = 0$ (b) $x - 2y + 3 = 0$
   (c) $x - 2y - 3 = 0$ (d) None of these
10. If the axes are rotated through an angle of 45° in the clockwise direction, the coordinates of a point in the new system are $(0, -2)$, then its original coordinates are
    (a) $(\sqrt{2}, \sqrt{2})$ (b) $(-\sqrt{2}, \sqrt{2})$
    (c) $(\sqrt{2}, -\sqrt{2})$ (d) $(-\sqrt{2}, -\sqrt{2})$

WORKED OUT
Examples

Example 1 *The base of an equilateral triangle with side 2a lies along the Y-axis such that the mid-point of the base is at the origin. Find vertices of the triangle.* **[NCERT]**

(a) $(-\sqrt{3}a, 0), (0, a), (0, -a)$ (b) $(\sqrt{3}a, 0), (0, -a), (0, a)$

(c) $(-\sqrt{3}a, 0), (0, a), (a, 0)$ (d) *None of these*

Solution (a) Let BC be the base of a triangle which lies on Y-axis and third vertex may be $A(h, 0)$ or A'.

Since, ΔABC is an equilateral, then $AB = BC$

$$AB^2 = BC^2$$

$$\Rightarrow \quad (h-0)^2 + (0-a)^2 = (2a)^2$$

[$\because$ distance between two points (x_1, y_1) and (x_2, y_2) $= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$]

For distance AB, $(x_1, y_1) = (a, 0)$, $(x_2, y_2) = (0, a)$

$\Rightarrow h^2 + a^2 = 4a^2 \Rightarrow h^2 = 3a^2 \Rightarrow h = \pm\sqrt{3}a$ (taking square root)

Hence, the vertices of triangle are $(\sqrt{3}a, 0), (0, a), (0, -a)$

or $(-\sqrt{3}a, 0), (0, a), (0, -a)$

Example 2 *The coordinates of point on the line joining the points $P(3, -4)$ and $Q(-2, 5)$ that is twice as far from P as from Q, are*

(a) (7, 14) (b) (–7, 14) (c) (14, 7) (d) (7, 15)

Solution (b) Let $A(x, y)$ be the required point,

$\therefore \quad PA = 2PQ$ (given)

Thus, A divides PQ internally or externally in the ratio 2 : 1.

If A divides PQ internally in the ratio 2 : 1, then coordinates of A are

$$x = \frac{2\times(-2) + 1\times 3}{2+1} \text{ and } y = \frac{2\times 5 + 1\times(-4)}{2+1}$$

$$\Rightarrow \quad x = -\frac{1}{3} \text{ and } y = 2$$

$\Rightarrow$ Coordinates of A are $\left(-\frac{1}{3}, 2\right)$.

Again, if A divides PQ externally in the ratio 2 : 1, then coordinates of A are,

$$x = \frac{2\times(-2) - 1\times 3}{2-1} \text{ and } y = \frac{2\times 5 - 1\times(-4)}{2-1}$$

$$\Rightarrow \quad x = -7 \text{ and } y = 14$$

$\therefore$ Coordinates of A are $(-7, 14)$.

Example 3 *Find the area of the quadrilateral, whose vertices are (–4, 5), (0, 7), (5, – 5) and (–4, – 2).* **[NCERT]**

(a) $\frac{121}{2}$ *sq units* (b) $\frac{111}{2}$ *sq units*

(c) $\frac{105}{2}$ *sq units* (d) *None of these*

Solution (a) Given vertices $A(-4, 5)$, $B(0, 7)$, $C(5, -5)$ and $D(-4, -2)$ are shown below in the X-Y plane. Joining all the vertices a quadrilateral $ABCD$ is formed.

Area of quadrilateral $ABCD$ = Area of ΔADC + Area of ΔABC ...(i)

Now, area of

$$\Delta ADC = \frac{1}{2}\left|[-4(-2+5) - 4(-5-5) + 5(5+2)]\right|$$

$$\left[\because \text{area} = \frac{1}{2}\{x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)\}\right]$$

Here, $(x_1, y_1) = (-4, 5), (x_2, y_2) = (-4, -2), (x_3, y_3) = (5, -5)$

$$= \frac{1}{2}[-4\times 3 - 4(-10) + 5\times 7]$$

$$= \frac{1}{2}[-12 - 40 + 35] = \frac{1}{2}\left|[75 - 12]\right| = \frac{63}{2}$$

Area of $\Delta ABC = \frac{1}{2}[-4(7-5) + 0(-5-5) + 5(5-7)]$

[here $(x_1, y_1) = (-4, 5), (x_2, y_2) = (0, 7)$ and $(x_3, y_3) = (5, -5)$]

$$= \frac{1}{2}\left|[-4\times 12 + 0\times(-10) + 5(-2)]\right| = \frac{1}{2}|-48 - 10| = \frac{|-58|}{2} = 29$$

$\therefore$ From Eq. (i), area of quadrilateral $ABCD$

$$= \frac{63}{2} + 29 = \frac{63 + 58}{2} = \frac{121}{2} \text{ sq units}$$

Example 4 *The points (3, 3), (h, 0) and (0, k) are collinear, if $\frac{1}{h} + \frac{1}{k}$ is equal to*

(a) $\frac{1}{2}$ (b) $\frac{1}{3}$ (c) 1 (d) 2

Solution (b) Given that, $P \equiv (3, 3)$, $Q \equiv (h, 0)$ and $R \equiv (0, k)$. Now, these points are collinear, if area of $\Delta PQR = 0$

$$\Rightarrow \quad \frac{1}{2}[3(0-k)+h(k-3)+0(3-0)]=0$$

$$\Rightarrow \quad \frac{1}{2}(-3k+hk-3h)=0$$

$$\Rightarrow \quad 3k+3h=hk$$

$$\Rightarrow \quad \frac{1}{h}+\frac{1}{k}=\frac{1}{3}$$

Example 5 *The coordinates of circumcentre of the triangle whose vertices are* $(-2,-3)$, $(-1,0)$, $(7,-6)$, *are*

(a) $(3, 3)$ (b) $(3,-3)$
(c) $(-3,3)$ (d) *None of these*

Solution (b) Let the vertices of triangle are $P\equiv(-2,-3)$, $Q\equiv(-1,0)$ and $R\equiv(7,-6)$. Let $A(x,y)$ be the circumcentre of ΔPQR.

$$\therefore \quad AP^2=AQ^2$$

$$\Rightarrow \quad (x+2)^2+(y+3)^2=(x+1)^2+y^2$$

$$\Rightarrow \quad 4x+6y+13=2x+1$$

$$\Rightarrow \quad 2x+6y=-12$$

$$\Rightarrow \quad x+3y=-6 \qquad \text{...(i)}$$

Similarly, $AP^2=AR^2$

$$\Rightarrow \quad (x+2)^2+(y+3)^2=(x-7)^2+(y+6)^2$$

$$\Rightarrow \quad 4x+6y+13=-14x+12y+85$$

$$\Rightarrow \quad 18x-6y=72 \Rightarrow 3x-y=12 \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$(x,y)\equiv(3,-3)$$

Hence, circumcentre is $A(3,-3)$.

Example 6 *If coordinates of vertices of triangle are* $(3,-5)$ *and* $(-7,4)$ *and its centroid is* $(2,-1)$. *The coordinates of third vertex are*

(a) $(10,2)$ (b) $(-10,2)$ (c) $(-10,-2)$ (d) $(10,-2)$

Solution (d) Let (x,y) be the coordinates of third vertex, then

$$\frac{x+3-7}{3}=2 \quad \text{and} \quad \frac{y-5+4}{3}=-1$$

$$\Rightarrow \quad x-4=6 \quad \text{and} \quad y-1=-3$$

$$\Rightarrow \quad x=10 \quad \text{and} \quad y=-2$$

Thus, the coordinates of the third vertex are $(10,-2)$.

Example 7 *The equation of the locus of a point equidistant from the points* $A(1,3)$ *and* $B(-2,1)$ *is*

(a) $6x+4y=0$ (b) $6x+y=5$
(c) $x+4y=5$ (d) $6x+4y=5$

Solution (d) Let $P(h,k)$ be any point on the locus, then given

$$PA^2=PB^2$$

$$\Rightarrow \quad (h-1)^2+(k-3)^2=(h+2)^2+(k-1)^2$$

$$\Rightarrow \quad 6h+4k=5$$

Hence, locus of (h,k) is $6x+4y=5$.

Example 8 *The origin is shifted to* $(1,2)$. *The equation* $y^2-8x-4y+12=0$ *changes to* $y^2=4ax$, *then* a *is equal to*

(a) 1 (b) 2 (c) -2 (d) -1

Solution (b) Let $P(x,y)$ be the original position of the point w.r.t. the original axes. Let us move the origin at new position to (h,k).

Hence, the position of the same point P in the new system is

$$x'=x-h$$

$$y'=y-k$$

Here, $(h,k)=(1,2)$

$$\therefore \quad x'=(x-1), \quad y'=(y-2)$$

According to question,

$$y^2-8x-4y+12\equiv(y-2)^2-4a(x-1)$$

$$\Rightarrow \quad y^2-8x-4y+12\equiv y^2-4y+4-4ax+4a$$

On comparing respective coefficients, we get

$$4a=8\Rightarrow a=2$$

Example 9 *If* $A(-a,0)$ *and* $B(a,0)$ *are two fixed points, then the locus of the point at which* AB *subtends a right angle is*

(a) $x^2+y^2=2a^2$ (b) $x^2-y^2=a^2$
(c) $x^2+y^2+a^2=0$ (d) $x^2+y^2=a^2$

Solution (d) Let $P(h,k)$ represents all those points subtending a right angle at A and B.

$$\therefore \quad m_{AP}\cdot m_{PB}=-1$$

$$\Rightarrow \quad \left(\frac{k-0}{h+a}\right)\left(\frac{k-0}{h-a}\right)=-1$$

$$\Rightarrow \quad k^2=-(h^2-a^2)$$

$$\Rightarrow \quad k^2+h^2=a^2$$

Replace k by y and h by x, we get

$$x^2+y^2=a^2$$

Example 10 *The centroid of the triangle is* $(3,3)$ *and the orthocentre is* $(-3,5)$, *then its circumcentre is*

(a) $(0,4)$ (b) $(0,8)$
(c) $(6,2)$ (d) $(6,-2)$

Solution (c) Since, the centroid divides the join of orthocentre and circumcentre in the ratio 2 : 1.

Let the circumcentre of triangle is (α,β).

$$\therefore \quad G(3,3)=G\left(\frac{2\alpha-3}{2+1},\frac{2\beta+5}{2+1}\right)$$

$$\Rightarrow \quad G(3,3)=G\left(\frac{2\alpha-3}{3},\frac{2\beta+5}{3}\right)$$

$$\Rightarrow \quad \frac{2\alpha-3}{3}=3 \text{ and } \frac{2\beta+5}{3}=3$$

$$\Rightarrow \quad 2\alpha-3=9 \text{ and } 2\beta+5=9$$

$$\Rightarrow \quad 2\alpha=12 \quad \text{and} \quad 2\beta=4$$

$$\Rightarrow \quad \alpha=6 \quad \text{and} \quad \beta=2$$

3. The distance between the points $(a\cos\alpha, a\sin\alpha)$ and $(a\cos\beta, a\sin\beta)$, where $a > 0$ is
(a) $2a\left|\sin\left(\frac{\alpha-\beta}{2}\right)\right|$ (b) $a\left|\sin\left(\frac{\alpha-\beta}{2}\right)\right|$
(c) $2\left|\sin\left(\frac{\alpha-\beta}{2}\right)\right|$ (d) None of these

4. The points P is equidistant from A (1, 3), $B(-3, 5)$ and $C(5, -1)$, then PA is equal to
(a) 5 (b) $5\sqrt{5}$ (c) 25 (d) $5\sqrt{10}$

5. The line joining $A(b\cos\alpha, b\sin\alpha)$ and $B(a\cos\beta, a\sin\beta)$ is produced to the point $M(x, y)$, so that $AM : MB = b : a$, then

$$x\cos\left(\frac{\alpha+\beta}{2}\right) + y\sin\left(\frac{\alpha+\beta}{2}\right) \text{ is}$$

(a) -1 (b) 0
(c) 1 (d) $a^2 + b^2$

6. P, Q, R and S are the points on the line joining the points $P(a, x)$ and $T(b, y)$ such that $PQ = QR = RS = ST$, then $\left(\frac{5a+3b}{8}, \frac{5x+3y}{8}\right)$ is the mid-point of
(a) PQ (b) QR
(c) RS (d) ST

7. Three vertices of a parallelogram taken in order are $(-1, -6)$, $(2, -5)$ and $(7, 2)$. The fourth vertex is
(a) (1, 4) (b) (4, 1)
(c) (1, 1) (d) (4, 4)

8. The coordinates of points A, B and C are (x_1, y_1), (x_2, y_2) and (x_3, y_3) and point D divides AB in the ratio $l : k$. If P divides line DC in the ratio $m : (k + l)$, coordinates of P are
(a) $\left(\frac{kx_1 + lx_2 + mx_3}{k+l+m}, \frac{ky_1 + ly_2 + my_3}{k+l+m}\right)$
(b) $\left(\frac{lx_1 + mx_2 + kx_3}{l+m+k}, \frac{ly_1 + my_2 + ky_3}{l+m+k}\right)$
(c) $\left(\frac{mx_1 + kx_2 + lx_3}{m+k+l}, \frac{my_1 + ky_2 + ly_3}{m+k+l}\right)$
(d) None of the above

9. y-axis divides the segment joining points $(-3, -4)$ and $(1, -2)$ in the ratio
(a) 1 : 3 (b) 2 : 3 (c) 3 : 1 (d) 3 : 2

10. Let AB be divided internally and externally at P and Q in the same ratio. Then, AP, AB and AQ are is
(a) AP (b) GP
(c) HP (d) None of these

11. The points whose coordinates are $x = x_1 + t(x_2 - x_1)$, $y = y_1 + t(y_2 - y_1)$ divides the join of (x_1, y_1) and (x_2, y_2) in the ratio
(a) $\frac{t}{(1+t)}$ (b) $\frac{(1+t)}{t}$ (c) $\frac{t}{(1-t)}$ (d) $\frac{(1-t)}{t}$

Area of Some Geometrical Figures

12. If $A(6, -3)$, $B(-3, 5)$, $C(4, -2)$, $P(\alpha, \beta)$, then the ratio of the areas of the ΔPBC, ΔABC is
(a) $|\alpha + \beta|$ (b) $|\alpha - \beta|$
(c) $|\alpha + \beta + 2|$ (d) $|\alpha + \beta - 2|$

13. The straight lines $x = y$, $x - 2y = 3$ and $x + 2y = -3$ form a triangle, which is
(a) isosceles (b) equilateral
(c) right angled (d) None of these

14. Length of the median from B on AC, where $A(-1, 3)$, $B(1, -1)$, $C(5, 1)$ is
(a) $\sqrt{18}$ (b) $\sqrt{10}$
(c) $2\sqrt{3}$ (d) 4

15. The centre of a circle which passes through points (1, 1), (2, 3) and (–2, 2) is
(a) (3, 4) (b) $\left(-\frac{1}{14}, -\frac{39}{14}\right)$
(c) $\left(-\frac{1}{14}, \frac{39}{14}\right)$ (d) $\left(-\frac{39}{14}, \frac{1}{14}\right)$

16. The points $A(2a, 4a)$, $B(2a, 6a)$ and $C(2a + \sqrt{3}a, 5a)$, $a > 0$ are the vertices of
(a) an isosceles triangle
(b) a right angled triangle
(c) an acute angled triangle
(d) None of the above

17. Two opposite vertices of a rectangle are (1, 3) and (5, 1). If the rest two vertices lie on the line $y - x + \lambda = 0$, then λ is equal to
(a) 1 (b) –1
(c) 2 (d) 3

18. Find the value of x for which the points $(x, -1)$, (2, 1) and (4, 5) are collinear. **[NCERT]**
(a) –1 (b) 1
(c) 2 (d) –2

19. Area of quadrilateral whose vertices are (2, 3), (3, 4), (4, 5) and (5, 6), is equal to
(a) 0 (b) 4
(c) 6 (d) None of these

20. If A and B are two points having coordinates (3, 4) and $(5, -2)$ respectively and P is a point such that $PA = PB$ and area of $\Delta PAB = 10$ sq units, then the coordinates of P are
(a) (7, 4) and (13, 2)
(b) (7, 2) and (1, 0)
(c) (2, 7) and (4, 13)
(d) None of the above

21. If area of triangle with vertices (0, 0), (0, 6) and (α, β) is 15 sq units, then
(a) $\alpha = \pm 5, \beta = 5$
(b) $\alpha = \pm 10, \beta = 5$
(c) $\alpha = \pm 5, \beta = 2$
(d) $\alpha = \pm 5$, β can take any real value

22. If the area of the triangle with vertices $(x, 0)$, (1, 1) and (0, 2) is 4 sq units, then the value of x is
(a) –2 (b) –4
(c) –6 (d) 8

23. If an equilateral triangle has one vertex at the point (0, 0) and another at $(3, \sqrt{3})$, then the coordinates of the third vertex is
(a) $(0, 2\sqrt{3})$ (b) $(0, -2\sqrt{3})$
(c) $(-1, 2\sqrt{3})$ (d) None of these

24. Let the opposite angular points of a square be (3, 4) and (1, –1). Then, the coordinates of the remaining angular points are
(a) $\left(\frac{9}{2}, \frac{1}{2}\right)$ and $\left(-\frac{1}{2}, \frac{5}{2}\right)$ (b) $\left(\frac{9}{2}, -\frac{1}{2}\right)$ and $\left(-\frac{1}{2}, \frac{5}{2}\right)$
(c) $\left(-\frac{9}{2}, \frac{1}{2}\right)$ and $\left(-\frac{1}{2}, \frac{5}{2}\right)$ (d) None of these

25. If the points (a_1, b_1), (a_2, b_2) and (a_3, b_3) are collinear, then lines $a_i x + b_i y + 1 = 0$ for $i = 1, 2, 3$, are
(a) concurrent (b) identical
(c) parallel (d) None of these

26. If $\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$, then the points (x_1, y_1), (x_2, y_2) and (x_3, y_3) are
(a) vertices of an equilateral triangle
(b) vertices of a right angled triangle
(c) vertices of an isosceles triangle
(d) None of the above

27. The length of altitude through A of the ΔABC, where $A \equiv (-3, 0)$, $B \equiv (4, -1)$, $C \equiv (5, 2)$, is
(a) $\frac{2}{\sqrt{10}}$ (b) $\frac{4}{\sqrt{10}}$
(c) $\frac{11}{\sqrt{10}}$ (d) $\frac{22}{\sqrt{10}}$

28. An equilateral triangle has each side equal to a. If the coordinates of its vertices are (x_1, y_1), (x_2, y_2) and (x_3, y_3), then the square of the determinant $\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}^2$ equals to
(a) $3a^4$ (b) $\frac{3}{4}a^4$
(c) $4a^4$ (d) None of these

29. If the vertices of a triangle have integral coordinates, the triangle cannot be
(a) an equilateral triangle (b) a right angled triangle
(c) an isosceles triangle (d) None of these

Different Points Related to a Triangle

30. The x-coordinate of the incentre of the triangle where the mid-point of the sides are (0, 1), (1, 1) and (1, 0), is
(a) $2 + \sqrt{2}$ (b) $1 + \sqrt{2}$ (c) $2 - \sqrt{2}$ (d) $1 - \sqrt{2}$

31. The orthocentre of the triangle formed by (0, 0), (8, 0) and (4, 6) is
(a) $\left(4, \frac{8}{3}\right)$ (b) (3, 4) (c) (4, 3) (d) (−3, 4)

32. If orthocentre and circumcentre of triangle are respectively (1, 1) and (3, 2), then the coordinates of its centroid are
(a) $\left(\frac{7}{3}, \frac{5}{3}\right)$ (b) $\left(\frac{5}{3}, \frac{7}{3}\right)$
(c) (7, 5) (d) None of these

33. The incentre of the triangle formed by lines $x = 0$, $y = 0$ and $3x + 4y = 12$, is at
(a) $\left(\frac{1}{2}, \frac{1}{2}\right)$ (b) (1, 1) (c) $\left(1, \frac{1}{2}\right)$ (d) $\left(\frac{1}{2}, 1\right)$

34. If $t_1 + t_2 + t_3 = -t_1t_2t_3$, then orthocentre of the triangle formed by the points $[at_1t_2, a(t_1 + t_2)], [at_2t_3, a(t_2 + t_3)]$ and $[at_3t_1, a(t_3 + t_1)]$, lies on
(a) $(a, 0)$ (b) $(-a, 0)$ (c) $(0, a)$ (d) $(0, -a)$

35. The coordinates of the circumcentre of the triangle with vertices (8, 6), (8, −2) and (2, −2) are
(a) $\left(6, \frac{2}{3}\right)$ (b) (8, 2) (c) (5, −2) (d) (5, 2)

36. If two vertices of a triangle are (−2, 3) and (5, −1). Orthocentre lies at the origin and centroid on the line $x + y = 7$, then the third vertex lies at
(a) (7, 4) (b) (8, 14)
(c) (12, 21) (d) None of these

37. If two vertices of an equilateral triangle are (0, 0) and $(3, 3\sqrt{3})$, then the third vertex is
(a) (3, −3) (b) (−3, 3)
(c) $(-3, 3\sqrt{3})$ (d) None of these

38. If the vertices P, Q, R of a ΔPQR are rational points, which of the following points of the ΔPQR is (are) always rational points ?
(a) Centroid (b) Incentre
(c) Circumcentre (d) Orthocentre

(A rational point is a point both of whose coordinates are rational numbers)

39. ABC is a triangle with vertices $A(-1, 4)$, $B(6, -2)$ and $C(-2, 4)$. D, E and F are the points which divide each AB, BC and CA respectively in the ratio 3 : 1 internally. Then, the centroid of ΔDEF is
(a) (3, 6) (b) (1, 2)
(c) (4, 8) (d) (−3, 6)

40. If (0, 1) is the orthocentre and (2, 3) is the centroid of a triangle. Then, its circumcentre is
(a) (3, 2) (b) (1, 0)
(c) (4, 3) (d) (3, 4)

41. The centroid of a triangle is (2, 7) and two of its vertices are (4, 8) and (−2, 6). The third vertex is
(a) (0, 0) (b) (4, 7) (c) (7, 4) (d) (7, 7)

Locus of a Point

42. The locus of a point P which moves such that $2PA = 3PB$, where coordinates of points A and B are (0, 0) and (4, −3), is
(a) $5x^2 - 5y^2 - 72x + 54y + 225 = 0$
(b) $5x^2 + 5y^2 - 72x + 54y + 225 = 0$
(c) $5x^2 + 5y^2 + 72x - 54y + 225 = 0$
(d) $5x^2 + 5y^2 - 72x - 54y - 225 = 0$

43. The locus of a point whose difference of distance from points (3, 0) and (−3, 0) is 4, is
(a) $\frac{x^2}{4} - \frac{y^2}{5} = 1$ (b) $\frac{x^2}{5} - \frac{y^2}{4} = 1$
(c) $\frac{x^2}{2} - \frac{y^2}{3} = 1$ (d) $\frac{x^2}{3} - \frac{y^2}{2} = 1$

44. What is the equation of the locus of a point which moves such that 4 times its distance from the x-axis is the square of its distance from the origin ?
(a) $x^2 + y^2 - 4y = 0$ (b) $x^2 + y^2 - 4|y| = 0$
(c) $x^2 + y^2 - 4x = 0$ (d) $x^2 + y^2 - 4|x| = 0$

45. A rod of length l slides with its ends on two perpendicular lines. The locus of a point which divides it in the ratio 1 : 2, is
(a) $36x^2 + 9y^2 = 4l^2$ (b) $36x^2 + 9y^2 = l^2$
(c) $9x^2 + 36y^2 = 4l^2$ (d) $9x^2 - 36y^2 = 4l^2$

46. A point moves in such a way that the sum of its distances from two fixed points $(ae, 0)$ and $(-ae, 0)$ is $2a$. Then, the locus of the points is
(a) $\frac{x^2}{a^2} + \frac{y^2}{a^2(1 - e^2)} = 1$ (b) $\frac{x^2}{a^2} - \frac{y^2}{a^2(1 - e^2)} = 1$
(c) $\frac{x^2}{a^2(1 - e^2)} + \frac{y^2}{a^2} = 1$ (d) None of these

47. Coordinates of two points are $A(1, 0)$ and $B(-1, 0)$ and Q is a point which satisfies $AQ - BQ = \pm 1$. The locus of the point Q is
(a) $12x^2 + 4y^2 = 3$ (b) $12x^2 - 4y^2 = 3$
(c) $12x^2 - 4y^2 + 3 = 0$ (d) $12x^2 + 4y^2 + 3 = 0$

48. A point moves is such a way that the sum of squares of its distances from $A(2, 0)$ and $B(-2, 0)$ is always eaual to the square of the distance between A and B, then the locus of point P is
(a) $x^2 + y^2 - 2 = 0$ (b) $x^2 + y^2 + 2 = 0$
(c) $x^2 + y^2 + 4 = 0$ (d) $x^2 + y^2 - 4 = 0$

49. If two points $A(a, 0)$ and $B(-a, 0)$ are stationary and if $\angle A - \angle B = \theta$ in ΔABC, the locus of C is
(a) $x^2 + y^2 + 2xy \tan\theta = a^2$
(b) $x^2 - y^2 + 2xy \tan\theta = a^2$
(c) $x^2 + y^2 + 2xy \cot\theta = a^2$
(d) $x^2 - y^2 + 2xy \cot\theta = a^2$

50. If $A(\cos\alpha, \sin\alpha)$, $B(\sin\alpha, -\cos\alpha)$, $C(1, 2)$ are the vertices of a ΔABC, then the locus of centroid of triangle is
(a) $x^2 + y^2 - 2x - 4y + 1 = 0$
(b) $3(x^2 + y^2) - 2x - 4y + 1 = 0$
(c) $x^2 + y^2 - 2x - 4y + 3 = 0$
(d) None of the above

Translation of Axes

51. The coordinate axes rotated through an angle 135°. If the coordinates of a point P in the new system are known to be $(4, -3)$, then the coordinates of P in the original system are
(a) $\left(\frac{1}{\sqrt{2}}, \frac{7}{\sqrt{2}}\right)$ (b) $\left(\frac{1}{\sqrt{2}}, -\frac{7}{\sqrt{2}}\right)$
(c) $\left(-\frac{1}{\sqrt{2}}, -\frac{7}{\sqrt{2}}\right)$ (d) $\left(-\frac{1}{\sqrt{2}}, \frac{7}{\sqrt{2}}\right)$

52. If a point $P(4, 3)$ is rotated through an angle 45° in anti-clockwise direction about origin, then coordinates of P in new position are
(a) $\left(\frac{1}{\sqrt{2}}, \frac{7}{\sqrt{2}}\right)$ (b) $\left(-\frac{7}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$
(c) $\left(-\frac{1}{\sqrt{2}}, \frac{7}{\sqrt{2}}\right)$ (d) $\left(\frac{1}{\sqrt{2}}, -\frac{7}{\sqrt{2}}\right)$

53. If origin is shifted to $(7, -4)$, then point $(4, 5)$ shifted to
(a) $(-3, 9)$ (b) $(3, 9)$
(c) $(11, 1)$ (d) None of these

54. If the axes are rotated through an angle 60°, the coordinates of a point in the new system are $(2, -\sqrt{3})$, then its original coordinates are
(a) $\left(\frac{5}{3}, -\frac{\sqrt{2}}{3}\right)$ (b) $\left(-\frac{5}{3}, \frac{\sqrt{2}}{3}\right)$
(c) $\left(\frac{5}{2}, \frac{\sqrt{3}}{2}\right)$ (d) $\left(-\frac{5}{2}, \frac{\sqrt{3}}{2}\right)$

55. Without change of axes the origin is shifted to (h, k), then from the equation $x^2 + y^2 - 4x + 6y - 7 = 0$ the terms containing linear powers are missing. Then, point (h, k) is
(a) $(3, 2)$ (b) $(-3, 2)$
(c) $(2, -3)$ (d) $(-2, -3)$

56. A line L has intercepts a and b on the coordinate axes. Keeping the origin fixed, the axes are rotated through a fixed angle. Now, the same line has intercepts p and q on the new axes too many
(a) $a^2 + p^2 = b^2 + q^2$ (b) $a^2 + b^2 = p^2 + q^2$
(c) $\frac{1}{a^2} + \frac{1}{b^2} = \frac{1}{p^2} - \frac{1}{q^2}$ (d) $\frac{1}{a^2} + \frac{1}{p^2} = \frac{1}{b^2} + \frac{1}{q^2}$

Miscellaneous

57. If points $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ are such that x_1, x_2, x_3 and y_1, y_2, y_3 are in AP, then
(a) A, B and C are concyclic points
(b) A, B and C are collinear points
(c) A, B and C are vertices of an equilateral triangle
(d) None of the above

58. The median BE and AD of a triangle with vertices $A(0, b)$, $B(0,0)$ and $C(a, 0)$ are perpendicular to each other, if
(a) $a = \frac{b}{2}$ (b) $b = \frac{a}{2}$
(c) $ab = 1$ (d) $a = \pm\sqrt{2}b$

Round II (Mixed Bag)

Only One Correct Option

1. A straight line with negative slope passing through the point $(1, 4)$ meets the coordinate axes at A and B. The minimum value of $OA + OB$ is equal to
(a) 5 (b) 6 (c) 9 (d) 8

2. The equation
$$\sqrt{(x-2)^2 + (y-1)^2} + \sqrt{(x+2)^2 + (y-4)^2} = 5$$
represents
(a) circle (b) ellipse
(c) line segment (d) None of these

3. Let equation of the side BC of a ΔABC be $x + y + 2 = 0$. If coordinates of its orthocentre and circumcentre are $(1, 1)$ and $(2, 0)$ respectively, then radius of the circumcircle of ΔABC is
(a) 3 (b) $\sqrt{10}$
(c) $2\sqrt{2}$ (d) None of these

4. If the points $(1, 2)$ and $(3, 4)$ were to be on the same side of the line $3x - 5y + a = 0$, then
(a) $1 < a < 6$ (b) $7 < a < 11$
(c) $a > 11$ (d) $a < 7$ or $a > 11$

5. Without change of axes the origin is shifted to (h, k), then from the equation

$$x^2 + y^2 - 4x + 6y - 7 = 0$$

the terms containing linear powers are missing. The point (h, k) is

(a) (3, 2) (b) (–3, 2)
(c) (2, – 3) (d) (–2, – 3)

6. If $P = (1, 0)$, $Q = (-1, 0)$ and $R = (2, 0)$ are three given points, then the locus of the point $S(x, y)$ satisfying the relation $SQ^2 + SR^2 = 2\,SP^2$ is

(a) a straight line parallel to x-axis
(b) a circle through the origin
(c) a circle with centre at the origin
(d) a straight line parallel to y-axis

7. The points (1, 3) and (5, 1) are two opposite vertices of a rectangle. The other two vertices lie on the line $y = 2x + c$, are

(a) (2, 0) and (4, 4) (b) (2, 0) and (–4, – 4)
(c) (2, 0) and (–4, 4) (d) (–2, 0) and (4, 4)

8. Given points are $A(0, 4)$ and $B(0, -4)$, the locus of $P(x, y)$ such that $|AP - BP| = 6$, is

(a) $9x^2 - 7y^2 + 63 = 0$ (b) $9x^2 + 7y^2 - 63 = 0$
(c) $9x^2 + 7y^2 + 63 = 0$ (d) None of these

9. The orthocentre of the triangle formed by the points (0, 0), (4, 0) and (3, 4) is

(a) (2, 0) (b) $\left(\frac{3}{2}, 2\right)$
(c) $\left(\frac{3}{4}, 3\right)$ (d) $\left(3, \frac{3}{4}\right)$

10. The area of the region bounded by the lines $y = |x - 2|$, $x = 1$, $x = 3$ and the x-axis is

(a) 1 (b) 2
(c) 3 (d) 4

11. The middle point of the line segment joining (3, – 1) and (1, 1) is shifted by two units (in the sense of increasing y) perpendicular to the line segment. Then, the coordinates of the point in the new position are

(a) $(2 - \sqrt{2}, 2)$ (b) $(2, 2 - \sqrt{3})$
(c) $(2 + \sqrt{2}, \sqrt{3})$ (d) None of these

12. ABC is an isosceles triangle, if the coordinates of the base are $B(1, 3)$ and $C(-2, 7)$, the coordinates of vertex A can be

(a) (1, 6) (b) $\left(-\frac{1}{2}, 5\right)$
(c) $\left(\frac{5}{6}, 6\right)$ (d) $\left(-8, \frac{1}{8}\right)$

13. Let $0 < \alpha < \frac{\pi}{2}$ be a fixed angle. If $P = (\cos\theta, \sin\theta)$ and $Q = \{\cos(\alpha - \theta), \sin(\alpha - \theta)\}$. Then, Q is obtained from P by

(a) clockwise rotation around the origin through angle α
(b) anti-clockwise rotation around origin through angle α
(c) reflection in the line through the origin with slope $\tan\alpha$
(d) reflection in the line through the origin with slope $\tan\frac{\alpha}{2}$

14. A line joining $A(2, 0)$ and $B(3, 1)$ is rotated about A in anti-clockwise direction through 15°. Find the equation of the line in the new position. If B goes to C in the new position, then coordinates of C are

(a) $\left(2 + \frac{1}{\sqrt{2}}, \frac{\sqrt{3}}{\sqrt{2}}\right)$ (b) $\left(2 - \frac{1}{\sqrt{2}}, \frac{\sqrt{3}}{\sqrt{2}}\right)$
(c) $\left(2 + \frac{1}{\sqrt{2}}, \frac{\sqrt{3}}{2}\right)$ (d) None of these

15. Two points $P(a, 0)$ and $Q(-a, 0)$ are given, R is a variable point on one side of the line PQ such that $\angle RPQ - \angle RQP$ is 2α, then

(a) locus of R is $x^2 - y^2 + 2xy\cot 2\alpha - a^2 = 0$
(b) locus of R is $x^2 + y^2 + 2xy\cot\alpha - a^2 = 0$
(c) locus of R is a hyperbola, if $\alpha = \frac{\pi}{4}$
(d) locus of R is a circle, if $\alpha = \frac{\pi}{4}$

More Than One Correct Option

16. The area of a triangle is 5 sq units. Two of its vertices are (2, 1) and (3, –2). The third vertex lies on $y = x + 3$. The coordinates of the third vertex can be

(a) (–3/2, 3/2) (b) (3/4, –3/2)
(c) (7/2, 13/2) (d) (–1/4, 11/4)

17. The point $(p + 1, 1), (2p + 1, 3)$ and $(2p + 2, 2p)$ collinear, if

(a) $p = -1$ (b) $p = 1/2$
(c) $p = 2$ (d) $p = -\frac{1}{2}$

18. The coordinates of the points A and B are respectively (–3, 2) and (2, 3). P and Q are points on the line joining A and B such that $AP = PQ = QB$. A square $PQRS$ is constructed on PQ as one side, the coordinates of R can be

(a) $\left(-\frac{4}{3}, \frac{7}{3}\right)$ (b) $\left(0, \frac{13}{3}\right)$
(c) $\left(\frac{1}{3}, \frac{8}{3}\right)$ (d) $\left(\frac{2}{3}, 1\right)$

Comprehension Based Questions

Passage

Directions (Q. Nos.19-21) *Consider a ΔPQR with coordinates of its vertices as $P(-8, 5)$; $Q(-15, -19)$ and $R(1, -7)$. The bisector of the interior angle of P has the equation which can be written in the form $ax + 2y + c = 0$.*

19. The distance between the orthocentre and the circumcentre of the ΔPQR is
(a) 25/2 (b) 29/2 (c) 37/2 (d) 51/2

20. Radius of the incircle of the ΔPQR is
(a) 4 (b) 5 (c) 6 (d) 8

21. The sum of $a + c$ is
(a) 129 (b) 78
(c) 89 (d) None of these

Assertion and Reason

Directions (Q. Nos. 22-25) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes (a), (b), (c) and (d) given below.*
(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

22. **Statement I** If the circumcentre of a triangle lies at the origin and centroid is the middle point of the line joining the points (2, 3) and (4, 7), then its orthocentre lies on the line $5x - 3y = 0$.

Statement II The circumcentre, centroid and the orthocentre of a triangle lies on the same line.

23. **Statement I** If the origin is shifted to the centroid of the triangle with vertices (0, 0), (3, 3) and (3, 6) without rotation of axes, then the vertices of the triangle in the new system of coordinates are $(-2, 0), (1, 3)$ and $(1, -3)$.

Statement II If the origin is shifted to the point (2, 3) without rotation of the axes, then the coordinates of the point $P(\alpha - 1, \alpha + 1)$ in the new system of coordinates are $(\alpha - 3, \alpha - 2)$.

24. **Statement I** The maximum area of triangle formed by the point (0, 0), $(a \cos\theta, b \sin\theta), (a \cos\theta, -b \sin\theta)$ is $\frac{1}{2}|ab|$.

Statement II Maximum value of $\sin\theta$ is 2.

25. **Statement I** If sum of algebraic distances from points $A(1, 1), B(2, 3), C(0, 2)$ is zero on the line $ax + by + c = 0$, then $a + 3b + c = 0$.

Statement II The centroid of triangle is (1, 2).

Previous Years' Questions

26. The x-coordinate of the incentre of the triangle that has the coordinates of mid-points of its sides as (0, 0), (1, 1) and (1, 0) is **[AIEEE 2011]**
(a) $2 + \sqrt{2}$ (b) $2 - \sqrt{2}$ (c) $1 + \sqrt{2}$ (d) $1 - \sqrt{2}$

27. If the line $2x + y = k$ passes through the point which divides the line segment joining the points (1, 1) and (2, 4) in the ratio 3 : 2, then k is equal to **[AIEEE 2012]**
(a) $\frac{29}{5}$ (b) 5 (c) 6 (d) $\frac{11}{5}$

28. If $A(2, -3)$ and $B(-2,1)$ are two vertices of a triangle and third vertex moves on the line $2x + 3y = 9$, then the locus of the centroid of the triangle is **[AIEEE 2011]**
(a) $2x - 3y = 1$ (b) $x - y = 1$
(c) $2x + 3y = 1$ (d) $2x + 3y = 3$

29. Three distinct points A, B and C given in the 2-dimensional coordinate plane such that the ratio of the distance of any one of them from the point (1, 0) to the distance from the point (–1, 0) is equal to $\frac{1}{3}$. Then, the circumcentre of the ΔABC is at the point **[AIEEE 2009]**
(a) $\left(\frac{5}{4}, 0\right)$ (b) $\left(\frac{5}{2}, 0\right)$
(c) $\left(\frac{5}{3}, 0\right)$ (d) (0, 0)

30. Let $A(h, k)$, $B(1, 1)$ and $C(2, 1)$ be the vertices of a right angled triangle with AC as its hypotenuse. If the area of the triangle is 1, then the set of values which k can take is given by **[AIEEE 2007]**
(a) $\{1, 3\}$ (b) $\{0, 2\}$ (c) $\{-1, 3\}$ (d) $\{-3, -2\}$

31. If a vertex of a triangle is (1, 1) and the mid-point of two sides of a triangle through this vertex are (–1, 2) and (3, 2), then the centroid of the triangle is **[AIEEE 2005]**
(a) $\left(-\frac{1}{3}, \frac{7}{3}\right)$ (b) $\left(-1, \frac{7}{3}\right)$ (c) $\left(\frac{1}{3}, \frac{7}{3}\right)$ (d) $\left(1, \frac{7}{3}\right)$

32. Let $A(2, -3)$ and $B(-2, 1)$ be the vertices of a ΔABC. If the centroid of this triangle moves on the line $2x + 3y = 1$, then the locus of the vertex C is the line **[AIEEE 2004]**
(a) $2x + 3y = 9$ (b) $2x - 3y = 7$
(c) $3x + 2y = 5$ (d) $3x - 2y = 3$

the Guidance

Round I

1. Let $P \equiv (a\cos\alpha, a\sin\alpha)$ and $O \equiv (0, 0)$,

then $|OP| = \sqrt{(a\cos\alpha - 0)^2 + (a\sin\alpha - 0)^2}$

$= \sqrt{(a^2\cos^2\alpha + a^2\sin^2\alpha)}$

$= \sqrt{a^2(\cos^2\alpha + \sin^2\alpha)} = \sqrt{a^2}$

$= |a|$, which is independent of α.

2. Let $P \equiv (x, y)$, $A \equiv (6, -1)$ and $B \equiv (2, 3)$

By the given condition, $PA = PB$

$\Rightarrow \quad \sqrt{(x-6)^2 + (y+1)^2} = \sqrt{(x-2)^2 + (y-3)^2}$

$\Rightarrow \quad (x-6)^2 + (y+1)^2 = (x-2)^2 + (y-3)^2$

$\Rightarrow \quad x^2 - 12x + 36 + y^2 + 2y + 1 = x^2 - 4x + 4 + y^2 - 6y + 9$

$\Rightarrow \quad 8x - 8y = 24$

$\Rightarrow \quad x - y = 3$

3. Let $P \equiv (a\cos\alpha, a\sin\alpha)$ and $Q \equiv (a\cos\beta, a\sin\beta)$

Then, $|PQ| = \sqrt{(a\cos\alpha - a\cos\beta)^2 + (a\sin\alpha - a\sin\beta)^2}$

$= \sqrt{a^2\{(\cos\alpha - \cos\beta)^2 + (\sin\alpha - \sin\beta)^2\}}$

$= \sqrt{a^2\{(\cos^2\alpha + \cos^2\beta - 2\cos\alpha\cos\beta + (\sin^2\alpha + \sin^2\beta - 2\sin\alpha\sin\beta)\}}$

$= \sqrt{a^2\{1 + 1 - 2(\cos\alpha\cos\beta + \sin\alpha\sin\beta)\}}$

$= \sqrt{a^2[2 - 2\cos(\alpha - \beta)]}$

$= \sqrt{2a^2[1 - \cos(\alpha - \beta)]} = \sqrt{\left[2a^2 \cdot 2\sin^2\left(\frac{\alpha - \beta}{2}\right)\right]}$

$= \sqrt{4a^2\sin^2\left(\frac{\alpha - \beta}{2}\right)} = \left|2a\sin\left(\frac{\alpha - \beta}{2}\right)\right|$

$= 2a\left|\sin\left(\frac{\alpha - \beta}{2}\right)\right| \quad (\because a > 0)$

4. For finding the distance AP, first we find out the perpendicular bisector of AB and AC.

Perpendicular bisector of $A(1, 3)$ and $B(-3, 5)$ is

$2x(x_1 - x_2) + 2y(y_1 - y_2) = (x_1^2 + y_1^2) - (x_2^2 + y_2^2)$

$\Rightarrow \quad 2x(1+3) + 2y(3-5) = (1+9) - (9+25)$

$\Rightarrow \quad 2x - y + 6 = 0 \quad \ldots(i)$

Similarly, perpendicular bisector of $A(1, 3)$ and $C(5, -1)$ is

$$2x(1-5)+2y(3+1)=(1+9)-(25+1)$$

$\Rightarrow$ $$-8x+8y=-16$$

$\Rightarrow$ $$x-y-2=0 \quad \text{...(ii)}$$

Point of intersection of Eqs. (i) and (ii) is

$P=(-8,-10)$

Then, the distance between P and A is

$$PA=\sqrt{(1+8)^2+(3+10)^2}=\sqrt{81+169}$$
$$=\sqrt{250}=\sqrt{25\times 10}=5\sqrt{10}$$

5. Given, M divides AB in the ratio $b : a$ (externally).

$\therefore$ $$x=\frac{ba\cos\beta-ab\cos\alpha}{b-a}$$

and $$y=\frac{ab\sin\beta-ab\sin\alpha}{b-a}$$

$\Rightarrow$ $$\frac{x}{y}=\frac{\cos\beta-\cos\alpha}{\sin\beta-\sin\alpha}$$

$\Rightarrow$ $$\frac{x}{y}=\frac{2\sin\left(\frac{\alpha+\beta}{2}\right)\sin\left(\frac{\alpha-\beta}{2}\right)}{2\cos\left(\frac{\alpha+\beta}{2}\right)\sin\left(\frac{\beta-\alpha}{2}\right)}$$

$\Rightarrow$ $$x\cos\left(\frac{\alpha+\beta}{2}\right)+y\sin\left(\frac{\alpha+\beta}{2}\right)=0$$

6. R is mid-point of PT.

Point $\left(\frac{5a+3b}{8}, \frac{5x+3y}{8}\right)$ divides PT in ratio 3 : 5 and that is mid-point of QR.

7. Let the fourth vertex be $D(x, y)$.

We know that, two diagonals of a parallelogram are bisect each other.

$\therefore$ $$\frac{-1+7}{2}=\frac{2+x}{2} \Rightarrow x=4$$

and $$\frac{-6+2}{2}=\frac{-5+y}{2} \Rightarrow y=1$$

$\therefore$ Fourth vertex of D is (4, 1).

8. Coordinates of point D are

$$D\left(\frac{lx_2+kx_1}{k+l}, \frac{ly_2+ky_1}{k+l}\right)$$

Coordinates of point P are

$$P\left(\frac{lx_2+kx_1+mx_3}{k+l+m}, \frac{ly_2+ky_1+my_3}{k+l+m}\right)$$

9. Let y-axis cuts in the ratio $\lambda : 1$, where $x=0$

$$x=\frac{\lambda\cdot 1+1(-3)}{\lambda+1}=0$$

$\Rightarrow$ $$\lambda-3=0 \Rightarrow \lambda=3$$

y-axis cuts in the ratio 3 : 1

10. Let P and Q divides the join of AB in the ratio of $\lambda : 1$ both internally and externally respectively as shown below.

Let coordinates of points A and B are (x_1, y_1) and (x_2, y_2)

$\therefore$ $$P\left(\frac{\lambda x_2+x_1}{\lambda+1}, \frac{\lambda y_2+y_1}{\lambda+1}\right)$$

and $$Q\left(\frac{\lambda x_2-x_1}{\lambda-1}, \frac{\lambda y_2-y_1}{\lambda-1}\right)$$

Now, $$|AP|=\sqrt{\left(x_1-\frac{\lambda x_2+x_1}{\lambda+1}\right)^2+\left(y_1-\frac{\lambda y_2+y_1}{\lambda+1}\right)^2}$$

$\Rightarrow$ $$|AP|=\sqrt{\left(\frac{\lambda x_1-\lambda x_2}{\lambda+1}\right)^2+\left(\frac{\lambda y_1-\lambda y_2}{\lambda+1}\right)^2}$$

$\Rightarrow$ $$|AP|=\left(\frac{\lambda}{\lambda+1}\right)\sqrt{(x_2-x_1)^2+(y_2-y_1)^2}$$

Also, $$|AB|=\sqrt{(x_2-x_1)^2+(y_2-y_1)^2}$$

and $$|AQ|=\sqrt{\left(x_1-\frac{\lambda x_2-x_1}{\lambda-1}\right)^2+\left(y_1-\frac{\lambda y_2-y_1}{\lambda-1}\right)^2}$$

$\Rightarrow$ $$|AQ|=\sqrt{\left(\frac{\lambda x_1-x_1-\lambda x_2+x_1}{\lambda-1}\right)^2+\left(\frac{\lambda y_1-y_1-\lambda y_2+y_1}{\lambda-1}\right)^2}$$

$\Rightarrow$ $$|AQ|=\left(\frac{\lambda}{\lambda-1}\right)\sqrt{(x_2-x)_1^2+(y_2-y_1)^2}$$

Clearly, $|AP|, |AB|$ and $|AQ|$ are in AP.

11. Since, $x=x_1+t(x_2-x_1)$

$\Rightarrow$ $$x=x_1+t\,x_2-t\,x_1 \Rightarrow x=(1-t)\,x_1+tx_2$$

$\Rightarrow$ $$x=\frac{(1-t)x_1+tx_2}{(1-t)+t}$$

Similarly, $$y=\frac{(1-t)y_1+ty_2}{(1-t)+t}$$

$\Rightarrow$ The point (x, y) divides the join of (x_1, y_1) and (x_2, y_2) in the ratio of $t : (1-t)$

12. $\because$ Area of $\Delta PBC = \frac{1}{2}\left\| \begin{matrix} \alpha & \beta & 1 \\ -3 & 5 & 1 \\ 4 & -2 & 1 \end{matrix} \right\| = \frac{1}{2}|7\alpha + 7\beta - 14|$

Also, Area of $\Delta ABC = \frac{1}{2}\left\| \begin{matrix} 6 & -3 & 1 \\ -3 & 5 & 1 \\ 4 & -2 & 1 \end{matrix} \right\|$

$$= \frac{1}{2}|42 - 21 - 14| = \frac{7}{2}$$

$$\therefore \quad \frac{\text{Area of } \Delta PBC}{\text{Area of } \Delta ABC} = \frac{\frac{7}{2}|\alpha + \beta - 2|}{\frac{7}{2}}$$

$$= |\alpha + \beta - 2|$$

13. The lines of a triangle are $x = y$, $x - 2y = 3$ and $x + 2y = -3$ intersection points at sides are $A(-3, -3)$, $B(-1, -1)$ and $C\left(0, -\frac{3}{2}\right)$

$$\therefore \quad AB = \sqrt{4+4} = 2\sqrt{2}$$

$$AC = \sqrt{9 + \frac{9}{4}} = \frac{3\sqrt{5}}{2}$$

and $$BC = \sqrt{1 + \frac{1}{4}} = \frac{\sqrt{5}}{2}$$

Now, $$\left(\frac{\sqrt{5}}{2}\right)^2 + (2\sqrt{2})^2 = \frac{5}{4} + 8 = \frac{37}{4}$$

$\therefore$ Hence, option (d) is correct.

14. Let BE be the median from B on AC, where E is the mid-point of AC.

According to mid-point formula, coordinates of E are $\left(\frac{5-1}{2}, \frac{1+3}{2}\right)$ *i.e.*, (2, 2).

$\therefore$ Length of median from $B = |BE|$.

$$\Rightarrow \quad |BE| = \sqrt{(2-1)^2 + (2+1)^2} = \sqrt{10}$$

15. Let $C(x, y)$ be centre of the circle passing through the points $P(1, 1)$, $Q(2, 3)$, $R(-2, 2)$

$$\therefore \quad |PC| = |QC| = |RC|$$

Case I $|PC| = |QC|$

$$(x-1)^2 + (y-1)^2 = (x-2)^2 + (y-3)^2$$

$$\Rightarrow \quad 2x + 4y = 11 \quad \text{...(i)}$$

Case II $|QC| = |RC|$

$$(x-2)^2 + (y-3)^2 = (x+2)^2 + (y-2)^2$$

$$\Rightarrow \quad 8x + 2y = 5 \quad \text{...(ii)}$$

On solving Eqs. (i) and (ii) for x and y, we have the coordinates of centre of circle are

$$C(x, y) = \left(-\frac{1}{14}, \frac{39}{14}\right)$$

16. Given vertices are $A(2a, 4a)$, $B(2a, 6a)$ and $C(2a + \sqrt{3}a, 5a)$, $a > 0$

Now, $$AB = \sqrt{(2a - 2a)^2 + (4a - 6a)^2} = 2a$$

$$BC = \sqrt{(\sqrt{3}a)^2 + a^2} = 2a$$

and $$CA = \sqrt{(\sqrt{3}a)^2 + (-a)^2} = 2a$$

$$\therefore \quad AB = BC = CA$$

Hence, triangle is an equilateral triangle, therefore it is an acute angled triangle.

17. The mid-point of (1, 3) and (5, 1) satisfies

$$y - x + \lambda = 0 \quad \text{...(i)}$$

Here, mid-point of given points, is (3, 2), which is satisfied the given Eq. (i)

$$\therefore \quad 2 - (3) + \lambda = 0 \Rightarrow \lambda = 1$$

18. Since, points are $A(x, -1)$, $B(2, 1)$ and $C(4, 5)$ are collinear.

Here, $x_1 = x, y_1 = -1, x_2 = 2, y_2 = 1, x_3 = 4$ and $y_3 = 5$

Slope of AB = Slope of BC

$$\Rightarrow \quad \frac{y_2 - y_1}{x_2 - x_1} = \frac{y_3 - y_2}{x_3 - x_2}$$

$$\Rightarrow \quad \frac{1+1}{2-x} = \frac{5-1}{4-2} \qquad \left(\because \text{slope of line} = \frac{y_2 - y_1}{x_2 - x_1}\right)$$

$$\Rightarrow \quad \frac{2}{2-x} = \frac{4}{2}$$

$$\Rightarrow \quad 2 - x = 1 \Rightarrow x = 2 - 1 = 1$$

19. The vertices of quadrilateral $ABCD$ is A (2, 3), B (3, 4), C(4, 5) and D (5, 6).

$$\text{Area of quadrilateral} = \frac{1}{2}|[x_1y_2 + x_2y_3 + x_3y_4 + x_4y_1] - [y_1x_2 + y_2x_3 + y_3x_4 + y_4x_1]|$$

$$= \frac{1}{2}|[2 \times 4 + 3 \times 5 + 4 \times 6 + 5 \times 3] - [3 \times 3 + 4 \times 4 + 5 \times 5 + 6 \times 2]|$$

$$= \frac{1}{2}|[8 + 15 + 24 + 15] - [9 + 16 + 25 + 12]|$$

$$= \frac{1}{2}|[62 - (62)]| = 0$$

20. Let P is a point on the perpendicular bisector of AB, its equation is

$$(y - 1) = \frac{1}{3}(x - 4) \quad \Rightarrow \quad x - 3y - 1 = 0$$

So, general point is $P(3h + 1, h)$.

$$\text{Area of } \Delta PAB = \frac{1}{2}\left| \begin{matrix} 3h+1 & h & 1 \\ 3 & 4 & 1 \\ 5 & -2 & 1 \end{matrix} \right| = \pm 10$$

$$\Rightarrow \quad h = 2, 0$$

$\therefore$ Position of points are (7, 2) and (1, 0).

21. Area of triangle $= \frac{1}{2} \times 6 \times |\alpha| = 15$

$$\Rightarrow \quad |\alpha| = 5 \quad \Rightarrow \quad \alpha = \pm 5$$

and β can take any real value.

22. Given that, $x_1 = x, \quad x_2 = 1, \quad x_3 = 0$

and $\quad y_1 = 0, \quad y_2 = 1, \quad y_3 = 2$

$\therefore$ Area of triangle

$$= \frac{1}{2}[x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)]$$

$$= \frac{1}{2}[x(1-2) + 1(2-0) + 0(0-1)]$$

$$= \frac{1}{2}[-x + 2 + 0] = \frac{1}{2}(2-x)$$

But area of triangle is 4 sq units

$$\therefore \quad \frac{1}{2}(2-x) = 4$$

$$\Rightarrow \quad 2 - x = 8 \quad \Rightarrow \quad x = -6$$

23. Let $O \equiv (0, 0)$ and $A \equiv (3, \sqrt{3})$ be the given points and let $B \equiv (x, y)$ be the required point. Then,

$OA = OB = AB$

$$\Rightarrow \quad (OA)^2 = (OB)^2 = (AB)^2$$

$$\Rightarrow \quad (3-0)^2 + (\sqrt{3} - 0)^2 = (x-0)^2 + (y-0)^2$$

$$= (x-3)^2 + (y - \sqrt{3})^2$$

$$\Rightarrow \quad 12 = x^2 + y^2 = x^2 + y^2 - 6x - 2\sqrt{3}y + 12$$

Taking first two members, then

$$x^2 + y^2 = 12 \quad \text{...(i)}$$

and taking last two members, then

$$6x + 2\sqrt{3}y = 12 \text{ or } y = \sqrt{3}(2 - x) \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$x^2 + 3(2-x)^2 = 12 \Rightarrow 4x^2 - 12x = 0$$

$$\Rightarrow \quad x = 0, 3$$

On putting $x = 0$, 3 respectively in Eq. (ii), we get $y = 2\sqrt{3}, -\sqrt{3}$

Hence, the coordinates of the third vertex B are $(0, 2\sqrt{3})$ or $(3, -\sqrt{3})$.

Short Cut Method

$$\left(\frac{x_1 + x_2 \mp \sqrt{3}(y_2 - y_1)}{2}, \frac{y_1 + y_2 \pm \sqrt{3}(x_2 - x_1)}{2}\right)$$

i.e., $$\left(\frac{0 + 3 \mp \sqrt{3}(\sqrt{3} - 0)}{2}, \frac{0 + \sqrt{3} \pm \sqrt{3}(3-0)}{2}\right)$$

$$\Rightarrow \quad = \left(\frac{3 \mp 3}{2}, \frac{\sqrt{3} \pm 3\sqrt{3}}{2}\right)$$

$$\Rightarrow \quad = (0, 2\sqrt{2}) \text{ or } (3, -\sqrt{3})$$

24. Let $A(3, 4)$ and $C(1, -1)$ be the given angular points of a square $ABCD$ and let $B(x, y)$ be the unknown vertex.

Then,

$$AB = BC$$

$$\Rightarrow \quad (AB)^2 = (BC)^2$$

$$\Rightarrow \quad (x-3)^2 + (y-4)^2 = (x-1)^2 + (y+1)^2$$

$$\Rightarrow \quad 4x + 10y - 23 = 0$$

$$\Rightarrow \quad x = \left(\frac{23 - 10y}{4}\right) \quad \text{...(i)}$$

Also in ΔABC,

$$(AB)^2 + (BC)^2 = (AC)^2$$

$$\Rightarrow (x-3)^2 + (y-4)^2 + (x-1)^2 + (y+1)^2 = (3-1)^2 + (4+1)^2$$

$$\Rightarrow \quad x^2 + y^2 - 4x - 3y - 1 = 0 \quad \text{...(ii)}$$

On substituting the value of x from Eq. (i) into Eq. (ii), we get

$$\left(\frac{23 - 10y}{4}\right)^2 + y^2 - 4\left(\frac{23 - 10y}{4}\right) - 3y - 1 = 0$$

$$\Rightarrow \quad 4y^2 - 12y + 5 = 0 \text{ or } (2y - 1)(2y - 5) = 0$$

$$\therefore \quad y = \frac{1}{2} \text{ or } \frac{5}{2}$$

On putting $y = \frac{1}{2}$ in Eq. (i), we get $x = \frac{9}{2}$,

and putting $y = \frac{5}{2}$, in Eq. (i) we get $x = -\frac{1}{2}$

Hence, the required vertices of the square are $\left(\frac{9}{2}, \frac{1}{2}\right)$ and $\left(-\frac{1}{2}, \frac{5}{2}\right)$

25. For collinearity, $\begin{vmatrix} a_1 & b_1 & 1 \\ a_2 & b_2 & 1 \\ a_3 & b_3 & 1 \end{vmatrix} = 0$

For concurrency to lines $a_i x + b_i y + 1 = 0$, $i = 1, 2, 3$, we have $\begin{vmatrix} a_1 & b_1 & 1 \\ a_2 & b_2 & 1 \\ a_3 & b_3 & 1 \end{vmatrix} = 0$, so lines are concurrent.

26. If $\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$, then the points are collinear.

27. In ΔABC the vertices are $A(-3, 0)$, $B(4, -1)$ and $C(5, 2)$.

$\therefore \quad BC = \sqrt{(5-4)^2 + (2+1)^2}$

$= \sqrt{1+9} = \sqrt{10}$

Area of ΔABC

$= \frac{1}{2}[x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)]$

$= \frac{1}{2}[-3(-1-2) + 4(2-0) + 5(0+1)]$

$= \frac{1}{2}[9 + 8 + 5] = 11$

As we know that, area of triangle $= \frac{1}{2} \times BC \times AL$

$\Rightarrow \quad 11 = \frac{1}{2} \times \sqrt{10} \times AL$

$\Rightarrow \quad AL = \frac{2 \times 11}{\sqrt{10}} = \frac{22}{\sqrt{10}}$

28. Since, the triangle is an equilateral triangle, therefore its area is given by

$$\Delta = \frac{\sqrt{3}}{4} a^2 \quad \text{...(i)}$$

Also, if $(x_1, y_1), (x_2, y_2)$ and (x_3, y_3) are the vertices of same triangle, then

$$\Delta = \frac{1}{2}\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = \frac{\sqrt{3}}{2} a^2$$

$$\Rightarrow \quad \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}^2 = \frac{3}{4} a^4$$

29. Area of triangle $= \frac{1}{2}\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$

= A rational number if vertices have integral coordinates only.

If triangle is equilateral, then area

$= \frac{\sqrt{3}}{4}[(x_1 - x_2)^2 + (y_1 - y_2)^2] =$ irrational quantity

So, triangle cannot be equilateral.

30. Since, (0, 1), (1, 1) and (1, 0) are mid-points of sides AB, BC and CA, respectively.

$\therefore$ Coordinates of A, B and C are (0, 0), (0, 2) and (2, 0), respectively.

Now, $\quad AB = 2, \quad BC = 2\sqrt{2}, \quad CA = 2$

$\therefore$ x-coordinate of incentre

$= \frac{0 + 0 + 2 \cdot 2}{2 + 2\sqrt{2} + 2} \qquad \left(\because x = \frac{ax_1 + bx_2 + cx_3}{a + b + c}\right)$

$= \frac{2}{2 + \sqrt{2}} = 2 - \sqrt{2}$

31. Line perpendicular to OA passing through B is $x = 4$.

Slope of $AB = -\frac{3}{2}$

Line perpendicular to AB through origin is $y = \frac{2}{3}x$.

$\therefore$ The point of intersection of a line $x = 4$ and $y = \frac{2}{3}x$ is $\left(4, \frac{8}{3}\right)$.

32. As we know that orthocentre, centroid and circumcentre are collinear and the centroid divides the line segment joining orthocentre and circumcentre in the ratio 2 : 1. If the coordinates of orthocentre and circumcentre are (1, 1) and (3, 2) respectively, the coordinate of centroid is

$$\left(\frac{2 \cdot 3 + 1 \cdot 1}{2+1}, \frac{2 \cdot 2 + 1 \cdot 1}{2+1}\right) = \left(\frac{7}{3}, \frac{5}{3}\right)$$

33. Given equation of lines are

$x = 0, \quad y = 0$ and $3x + 4y = 12$

Incentre is on the line $y = x$ (Angle bisector of OA and OB)

Angle bisector of $y = 0$ and $3x + 4y = 12$ is

$\pm 5y = 3x + 4y - 12$

$\Rightarrow \quad 3x + 9y = 12$ and $3x - y = 12$

Here, $3x + 9y = 12$ internal bisector.

So, intersection point of $y = x$ and $3x + 9y = 12$ is (1, 1).

$\therefore$ The required point of the incentre of triangle is (1, 1).

34. Let $A[at_1t_2, a(t_1 + t_2)]$, $B[at_2t_3, a(t_2 + t_3)]$, $C[at_3t_1, a(t_3 + t_1)]$

Slope of $AB(m_{AB}) = \frac{a(t_3 - t_1)}{at_2(t_3 - t_1)} = \frac{1}{t_2}$

Equation of line through C perpendicular to AB is

$$y - a(t_3 + t_1) = -t_2(x - at_3t_1)$$

$$\Rightarrow \quad y - a(t_3 + t_1) = -t_2x + at_1t_2t_3 \quad \text{...(i)}$$

Similarly, equation of line through B perpendicular to CA is

$$y - a(t_2 + t_3) = -t_1(x - at_2t_3)$$

$$\Rightarrow \quad y - a(t_2 + t_3) = -t_1x + at_1t_2t_3 \quad \text{...(ii)}$$

Using $t_1t_2t_3 = -(t_1 + t_2 + t_3)$ in Eqs. (i) and (ii), we get

$$y = -t_2x - at_2 \text{ and } y = -t_1x - at_1$$

$$\Rightarrow \quad t_2(x + a) = t_1(x + a) \Rightarrow x = -a, \quad y = 0$$

35. Triangle is right angled triangle. In right angled triangle mid-point of hypotenuse is circumcentre.

So, coordinates of the circumcentre are (5, 2).

36. Let $O(0, 0)$ be the orthocentre, $A(h, k)$ be the third vertex and $B(-2, 3)$ and $C(5, -1)$ the other two vertices. Then, the slope of the line through A and O is $\frac{k}{h}$, while the line through B and C has the slope $\frac{(-1-3)}{(5+2)} = -\frac{4}{7}$. By the poperty of the orthocentre, these two lines must be perpendicular, so we have

$$\left(\frac{k}{h}\right)\left(-\frac{4}{7}\right) = -1$$

$$\Rightarrow \quad \frac{k}{h} = \frac{7}{4} \quad \text{...(i)}$$

Also, $$\frac{5-2+h}{3} + \frac{-1+3+k}{3} = 7$$

$$\Rightarrow \quad h + k = 16 \quad \text{...(ii)}$$

which is not satisfied by the points given in the options (a), (b) or (c).

37.

$\angle AOM$ is 30°. Hence, required point of B is $(-3, 3\sqrt{3})$.

38. Since, coordinates of the centroid are $\left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3}\right)$, the centroid is always a rational point.

39. Let $(x_1, y_1), (x_2, y_2)$ and (x_3, y_3) are coordinates of the points D, E and F, which divide each AB, BC and CA respectively in the ratio 3 : 1 (internally).

$$\therefore \quad x_1 = \frac{3 \times 6 - 1 \times 1}{4} = \frac{17}{4}$$

$$y_1 = \frac{-2 \times 3 + 4 \times 1}{4} = -\frac{2}{4} = -\frac{1}{2}$$

Similarly, $x_2 = 0$, $y_2 = \frac{5}{2}$ and $x_3 = -\frac{5}{4}$, $y_3 = 4$

Let (x, y) be the coordinates of centroid of ΔDEF

$$\therefore \quad x = \frac{1}{3}\left(\frac{17}{4} + 0 - \frac{5}{4}\right) = 1$$

and $$y = \frac{1}{3}\left(-\frac{1}{2} + \frac{5}{2} + 4\right) = 2$$

$\therefore$ Coordinates of centroid are (1, 2).

40. Given orthocentre $O(0, 1)$, centroid $G(2, 3)$. Let the circumcentre be (x, y).

Since, we know that centroid divide orthocentre and circumcentre in the ratio 2 : 1.

$$\therefore \quad G(2, 3) = G\left[\frac{2(x) + 1(0)}{2+1}, \frac{2(y) + 1(1)}{2+1}\right]$$

$$\Rightarrow \quad G(2, 3) = G\left(\frac{2x}{3}, \frac{2y+1}{3}\right)$$

$$\therefore \quad 2 = \frac{2x}{3} \text{ and } 3 = \frac{2y+1}{3}$$

$$\Rightarrow \quad x = 3 \text{ and } y = 4$$

41. Let the third vertex of the triangle be (x, y), then

$$\frac{x + 4 + (-2)}{3} = 2 \Rightarrow x = 4$$

and $$\frac{y + 8 + 6}{3} = 7 \Rightarrow y = 7$$

$\therefore$ The coordinates of the third vertex are (4, 7).

42. Let $P(h, k)$ be the required point, then

$$4PA^2 = 9PB^2$$

$$\Rightarrow \quad 4(h^2 + k^2) = 9(h - 4)^2 + 9(k + 3)^2$$

$$\Rightarrow \quad 4h^2 + 4k^2 = 9(h^2 + 16 - 8h) + 9(k^2 + 9 + 6k)$$

$$\Rightarrow \quad 5h^2 + 5k^2 - 72h + 54k + 225 = 0$$

$\therefore$ Required locus of $P(h, k)$ is

$$5x^2 + 5y^2 - 72x + 54y + 225 = 0$$

43. Let the point be $P(h, k)$.

It is given that difference of the distance from points $A(3, 0)$ and $B(-3, 0)$ is 4 *i.e.*, $PA - PB = 4$

$$\Rightarrow \quad \sqrt{(h-3)^2+k^2} - \sqrt{(h+3)^2+k^2} = 4$$

$$\Rightarrow \quad \sqrt{(h-3)^2+k^2} = 4 + \sqrt{(h+3)^2+k^2}$$

On squaring both sides, we get

$$(h-3)^2+k^2 = 16 + (h+3)^2 + k^2 + 8\sqrt{(h+3)^2+k^2}$$

$$\Rightarrow \quad h^2+9-6h+k^2 = 16+h^2+9+6h+k^2+8\sqrt{(h+3)^2+k^2}$$

$$\Rightarrow \quad -6h = 16+6h+8\sqrt{(h+3)^2+k^2}$$

$$\Rightarrow \quad -8\sqrt{(h+3)^2+k^2} = 12h+16$$

Again, squaring both sides, we get

$$64\{(h+3)^2+k^2\} = (12h+16)^2$$

$$\Rightarrow \quad 64(h^2+9+6h+k^2) = 144h^2+256+2\cdot 16\cdot 12h$$

$$\Rightarrow \quad 64(h^2+9+6h+k^2) = 16(9h^2+16+24h)$$

$$\Rightarrow \quad 4(h^2+9+6h+k^2) = 9h^2+16+24h$$

$$\Rightarrow \quad 4h^2+36+24h+4k^2 = 9h^2+16+24h$$

$$\Rightarrow \quad 5h^2-4k^2 = 20$$

$$\Rightarrow \quad \frac{h^2}{4} - \frac{k^2}{5} = 1$$

Hence, the locus of point P is $\frac{x^2}{4} - \frac{y^2}{5} = 1$.

44. Let (h, k) be the point.

According to the question,

$$4\sqrt{(h-h)^2+k^2} = h^2+k^2$$

$$\Rightarrow \quad 4|k| = h^2+k^2$$

Locus of the point is

$$4|y| = x^2+y^2 \quad \Rightarrow \quad x^2+y^2-4|y| = 0$$

45. $\therefore \quad h = \frac{1(a)+2\cdot 0}{2+1}$

and $\quad k = \frac{1\cdot 0+2\cdot b}{2+1}$

$$\Rightarrow \quad h = \frac{a}{3} \text{ and } k = \frac{2b}{3}$$

$$\Rightarrow \quad a = 3h \text{ and } b = \frac{3k}{2}$$

$$\therefore \quad 9h^2 + \frac{9k^2}{4} = l^2 \Rightarrow 36h^2+9k^2 = 4l^2$$

Hence, locus of a point is $36x^2 + 9y^2 = 4l^2$

46. Since, $A(ae, 0)$ and $B(-ae, 0)$ be the given points and let $P(h, k)$ be any point whose distance from A and B is constant *i.e.*, $2a$.

i.e., $\quad |PA| + |PB| = 2a$

$$\Rightarrow \quad \sqrt{(h-ae)^2+k^2} + \sqrt{(h+ae)^2+k^2} = 2a \quad \text{...(i)}$$

Let us assume

$$\{(h-ae)^2+k^2\} - \{(h+ae)^2+k^2\} = -4aeh \quad \text{...(ii)}$$

On dividing Eq. (ii) by Eq. (i), we have

$$\frac{\{(h-ae)^2+k^2\} - \{(h+ae)^2+k^2\}}{\sqrt{(h-ae)^2+k^2} + \sqrt{(h+ae)^2+k^2}} = \frac{4aeh}{2a}$$

$$\Rightarrow \quad \sqrt{(h-ae)^2+k^2} - \sqrt{(h+ae)^2+k^2} = -2eh \quad \text{...(iii)}$$

$$\{\because a-b = (\sqrt{a}+\sqrt{b})(\sqrt{a}-\sqrt{b})\}$$

On adding Eqs. (i) and (iii), we have

$$2\sqrt{(b-ae)^2+k^2} = 2a-2eh$$

$$\Rightarrow \quad 2\sqrt{(h-ae)^2+k^2} = 2(a-eh)$$

On squaring both sides, we have

$$(h-ae)^2+k^2 = (a-eh)^2$$

$$\Rightarrow \quad h^2+a^2e^2-2aeh+k^2 = a^2+e^2h^2-2aeh$$

$$h^2-e^2h^2+k^2 = a^2-a^2e^2$$

$$\Rightarrow \quad h^2(1-e^2)+k^2 = a^2(1-e^2)$$

Replacing h by x and k by y, we get the locus of point $P(h, k)$ which is the locus of an ellipse.

$$\frac{x^2}{a^2} + \frac{y^2}{a^2(1-e^2)} = 1$$

47. Let $Q(x, y)$ be a point.

Such that, $\quad AQ - BQ = \pm 1$

$$\Rightarrow \quad \sqrt{(x-1)^2+y^2} - \sqrt{(x+1)^2+y^2} = \pm 1$$

Assuming $[(x-1)^2+y^2] + [(x+1)^2+y^2]$

$$-2\sqrt{(x-1)^2+y^2}\sqrt{(x+1)^2+y^2} = 1$$

$$\Rightarrow \quad 2x^2+2y^2+1 = 2\sqrt{(x-1)^2+y^2}\sqrt{(x+1)^2+y^2}$$

On squaring, we have

$$12x^2-4y^2 = 3$$

48. Let $P(h, k)$ be the point such that

$$|PA|^2 + |PB|^2 = |AB|^2$$

$$\Rightarrow \quad (h-2)^2+k^2+(h+2)^2+k^2 = 4^2+0$$

$$\Rightarrow \quad 2h^2+8+2k^2 = 16$$

$$\Rightarrow \quad h^2+k^2 = 4$$

$\therefore$ Locus of P is $x^2+y^2 = 4$.

49. Slope of line $AC = m_{AC} = \dfrac{k-0}{h-a} = \tan\alpha$

Slope of line BC $= m_{BC} = \dfrac{k-0}{h+a} = \tan\beta$

Since, $\angle A = \pi - \alpha$ (from figure)

$\therefore$ $\tan A = \tan(\pi - \alpha) = -\tan\alpha = -\dfrac{k}{h-a}$ ...(i)

Similarly, $\angle B = \beta$

$\therefore$ $\tan B = \tan\beta = \dfrac{k}{h+a}$ ...(ii)

Also, $A - B = \theta$ (given)

$\therefore$ $\tan(A - B) = \tan\theta$

$\Rightarrow$ $\dfrac{\tan A - \tan B}{1 + \tan A \tan B} = \tan\theta$

$\Rightarrow$ $\dfrac{\left(\dfrac{-k}{h-a}\right) - \left(\dfrac{k}{h+a}\right)}{1 + \left(\dfrac{-k}{h-a}\right)\left(\dfrac{k}{h+a}\right)} = \tan\theta$ [using Eqs. (i) and (ii)]

$\Rightarrow$ $\tan\theta = \dfrac{-k(h+a) - k(h-a)}{(h^2 - a^2) + (-k^2)}$

$\Rightarrow$ $\tan\theta = \dfrac{-2hk}{h^2 - k^2 - a^2}$

$\Rightarrow$ $h^2 - k^2 + 2hk\cot\theta = a^2$

Replacing h by x and k by y, we have the locus of point C is

$$x^2 - y^2 + 2xy\cot\theta = a^2.$$

50. Let $G(h, k)$ be the centroid of the triangle having vertices $A(\cos\alpha, \sin\alpha), B(\sin\alpha, -\cos\alpha), C(1, 2)$

Then, $h = \dfrac{\cos\alpha + \sin\alpha + 1}{3}$

and $k = \dfrac{\sin\alpha - \cos\alpha + 2}{3}$ (by definition)

$\Rightarrow$ $3h - 1 = \cos\alpha + \sin\alpha$

and $3k - 2 = \sin\alpha - \cos\alpha$

$\Rightarrow$ $(3h-1)^2 + (3k-2)^2 = 2$ (squaring and adding)

$\Rightarrow$ $9(h^2 + k^2) - 6h - 12k + 3 = 0$

$\Rightarrow$ $3(h^2 + k^2) - 2h - 4k + 1 = 0$

$\therefore$ Locus of centroid $G(h, k)$ is

$$3(x^2 + y^2) - 2x - 4y + 1 = 0.$$

which is a circle.

51. We know, if coordinate axes are rotated, then

$$p = (x\cos\theta - y\sin\theta, x\sin\theta + y\cos\theta)$$

It is rotated at an angle 135° *i.e.*, $\theta = 135°$ and the new point be

$$p = [4\cos(90° + 45°) + 3\sin(90° + 45°),$$
$$4\sin(90° + 45°) - 3\cos(90° + 45°)]$$
$$= [-4\sin 45° + 3\cos 45°, 4\cos 45° + 3\sin 45°]$$
$$= \left[4\cdot\left(\frac{-1}{\sqrt{2}}\right) + 3\cdot\frac{1}{\sqrt{2}}, 4\cdot\frac{1}{\sqrt{2}} + 3\cdot\frac{1}{\sqrt{2}}\right] = \left(-\frac{1}{\sqrt{2}}, \frac{7}{\sqrt{2}}\right)$$

52. Slope of line $OP = \dfrac{3}{4}$, let new position is $Q(x, y)$.

Slope of $OQ = \dfrac{y}{x}$ also $x^2 + y^2 = OQ^2 = 25 = (OP^2)$

$$\tan 45° = \left|\frac{\dfrac{y}{x} - \dfrac{3}{4}}{1 + \dfrac{3y}{4x}}\right| \Rightarrow \pm 1 = \frac{4y - 3x}{4x + 3y}$$

Straight lines and pair of straight lines

$$4x + 3y = 4y - 3x \text{ or } -4x - 3y = 4y - 3x$$

$$x = \frac{1}{7}y \quad \text{...(i)}$$

$$-x = 7y \quad \text{...(ii)}$$

Correct relation is $x = \dfrac{1}{7}y$ as new point must lies in Ist quadrant.

$$x^2 + 49x^2 = 25$$

$$\Rightarrow \quad x = -\frac{1}{\sqrt{2}}, \quad y = \frac{7}{\sqrt{2}}$$

53. Let $X = x - h, \quad Y = y - k$

$\Rightarrow$ $0 = 7 - h, \quad 0 = -4 - k$

$\Rightarrow$ $h = 7, \quad k = -4$

Hence, $X = x - 7$ and $Y = y + 4$, then the point (4, 5) shifted to $(-3, 9)$.

54. Let $P(x', y')$ be the coordinates of the point obtained by rotating the axes through an angle of 60°.

$\therefore$ The transformation matrix can be written as

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}\begin{bmatrix} x \\ y \end{bmatrix}$$

$$\Rightarrow \quad \begin{bmatrix} 2 \\ -\sqrt{3} \end{bmatrix} = \begin{bmatrix} \dfrac{1}{2} & \dfrac{\sqrt{3}}{2} \\ -\dfrac{\sqrt{3}}{2} & \dfrac{1}{2} \end{bmatrix}\begin{bmatrix} x \\ y \end{bmatrix}$$

$$\Rightarrow \quad \begin{bmatrix} 2 \\ -\sqrt{3} \end{bmatrix} = \begin{bmatrix} \dfrac{x}{2} + \dfrac{\sqrt{3}y}{2} \\ -\dfrac{\sqrt{3}x}{2} + \dfrac{y}{2} \end{bmatrix}$$

$\Rightarrow$ $x + \sqrt{3}y = 4$ and $\sqrt{3}x - y = 2\sqrt{3}$

On solving the above equations, we have

$$(x, y) \equiv \left(\frac{5}{2}, \frac{\sqrt{3}}{2}\right)$$

55. Let the new coordinates of point $P(x, y)$ after shifting the origin to (h, k) is $P(x', y')$.

$\Rightarrow$ $x' = x - h$ and $y' = y - k$

$\Rightarrow$ $x = x' + h$ and $y = y' + k$

Since, (x, y) satisfy the equation, we have

$$(x' + h)^2 + (y' + k)^2 - 4(x' + h) + 6(y' + k) - 7 = 0$$

$$\Rightarrow \quad (x')^2 + (y')^2 + 2(h - 2)x' + 2(k + 3)y' + (h^2 + k^2 - 4h + 6k - 7) = 0$$

Since, the terms containing linear powers are missing

$\therefore$ $h - 2 = 0$ and $k + 3 = 0$

$\Rightarrow$ $(h, k) \equiv (2, -3)$

56. Since, the line L makes intercepts a and b along axes.

$\Rightarrow$ The line L passes through $(a, 0)$ and $(0, b)$.

Similarly, the same line passes through $(p, 0)$ and $(0, q)$ after rotation

$$\therefore \quad \begin{bmatrix} p \\ 0 \end{bmatrix} = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} a \\ 0 \end{bmatrix}$$

$$\Rightarrow \quad \begin{bmatrix} p \\ 0 \end{bmatrix} = \begin{bmatrix} a\cos\theta \\ -a\sin\theta \end{bmatrix}$$

$\Rightarrow$ $p = a\cos\theta$ or $-a\sin\theta = 0$ ...(i)

Also, $$\begin{bmatrix} 0 \\ q \end{bmatrix} = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} 0 \\ b \end{bmatrix}$$

$$\Rightarrow \quad \begin{bmatrix} 0 \\ q \end{bmatrix} = \begin{bmatrix} -b\sin\theta \\ b\cos\theta \end{bmatrix}$$

$\Rightarrow$ $-b\sin\theta = 0$ or $b\cos\theta = q$ ...(ii)

From Eqs. (i) and (ii), we get it is clear that

$\sin\theta = 0$

$\Rightarrow$ $\theta = n\pi$

$\Rightarrow$ $p = a(\pm 1)$ or $q = b(\pm 1)$ [using Eqs. (i) and (ii)]

On squaring and adding, we have

$$a^2 + b^2 = p^2 + q^2$$

57. Since, y_1, y_2, y_3 and x_1, x_2, x_3 are in AP.

$\therefore$ $y_2 - y_1 = y_3 - y_2$ and $x_2 - x_1 = x_3 - x_2$

So, $$\frac{y_3 - y_2}{x_3 - x_2} = \frac{y_2 - y_1}{x_2 - x_1}$$

So, points are collinear.

58. The vertices of a ΔABC are $A(0, b)$, $B(0, 0)$ and $C(a, 0)$.

Mid-point of E and D are $\left(\frac{a}{2}, \frac{b}{2}\right)$ and $\left(\frac{a}{2}, 0\right)$.

The slope of median BE, $m_1 = \frac{b}{a}$

and slope of AD, $m_2 = -\frac{2b}{a}$

Since, the medians are perpendicular to each other.

$\therefore$ $m_1 m_2 = -1$

$\Rightarrow$ $\frac{b}{a} \times \left(\frac{-2b}{a}\right) = -1$

$\Rightarrow$ $-2b^2 = -a^2 \Rightarrow a = \pm\sqrt{2}b$

Round II

1. Let $\angle OAB = \theta$

Then, $OA + AB = 1 + 4\cot\theta + 4 + \tan\theta$

$= 5 + 4\cot\theta + \tan\theta \geq 5 + 4 = 9$

(using AM $\geq$ GM)

2. Let $A(2, 1)$, $B(-2, 4)$ $\therefore AB = 5$

Hence, the locus is the line segment AB.

3. Since, reflection of the orthocentre of ΔABC in base BC will always lie on the circumcircle of the ΔABC, therefore coordinate of a point lying on the circumcircle is $\left(1 - \frac{1 \times 4}{2}, 1 - \frac{1 \times 4}{2}\right)$ *i.e.*, $(-1, -1)$ and coordinates of the circumcentre is $(2, 0)$.

$\therefore$ Radius of the circumcircle of $\Delta ABC = \sqrt{(2+1)^2 + (1)^2}$

$= \sqrt{10}$

4. $(3 - 10 + a)(9 - 20 + a) > 0$

or $(a - 7)(a - 11) > 0$

$\therefore$ $a \in (-\infty, 7) \cup (11, \infty)$

5. Let the new coordinates be $P(x', y')$ after shifting origin to $P(x', y')$ *i.e.*, $x = x' + h$ and $y = y' + k$

$\therefore$ $(x' + h)^2 + (y' + k)^2 - 4(x' + h) + 6(y' + k) - 7 = 0$

$\Rightarrow \quad (x')^2 + (y')^2 + 2(h-2)x' + 2(k+3)y'$
$+ (h^2 + k^2 - 4h + 6k - 7) = 0$

According to the question,

$h - 2 = 0$ and $k + 3 = 0$

$\Rightarrow \quad (h, k) = (2, -3)$

6. $(x+1)^2 + y^2 + (x-2)^2 + y^2 = 2[(x-1)^2 + y^2]$

On simplification, we get $2x + 3 = 0$

7. The diagonals meet at the mid-point of AC, *i.e.*, at $(3, 2)$ which lies on $y = 2x + c$

$\therefore \quad c = -4$

Let $\quad B = (\alpha, 2\alpha - 4)$

$\because \quad AB \perp BC$

$\Rightarrow \quad \left(\frac{2\alpha - 7}{\alpha - 1}\right)\left(\frac{2\alpha - 5}{\alpha - 5}\right) = -1$

$\therefore \quad \alpha^2 - 6\alpha + 8 = 0 \Rightarrow \alpha = 2, 4$

The other two vertices are (2, 0) and (4, 4).

8. $BP - AP = \pm 6$ or $BP = AP \pm 6$

$\Rightarrow \quad \sqrt{x^2 + (y+4)^2} = \sqrt{x^2 + (y-4)^2} \pm 6$

On squaring and simplifying, we get

$4y - 9 = \pm 3\sqrt{x^2 + (y-4)^2}$

Again squaring, we get

$9x^2 - 7y^2 + 63 = 0$

9. Let $H(3, \alpha)$ is the orthocentre.

$\therefore$ Slope of $BH \times$ Slope of $AC = -1$

$\Rightarrow \quad -\alpha \cdot \frac{4}{3} = -1$

$\Rightarrow \quad \alpha = \frac{3}{4}$

Hence, orthocentre of a triangle is $\left(3, \frac{3}{4}\right)$.

10. $y = |x - 2| \Rightarrow y = x - 2$ and $y = 2 - x$

Area of shaded region $= 2\,ABC = 2 \cdot \frac{1}{2} \cdot 1 \cdot 1 = 1$

11. Let P be the middle point of the line segment joining $A(3, -1)$ and $B(1, 1)$ is $(2, 0)$.

Let P be shifted to Q by 2 unit and y-coordinate of Q is greater than that of P.

Now, slope of $AB = \frac{1-(-1)}{1-3} = 1$,

then slope of $PQ = -1$

The coordinate of Q becomes $(2 \pm 2\cos\theta, 0 \pm 2\sin\theta)$, where $\tan\theta = 1$

i.e., $\quad (2 \pm \sqrt{2}, \pm\sqrt{2})$

As, y-coordinate of Q is greater than that of P.

$\therefore$ We take $\quad Q = (2 + \sqrt{2}, \sqrt{2})$

12. Let the vertex $A(x, y)$ is equidistant from B and C.

$\therefore \quad (x-1)^2 + (y-3)^2 = (x+2)^2 + (y-7)^2$

$\Rightarrow \quad 6x - 8y + 43 = 0$

Only the option (c) satisfy it.

13. OP is inclined at angle θ with x-axis and OQ is inclined at angle $\alpha - \theta$ with x-axis.

The bisector of $\angle POQ$ is inclined at angle

$\frac{\theta + \alpha - \theta}{2} = \frac{\alpha}{2}$ with x-axis

14. Since, $AB = AC = \sqrt{2}$

The slope AB is 1. Hence, AB is inclined at 45° with the x-axis and AC is inclined at 60° with the x-axis. Equation of AC is

$$y = \sqrt{3}\,(x - 2).$$

The coordinates of C is $(2 + \sqrt{2}\cos 60°, 0 + \sqrt{2}\sin 60°)$

or $$\left(2 + \frac{1}{\sqrt{2}}, \sqrt{\frac{3}{2}}\right)$$

15. Let $\angle RPQ = \theta$ and $\angle RQP = \phi$

$\therefore \quad \theta - \phi = 2\alpha$

Let $RM \perp PQ$, so that $RM = k$,

$$MP = a - h \quad \text{and} \quad MQ = a + h$$

Then, $$\tan\theta = \frac{RM}{MP} = \frac{k}{a-h}$$

and $$\tan\phi = \frac{RM}{MQ} = \frac{k}{a+h}$$

Again now, $2\alpha = \theta - \phi$

$$\therefore \quad \tan 2\alpha = \tan(\theta - \phi) = \frac{\tan\theta - \tan\phi}{1 + \tan\theta\tan\phi} = \frac{k(a+h) - k(a-h)}{a^2 - h^2 + k^2}$$

$$\Rightarrow \quad a^2 - h^2 + k^2 = 2hk\cot 2\alpha$$

Hence, the locus is $x^2 - y^2 + 2xy\cot 2\alpha - a^2 = 0$

16. As the third vertex lies on the line $y = x + 3$, its coordinates are of the form $(x, x + 3)$. The area of the triangle with vertices $(2, 1), (3, -2)$ and $(x, x + 3)$ is given by

$$\frac{1}{2}\left\|\begin{matrix} x & x+3 & 1 \\ 2 & 1 & 1 \\ 3 & -2 & 1 \end{matrix}\right\|$$

$$\Rightarrow \quad |2x - 2| = 5 \quad \text{(given)}$$

$$\therefore \quad 2x - 2 = \pm 5$$

$$\Rightarrow \quad x = 3/2,\ 7/2$$

Thus, the coordinates of the third vertex are (7/2, 13/2) or (–3/2, 3/2)

17. Let $A \equiv (p + 1, 1)$, $B = (2p + 1, 3)$ and $C \equiv (2p + 2, 2p)$

$\therefore$ Slope of AB = slope of AC

$$\Rightarrow \quad \frac{3-1}{2p+1-p-1} = \frac{2p-1}{2p+2-p-1}$$

$$\Rightarrow \quad \frac{2}{p} = \frac{2p-1}{p+1}$$

$$\Rightarrow \quad 2p + 2 = 2p^2 - p$$

$$\Rightarrow \quad 2p^2 - 3p - 2 = 0$$

$$(2p + 1)(p - 2) = 0$$

$$\Rightarrow \quad p = 2, -\frac{1}{2}$$

18. P, Q divides AB in the ratio of 1 : 2 and 2 : 1 respectively and hence the coordinates of P and Q are

$$\left[\frac{1\times 2 + 2(-3)}{3}, \frac{1\times 3 + 2\times 2}{3}\right]$$

and $$\left[\frac{2\times 2 + 1(-3)}{3}, \frac{2\times 3 + 1\times 2}{3}\right]$$

$$\Rightarrow \quad P\left(-\frac{4}{3}, \frac{7}{3}\right) \text{ and } Q\left(\frac{1}{3}, \frac{8}{3}\right), \text{ then}$$

$$PQ = \sqrt{\left(\frac{1}{3} + \frac{4}{3}\right)^2 + \left(\frac{8}{3} - \frac{7}{3}\right)^2} = \frac{\sqrt{26}}{3}$$

Let the coordinates of R be (x, y).

Then, $$QR = PQ \Rightarrow \left(x - \frac{1}{3}\right)^2 + \left(y - \frac{8}{3}\right)^2 = \frac{26}{9} \quad \text{...(i)}$$

and QR is perpendicular to PQ.

$$\Rightarrow \quad \frac{y - \frac{8}{3}}{x - \frac{1}{3}} \times \frac{\frac{8}{3} - \frac{7}{3}}{\frac{1}{3} + \frac{4}{3}} = -1$$

$$\Rightarrow \quad \left(y - \frac{8}{3}\right) = -5\left(x - \frac{1}{3}\right) \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$26\left(x - \frac{1}{3}\right)^2 = \frac{26}{9}, x - \frac{1}{3} = \pm\frac{1}{3}$$

$$\Rightarrow \quad x = 0 \text{ or } x = \frac{2}{3}$$

From Eq. (ii), when $x = 0, y = \frac{13}{3}$ and when $x = \frac{2}{3}, y = 1$.

So, the required coordinates of R are $\left(0, \frac{13}{3}\right)$ or $\left(\frac{2}{3}, 1\right)$.

19. Since, triangle is right angled, circumcentre is the mid-point of PQ and orthocentre is $R(1, -7)$.Hence,

$$RM = \left|\sqrt{\left(\frac{23}{2}+1\right)^2}\right| = 12\frac{1}{2} = \frac{25}{2}$$

20. The coordinates of the incentre are given as follows

$$\bar{x} = \frac{20(-8)+15(-15)+25(1)}{20+15+25}$$

$$= \frac{-360}{60} = -6$$

$$\bar{y} = \frac{20(5)+15(-19)+25(-7)}{60} = -6$$

Hence, incentre I is $(-6, -6)$.

Now, equation of side PR is

$$y + 7 = \frac{12}{-9}(x-1)$$

$\Rightarrow$ $4x - 4 = -3y - 21$

$\Rightarrow$ $4x + 3y + 17 = 0$

Inradius is given as the distance of I from side PR,

i.e., $\frac{|-24-18+17|}{5} = 5$

21. Coordinates of D using section formula are $(-5. -23/2)$ and $m_{PD} = -\frac{11}{2}$

$\therefore$ Equation of PD is $11x + 2y + 78 = 0$.

$\Rightarrow$ $a + c = 89$

22. The orthocentre lies on the line joining the points (0, 0) and (3, 5) *i.e.*, $5x - 3y = 0$.

Also, statement II is true.

23. Statement II is true as the coordinates of the point P in new system are $(\alpha - 1 - 2, \alpha + 1 - 3)$.

In statement I, the centroid is (2, 3), so the coordinates of the vertices in the new system of coordinates are $(-2, -3)$, (1, 0), (1, 3).

24. Area of triangle

$$A = \frac{1}{2}|-ab\sin\theta\cos\theta - ab\sin\theta\cos\theta|$$

$$= |ab\sin\theta\cos\theta| = \left|\frac{ab}{2}\sin 2\theta\right|$$

$\therefore$ $A_{max} = \frac{|ab|}{2}$

25. We know that, if sum of algebraic distances from three points on the variable line is zero, then the line always passes through the mean of the given point, which is centroid of triangle formed by given three points. But centroid of triangle is (1, 2). Hence, the line must pass through it, for which $a + 2b + c = 0$. Therefore, statement I is false and statement II is true.

26. Given mid-points of a triangle are (0, 1), (1, 1) and (1, 0). Plotting these points on a graph paper and make a triangle.

So, the sides of a triangle will be 2, 2 and $\sqrt{2^2+2^2}$ *i.e.*, $2\sqrt{2}$

x-coordinate of incentre $= \frac{2\times 0 + 2\sqrt{2}\cdot 0 + 2\cdot 2}{2+2+2\sqrt{2}}$

$$= \frac{2}{2+\sqrt{2}} \times \frac{2-\sqrt{2}}{2-\sqrt{2}}$$

$$= 2 - \sqrt{2}$$

27. Using section formula, the coordinates of the point P, which divides AB internally in the ratio 3 : 2 are

$$P\left(\frac{3\times 2 + 2\times 1}{3+2}, \frac{3\times 4 + 2\times 1}{3+2}\right) \equiv P\left(\frac{8}{5}, \frac{14}{5}\right)$$

Also, since the line L passes through P, hence substituting the coordinates of $P\left(\frac{8}{5}, \frac{14}{5}\right)$ in the equation of $L: 2x + y = k$, we get

$\Rightarrow$ $2\left(\frac{8}{5}\right) + \left(\frac{14}{5}\right) = k$

$\Rightarrow$ $k = 6$

28. The third vertex lies on $2x + 3y = 9$

i.e., $\left(x, \frac{9-2x}{3}\right)$

$\therefore$ Locus of centroid is

$$\left(\frac{2-2+x}{3}, \frac{-3+\frac{9-2x}{3}+1}{3}\right) = (h, k)$$

$\therefore \quad h = \frac{x}{3}$

$k = \frac{3-2x}{9}$

$\Rightarrow \quad 9k = 3 - 2(3h)$

$\Rightarrow \quad 9k = 3 - 6h$

$\Rightarrow \quad 2h + 3k = 1$

Hence, locus of a point is

$\Rightarrow \quad 2x + 3y = 1$

29. Let (x, y) denotes the coordinates in A, B and C plane.

Then, $\frac{(x-1)^2 + y^2}{(x+1)^2 + y^2} = \frac{1}{9}$

$\Rightarrow \quad 9x^2 + 9y^2 - 18x + 9 = x^2 + y^2 + 2x + 1$

$\Rightarrow \quad 8x^2 + 8y^2 - 20x + 8 = 0$

$\Rightarrow \quad x^2 + y^2 - \frac{5}{2}x + 1 = 0$

$\therefore A, B$ and C lie on a circle with $C(5/4, 0)$.

30. Now, $AB = \sqrt{(1-h)^2 + (1-k)^2}$

$BC = \sqrt{(2-1)^2 + (1-1)^2} = 1$

and $CA = \sqrt{(h-2)^2 + (k-1)^2}$

Since, $AC^2 = AB^2 + BC^2$

$\Rightarrow \quad h^2 + 4 - 4h + k^2 + 1 - 2k$

$= 1 + h^2 - 2h + k^2 + 1 - 2k$

$\Rightarrow \quad h = 1 \quad \ldots(i)$

$\therefore$ Area of $\Delta ABC = \frac{1}{2} \times AB \times BC$

$\Rightarrow \quad 1 = \frac{1}{2} \times \sqrt{(1-h)^2 + (1-k)^2} \times 1$

$\Rightarrow \quad 2 = \sqrt{(k-1)^2}$ [from Eq. (i)]

$\Rightarrow \quad 4 = k^2 + 1 - 2k$

$\Rightarrow \quad (k-3)(k+1) = 0$

$\Rightarrow \quad k = -1, 3$

31. Let ABC be the triangle with $A(1, 1)$. The mid-point of AB is $(-1, 2)$.

$\Rightarrow \quad B(-3, 3)$

The mid-point of AC is $(3, 2)$

$\Rightarrow \quad C(5, 3)$

Hence, centroid is $\left(1, \frac{7}{3}\right)$.

32. Let the third vertex be $C(x_1, y_1)$.

The centroid is $\left(\frac{2-2+x_1}{3}, \frac{-3+1+y_1}{3}\right)$.

i.e., $\left(\frac{x_1}{3}, \frac{y_1-2}{3}\right)$

It lies on the line $2x + 3y = 1$,

$\therefore \quad \frac{2}{3}(x_1) + 3\left(\frac{y_1-2}{3}\right) = 1$

Hence, the locus of C is $2x + 3y = 9$.

12 Straight Lines

JEE Main MILESTONE

- Straight Line

12.1 Straight Line

A straight line is the locus of all those points which are collinear with two given points. Since, we know that one and only one line can be drawn from any two given points. Let $A(x_1, y_1)$ and $B(x_2, y_2)$ be two such given fixed points. Let $P(x, y)$ be a point such that the points A, B and P always lie in the same straight line, then the locus of all such points will be the straight line through AB.

Straight line equations have simple variable expressions with no exponents on them.

The various 'standard' forms are often holdovers from a few centuries ago, when Mathematicians couldn't handle very complicated equations, so they tended to obsess about the simple cases. Now-a-days, you likely needn't worry too much about the 'standard' forms, this lesson will only cover the more helpful forms.

Note

- We can have one and only one line through a fixed point in a given direction.
- We can have infinitely many lines through a given point .

12.2 Slope or Gradient of a Line

If a line AB makes an angle θ with the positive x-axis, then m or $\tan\theta$ is called the slope or gradient of the line.

i.e., $m = \tan\theta$

If $0° < \theta < 90°$, then θ is an acute angle.

If $\theta = 0°$, either the line is x-axis or it is parallel to x-axis.

If $90° < \theta < 180°$, then θ is an obtuse angle.

Slope of a Line when Coordinates of Any Two Points are Given

If a line passes through $A(x_1, y_1)$ and $B(x_2, y_2)$, then the slope of a line is given by

$$m = \tan\theta = \frac{y_2 - y_1}{x_2 - x_1}$$

Note

- If a angle θ is measured from x-axis in anti-clockwise or clockwise direction, then sign will be taken as positive or negative.
- Slope of any line parallel to x-axis is zero.
- Slope of any line parallel to y-axis *i.e.*, perpendicular to x-aixs is infinite.
- If three points A, B and C are collinear, then
  slope of AB = slope of BC = slope of CA

***Sample* Problem 1** *Find the angle between the x-axis and the line joining the points* (3, – 1) *and* (4, – 2). **[NCERT]**

(*a*) 130° (*b*) 135°
(*c*) 150° (*d*) *None of these*

Interpret (*b*) Given,

$(x_1, y_1) = (3, -1)$

and $(x_2, y_2) = (4, -2)$

Slope of line $m = \dfrac{y_2 - y_1}{x_2 - x_1} = \dfrac{-2+1}{4-3}$

$\tan\theta = \dfrac{-1}{1}$

$\Rightarrow \quad \tan\theta = -1$

$\Rightarrow \quad \tan\theta = -\tan 45°$ $\quad (\because 1 = \tan 45°)$

$\Rightarrow \quad \tan\theta = \tan(180° - 45°)$ $\quad [\because \tan(180° - \theta) = -\tan\theta]$

$\Rightarrow \quad \tan\theta = \tan 135°$

$\Rightarrow \quad \theta = 135°$

12.3 Equations of Lines Parallel to Axes

Equation of a Line Parallel to x-axis

Let AB be a straight line parallel to x-axis at a distance b from it. Then, the ordinate of every point on AB is b. So, it can be treated as the locus of a point at a distance b from x-axis, then $y = b$ is an equation of line AB.

If a line parallel to x-axis is at a distance b and below x-axis, then equation is $y = -b$

Equation of x-axis is $y = 0$.

Equation of a Line Parallel to y-axis

Let AB be a straight line parallel to y-axis and at a distance a from it. Then, the abscissa of every point on AB is a. So, it can be treated as the locus of a point at a distance a from y-axis, then $x = a$ is an equation of line AB. If a line parallel to y-axis is at a distance a and to the left of y-axis, then its equation is $x = -a$.

Equation of y-axis is $x = 0$

***Sample* Problem 2** *Find the equation of line, which is parallel to y-axis and at a 3 distance from left of the origin is*

(*a*) $x = 3$ (*b*) $y = -3$ (*c*) $x = -3$ (*d*) $y = 3$

Interpret (*c*) We know, the equation of line which is parallel to y-axis is of the form $y = k$.

Here, we take $k = -3$, because it is left side of the origin.

$\therefore \quad y = -3$

12.4 Various Forms of Equations of a Line

(i) Slope intercept Form

The equation of a line with slope m and making an intercept c on y-axis is

$$y = mx + c$$

Note If the line passes through the origin, then $c = 0$, then equation of the line will become $y = mx$.

(ii) Point slope Form

The equation of a line which passes through a point $P(x_1, y_1)$ and has the slope m, is $y - y_1 = m(x - x_1)$.

(iii) Two point Form

The equation of a line passing through two points $A(x_1, y_1)$ and $B(x_2, y_2)$ is given by

$$\frac{y-y_1}{y_2-y_1}=\frac{x-x_1}{x_2-x_1}$$

Note If a line AB is passes through two points $A(x_1, y_1)$ and $B(x_2, y_2)$, then the equation of line is $\begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix}=0$

(iv) Intercept Form

If a line makes intercept a and b on x-axis and y-axis respectively, then the equation of line is $\frac{x}{a}+\frac{y}{b}=1$.

intercept may be –ve but length of intercept is always +ve.

(v) Normal (Perpendicular) Form

If perpendicular distance of the origin from the line is p and perpendicular drawn from origin to the line is making an angle α from the positive direction of x-axis, then equation of line is $x\cos\alpha + y\sin\alpha = p,\ 0 \le \alpha \le \pi$

(vi) Parametric Form or the Distance Form or Symmetric Form

The equation of the straight line passing through (x_1, y_1) and making an angle θ with the positive direction of x-axis is

$$\frac{x-x_1}{\cos\theta}=\frac{y-y_1}{\sin\theta}=r$$

where, r is the directed distance between the points (x, y) (any point on the line) and (x_1, y_1).

Note

- $x = x_1 + r\cos\theta$, $y = y_1 + r\sin\theta$ are called parametric equations of straight line AB.
- If point P above Q, then r is positive and if P below Q, then r is negative.

(vii) General Form

General equation of first degree in x and y is $ax + by + c = 0$, which represents an equation of line. Slope of this line is given by

$$-\frac{(\text{coefficient of } x)}{(\text{coefficient of } y)}=-\frac{a}{b}$$

Given equation of a line can be written as $y=\frac{-ax}{b}+\left(\frac{-c}{b}\right)$

The intercept form of a line is $\frac{x}{c/a}+\frac{y}{c/b}=-1$

***Sample* Problem 3** *The normal form of the equation* $x-\sqrt{3}y+8=0$ *is* **[NCERT]**

(*a*) $x\cos 120° - y\sin 120° = 4$
(*b*) $x\cos 120° + y\sin 120° = 4$
(*c*) $x\cos 120° + y\sin 120° = 8$
(*d*) *None of the above*

Interpret (*b*) Given, equation of line is

$$x-\sqrt{3}y+8=0$$

$$\Rightarrow \quad x-\sqrt{3}y=-8$$

$$\Rightarrow \quad -x+\sqrt{3}y=8 \quad \ldots(i)$$

Now, divide by $\sqrt{(\text{coefficient of } x)^2 + (\text{coefficient of } y)^2}$

$$\Rightarrow \quad \sqrt{(-1)^2+(\sqrt{3})^2}=\sqrt{1+3}=2, \text{we get}$$

$$-\frac{1}{2}x+\frac{\sqrt{3}}{2}y=\frac{8}{2}$$

$$\Rightarrow \quad -\cos 60° x + \sin 60° y = 4$$

($\because$ convert in form of $x\cos\alpha + y\sin\alpha = p$)

($\because$ $\cos x$ is negative and $\sin x$ is positive, it is possible in second quadrant.)

$$\Rightarrow \quad x\cos(180° - 60°) + y\sin(180° - 60°) = 4$$

$$\Rightarrow \quad x\cos 120° + y\sin 120° = 4$$

***Sample* Problem 4** *Equation of a line passing through* $(2, 2\sqrt{3})$ *and inclined with x-axis at an angle of* 75°. **[NCERT]**

(*a*) $(2+\sqrt{3})x - y - 4 = 0$
(*b*) $(2-\sqrt{3})x - y - 4 = 0$
(*c*) $(2-\sqrt{3})x + y - 4 = 0$
(*d*) *None of the above*

Interpret (*a*) Here, $(x_1, y_1) = (2, 2\sqrt{3})$,

$$\Rightarrow \quad m = \tan 75°$$

$$= \tan(45° + 30°)$$

$$= \frac{\tan 45° + \tan 30°}{1 - \tan 45° \tan 30°}$$

$$\left[\because \tan(A+B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}\right]$$

$$\Rightarrow \quad m = \frac{1+\frac{1}{\sqrt{3}}}{1-\frac{1}{\sqrt{3}}} = \frac{\sqrt{3}+1}{\sqrt{3}-1} \Rightarrow m = \frac{\sqrt{3}+1}{\sqrt{3}-1} \times \frac{\sqrt{3}+1}{\sqrt{3}+1} = \frac{(\sqrt{3}+1)^2}{3-1}$$

(on multiplying numerator and denominator by $\sqrt{3}+1$)

$$\Rightarrow \quad m = \frac{3+1+2\sqrt{3}}{2} = \frac{4+2\sqrt{3}}{2} = 2+\sqrt{3}$$

Equation of line in one point form is

$$y - y_1 = m(x - x_1) \Rightarrow y - 2\sqrt{3} = (2+\sqrt{3})(x-2)$$

$$\Rightarrow \quad y - 2\sqrt{3} = (2+\sqrt{3})x - 2(2+\sqrt{3})$$

$$\Rightarrow \quad y - 2\sqrt{3} = (2+\sqrt{3})x - 4 - 2\sqrt{3}$$

$$\Rightarrow \quad (2+\sqrt{3})x - y - 4 = 0$$

12.5 Angle between Two Lines

Let the equations of two lines are $y = m_1x + c_1$ and $y = m_2x + c_2$, then angle between these lines is given by

$$\theta = \tan^{-1}\left|\left(\frac{m_1 - m_2}{1 + m_1m_2}\right)\right|$$

If θ is the angle between the lines $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$, then

$$\theta = \tan^{-1}\left|\frac{a_2b_1 - a_1b_2}{a_1a_2 + b_1b_2}\right|$$

If two lines are parallel to each other, then

$$m_1 = m_2, \quad a_2b_1 - a_1b_2 = 0 \text{ or } \frac{a_1}{a_2} = \frac{b_1}{b_2}$$

If two lines are perpendicular to each other, then $m_1m_2 = -1$ or $a_1a_2 + b_1b_2 = 0$

Note Coordinates of point of intersection of two lines $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$ are

$$\left\{\left(\frac{b_1c_2 - b_2c_1}{a_1b_2 - a_2b_1}\right), \left(\frac{a_2c_1 - a_1c_2}{a_1b_2 - a_2b_1}\right)\right\}$$

Method to Determine Acute/obtuse Angle of a Triangle

If three vertices of a triangle are given, then firstly determine the sides of a triangle, then using the cosine formula of the corresponding to the largest side of a triangle.

i.e., $$\cos A = \frac{b^2 + c^2 - a^2}{2bc}$$

(i) If $\cos A > 0$, then it is acute angle.

(ii) If $\cos A < 0$, then it is obtuse angle.

(iii) $\cos A$, then it is right angle.

Remark In three types of problem please avoid to use the formula $\tan\theta = \frac{|m_1 - m_2|}{1 + m_1m_2}$ (*think yourself*)

***Sample* Problem 5** *One of the equation of the straight lines which passes through the point (3, 2) and are inclined to $x - 2y = 3$ at an angle of 45°, is*

(a) $3x - y - 9 = 0$ (b) $3x - y - 7 = 0$

(c) $x + 3y - 7 = 0$ (d) *None of these*

Interpret (d) Equation of straight line passing through (3, 2) and having slope m is

$$y - 2 = m(x - 3) \quad \ldots(i)$$

and slope of line $x - 2y = 3$ is $\frac{1}{2}$.

$$\therefore \quad \tan 45° = \left|\frac{m - \frac{1}{2}}{1 + \frac{m}{2}}\right|$$

$$\Rightarrow \quad \pm 1 = \frac{m - \frac{1}{2}}{1 + \frac{m}{2}} \Rightarrow m = 3, -\frac{1}{3}$$

$\therefore$ From Eq. (i), the equation of straight lines are

$$y - 2 = 3(x - 3) \Rightarrow 3x - y - 7 = 0$$

and $$y - 2 = -\frac{1}{3}(x - 3) \Rightarrow x + 3y - 9 = 0$$

12.6 Condition of Concurrency of Three Lines

Let the equation of three lines are $L_1 \equiv a_1x + b_1y + c_1 = 0$, $L_2 \equiv a_2x + b_2y + c_2 = 0$ and $L_3 \equiv a_3x + b_3y + c_3 = 0$, then three lines will be concurrent, if $\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0$

Another condition Three lines L_1, L_2 and L_3 are concurrent iff there exists constants λ_1, λ_2 and λ_3 not all zero such that $\lambda_1L_1 + \lambda_2L_2 + \lambda_3L_3 = 0$

i.e., $$\lambda_1(a_1x + b_1y + c_1) + \lambda_2(a_2x + b_2y + c_2) + \lambda_3(a_3x + b_3y + c_3) = 0$$

***Sample* Problem 6** *The lines $a_1x + b_1y + c_1 = 0$, $a_2x + b_2y + c_2 = 0$ and $a_3x = 0$ are concurrent, if $b_1c_2 - b_2c_1$ is equal to*

(a) 10 (b) 1

(c) 0 (d) *None of these*

Interpret (c) Let the lines $a_1x + b_1y + c_1 = 0$, $a_2x + b_2y + c_2 = 0$ and $a_3x = 0$ are concurrent.

$$\therefore \quad \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & 0 & 0 \end{vmatrix} = 0$$

$$\Rightarrow \quad a_3 | b_1c_2 - b_2c_1 | = 0$$

$$\Rightarrow \quad b_1c_2 - b_2c_1 = 0 \quad (\because a_3 \neq 0)$$

12.7 Equation of a Line Parallel to a Given Line

Let $ax + by + c = 0$ be any straight line, then the equation of a line parallel to given line is $ax + by + \lambda = 0$, where λ is an arbitrary constant, which can be determined by some given conditions.

Note Parallel lines differ by a constant.

***Sample* Problem 7** *Find equation of the line parallel to the line $3x - 4y + 2 = 0$ and passing through the point $(-2, 3)$.* [NCERT]

(a) $3x - 4y + 18 = 0$ (b) $3x + 4y + 18 = 0$
(c) $3x - 4y - 18 = 0$ (d) *None of these*

Interpret (a) Given equation of a line is

$$3x - 4y + 2 = 0 \quad \ldots(i)$$

Equation of line parallel to Eq. (i) is

$$3x - 4y + k = 0 \quad \ldots(ii)$$

$\because$ Line (ii) passes through the point $(-2, 3)$ *i.e.,* put $x = -2, y = 3$ in Eq. (ii).

$\therefore$ $3(-2) - 4 \times 3 + k = 0$

$\Rightarrow$ $-6 - 12 + k = 0 \Rightarrow k = 18$

Put $k = 18$ in Eq. (ii), we get

$$3x - 4y + 18 = 0$$

12.8 Equation of a Line Perpendicular to a Given Line

Let $ax + by + c = 0$ is an equation of straight line, then equation of straight line perpendicular to given line is $bx - ay + \lambda = 0$, where λ is an arbitrary constant.

***Sample* Problem 8** *Find the equation of the line perpendicular to the line $x - 7y + 5 = 0$ and having x-intercept 3.* [NCERT]

(a) $7x + y + 21 = 0$ (b) $7x + y - 21 = 0$
(c) $7x - y - 21 = 0$ (d) *None of these*

Interpret (b) Given equation of line is

$$x - 7y + 5 = 0 \quad \ldots(i)$$

Equation of line perpendicular to Eq. (i) is

$$7x + y + k = 0 \quad \ldots(ii)$$

$\because$ Line (ii) passes through the point $(3, 0)$ *i.e.,* put $x = 3, y = 0$ in Eq. (i)

$$7 \times 3 + 0 + k = 0$$

$\Rightarrow$ $k = -21$

Put $k = -21$ in Eq. (ii), we get

$$7x + y - 21 = 0$$

12.9 Area of Parallelogram

Area of Parallelogram *ABCD* whose side *AB, BC, CD* and *DA* are represented by

$$lx + my + n_1 = 0, ax + by + c_1 = 0,$$
$$lx + my + n_2 = 0 \text{ and } ax + by + c_2 = 0,$$

then area of parallelogram is given by

$$\frac{|n_2 - n_1||c_2 - c_1|}{\begin{vmatrix} a & b \\ l & m \end{vmatrix}_{2\times 2}} \text{ or } \frac{p_1 p_2}{\sin\theta}$$

12.10 Distance of a Point from a Line

Let $ax + by + c = 0$ be any equation of line and $P(x_1, y_1)$ be any point in space, then the perpendicular distance d of point P from the line is given by

$$d = \left|\frac{ax_1 + by_1 + c}{\sqrt{a^2 + b^2}}\right|$$

The length of the perpendicular from the origin to the line $ax + by + c = 0$ is $\frac{|c|}{\sqrt{a^2 + b^2}}$

Note

- If the length of perpendicular drawn from the origin to the line $ax + by + c = 0$ is p, then
$$\frac{1}{p^2} = \frac{1}{a^2} + \frac{1}{b^2}$$
- The equation of a line which makes a triangle of centroid (x_1, y_1) with coordinates axes, is $\frac{x}{3x_1} + \frac{y}{3y_1} = 1$

***Sample* Problem 9** *If p is the length of perpendicular from origin to the line whose intercepts on the axes are a and b, then $\frac{1}{a^2} + \frac{1}{b^2}$ is equal to* [NCERT]

(a) p^2 (b) $\frac{1}{p^2}$
(c) $2p^2$ (d) $\frac{1}{2p^2}$

Interpret (*b*) Equation of line in intercept form is

$$\frac{x}{a}+\frac{y}{b}=1 \Rightarrow \frac{x}{a}+\frac{y}{b}-1=0$$

Its distance from origin is

$$\left|\frac{0+0-1}{\sqrt{\frac{1}{a^2}+\frac{1}{b^2}}}\right|=p \qquad \left(\because d=\left|\frac{ax_1+by_1+c}{\sqrt{a^2+b^2}}\right|\right)$$

$$\Rightarrow \qquad p=\frac{1}{\sqrt{\frac{1}{a^2}+\frac{1}{b^2}}} \Rightarrow \frac{1}{p}=\sqrt{\frac{1}{a^2}+\frac{1}{b^2}}$$

On squaring both sides, we get

$$\frac{1}{p^2}=\frac{1}{a^2}+\frac{1}{b^2}$$

12.11 Position of Two Points (x_1, y_1) and (x_2, y_2) Relative to a Given Line

Let the equation of line be $ax+by+c=0$ and $P(x_1, y_1)$ and $Q(x_2, y_2)$ are two given points.

(i) If ax_1+by_1+c and ax_2+by_2+c both are of the same sign and hence, $\frac{ax_1+by_1+c}{ax_2+by_2+c}>0$, then the points $P(x_1, y_1)$ and $Q(x_2, y_2)$ lie on same side of line $ax+by+c=0$

(ii) If ax_1+by_1+c and ax_2+by_2+c both are of opposite signs to each other and hence, $\frac{ax_1+by_1+c}{ax_2+by_2+c}<0$, then the points $P(x_1, y_1)$ and $Q(x_2, y_2)$ lie on opposite side of the line $ax+by+c=0$

(iii) If origin lie on line, then the line is known as origin side.

Note

- A point (α, β) will lie on origin side of the line $ax+by+c=0$, if $a\alpha+b\beta+c$ and c have same sign.
- A point (α, β) will lie on non-origin side of the line $ax+by+c=0$, if $a\alpha+b\beta+c$ and c have opposite sign.

***Sample* Problem 10** *The points* (2, 1) *and* (– 3, 5) *are lies along the line* $3x-2y+1=0$

(a) *same side* (b) *opposite side*
(c) *can't say* (d) *None of these*

Interpret (*b*) Let $\lambda=3x-2y+1$

Then, the value of λ at (2, 1) is

$$3\times 2-2\times 1+1=\lambda_1 \quad \text{(say)}$$

$$\Rightarrow \qquad \lambda_1=5$$

and the value of λ at $(-3, 5)$ is

$$3\times(-3)-2\times 5+1=\lambda_2 \quad \text{(say)}$$

$$\Rightarrow \qquad \lambda_2=-18$$

Since, λ_1 and λ_2 are of opposite signs, therefore, the two points are on the opposite sides of the given line.

12.12 Distance between Two Parallel Lines

Distance between two parallel lines $a_1x+b_1y+c_1=0$ and $a_1x+b_1y+c_2=0$ is given by

$$d=\left|\frac{c_1 \sim c_2}{\sqrt{a_1^2+b_1^2}}\right|$$

***Sample* Problem 11** *The distance between the lines* $5x-12y+65=0$ *and* $10x-24y-39=0$ *is*

(a) $\frac{\sqrt{169}}{5}$ (b) $\frac{\sqrt{169}}{2}$
(c) $\sqrt{169}$ (d) *None of these*

Interpret (*b*) Given lines are $5x-12y+65=0$

and $\quad 10x-24y-39=0 \Rightarrow 5x-12y-\frac{39}{2}=0$

Since, given lines are parallel.

$\therefore$ Distance between two lines

$$=\frac{|c_2-c_1|}{\sqrt{a^2+b^2}}=\frac{\left|-\frac{39}{2}-65\right|}{\sqrt{5^2+(-12)^2}}=\frac{\left|-\frac{169}{2}\right|}{\sqrt{25+144}}=\frac{\frac{169}{2}}{\sqrt{169}}=\frac{\sqrt{169}}{2}$$

12.13 Equation of Internal and External Bisectors of Angles between Two Lines

The equation of bisectors of the angle between the lines $a_1x+b_1y+c_1=0$ and $a_2x+b_2y+c_2=0$ is given by

$$\frac{a_1x+b_1y+c_1}{\sqrt{a_1^2+b_1^2}}=\pm\frac{a_2x+b_2y+c_2}{\sqrt{a_2^2+b_2^2}}$$

(i) If $c_1 > 0, c_2 > 0$

(ii) If $a_1a_2 + b_1b_2 > 0$, then the bisector for positive sign gives the obtuse angle bisector and for negative sign gives the acute angle bisector.

(iii) If $a_1a_2 + b_1b_2 < 0$, then bisector corresponding to positive and negative give the acute and obtuse angle bisectors respectively.

***Sample* Problem 12** *The equation of line bisecting the obtuse angle between $y - x = 2$ and $2y + x = 5$ is $\frac{y-x-2}{\sqrt{2}} = \frac{x+2y-5}{n}$, where n is*

(a) 5 (b) $\sqrt{2}$

(c) $\sqrt{5}$ (d) *None of these*

Interpret (c) Equations of given lines are

$$-x + y = 2 \quad \ldots(i)$$

and

$$x + 2y = 5 \quad \ldots(ii)$$

Since, $a_1a_2 + b_1b_2 = -1 + 2 = 1 > 0$

$\therefore$ Equation of bisector of the obtuse angle is

$$\frac{x-y+2}{\sqrt{2}} = \frac{-x-2y+5}{\sqrt{5}}$$

$$\Rightarrow \quad \frac{y-x-2}{\sqrt{2}} = \frac{x+2y-5}{\sqrt{5}}$$

Hence, $n = \sqrt{5}$

12.14 Foot of Perpendicular

The foot M of perpendicular drawn from a point $P(x_1, y_1)$ to the line $ax + by + c = 0$ is given by

$$\frac{x - x_1}{a} = -y\frac{y_1}{b} = -\frac{(ax_1 + by_1 + c)}{a^2 + b^2}$$

12.15 Image of a Point with Respect to a Line

The image of a point (x_1, y_1) with respect to the line mirror $ax + by + c = 0$ be $Q(x, y)$ is given by

$$\frac{x - x_1}{a} = \frac{y - y_1}{b} = -\frac{2(ax_1 + by_1 + c)}{a^2 + b^2}$$

***Sample* Problem 13** *Find the image of the point (3, 8) with respect to the line x + 3y = 7 assuming the line to be plane mirror.* **[NCERT]**

(a) (1, 4) (b) (–1, –4)

(c) (–1, 4) (d) (1, –4)

Interpret (b) Given point $(x_1, y_1) = (3, 8)$ and line $x + 3y - 7 = 0$

Using the relation

$$\frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{-2(ax_1 + by_1 + c)}{a^2 + b^2}$$

$$\therefore \quad \frac{x-3}{1} = \frac{y-8}{3} = \frac{-2(1\times 3 + 3\times 8 - 7)}{1^2 + 3^2}$$

$$\Rightarrow \quad \frac{x-3}{1} = \frac{y-8}{3} = \frac{-2(20)}{10} \Rightarrow \frac{x-3}{1} = \frac{y-8}{3} = -4$$

$$\Rightarrow \quad x = -4 + 3, y = -12 + 8$$

$$\Rightarrow \quad x = -1, y = -4$$

12.16 Family of Lines

If $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$ are two non-parallel lines, then

$$(a_1x + b_1y + c_1) + \lambda(a_2x + b_2y + c_2) = 0$$

represents the family of all those lines, which passes through the point of intersection of given lines.

Note

- If a straight line is such that the algebraic sum of the perpendiculars drawn upon it from any numbers of fixed points is zero, then the line always passes through a fixed point.
- If there are three points are given such that algebric sum of perpendicular drawn from it zero, then fix point is centoid of Δ.

***Sample* Problem 14** *The straight lines $x(a + 2b) + y(a + 3b) = a + b$, for different values of a and b pass through a fixed point.*

(a) (2, 1) (b) (–2, 1)

(c) (2, –1) (d) (–2, –1)

Interpret (c) Given equation can be rewritten as

$$a(x + y - 1) + b(2x + 3y - 1) = 0 \quad \ldots(i)$$

Both a and b cannot be simultaneously zero, therefore atleast one of a and b is non-zero.

Let $a \neq 0$. Now, from Eq. (i) can be rewritten as

$$x + y - 1 + \frac{b}{a}(2x + 3y - 1) = 0$$

$$\Rightarrow \quad x + y - 1 + k(2x + 3y - 1) = 0$$

where $k = \frac{b}{a}$ ...(ii)

From Eq.(ii), it is clear that lines (ii) pass through the point of intersection of lines

$$x + y - 1 = 0 \quad \ldots(iii)$$

and

$$2x + 3y - 1 = 0 \quad \ldots(iv)$$

On solving Eqs. (iii) and (iv), we get

$$x = 2, y = -1$$

WORKED OUT
Examples

Example 1 *The point (4, 1) undergoes the following two successive transformations*

(i) *Reflection about the line $y = x$*

(ii) *Translation through a distance 2 units along the positive x-axis*

Then, the final coordinates of the point are **[NCERT Exemplar]**

(a) (4, 3) (b) (3, 4)

(c) (1, 4) (d) $\left(\frac{7}{2}, \frac{7}{2}\right)$

Solution (b) The image of the point (4, 1) after reflection about the line $y = x$ is (1, 4).

And then translation through a distance of 2 units along x-axis.

$\therefore$ Final position of a point is $(1 + 2, 4)$ *i.e.*, (3, 4).

Example 2 *The vertices of ΔPQR are $P(2, 1)$, $Q(-2, 3)$ and $R(4, 5)$. Find equation of the median through the vertex R.* **[NCERT]**

(a) $3x - 4y - 8 = 0$ (b) $4x - 3y + 8 = 0$

(c) $3x - 4y + 8 = 0$ (d) $3x + 4y - 8 = 0$

Solution (c) Since, median bisects the opposite side *i.e.*, S is the mid-point of PQ.

$$S = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$$

$$= \left(\frac{2-2}{2}, \frac{1+3}{2}\right) = \left(0, \frac{4}{2}\right) = (0, 2)$$

$$(\because x_1 = 2, y_1 = 1, x_2 = -2, y_1 = 3)$$

$\therefore$ Equation of line RS by using

$$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1)$$

$$\Rightarrow \quad y - 5 = \frac{2-5}{0-4}(x - 4) \quad (\because x_1 = 4, y_1 = 5, x_2 = 0, y_2 = 2)$$

$$\Rightarrow \quad y - 5 = \frac{-3}{-4}(x - 4)$$

$$\Rightarrow \quad 4y - 20 = 3x - 12$$

$$\Rightarrow \quad 3x - 4y + 8 = 0$$

Example 3 *The owner of a milk store finds that he can sell 980 L of milk each week at ₹ 14 per litre and 1220 L of milk each week at ₹ 16 per litre. Assuming a linear relationship between selling price and demand, how many litres could he sell weekly at ₹ 17 per litre?* **[NCERT]**

(a) 1240 L (b) 1340 L

(c) 1350 L (d) *None of these*

Solution (b) Let price and litre be denoted in ordered pair (x, y), where x denotes the ₹ per litre and y denotes the quantity of milk in litre.

Given, (14, 980) and (16, 1220) are two points.

Let linear relations *i.e.*, linear equation is

$$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1)$$

$$\Rightarrow \quad y - 980 = \frac{1220 - 980}{16 - 14}(x - 14)$$

$$\Rightarrow \quad y - 980 = \frac{240}{2}(x - 14)$$

$$(\because x_1 = 14, y_1 = 980, x_2 = 16, y_2 = 1220)$$

$$\Rightarrow \quad y - 980 = 120(x - 14)$$

$$\Rightarrow \quad y - 980 = 120x - 120 \times 14$$

$$\Rightarrow \quad 120x - y = 1680 - 980$$

$$\Rightarrow \quad 120x - y = 700$$

When price $x = 17$,

$$\Rightarrow \quad 120 \times 17 - y = 700$$

$$\Rightarrow \quad y = 2040 - 700$$

$$y = 1340$$

He will sell weekly 1340 L milk at the rate of ₹ 17 L.

Example 4 *Find the equation of line parallel to Y-axis and drawn through the point of intersection of the line $x - 7y + 5 = 0$ and $3x + y = 0$.* **[NCERT]**

(a) $x + 22 = 0$ (b) $22x + 5 = 0$

(c) $x + 44 = 0$ (d) $22x - 5 = 0$

Solution (*b*) Given, equation of lines are

$$x - 7y + 5 = 0 \quad \ldots(i)$$

and $$3x + y = 0 \quad \ldots(ii)$$

On solving Eqs. (i) and (ii), to find the point of intersection, from Eq. (i),

$$x = 7y - 5$$

On putting the value of x in Eq. (ii), we get

$$3(7y - 5) + y = 0 \Rightarrow 21y - 15 + y = 0$$

$$\Rightarrow \quad 22y = 15$$

$$\Rightarrow \quad y = \frac{15}{22}$$

$\therefore$ From Eq. (i), $$x = \frac{7 \times 15}{22} - 5 = \frac{105 - 110}{22}$$

$$\Rightarrow \quad x = -\frac{5}{22}$$

Hence, the point is $\left(-\frac{5}{22}, \frac{15}{22}\right)$

Hence, equation of required line by using

$$y - y_1 = m(x - x_1)$$

where $(x_1, y_1) = \left(\frac{-5}{22}, \frac{15}{22}\right)$ and $m = \frac{1}{0}$ as line parallel to Y-axis, is

$$y - \frac{15}{22} = \frac{1}{0}\left(x + \frac{5}{22}\right) \Rightarrow 0 = x + \frac{5}{22}$$

$$\Rightarrow \quad 22x + 5 = 0$$

Example 5 *The angle between the line $x + y = 3$ and the line joining the points (1, 1) and (– 3, 4) is*

(*a*) $\tan^{-1}(7)$ (*b*) $\tan^{-1}(-1/7)$

(*c*) $\tan^{-1}(1/7)$ (*d*) *None of these*

Solution (*c*) Let $P = (1, 1)$ and $Q = (-3, 4)$

$\therefore$ Slope of line PQ, $m_1 = \frac{1-4}{1+3} = \frac{-3}{4}$

Given line is $x + y = 3$ or $x + y - 3 = 0$ ...(i)

Its slope, $m_2 = \frac{-1}{1} = -1$

$$\therefore \quad \tan\theta = \left|\frac{m_1 - m_2}{1 + m_1 m_2}\right| = \left|\frac{\frac{-3}{4} + 1}{1 + \frac{3}{4}}\right| = \frac{1}{7}$$

$$\Rightarrow \quad \theta = \tan^{-1}\left(\frac{1}{7}\right)$$

Example 6 *Point $R(h, k)$ divides a line segment between the axes in the ratio 1 : 2. Find equation of the line.* **[NCERT]**

(*a*) $2kx + hy = 3hk$ (*b*) $2kx + hy = 2hk$

(*c*) $2kx - hy = 3hk$ (*d*) *None of these*

Solution (*a*) Let equation of line AB is

$$\frac{x}{a} + \frac{y}{b} = 1 \quad \ldots(i)$$

Let a point $R(h, k)$ divide line AB in the ratio 1 : 2.

By using internally ratio

$$R(h, k) = \left(\frac{1x_2 + 2x_1}{1+2}, \frac{1y_2 + 2y_1}{1+2}\right)$$

$$\Rightarrow \quad h = \frac{1 \times 0 + 2 \times a}{1+2}, \; k = \frac{1 \times b + 2 \times 0}{1+2}$$

[$\because P(x, y)$ divide the line $A(x_1, y_1)$ and $B(x_2, y_2)$ in the ratio $m : n$ internally

$$\therefore \quad P(x, y) = \left(\frac{nx_2 + mx_1}{n+m}, \frac{ny_2 + my_1}{n+m}\right)\Bigg]$$

$$\Rightarrow \quad h = \frac{2a}{3}, \; k = \frac{b}{3} \Rightarrow a = \frac{3h}{2}, \; b = 3k$$

On putting the values of a and b in Eq. (i), we get

$$\frac{x}{\frac{3h}{2}} + \frac{y}{3k} = 1$$

$$\Rightarrow \quad \frac{2x}{3h} + \frac{y}{3k} = 1$$

$$\Rightarrow \quad \frac{2kx + hy}{3hk} = 1$$

$$\Rightarrow \quad 2kx + hy = 3hk$$

Example 7 *If p and p' be the perpendicular from the origin upon the straight lines $x \sec\theta + y \operatorname{cosec}\theta = a$ and $x \cos\theta - y \sin\theta = a \cos 2\theta$. Then, $4p^2 + p'^2$ is equal to* **[NCERT]**

(*a*) a^2 (*b*) a (*c*) a^3 (*d*) a^4

Solution (*a*) Here, p = Length of perpendicular from (0, 0) to

$$x \sec\theta + y \operatorname{cosec}\theta = a$$

$$= \left|\frac{0 \sec\theta + 0 \operatorname{cosec}\theta - a}{\sqrt{\sec^2\theta + \operatorname{cosec}^2\theta}}\right|$$

$$= \frac{a \cos\theta \sin\theta}{\sqrt{\sin^2\theta + \cos^2\theta}} = a \sin\theta \cos\theta$$

Similarly, $p' = a \cos 2\theta$

$$\therefore \quad 4p^2 + p'^2 = 4a^2 \sin^2\theta \cos^2\theta + a^2 \cos^2 2\theta$$

$$= a^2(2 \sin\theta \cos\theta)^2 + a^2 \cos^2 2\theta$$

$$= a^2(\sin^2 2\theta + \cos^2 2\theta) = a^2$$

Example 8 *A person standing at the junction (crossing) of two straight paths represented by the equations $2x - 3y + 4 = 0$ and $3x + 4y - 5 = 0$ wants to reach the path whose equation is $6x - 7y + 8 = 0$ in the least time. Find equation of the path that he should follow.* **[NCERT]**

(*a*) $102x + 119y - 125 = 0$ (*b*) $119x + 102y - 125 = 0$

(*c*) $119x + 102y - 60 = 0$ (*d*) $119x + 102y + 125 = 0$

Solution (*b*) Given equation of straight path is

$$2x - 3y + 4 = 0 \quad \ldots(i)$$

and $$3x + 4y - 5 = 0 \quad \ldots(ii)$$

On solving Eqs. (i) and (ii), we get

$$\therefore \qquad x = -\frac{1}{17}, \quad y = \frac{22}{17}$$

Suppose, the person is standing at point P, then he can reach the path.

AB in least time if he goes straight to it *i.e.,* perpendicular to it. It means we have to find the equation of PQ.

$\because$ Line $PQ \perp$ Line AB

$\therefore$ Slope of $PQ \times$ Slope of $AB = -1$

$$\Rightarrow \qquad m \times -\left(\frac{6}{-7}\right) = -1$$

$$\Rightarrow \qquad m \times \frac{6}{7} = -1 \;\Rightarrow\; m = -\frac{7}{6}$$

Equation of PQ by using

$$y - y_1 = m(x - x_1)$$

where $(x_1, y_1) = \left(-\frac{1}{17}, \frac{22}{17}\right)$ and $m = -\frac{7}{6}$ is

$$y - \frac{22}{17} = -\frac{7}{6}\left(x + \frac{1}{17}\right)$$

$$\Rightarrow \qquad 6 \times 17y - 22 \times 6 = -7 \times 17x - 7$$

$$\Rightarrow \qquad 102y - 132 = -119x - 7$$

$$\Rightarrow \qquad 119x + 102y - 132 + 7 = 0$$

$$\Rightarrow \qquad 119x + 102y - 125 = 0$$

Example 9 *The equation of straight line cutting off an intercept – 2 from y-axis and being equally inclined to the axes are*

(a) $y = x + 2, y = x - 2$ (b) $y = -x - 2, y = x - 2$
(c) $y = x - 2, y = x - 2$ (d) *None of these*

Solution (*b*)Since, the required line is equally inclined with the coordinate axes, therefore it makes an angle of 45° or 135° with the x-axis.

So, its slope is either $m = \tan 45°$ or $m = \tan 135°$

i.e., $\qquad m = 1$ or -1

It is given that $c = -2$

Hence, the equation of the lines are

$$y = x - 2 \quad \text{or} \quad y = -x - 2$$

Example 10 *If three lines whose equations are $y = m_1x + c_1$, $y = m_2x + c_2$ and $y = m_3x + c_3$ are concurrent, then $m_1(c_2 - c_3) + m_2(c_3 - c_1) + m_3(c_1 - c_2)$ is equal to* [NCERT]

(a) –1 (b) 0 (c) 1 (d) 2

Solution (*b*) Given equation of lines are

$$y = m_1x + c_1 \qquad \ldots(i)$$

$$y = m_2x + c_2 \qquad \ldots(ii)$$

$$y = m_3x + c_3 \qquad \ldots(iii)$$

On solving Eqs. (i) and (ii), we get

$$x = \frac{c_2 - c_1}{m_1 - m_2} \text{ and } y = \frac{m_1c_2 - m_2c_1}{m_1 - m_2}$$

On putting the values of x and y in Eq. (iii), we get

$$\frac{m_1c_2 - m_2c_1}{m_1 - m_2} = m_3\left(\frac{c_2 - c_1}{m_1 - m_2}\right) + \frac{c_3}{1}$$

$$\Rightarrow \qquad \frac{m_1c_2 - m_2c_1}{m_1 - m_2} = \frac{m_3c_2 - m_3c_1 + m_1c_3 - m_2c_3}{m_1 - m_2}$$

$$\Rightarrow \qquad m_1c_2 - m_2c_1 = m_3c_2 - m_3c_1 + m_1c_3 - m_2c_3$$

$$\Rightarrow \qquad m_1c_2 - m_2c_1 - m_3c_2 + m_3c_1 - m_1c_3 + m_2c_3 = 0$$

$$\Rightarrow \qquad m_1(c_2 - c_3) + m_2(c_3 - c_1) + m_3(c_1 - c_2) = 0$$

Example 11 *The equation of line with slope 2 and the length of the perpendicular from the origin equal to $\sqrt{5}$, are*

(a) $y = 2x \pm 5$ (b) $x = 2y \pm 5$
(c) $y = x \pm 5$ (d) *None of these*

Solution (*a*) Let c be the intercept on y-axis, then the equation of the line is

$$y = 2x + c \qquad \ldots(i)$$

$$\Rightarrow \qquad -2x + y = c$$

$$\Rightarrow \qquad -\frac{2x}{\sqrt{(-2)^2 + 1^2}} + \frac{y}{\sqrt{(-2)^2 + 1^2}} = \frac{c}{\sqrt{(-2)^2 + 1^2}}$$

$$\Rightarrow \qquad -\frac{2}{\sqrt{5}}x + \frac{y}{\sqrt{5}} = \frac{c}{\sqrt{5}} \qquad \ldots(ii)$$

This is the normal form, therefore RHS denotes the length of the perpendicular from the origin. But the length of the perpendicular from the origin is $\sqrt{5}$.

$$\therefore \qquad \left|\frac{c}{\sqrt{5}}\right| = \sqrt{5} \;\Rightarrow\; |c| = 5$$

On putting $c = \pm 5$ in Eq. (i), we get the equation of line as $y = 2x \pm 5$

Example 12 *The equation of the bisector of the obtuse angle between the lines $3x - 4y + 7 = 0$ and $-12x - 5y + 2 = 0$ is*

(a) $21x + 77y + 101 = 0$ (b) $21x + 77y - 101 = 0$
(c) $21x + 77y = 0$ (d) *None of these*

Solution (*b*) $a_1a_2 + b_1b_2 = (3) \times (-12) + (-4) \times (-5)$

$$= -36 + 20 = -16$$

$$\Rightarrow \qquad a_1a_2 + b_1b_2 \le 0 \qquad \text{(obtuse bisector)}$$

$\therefore$ The equation of obtuse bisector is

$$\frac{(3x-4y+7)}{\sqrt{3^2+(-4)^2}} = -\frac{-12x-5y+2}{\sqrt{(-12)^2+(-5)^2}}$$

$$\Rightarrow \quad 13(3x-4y+7) = -5(-12x-5y+2)$$

$\Rightarrow$ $21x+77y-101=0$ is the obtuse angle bisector.

Example 13 *The locus of a point which moves such that its distance from the point* (0, 0) *is twice its distance from the y-axis, is*

(a) $x^2-y^2=0$ (b) $x^2-3y^2=0$

(c) $3x^2-y^2=0$ (d) *None of these*

Solution (c) By hypothesis

$$|OP| = 2|PM|$$

$$\Rightarrow \quad \sqrt{x_1^2+y_1^2} = 2|x_1|$$

On squaring both sides, we get

$$x_1^2+y_1^2 = 4x_1^2 \Rightarrow 3x_1^2-y_1^2=0$$

$\therefore$ Locus of the point is

$$3x^2-y^2=0$$

Example 14 *Find the distance of the line* $4x+7y+5=0$ *from the point* (1, 2) *along the line* $2x-y=0$. **[NCERT]**

(a) $\frac{23}{7}\sqrt{5}$ *sq units* (b) $\frac{23}{18}\sqrt{5}$ *sq units*

(c) $\frac{23}{8}\sqrt{5}$ *sq units* (d) *None of these*

Solution (b) The equation of line AB is

$$4x+7y+5=0 \quad \text{...(i)}$$

and equation of PQ is $2x-y=0$ ...(ii)

On solving Eqs. (i) and (ii), we get

$$x = -\frac{5}{18} \text{ and } y = -\frac{5}{9}$$

$\therefore$ Coordinate of $Q = \left(-\frac{5}{18}, -\frac{5}{9}\right)$

Length of $QP = \sqrt{(x_2-x_1)^2+(y_2-y_1)^2}$

$$= \sqrt{\left(1+\frac{5}{18}\right)^2+\left(2+\frac{5}{9}\right)^2}$$

$$= \sqrt{\left(\frac{23}{18}\right)^2+\left(\frac{23}{9}\right)^2} = \frac{23}{9}\sqrt{\frac{1}{4}+1} = \frac{23}{9}\times\frac{\sqrt{5}}{2}$$

$$= \frac{23}{18}\sqrt{5} \text{ sq units}$$

Example 15 *If the lines* $y=3x+1$ *and* $2y=x+3$ *are equally inclined to the line* $y=mx-4$, *find the value of m.* **[NCERT]**

(a) $\frac{2\pm5\sqrt{2}}{7}$ (b) $\frac{1\pm3\sqrt{2}}{7}$

(c) $\frac{1\pm5\sqrt{2}}{7}$ (d) *None of these*

Solution (c) Let the angle between the lines $y=3x+1$ and $y=mx+4$ is θ.

Here, slopes of the lines are $m_1=3, m_2=m$

$$\tan\theta = \left|\frac{3-m}{1+3m}\right| \quad \text{...(i)}$$

$$\left(\because \tan\theta = \left|\frac{m_1-m_2}{1+m_1m_2}\right|\right)$$

Again, it is given that angle between the lines $2y=x+3$ and $y=mx+4$ is also θ.

Here, slopes are $m_1=\frac{1}{2}$ and $m_2=m$.

$$\therefore \quad \tan\theta = \left|\frac{\frac{1}{2}-m}{1+\frac{1}{2}\times m}\right| \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\left|\frac{3-m}{1+3m}\right| = \left|\frac{\frac{1}{2}-m}{1+\frac{m}{2}}\right|$$

$$\Rightarrow \quad \frac{3-m}{1+3m} = \pm\left(\frac{1-2m}{2+m}\right)$$

Taking positive sign,

$$(3-m)(2+m) = (1-2m)(1+3m)$$

$$\Rightarrow \quad 6+3m-2m-m^2 = 1+3m-2m-6m^2$$

$$\Rightarrow \quad 6 = 1-5m^2$$

$$\Rightarrow \quad m^2 = \frac{-5}{5} = -1$$

which is not possible as $m^2 \geq 0$.

Again, taking negative sign, we get

$$\frac{3-m}{1+3m} = -\frac{1-2m}{2+m}$$

$$\Rightarrow \quad (3-m)(2+m) = (2m-1)(1+3m)$$

$$\Rightarrow \quad 6+3m-2m-m^2 = 2m+6m^2-1-3m$$

$$\Rightarrow \quad 6+m-m^2 = 6m^2-m-1$$

$$\Rightarrow \quad 6m^2-m-1-6-m+m^2=0$$

$$\Rightarrow \quad 7m^2-2m-7=0$$

$$\Rightarrow \quad m = \frac{2\pm\sqrt{4+4\times7\times7}}{2\times7} = \frac{2\pm2\sqrt{1+49}}{2\times7}$$

$$m = \frac{1\pm\sqrt{50}}{7} \Rightarrow m = \frac{1\pm5\sqrt{2}}{7}$$

Note When we remove the mod sign, then we use $a\pm$ sign.

$$|a|=|b| \Rightarrow a=\pm b$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Equation of Straight Line in Standard Form

1. For specifying a straight line, how many geometrical parameters should be known? [NCERT Exemplar]
(a) 1 (b) 2 (c) 4 (d) 3

2. Slope of a line which cuts of intercepts of equal lengths on the axes is [NCERT Exemplar]
(a) –1 (b) –0 (c) 2 (d) $\sqrt{3}$

3. If the line $\frac{x}{a}+\frac{y}{b}=1$ passes through the points (2, –3) and (4, –5), then (a, b) is [NCERT Exemplar]
(a) (1, 1) (b) (–1, 1)
(c) (1, –1) (d) (–1, –1)

4. The equations of the lines which pass through the point (3, –2) and are inclined at 60° to the line $\sqrt{3}x+y=1$ is [NCERT Exemplar]
(a) $y+2=0, \sqrt{3}x-y-2-3\sqrt{3}=0$
(b) $x-2=0, \sqrt{3}x-y+2+3\sqrt{3}=0$
(c) $\sqrt{3}x-y-2-3\sqrt{3}=0$
(d) None of the above

5. Equation to the straight line cutting off an intercept 2 from the negative direction of the axis of y and inclined at 30° to the positive direction of x-axis, is
(a) $y+x-\sqrt{3}=0$ (b) $y-x+2=0$
(c) $y-\sqrt{3}x-2=0$ (d) $\sqrt{3}y-x+2\sqrt{3}=0$

6. In the adjacent figure, equation of refracted ray is

(a) $y=\sqrt{3}x+1$ (b) $y+\sqrt{3}x-3=0$
(c) $\sqrt{3}x+y-\sqrt{3}=0$ (d) None of these

7. The determinant $\begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix}=0$ represents
(a) parabola (b) a straight line
(c) a circle (d) None of these

8. If the intercept of a line between the coordinate axes is divided by the point (–5, 4) in the ratio 1 : 2, then find the equation of the line. [NCERT Exemplar]
(a) $8x-5y+60=0$ (b) $8x-6y+60=0$
(c) $8x+5y+60=0$ (d) None of these

9. The straight line whose sum of the intercepts on the axes is equal to half of the product of the intercepts, passes through the point whose coordinates are
(a) (1, 1) (b) (2, 2) (c) (3, 3) (d) (4, 4)

10. If non-zero numbers a, b, c are in HP, then the straight line $\frac{x}{a}+\frac{y}{b}+\frac{1}{c}=0$ always passes through a fixed point. That point is
(a) $\left(1,-\frac{1}{2}\right)$ (b) $(1, -2)$
(c) $(-1,-2)$ (d) $(-2,2)$

11. If the coordinates of the middle point of the portion of a line intercepted between the coordinate axes is (3, 2), then the equation of the line will be [NCERT Exemplar]
(a) $2x+3y=12$ (b) $3x+2y=12$
(c) $4x-3y=6$ (d) $5x-2y=10$

12. If the straight line $ax+by+c=0$ always passes through $(1,-2)$, then a, b, c are in
(a) AP (b) HP
(c) GP (d) None of these

13. The ratio in which the line $3x + 4y + 2 = 0$ divides the distance between the lines $3x + 4y + 5 = 0$ and $3x + 4y - 5 = 0$ is [NCERT Exemplar]

(a) 1 : 2 (b) 3 : 7 (c) 2 : 3 (d) 2 : 5

14. A straight line through $P(1, 2)$ is such that its intercept between the axes is bisected at P. Its equation is

(a) $x + y = -1$ (b) $x + y = 3$
(c) $x + 2y = 5$ (d) $2x + y = 4$

Equation of Straight Line Through Intersection Point

15. Equation of a line, which is intersecting the X-axis at a distance of 3 units to the left of origin with slope –2, is [NCERT]

(a) $2x + y + 6 = 0$ (b) $2x - y + 6 = 0$
(c) $2x - y - 6 = 0$ (d) None of these

16. Find the equations of the lines, which cut off intercepts on the axes whose sum and product are 1 and – 6, respectively. [NCERT]

(a) $2x + 3y + 6 = 0$ or $3x - 2y + 6 = 0$
(b) $2x - 3y - 6 = 0$ or $3x - 2y + 6 = 0$
(c) $2x - 3y - 6 = 0$ or $3x + 2y + 6 = 0$
(d) None of the above

17. Let PS be the median of the triangle with vertices $P(2, 2)$, $Q(6, -1)$ and $R(7, 3)$. The equation of the line passing through (1, – 1) and parallel to PS is

(a) $2x - 9y - 7 = 0$ (b) $2x - 9y - 11 = 0$
(c) $2x + 9y - 11 = 0$ (d) $2x + 9y + 7 = 0$

18. Find the equation of one of the sides of an isosceles right angled triangle whose hypotenuse is given by $3x + 4y = 4$ and the opposite vertex of the hypotenuse is (2, 2). [NCERT Exemplar]

(a) $x - 7y + 12 = 0,\ 7x + y - 16 = 0$
(b) $x - 7y + 6 = 0, 7x + y - 16 = 0$
(c) $x - 7y + 12 = 0, 7x + y + 16 = 0$
(d) None of the above

19. The equations of the lines passing through the point (1, 0) and at a distance $\frac{\sqrt{3}}{2}$ from the origin, are [NCERT Exemplar]

(a) $\sqrt{3}x + y - \sqrt{3} = 0, \sqrt{3}x - y - \sqrt{3} = 0$
(b) $\sqrt{3}x + y + \sqrt{3} = 0, \sqrt{3}x - y + \sqrt{3} = 0$
(c) $x + \sqrt{3}y - \sqrt{3} = 0, x - \sqrt{3}y - \sqrt{3} = 0$
(d) None of the above

20. Find the equation of the lines through the point (3, 2) which make an angle of 45° with the line $x - 2y = 3$. [NCERT]

(a) $3x + y + 7 = 0$ (b) $3x - y - 7 = 0$
(c) $3x + 2y - 7 = 0$ (d) None of these

21. A ray of light passing through the point (1, 2) reflects on the X-axis at point A and the reflected ray passes through the point (5, 3). Find coordinates of A. [NCERT]

(a) $\left(\frac{13}{5}, 0\right)$ (b) $\left(-\frac{13}{5}, 0\right)$
(c) $\left(0, \frac{13}{5}\right)$ (d) None of these

22. Find the equation of the line passing through the point (5, 2) and perpendicular to the line joining the points (2, 3) and (3, –1). [NCERT Exemplar]

(a) $x - 4y + 3 = 0$ (b) $x + 4y - 3 = 0$
(c) $x - 4y - 3 = 0$ (d) None of these

23. Find the equation of the line passing through the point of intersection of $2x + y = 5$ and $x + 3y + 8 = 0$ and parallel to the line $3x + 4y = 7$. [NCERT Exemplar]

(a) $4x - 3y + 3 = 0$ (b) $3x + 4y + 3 = 0$
(c) $4x + 3y - 3 = 0$ (d) $3x - 4y - 3 = 0$

24. Find the equations of the lines through the point of intersection of the lines $x - y + 1 = 0$ and $2x - 3y + 5 = 0$ and whose distance from the point (3, 2) is $\frac{7}{5}$. [NCERT Exemplar]

(a) $3x - 4y + 6 = 0$ and $4x - 3y + 1 = 0$
(b) $3x + 4y + 6 = 0$ and $4x + 3y + 1 = 0$
(c) $3x - 4 - 6 = 0$ and $4x + 3y + 1 = 0$
(d) None of the above

25. The equation of the straight line passing through the point (3, 2) and perpendicular to the line $y = x$ is [NCERT Exemplar]

(a) $x - y = 5$ (b) $x + y = 5$
(c) $x + y = 1$ (d) $x - y = 1$

26. Find equation of the line passing through the point (2, 2) and cutting off intercepts the axes whose sum is 9. [NCERT]

(a) $x + 2y = 6$ (b) $2x + y = 8$
(c) $2x + y = 5$ (d) $2x - y = 6$

27. The equation of the straight line joining the origin to the point of intersection of $y - x + 7 = 0$ and $y + 2x - 2 = 0$, is

(a) $3x + 4y = 0$ (b) $3x - 4y = 0$
(c) $4x - 3y = 0$ (d) $4x + 3y = 0$

28. The line passing through $\left(-1, \frac{\pi}{2}\right)$ and perpendicular to $\sqrt{3}\sin\theta + 2\cos\theta = \frac{4}{r}$, is

(a) $2 = \sqrt{3}r\cos\theta - 2r\sin\theta$ (b) $5 = -2\sqrt{3}r\sin\theta + 4r\cos\theta$
(c) $2 = \sqrt{3}r\cos\theta + 2r\sin\theta$ (d) $5 = 2\sqrt{3}r\sin\theta - 4r\cos\theta$

29. A line perpendicular to the line segment joining the points (1, 0) and (2, 3) divides it in the ratio $1 : n$. Find the equation of the line. [NCERT]

(a) $x(n + 1) + 3(n + 1)y = n + 11$
(b) $x(n + 1) - 3(n + 1)y = n + 11$
(c) $x(n + 1) + 3(n + 1)y = n - 11$
(d) None of the above

30. A line AB makes zero intercepts on x-axis and y-axis and it is perpendicular to another line CD which is $3x + 4y + 6 = 0$. The equation of line AB is

(a) $y = 4$ (b) $4x - 3y + 8 = 0$
(c) $4x - 3y = 0$ (d) $4x - 3y + 6 = 0$

31. Equation of a line passing through the line of intersection of lines $2x - 3y + 4 = 0$, $3x + 4y - 5 = 0$ and perpendicular to $6x - 7y + 3 = 0$, is

(a) $119x + 102y + 125 = 0$ (b) $119x + 102y = 125$
(c) $119x - 102y = 125$ (d) None of these

32. If the lines $x = a + m$, $y = -2$ and $y = mx$ are concurrent, then least value of $|a|$ is

(a) 0 (b) $\sqrt{2}$
(c) $2\sqrt{2}$ (d) None of these

33. The equation of straight line through the intersection of the lines $x - 2y = 1$ and $x + 3y = 2$ and parallel to $3x + 4y = 0$, is

(a) $3x + 4y + 5 = 0$ (b) $3x + 4y - 10 = 0$
(c) $3x + 4y - 5 = 0$ (d) $3x + 4y + 6 = 0$

34. The lines $ax + by + c = 0$, $bx + cy + a = 0$ and $cx + ay + b = 0\,(a \neq b \neq c)$ are concurrent, if

(a) $a^3 + b^3 + c^3 + 3abc = 0$
(b) $a^2 + b^2 + c^2 - 3abc = 0$
(c) $a + b + c = 0$
(d) None of the above

35. The line $\frac{x}{a} - \frac{y}{b} = 1$ cuts the x-axis at P. The equation of the line through P perpendicular to the given line is

(a) $x + y = ab$ (b) $x + y = a + b$
(c) $ax + by = a^2$ (d) $bx + ay = b^2$

36. A line passes through (2, 2) and is perpendicular to the line $3x + y = 3$. Its y-intercept is [NCERT Exemplar]

(a) $\frac{1}{3}$ (b) $\frac{2}{3}$
(c) 1 (d) $\frac{4}{3}$

37. The value of λ for which the lines $3x + 4y = 5$, $5x + 4y = 4$ and $\lambda x + 4y = 6$ meet at a point is

(a) 2 (b) 1
(c) 4 (d) 3

38. Find the values of θ and p, if the equation $x \cos\theta + y \sin\theta = p$ is the normal form of the line $\sqrt{3}x + y + 2 = 0$. [NCERT]

(a) 210°, 1 (b) 210°, 2
(c) 220°, 3 (d) None of these

39. The line through the points $(h, 3)$ and $(4, 1)$ intersects the line $7x - 9y - 19 = 0$ at right angle. Find the value of h. [NCERT]

(a) $-\frac{22}{9}$ (b) $\frac{22}{9}$
(c) $\frac{22}{7}$ (d) $\frac{22}{13}$

Angle between Two Lines

40. Find the angle between the lines $y = (2 - \sqrt{3})(x + 5)$ and $y = (2 + \sqrt{3})(x - 7)$. [NCERT Exemplar]

(a) $-\frac{\pi}{3}$ or $\frac{2\pi}{3}$ (b) $\frac{\pi}{3}$ or $\frac{2\pi}{3}$
(c) $\frac{\pi}{3}$ or $-\frac{2\pi}{3}$ (d) None of these

41. Find angles between the lines $\sqrt{3}x + y = 1$ and $x + \sqrt{3}y = 1$. [NCERT]

(a) 35° (b) 30° (c) 45° (d) 60°

42. In what direction should a line be drawn through the point (1, 2) so that its point of intersection with the line $x + y = 4$ is at a distance of $\frac{\sqrt{6}}{3}$ from the given point? [NCERT Exemplar]

(a) 75° (b) 60° (c) 90° (d) 45°

43. The equation of the sides of a triangle are $x - 3y = 0$, $4x + 3y = 5$ and $3x + y = 0$. The line $3x - 4y = 0$ passes through the

(a) incentre (b) centroid
(c) orthocentre (d) circumcentre

44. The triangle formed by the lines $x + y = 0, 3x + y = 4$, $x + 3y = 4$ is

(a) isosceles (b) equilateral
(c) right angled (d) None of these

45. Two lines are drawn through (3, 4) each of which makes angle of 45° with line $x - y = 2$, then area of the triangle formed by these lines is

(a) 9 sq units (b) 9/2 sq units
(c) 2 sq units (d) 2/9 sq unit

46. The inclination of the straight line passing through the point $(-3, 6)$ and the mid-point of the line joining the points $(4, -5)$ and $(-2, 9)$ is

(a) $\frac{\pi}{4}$ (b) $\frac{\pi}{6}$
(c) $\frac{\pi}{3}$ (d) $\frac{3\pi}{4}$

Distance between Two Lines and Distance of a Point from a Line

47. Distance between the lines $5x + 3y - 7 = 0$ and $15x + 9y + 14 = 0$ is

(a) $\frac{35}{\sqrt{34}}$ (b) $\frac{1}{3\sqrt{34}}$ (c) $\frac{35}{3\sqrt{34}}$ (d) $\frac{35}{2\sqrt{34}}$

48. The distance of the point of intersection of lines $2x - 3y + 5 = 0$ and $3x + 4y = 0$ from the line $5x - 2y = 0$ is [NCERT Exemplar]

(a) $\frac{130}{17\sqrt{29}}$ (b) $\frac{13}{7\sqrt{29}}$ (c) $\frac{130}{7}$ (d) $\frac{13}{7}$

49. The coordinates of the foot of perpendicular from the point (2, 3) on the line $y = 3x + 4$ is given by [NCERT Exemplar]

(a) $\left(\frac{37}{10}, \frac{-1}{10}\right)$ (b) $\left(\frac{-1}{10}, \frac{37}{10}\right)$ (c) $\left(\frac{10}{37}, -10\right)$ (d) $\left(\frac{2}{3}, -\frac{1}{3}\right)$

50. A point equidistant from the lines $4x + 3y + 10 = 0$, $5x - 12y + 26 = 0$ and $7x + 24y - 50 = 0$ is [NCERT Exemplar]

(a) (1, –1) (b) (1, 1) (c) (0, 0) (d) (0, 1)

51. The length of perpendicular from the point $(a\cos\alpha, a\sin\alpha)$ upon the straight line $y = x\tan\alpha + c$, $c > 0$, is

(a) c (b) $c\sin^2\alpha$ (c) $c\cos\alpha$ (d) $c\sec^2\alpha$

52. The distance of the point (3, 5) from the line $2x + 3y - 14 = 0$ measured parallel to line $x - 2y = 1$, is

(a) $\frac{7}{\sqrt{5}}$ (b) $\frac{7}{\sqrt{13}}$ (c) $\sqrt{5}$ (d) $\sqrt{13}$

53. Equation of the line passing through (1, 2) and parallel to the line $y = 3x - 1$ is [NCERT Exemplar]

(a) $y + 2 = x + 1$ (b) $y + 2 = 3(x + 1)$
(c) $y - 2 = 3(x - 1)$ (d) $y - 2 = x - 1$

Bisector of Lines

54. P is a point on either of the two lines $y - \sqrt{3}|x| = 2$ at a distance 5 units from their point of intersection. The coordinates of the foot of the perpendicular from P on the bisector of the angle between them are

(a) $\left(0, \frac{4 + 5\sqrt{3}}{2}\right)$ or $\left(0, \frac{4 - 5\sqrt{3}}{2}\right)$ depending on which the point P is taken

(b) $\left(0, \frac{4 + 5\sqrt{3}}{2}\right)$

(c) $\left(0, \frac{4 - 5\sqrt{3}}{2}\right)$

(d) $\left(\frac{5}{2}, \frac{5\sqrt{3}}{2}\right)$

55. The equations of perpendicular bisectors of sides AB and AC of a ΔABC are $x - y + 5 = 0$ and $x + 2y = 0$ respectively. If the coordinates of vertex A are $(1, -2)$, then equation of BC is

(a) $23x + 14y - 40 = 0$
(b) $14x - 23y + 40 = 0$
(c) $23x - 14y + 40 = 0$
(d) $14x + 23y - 40 = 0$

56. The equation of the bisector of the acute angle between the lines $3x - 4y + 7 = 0$ and $12x + 5y - 2 = 0$ is

(a) $99x - 27y - 81 = 0$ (b) $11x - 3y + 9 = 0$
(c) $21x + 77y - 101 = 0$ (d) $21x + 77y + 101 = 0$

57. The equation of bisectors of the angles between the lines $|x| = |y|$ are

(a) $y = \pm x$ and $x = 0$ (b) $x = \frac{1}{2}$ and $y = \frac{1}{2}$
(c) $y = 0$ and $x = 0$ (d) None of these

Family of Lines

58. Equation of straight line belonging to families of straight lines $(x + 2y) + \lambda(3x + 2y + 1) = 0$ and $(x - 2y) + \mu(x - y + 1) = 0$ is

(a) $6x + 5y = 2$ (b) $5x - 6y + 4 = 0$
(c) $5x + 6y = 4$ (d) None of these

59. Equations of diagonals of the square formed by the lines $x = 0$, $y = 0$, $x = 1$ and $y = 1$ are [NCERT Exemplar]

(a) $y = x$, $y + x = 1$
(b) $y = x$, $x + y = 2$
(c) $2y = x$, $y + x = \frac{1}{3}$
(d) $y = 2x$, $y + 2x = 1$

60. Lines $2x + y = 1$ and $2x + y = 7$ are

(a) on the same side of a point $\left(0, \frac{1}{2}\right)$

(b) on the opposite side of a point $\left(0, \frac{1}{2}\right)$

(c) same lines
(d) perpendicular lines

61. Locus of the image of the point (2, 3) in the line $(x - 2y + 3) + \lambda(2x - 3y + 4) = 0$ is $(\lambda \in R)$

(a) $x^2 + y^2 - 3x - 4y - 4 = 0$

(b) $2x^2 + 3y^2 + 2x + 4y - 7 = 0$

(c) $x^2 + y^2 - 2x - 4y + 4 = 0$

(d) None of the above

Applications of Straight Line in Geometry

62. A square of area 25 sq units is formed by taking two sides as $3x + 4y = k_1$ and $3x + 4y = k_2$, then $|k_1 - k_2|$ is
(a) 5 units (b) 1 unit
(c) 25 units (d) None of these

63. Two vertices of a triangle are $(5, -1)$ and $(-2, 3)$. If the orthocentre of the triangle is the origin, then coordinates of third vertex are
(a) (4, 7) (b) $(-4, -7)$
(c) $(-4, 7)$ (d) None of these

64. Orthocentre of triangle with vertices (0, 0), (3, 4) and (4, 0) is
(a) (3, 5/4) (b) (3, 12)
(c) (3, 3/4) (d) (3, 9)

65. Orthocentre of the triangle formed by the lines $x + y = 1$ and $xy = 0$ is
(a) (0, 0) (b) (0, 1)
(c) (1, 0) (d) $(-1, 1)$

66. If t_1 and t_2 are roots of the equation $t^2 + \lambda t + 1 = 0$, where λ is an arbitrary constant. Then, the line joining the points $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$ always passes through a fixed point whose coordinates are
(a) $(a, 0)$ (b) $(-a, 0)$ (c) $(0, a)$ (d) $(0, -a)$

67. The point moves such that the area of the triangle formed by it with the points (1, 5) and (3, – 7) is 21 sq units. The locus of the point is
(a) $6x + y - 32 = 0$ (b) $6x - y + 32 = 0$
(c) $x + 6y - 32 = 0$ (d) $6x - y - 32 = 0$

Round II (Mixed Bag)

Only One Correct Option

1. A system of lines is given as $y = m_i x + c_i$, where m_i can take any value out of 0, 1, – 1 and when m_i is positive, then c_i can be 1 or – 1, when m_i equal 0, c_i can be 0 or 1 and when m_i equals to – 1, c_i can take 0 or 2. Then, the area enclosed by all these straight line is
(a) $\frac{3}{\sqrt{2}}(\sqrt{2} - 1)$ sq units (b) $\frac{3}{\sqrt{2}}$ sq units
(c) $\frac{3}{2}$ sq units (d) None of these

2. The number of points on the line $3x + 4y = 5$, which are at a distance of $\sec^2\theta + 2\,\text{cosec}^2\theta$, $\theta \in R$, from the point (1, 3) is
(a) 1 (b) 2 (c) 3 (d) infinite

3. The base BC of ΔABC is bisected at (p, q) and equation of sides AB and AC are $px + qy = 1$ and $qx + py = 1$ respectively. Then, the equation of the median through A is
(a) $(2pq - 1)(px + qy - 1) = (p^2 + q^2 - 1)(qx + py - 1)$
(b) $(px + qy - 1)(qx + py - 1) = 0$
(c) $(px + qy - 1)(qx - py - 1) = 0$
(d) None of the above

4. A beam of light is sent along the line $x - y = 1$. Which after refracting from the x-axis enters the opposite side by turning through 30° towards the normal at the point of incidence on the x-axis. Then, the equation of the refracted ray is
(a) $(2 - \sqrt{3})x - y = 2 + \sqrt{3}$ (b) $(2 + \sqrt{3})x - y = 2 + \sqrt{3}$
(c) $(2 - \sqrt{3})x + y = 2 + \sqrt{3}$ (d) None of these

5. If $5a + 4b + 20c = t$, then the value of t for which the line $ax + by + c - 1 = 0$ always passes through a fixed point is
(a) 0 (b) 20
(c) 30 (d) None of these

6. Consider the family of lines

$$(x + y - 1) + \lambda(2x + 3y - 5) = 0$$

and $$(3x + 2y - 4) + \mu(x + 2y - 6) = 0,$$

equation of a straight line that belongs to both the families is
(a) $x - 2y - 8 = 0$ (b) $x - 2y + 8 = 0$
(c) $2x + y - 8 = 0$ (d) $2x - y - 8 = 0$

7. If the distance of any point (x, y) from the origin is defined as $d(x, y) = \max\{|x|, |y|\}$, $d(x, y) = a$, non-zero constant, then the locus is a
(a) circle (b) straight line
(c) square (d) triangle

8. The straight line $ax + by + c = 0$ where $abc \neq 0$ will pass through the first quadrant if
(a) $ac > 0$, $bc > 0$
(b) $c > 0$ and $bc < 0$
(c) $bc > 0$ and/or $ac > 0$
(d) $ac < 0$ and/or $bc < 0$

9. The lines $y = m_1x$, $y = m_2x$ and $y = m_3x$ make equal intercepts on the line $x + y = 1$, then
(a) $2(1 + m_1)(1 + m_3) = (1 + m_2)(2 + m_1 + m_3)$
(b) $(1 + m_1)(1 + m_3) = (1 + m_2)(1 + m_1 + m_3)$
(c) $(1 + m_1)(1 + m_2) = (1 + m_3)(2 + m_1 + m_3)$
(d) None of the above

10. One diagonal of a square is along the line $8x - 15y = 0$ and one of its vertex is (1, 2). Then, the equations of the sides of the square passing through this vertex are
(a) $23x + 7y = 9, 7x + 23y = 53$
(b) $23x - 7y + 9 = 0, 7x + 23y + 53 = 0$
(c) $23x - 7y - 9 = 0, 7x + 23y - 53 = 0$
(d) None of the above

11. A light ray coming along the line $3x + 4y = 5$ gets reflected from the line $ax + by = 1$ and goes along the line $5x - 12y = 10$. Then,
(a) $a = 64/115, b = 112/15$ (b) $a = 14/15, b = -8/115$
(c) $a = 64/115, b = -8/115$ (d) $a = 64/15, b = 14/15$

12. The straight lines $4ax + 3by + c = 0$, where $a + b + c = 0$, are concurrent at the point
(a) (4, 3) (b) (1/4, 1/3)
(c) (1/2, 1/3) (d) None of these

More Than One Correct Option

13. Two sides of a triangle are the lines $(a + b)x + (a - b)y - 2ab = 0$ and $(a - b)x + (a + b)y - 2ab = 0$. If the triangle is isosceles and the third side passes through point $(b - a, a - b)$, then the equation of third side can be
(a) $x + y = 0$ (b) $x = y + 2(b - a)$
(c) $x - b + a = 0$ (d) $y - a + b = 0$

14. If $bx + cy = a$, where a, b, c are of the same sign, be a line such that the area enclosed by the line and the axes of reference is $\frac{1}{8}$ sq unit, then
(a) b, a, c are in GP (b) $b, 2a, c$ are in GP
(c) $b, \frac{a}{2}, c$ are in AP (d) $b, -2a, c$ are in GP

15. Consider the straight lines $x + 2y + 4 = 0$ and $4x + 2y - 1 = 0$. The line $6x + 6y + 7 = 0$ is
(a) bisector of the angle including origin
(b) bisector of acute angle
(c) bisector of obtuse angle
(d) None of the above

Comprehension Based Questions

Passage

Directions (Q. Nos. 16-18) *Let L be the line belonging to the family of the straight lines* $(a + 2b)x + (a - 3b)y + a - 8b = 0$, $a, b \in R$, *which is farthest from the point* (2, 2).

16. The equation of line L is
(a) $x + 4y + 7 = 0$ (b) $2x + 3y + 4 = 0$
(c) $4x - y - 6 = 0$ (d) None of these

17. Area formed by the line L with coordinate axis is
(a) 4/3 sq units (b) 9/2 sq units
(c) 49/8 sq units (d) None of these

18. If L is concurrent with the lines $x - 2y + 1 = 0$ and $3x - 4y + \lambda = 0$, then the value of λ is
(a) 2 (b) 1 (c) –4 (d) 5

Assertion and Reason

Directions (Q. Nos. 19-21) *Each of these questions contains two statements : Statement* I *(Assertion) and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*), (*d*) *given below.*
(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

19. Consider a, b and c are variables.

Statement I Such that $3a + 2b + 4c = 0$, then the family of lines given by $ax + by + c = 0$ pass through a fixed point (3, 2).

Statement II The equation $ax + by + c = 0$ will represent a family of straight line passing through a fixed point iff there exists a linear relation between a, b and c.

20. **Statement I** Each point on the line $y - x + 12 = 0$ is equidistant from the lines $4y + 3x - 12 = 0$, $3y + 4x - 24 = 0$.

Statement II The locus of a point which is equidistant from two given lines is the angular bisector of the two lines.

21. **Statement I** If the points (1, 2) and (3, 4) be on the same side of the line $3x - 5y + \lambda = 0$, then $\lambda < 7$ or $\lambda > 11$

Statement II If the points (x_1, y_1) and (x_2, y_2) be on the same side of the line $f(x, y) \equiv ax + by + c = 0$, then $\frac{f(x_1, y_1)}{f(x_2, y_2)} < 0$

Previous Years' Questions

22. The lines $x + y = |a|$ and $ax - y = 1$ intersect each other in the first quadrant. Then, the set of all possible values of a in the interval **[AIEEE 2011]**

(a) $(-1, 1]$ (b) $(0, \infty)$ (c) $[1, \infty)$ (d) $(-1, \infty)$

23. The line L given by $\frac{x}{5} + \frac{y}{b} = 1$ passes through the point (13, 32). The line K is parallel to L and has the equation $\frac{x}{c} + \frac{y}{3} = 1$. Then, the distance between L and K is **[AIEEE 2010]**

(a) $\frac{23}{\sqrt{15}}$ (b) $\sqrt{17}$ (c) $\frac{17}{\sqrt{15}}$ (d) $\frac{23}{\sqrt{17}}$

24. The lines $p(p^2 + 1)x - y + q = 0$ and $(p^2 + 1)^2 x + (p^2 + 1)y + 2q = 0$ are perpendicular to a common line for **[AIEEE 2009]**

(a) exactly one value of p
(b) exactly two values of p
(c) more than two values of p
(d) no values of p

25. The perpendicular bisector of the line segment joining $P(1, 4)$ and $Q(k, 3)$ has y-intercept -4. Then, a possible value of k is **[AIEEE 2008]**

(a) 4 (b) 1 (c) 2 (d) -2

26. Let $P = (-1, 0), Q = (0, 0)$ and $R = (3, 3\sqrt{3})$ be three points. The equation of the bisector of the $\angle PQR$ is **[AIEEE 2007]**

(a) $\frac{\sqrt{3}}{2}x + y = 0$ (b) $x + \sqrt{3}y = 0$

(c) $\sqrt{3}x + y = 0$ (d) $x + \frac{\sqrt{3}}{2}y = 0$

27. A straight line through the point $A(3, 4)$ is such that is intercept between the axis is bisected at A. Its equation is **[AIEEE 2006]**

(a) $4x + 3y = 24$ (b) $3x + 4y = 25$
(c) $x + y = 7$ (d) $3x - 4y + 7 = 0$

28. If (a, a^2) falls inside the angle made by the lines, $y = \frac{x}{2}, x > 0$ and $y = 3x, x > 0$, then $a \in$ **[AIEEE 2006]**

(a) $\left(\frac{1}{2}, 3\right)$ (b) $\left(-3, -\frac{1}{2}\right)$ (c) $\left(0, \frac{1}{2}\right)$ (d) $(3, \infty)$

29. If non-zero numbers a, b and c are in HP, then the straight line $\frac{x}{a} + \frac{y}{b} + \frac{1}{c} = 0$ always passes through a fixed point. That point is **[AIEEE 2005]**

(a) $\left(1, -\frac{1}{2}\right)$ (b) $(1, -2$

(c) $(-1, -2)$ (d) $(-1, 2)$

30. The line parallel to the x-axis and passing through the intersection of the lines $ax + 2by + 3b = 0$ and $bx - 2ay - 3a = 0$, where $(a, b) \neq (0, 0)$, is **[AIEEE 2005]**

(a) above the x-axis at a distance of (2/3) from it
(b) above the x-axis at a distance of (3/2) from it
(c) below the x-axis at a distance of (2/3) from it
(d) below the x-axis at a distance of (3/2) from it

31. The equation of the bisector of the actue angles between the lines $3x - 4y + 7 = 0$ and $12x + 5y - 2 = 0$ is **[AIEEE 2004]**

(a) $99x - 27y - 81 = 0$
(b) $11x - 3y + 9 = 0$
(c) $21x + 77y - 101 = 0$
(d) $21x + 77y + 101 = 0$

32. Let $A(2, -3)$ and $B(-2, 1)$ be vertices of a ΔABC. If the centroid of this triangle moves on the line $2x + 3y = 1$, then the locus of the vertex C is the line **[AIEEE 2004]**

(a) $2x + 3y = 9$ (b) $2x - 3y = 7$
(c) $3x + 2y = 5$ (d) $3x - 2y = 3$

33. The equation of the straight line passing through the point (4, 3) and making intercepts on the coordinate axes whose sum is -1, is **[AIEEE 2004]**

(a) $\frac{x}{2} + \frac{y}{3} = -1, \frac{x}{-2} + \frac{y}{1} = -1$

(b) $\frac{x}{2} - \frac{y}{3} = -1, \frac{x}{-2} + \frac{y}{1} = -1$

(c) $\frac{x}{2} + \frac{y}{3} = 1, \frac{x}{2} + \frac{y}{1} = 1$

(d) $\frac{x}{2} - \frac{y}{3} = 1, \frac{x}{-2} + \frac{y}{1} = 1$

the **Guidance**

Round I

1. Let the equation of a line be $y = mx + c$, where m and c are parameters.

$\therefore$ Number of parameters $= 2$

2. Slope of a line $= \tan\theta$

$$= \left|\frac{a}{a}\right| = \pm 1$$

($\because$ line can be equally intercept in any of the four quadrants)

$\therefore$ slope $= -1$

3. $\frac{x}{a} + \frac{y}{b} = 1$

It passes $(2, -3)$ and $(4, -5)$, then $\frac{2}{a} - \frac{3}{b} = 1$ and $\frac{4}{a} - \frac{5}{b} = 1$

On solving, we get

$$a = -1, b = -1$$

4. Equation of a line is $y - y_1 = \left(\frac{m \pm \tan\alpha}{1 \mp m\tan\alpha}\right)(x - x_1)$

$$\Rightarrow \quad y + 2 = \left(\frac{-\sqrt{3} \pm \tan 60°}{1 \mp (-\sqrt{3})\tan 60°}\right)(x - 3)$$

$$\Rightarrow \quad y + 2 = \frac{-\sqrt{3} \pm \sqrt{3}}{1 \mp (-3)}(x - 3)$$

$$\Rightarrow \quad y + 2 = \frac{-\sqrt{3} + \sqrt{3}}{1 - (-3)}(x - 3) \text{ and } y + 2 = \frac{-\sqrt{3} - \sqrt{3}}{1 + (-3)}(x - 3)$$

$$\Rightarrow \quad y + 2 = 0$$

and $\quad \sqrt{3}x - y - 2 - 3\sqrt{3} = 0$

5. Let the equation of line is

$$y = mx + c$$

$\because \quad m = \tan 30° = \frac{1}{\sqrt{3}}$

and $\quad c = -2$

($\because$ it is intercepted in negative axis of y with an angle of 30°)

$\therefore$ The equation of required line is

$$y = \frac{x}{\sqrt{3}} - 2$$

$$\Rightarrow \quad \sqrt{3}y - x + 2\sqrt{3} = 0$$

6. Slope of refracted ray is

$$-\tan 60° = -\sqrt{3}$$

It passes through $(1, 0)$

$\therefore \quad y = -\sqrt{3}(x - 1)$

$$\Rightarrow \quad \sqrt{3}x + y - \sqrt{3} = 0$$

7. The given determinant represents a straight line.

8. $-5 = \frac{2x_1 + 0}{3} \Rightarrow x_1 = \frac{-15}{2}$

and $\quad 4 = \frac{0 + y_1}{3}$

$$\Rightarrow \quad y_1 = 12$$

$\therefore$ Equation of line is $\frac{x}{-15/2} + \frac{y}{12} = 1$

$$\Rightarrow \quad 8x - 5y + 60 = 0$$

9. Let a and b the intercepts made by the straight line on the axes.

Given that, $a + b = \frac{ab}{2}$

$\Rightarrow \quad \frac{2a + 2b}{ab} = 1 \Rightarrow \frac{2}{a} + \frac{2}{b} = 1$

On comparing with $\frac{x}{a} + \frac{y}{b} = 1$, we get $x = 2$, $y = 2$

$\therefore$ Required point is $(2, 2)$.

So, the straight line passes through the point $(2, 2)$.

10. Since, a, b and c are in HP.

$\therefore \quad \frac{2}{b} = \frac{1}{a} + \frac{1}{c} \Rightarrow \frac{1}{\alpha} - \frac{2}{\beta} + \frac{1}{\chi} = 0$

So, straight line $\frac{x}{a} + \frac{y}{b} + \frac{1}{c} = 0$ always passes through a fixed point $(1, -2)$.

11. P is the mid-point of A and B.

$\Rightarrow \quad 3 = \frac{a+0}{2} \Rightarrow a = 6$

and $\quad 2 = \frac{b+0}{2} \Rightarrow b = 4$

$\therefore$ Equation of a line AB is

$\frac{x}{a} + \frac{y}{b} = 1 \Rightarrow \frac{x}{6} + \frac{y}{4} = 1$

$\Rightarrow \quad 2x + 3y = 12$

12. Since, $ax + by + c = 0$ is always passes through $(1, -2)$.

$\therefore \quad a - 2b + c = 0$

$\Rightarrow \quad 2b = a + c$

Therefore, a, b and c are in AP.

13. Lines are, $L_1 : 3x + 4y + 2 = 0$, $L_2 : 3x + 4y + 5 = 0$,

$L_3 : 3x + 4y - 5 = 0$

Ratio of distance $= \frac{\text{Distance between } L_1 \text{ and } L_2}{\text{Distance between } L_1 \text{ and } L_3}$

$= \frac{\frac{|2-5|}{\sqrt{3^2+5^2}}}{\frac{|2+5|}{\sqrt{3^2+5^2}}} = \frac{3}{7}$

$\left(\because \text{ distance between lines} = \frac{|c_1 - c_2|}{\sqrt{a^2+b^2}}\right)$

14. Since, $P(1, 2)$ is mid-point of AB. Therefore, coordinate of A and B are $(2, 0)$ and $(0, 4)$ respectively.

$\therefore$ Equation of line AB is

$y - 0 = \frac{4}{-2}(x - 2)$

$\Rightarrow \quad 2x + y = 4$

15. Since, the line intersect the X-axis to the left of origin. It means it intersect the negative X-axis. Clearly, line AB passes through the point $(-3, 0)$ and $m = -2$.

Equation of line in one point form is

$y - y_1 = m(x - x_1)$

$\Rightarrow \quad y - 0 = -2(x + 3)$

$\Rightarrow \quad y = -2x - 6$

$\Rightarrow \quad 2x + y + 6 = 0$

16. Let the intercept form of a line is $\frac{x}{a} + \frac{y}{b} = 1$ ...(i)

Given, $\quad a + b = 1$ ...(ii)

and $\quad ab = -6$ ...(iii)

For solving Eqs. (ii) and (iii), to find the value of a and b.

Put $b = \frac{-6}{a}$ from Eq. (i) in Eq. (ii),

$a - \frac{6}{a} = 1$

$\Rightarrow \quad a^2 - 6 = a \Rightarrow a^2 - a - 6 = 0$

$\Rightarrow \quad (a + 2)(a - 3) = 0$

$\Rightarrow \quad a = 3, -2$

and $\quad b = -2, 3$

Put $a = 3, -2$ respectively in Eq. (i), we get the required equations of lines

$\frac{x}{3} + \frac{y}{-2} = 1$ or $\frac{x}{-2} + \frac{y}{3} = 1$

$\Rightarrow \quad 2x - 3y = 6$ or $-3x + 2y = 6$

$\Rightarrow \quad 2x - 3y - 6 = 0$ or $3x - 2y + 6 = 0$

17. Since, S is mid-point of QR.

$\therefore$ Coordinate of S are

$\left(\frac{6+7}{2}, \frac{-1+3}{2}\right) = \left(\frac{13}{2}, 1\right)$

$\therefore$ Slope of $PS = \frac{2-1}{2 - \frac{13}{2}} = -\frac{2}{9}$

The required equation which is passing through $(1, -1)$ and slope $-\frac{2}{9}$, is

$y + 1 = -\frac{2}{9}(x - 1)$

$\Rightarrow \quad 9y + 9 = -2x + 2$

$\Rightarrow \quad 2x + 9y + 7 = 0$

18. Let ABC be an isosceles right angled triangle at A with $AB = AC$.

$\Rightarrow \quad \angle ABC = \angle ACB = 45°$

Now, we have to determine the angle between AC and BC.

The slope of line BC *i.e.*, $3x + 4y = 4$ is

$$m_2 = -\frac{3}{4}$$

Let the slope of the line AC is $m_1 = m$.

$\because$ Angle between two lines is

$$\tan\theta = \left|\frac{m_1 - m_2}{1 + m_1 m_2}\right| \Rightarrow \tan 45° = \left|\frac{m - \left(\frac{-3}{4}\right)}{1 + m\left(\frac{-3}{4}\right)}\right|$$

$$\Rightarrow \quad 1 = \left|\frac{m + \frac{3}{4}}{1 - \frac{3m}{4}}\right| \Rightarrow \pm 1 = \frac{4m + 3}{4 - 3m}$$

Taking positive sign, $1 = \dfrac{4m + 3}{4 - 3m}$

$\Rightarrow \quad 4 - 3m = 4m + 3$

$\Rightarrow \quad 4 - 3 = 4m + 3m$

$\Rightarrow \quad 7m = 1$

$\Rightarrow \quad m = \dfrac{1}{7}$

Taking negative sign, $-1 = \dfrac{4m + 3}{4 - 3m}$

$\Rightarrow \quad -4 + 3m = 4m + 3$

$\Rightarrow \quad -4 - 3 = m \Rightarrow m = -7$

Hence, equation of line AB and line AC are

$$y - 2 = \frac{1}{7}(x - 2) \text{ and } y - 2 = -7(x - 2)$$

$\Rightarrow \quad 7y - 14 = x - 2$ and $y - 2 = -7x + 14$

$\Rightarrow \quad x - 7y + 12 = 0$ and $7x + y - 16 = 0$

19. Let slope of a line be m.

Now, the equation of a line passing through (1, 0) is

$$y - 0 = m(x - 1) \Rightarrow mx - y - m = 0$$

Distance from origin $= \dfrac{\sqrt{3}}{2}$

$$\Rightarrow \quad \frac{|-m|}{\sqrt{1 + m^2}} = \frac{\sqrt{3}}{2} \Rightarrow 4m^2 = 3(1 + m^2)$$

$\Rightarrow \quad m^2 = 3$

$\Rightarrow \quad m = \pm\sqrt{3}$

$\therefore$ Equations are

$$\sqrt{3}x - y - \sqrt{3} = 0 \text{ and } -\sqrt{3}x - y + \sqrt{3} = 0$$

$\Rightarrow \quad \sqrt{3}x - y - \sqrt{3} = 0$ and $\sqrt{3}x + y - \sqrt{3} = 0$

20. Equation of line l_1 is

$$x - 2y = 3 \quad \ldots(i)$$

Slope of Eq. (i),

$$m_1 = -\left(\frac{1}{-2}\right) \Rightarrow m_1 = \frac{1}{2}$$

Angle between two lines is

$$\tan\theta = \left|\frac{m_1 - m_2}{1 + m_1 m_2}\right|$$

Given, $\quad \theta = 45°, m_1 = \dfrac{1}{2}, m_2 = m$ (let)

$$\therefore \quad \tan 45° = \left|\frac{\frac{1}{2} - m}{1 + \frac{1}{2}m}\right| \Rightarrow 1 = \left|\frac{1 - 2m}{2 + m}\right| \Rightarrow \frac{1 - 2m}{2 + m} = \pm 1$$

Taking positive sign,

$$\frac{1 - 2m}{2 + m} = 1 \Rightarrow 1 - 2m = 2 + m$$

$$\Rightarrow \quad 1 - 2 = 3m \Rightarrow m = -\frac{1}{3}$$

Taking negative sign,

$$\frac{1 - 2m}{2 + m} = -1$$

$\Rightarrow \quad 1 - 2m = -2 - m \Rightarrow 1 + 2 = 2m - m$

$\Rightarrow \quad m = 3$

Now, equation of line l_2 by using

$$y - y_1 = m(x - x_1)$$

$$\Rightarrow \quad y - 2 = -\frac{1}{3}(x - 3) \quad \left(\text{when } m = -\frac{1}{3}, x_1 = 3, y_1 = 2\right)$$

$\Rightarrow \quad 3y - 6 = -x + 3$

$\Rightarrow \quad x + 3y - 9 = 0$

Again, $\quad y - 2 = 3(x - 3) \quad \left(\text{when } m = 3, x_1 = 3, y_1 = 2\right)$

$\Rightarrow \quad y - 2 = 3x - 9 \Rightarrow 3x - y - 9 + 2 = 0$

$\Rightarrow \quad 3x - y - 7 = 0$

21. In a figure, PA is the incident ray and AR is the reflected ray, which makes an angle θ from the X-axis.

It is clear from the figure that

$$AS \perp OX$$

It means AS bisect the angle PAR.

Then, $\angle PAS = \angle RAS$

$\Rightarrow$ $\angle RAX = \angle PAO = \theta$ (let)

$\Rightarrow$ $\angle XAP = 180 - \theta$

Slope of $AR = \tan\theta = \dfrac{y_2 - y_1}{x_2 - x_1} = \dfrac{3-0}{5-k}$ ...(i)

[where point A is $(k, 0)$]

Slope of $AP = \tan(180° - \theta)$

$$= -\tan\theta = \frac{y_2 - y_1}{x_2 - x_1} = \frac{2-0}{1-k} \quad \text{...(ii)}$$

$\therefore$ From Eqs. (i) and (ii),

$$\frac{3}{5-k} = -\frac{2}{1-k} \Rightarrow 3 - 3k = -10 + 2k$$

$$\Rightarrow \quad 5k = 13 \Rightarrow k = \frac{13}{5}$$

Hence, the coordinate of A is $\left(\dfrac{13}{5}, 0\right)$.

22. Slope of line joining $(2, 3)$ and $(3, -1)$ is

$$m_1 = \frac{-1-3}{3-2} = -4$$

Slope of line perpendicular to it is, $m_2 = \dfrac{-1}{-4} = \dfrac{1}{4}$

$\therefore$ Equation of a line passing through $(5, 2)$ is

$$y - 2 = \frac{1}{4}(x - 5)$$

$$\Rightarrow \quad x - 4y + 3 = 0$$

23. Equation of a line passing through the intersection of given lines is

$$(2x + y - 5) + \lambda(x + 3y + 8) = 0$$

$$\Rightarrow \quad x(2 + \lambda) + y(1 + 3\lambda) - 5 + 8\lambda = 0 \quad \text{...(i)}$$

It is parallel to $3x + 4y = 7$

$$\Rightarrow \quad \frac{-(2+\lambda)}{1+3\lambda} = \frac{-3}{4}$$

$$\Rightarrow \quad \lambda = 1$$

Put in Eq. (i),

$$3x + 4y + 3 = 0$$

24. Equation of a line passing through the point of intersection of lines is

$$x - y + 1 + \lambda(2x - 3y + 5) = 0$$

$$\Rightarrow \quad x(1 + 2\lambda) + y(-1 - 3\lambda) + 1 + 5\lambda = 0 \quad \text{...(i)}$$

Its distance from point $(3, 2) = \dfrac{7}{5}$

$$\Rightarrow \quad \frac{|3(1+2\lambda) + 2(-1-3\lambda) + 1 + 5\lambda|}{\sqrt{(1+2\lambda)^2 + (-1-3\lambda)^2}} = \frac{7}{5}$$

$$\Rightarrow \quad \frac{|2 + 5\lambda|}{\sqrt{13\lambda^2 + 10\lambda + 2}} = \frac{7}{5}$$

On squaring, we get

$$25(4 + 25\lambda^2 + 20\lambda) = 49(13\lambda^2 + 10\lambda + 2)$$

$$\Rightarrow \quad 6\lambda^2 - 5\lambda - 1 = 0 \Rightarrow \lambda = 1, -\frac{1}{6}$$

On putting $\lambda = 1, -\dfrac{1}{6}$ in Eq. (i) respectively, we get

$$3x - 4y + 6 = 0 \text{ and } 4x - 3y + 1 = 0$$

25. Equation of a line perpendicular to $y = x$ is $x + y + \lambda = 0$ and passes through $(3, 2)$.

$\therefore$ $3 + 2 + \lambda = 0 \Rightarrow \lambda = -5$

$\Rightarrow$ Equation is $x + y - 5 = 0$

26. Equation of line in intercept form is

$$\frac{x}{a} + \frac{y}{b} = 1 \quad \text{...(i)}$$

Given, $a + b = 9$ ...(ii)

And line (i) passes through the point $(2, 2)$ *i.e.*, it will satisfy the line (i) *i.e.*, put $x = 2, y = 2$ in Eq. (i),

$$\Rightarrow \quad \frac{2}{a} + \frac{2}{b} = 1 \quad \text{...(iii)}$$

On solving Eqs. (i) and (ii), we get

$\Rightarrow$ $a = 6$ or $3 \Rightarrow b = 3$ or 6

Hence, Eq. (i) becomes

$$\frac{x}{6} + \frac{y}{3} = 1 \quad \text{or} \quad \frac{x}{3} + \frac{y}{6} = 1$$

$\Rightarrow$ $3x + 6y = 18$ or $6x + 3y = 18$

$\Rightarrow$ $x + 2y = 6$ or $2x + y = 6$

27. The intersection point of $y - x + 7 = 0$ and $y + 2x - 2 = 0$ is $(3, -4)$.

$\therefore$ Equation of straight line joining from origin to the point $(3, -4)$ is

$$y - 0 = \frac{-4}{3}(x - 0) \Rightarrow 3y = -4x$$

$$\Rightarrow \quad 4x + 3y = 0$$

28. Any line which is perpendicular to $\sqrt{3}\sin\theta + 2\cos\theta = \dfrac{4}{r}$ is

$$\sqrt{3}\sin\left(\frac{\pi}{2} + \theta\right) + 2\cos\left(\frac{\pi}{2} + \theta\right) = \frac{k}{r} \quad \text{...(i)}$$

Since, it is passing through $\left(-1, \dfrac{\pi}{2}\right)$.

$$\therefore \quad \sqrt{3}\sin\pi + 2\cos\pi = \frac{k}{-1} \Rightarrow k = 2$$

On putting $k = 2$ in Eq. (i), we get

$$\sqrt{3}\cos\theta - 2\sin\theta = \frac{2}{r}$$

$$\Rightarrow \quad 2 = \sqrt{3}r\cos\theta - 2r\sin\theta$$

29. Let the given points are $A(1, 0)$ and $B(2, 3)$. Let the line PQ divide AB in the ratio $1 : n$ at R.

Using internally ratio

$$R=\left(\frac{1\times x_2+n\times x_1}{1+n},\ \frac{1\times y_2+n\times y_1}{1+n}\right)$$
$$=\left(\frac{1\times 2+n\times 1}{1+n},\ \frac{1\times 3+n\times 0}{1+n}\right)$$
$$=\left(\frac{n+2}{n+1},\ \frac{3}{1+n}\right)$$

Also, $PQ \perp AB$

Let slope of line PQ is m.

$\therefore$ Slope of line $PQ \times$ Slope of line $AB=-1$ $\quad(\because m_1 m_2=-1)$

$$\Rightarrow \quad m\times\frac{y_2-y_1}{x_2-x_1}=-1 \Rightarrow m\times\frac{3-0}{2-1}=-1$$

$$\Rightarrow \quad m\times 3=-1 \ \Rightarrow\ m=-\frac{1}{3}$$

Now, equation of line PQ by using

$$y-y_1=m(x-x_1)$$

$$\Rightarrow \quad y-\frac{3}{1+n}=\frac{-1}{3}\left(x-\frac{n+2}{n+1}\right)$$

$$\Rightarrow \quad \frac{3(n+1)y-9}{1+n}=\frac{-x(n+1)+(n+2)}{n+1}$$

$$\Rightarrow \quad 3(n+1)y-9=-x(n+1)+(n+2)$$

$$\Rightarrow \quad x(n+1)+3(n+1)y=n+2+9$$

$$\Rightarrow \quad x(n+1)+3(n+1)y=n+11$$

30. Given line AB makes 0 intercepts on x-axis and y-axis or $(x_1, y_1)\equiv(0,0)$ and the line is perpendicular to line CD, $3x+4y+6=0$.

$\therefore$ Slope of required line which is perpendicular to $3x+4y+6=0$ is 4/3.

$\therefore$ Required line which is passing through origin and having slope 4/3, is

$$y-0=\frac{4}{3}(x-0)\Rightarrow 4x-3y=0$$

31. The point of intersection of lines $2x-3y+4=0$ and $3x+4y-5=0$ is $\left(-\frac{2}{34}, \frac{22}{17}\right)$.

The slope of required line which is perpendicular to $6x-7y+3=0$ is $-\frac{7}{6}$.

$\therefore$ Equation of required line

$$y-\frac{22}{17}=-\frac{7}{6}\left(x+\frac{2}{34}\right)$$

$$\Rightarrow \quad \frac{6(17y-22)}{17}=-\frac{7(34x+2)}{34}$$

$$\Rightarrow \quad 119x+102y=125$$

32. From the given equations, we get

$$m^2+am+2=0$$

Since, m is real, $a^2\geq 8\Rightarrow |a|\geq 2\sqrt{2}$

So, least value of $|a|$ is $2\sqrt{2}$.

33. The intersection point of lines $x-2y=1$ and $x+3y=2$ is $\left(\frac{7}{5}, \frac{1}{5}\right)$.

$\because$ Required line is parallel to $3x+4y=0$.

$\therefore$ The slope of required line $=-\frac{3}{4}$

$\therefore$ Equation of required line which passes through $\left(\frac{7}{5}, \frac{1}{5}\right)$ and having slope $-\frac{3}{4}$, is

$$y-\frac{1}{5}=\frac{-3}{4}\left(x-\frac{7}{5}\right)$$

$$\Rightarrow \quad \frac{3x}{4}+y=\frac{21}{20}+\frac{1}{5}$$

$$\Rightarrow \quad \frac{3x+4y}{4}=\frac{21+4}{20}$$

$$\Rightarrow \quad 3x+4y=5\Rightarrow 3x+4y-5=0$$

34. Since, the given lines are concurrent.

$$\therefore \quad \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}=0 \ \Rightarrow\ a^3+b^3+c^3-3abc=0$$

$$\Rightarrow \quad (a+b+c)(a^2+b^2+c^2-ab-bc-ca)=0$$

$$\Rightarrow \quad \frac{(a+b+c)}{2}\{(a-b)^2+(b-c)^2+(c-a)^2\}=0$$

$$\Rightarrow \quad a+b+c=0 \qquad (\text{as } a\neq b\neq c)$$

35. Line perpendicular to the given line $\frac{x}{a}-\frac{y}{b}=1$ is

$$\frac{1}{b}x+\frac{1}{a}y+\lambda=0 \qquad \ldots(\text{i})$$

According to the question, line (i) is passing through the point $P(a, 0)$.

$$\therefore \quad \frac{a}{b}+0+\lambda=0\Rightarrow\lambda=-\frac{a}{b}$$

On putting the value of λ in Eq. (i), we get

$$\frac{x}{b}+\frac{y}{a}-\frac{a}{b}=0\Rightarrow ax+by=a^2$$

36. Equation of a line perpendicular to $3x+y=3$ is

$$x-3y+\lambda=0$$

It passes (2, 3).

$$\Rightarrow \quad 2-6+\lambda=0\Rightarrow\lambda=4$$

$\therefore$ Equation is

$$x-3y+4=0$$

i.e., $\quad y=\frac{x}{3}+\frac{4}{3}$

So, y-intercept is $\frac{4}{3}$.

37. Given lines are $3x + 4y = 5$, $5x + 4y = 4$ and $\lambda x + 4y = 6$ These three lines meet at a point, if the point of intersection of first two lines lies on the third line.

Now, point of intersection of line $3x + 4y = 5$ and $5x + 4y = 4$ is $\left(-\frac{1}{2}, \frac{13}{8}\right)$.

The line $\lambda x + 4y = 6$ passes through the point $\left(-\frac{1}{2}, \frac{13}{8}\right)$.

$$\therefore \quad \lambda\left(-\frac{1}{2}\right) + 4\left(\frac{13}{8}\right) = 6 \Rightarrow -\lambda + 13 = 12$$

$$\Rightarrow \quad \lambda = 1$$

38. Given, equation of line is $\sqrt{3}x + y + 2 = 0$

$$\Rightarrow \quad \sqrt{3}\,x + y = -2 \Rightarrow -\sqrt{3}x - y = 2$$

On dividing above equation by

$$\sqrt{(\text{coefficient of } x)^2 + (\text{coefficient of } y)^2}$$

i.e., $\sqrt{(-\sqrt{3})^2 + (-1)^2} = \sqrt{3+1} = \sqrt{4} = 2$

$$\Rightarrow \quad \frac{-\sqrt{3}}{2}x - \frac{1}{2}y = \frac{2}{2}$$

$$\Rightarrow \quad -\cos 30^\circ x - \sin 30^\circ y = 1$$

($\because$ for convert in the form of $x\cos\alpha + y\sin\alpha = p$)

$$\Rightarrow \quad \cos(180^\circ + 30^\circ)x + \sin(180^\circ + 30^\circ)y = 1$$

($\because \cos\theta$ and $\sin\theta$ both are negative in third quadrant)

$$\Rightarrow \quad (\cos 210^\circ)x + (\sin 210^\circ)y = 1$$

On comparing with $x\cos\theta + y\sin\theta = p$, we get

$$\theta = 210^\circ \quad \text{and} \quad p = 1$$

39. Equation of line through $(h, 3)$ and $(4, 1)$ by using

$$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1)$$

$$\Rightarrow \quad y - 3 = \frac{1-3}{4-h}(x - h)$$

$$\Rightarrow \quad y - 3 = \frac{-2}{4-h}(x - h)$$

$$\Rightarrow \quad y - 3 = -\frac{2x}{4-h} + \frac{2h}{4-h}$$

$$\Rightarrow \quad y = -\frac{2x}{4-h} + \left(3 + \frac{2h}{4-h}\right) = 0 \qquad \text{...(i)}$$

Given equation of line is

$$7x - 9y - 19 = 0$$

$$\Rightarrow \quad y = \frac{7}{9}x - \frac{19}{9} \qquad \text{...(ii)}$$

Compare lines (i) and (ii) with $y = mx + c$

$$\therefore \quad m_1 = -\frac{2}{4-h} \text{ and } m_2 = \frac{7}{9}$$

$\because$ Lines (i) and (ii) are perpendicular to each other, *i.e.*,

Slope of line (i) $\times$ Slope of line (ii) $= -1$

$$\therefore \quad m_1 m_2 = -1$$

$$\Rightarrow \quad -\frac{2}{4-h} \times \frac{7}{9} = -1 \Rightarrow 14 = 9(4 - h)$$

$$\Rightarrow \quad 14 = 36 - 9h \Rightarrow 9h = 22 \Rightarrow h = \frac{22}{9}$$

40. $y = (2 - \sqrt{3})(x + 5)$ and $y = (2 + \sqrt{3})(x - 7)$

Slopes are,

$$m_1 = 2 - \sqrt{3}, m_2 = 2 + \sqrt{3}$$

Angle between two lines,

$$\tan\theta = \left|\frac{2 + \sqrt{3} - (2 - \sqrt{3})}{1 + (2 + \sqrt{3})(2 - \sqrt{3})}\right|$$

$$\Rightarrow \quad \tan\theta = |\sqrt{3}|$$

i.e., $\tan\theta = \sqrt{3}$ and $\tan\theta = -\sqrt{3}$

$$\therefore \quad \theta = \frac{\pi}{3} \text{ or } \frac{2\pi}{3}$$

41. Given, equation of lines are

$$\sqrt{3}x + y = 1 \Rightarrow y = -\sqrt{3}x + 1$$

and $x + \sqrt{3}y = 1 \Rightarrow \sqrt{3}y = -x + 1$

$$\Rightarrow \quad y = \frac{-1}{\sqrt{3}}x + \frac{1}{\sqrt{3}}$$

On comparing with $y = m_1x + c_1$ and $y = m_2x + c_2$, we get

$$m_1 = -\sqrt{3} \text{ and } m_2 = -\frac{1}{\sqrt{3}}$$

$$\therefore \quad \tan\theta = \left|\frac{-\sqrt{3} - \left(-\frac{1}{\sqrt{3}}\right)}{1 + (-\sqrt{3})\left(-\frac{1}{\sqrt{3}}\right)}\right| \qquad \left(\because \tan\theta = \left|\frac{m_1 - m_2}{1 + m_1m_2}\right|\right)$$

$$\Rightarrow \quad \tan\theta = \left|\frac{-\sqrt{3} + \frac{1}{\sqrt{3}}}{1+1}\right| = \left|\frac{\frac{-3+1}{\sqrt{3}}}{2}\right|$$

$$\Rightarrow \quad \tan\theta = \frac{1}{\sqrt{3}} \Rightarrow \tan\theta = \tan 30^\circ \Rightarrow \theta = 30^\circ$$

42. Let equation of line is

$$\frac{x - x_1}{\cos\theta} = \frac{y - y_1}{\sin\theta} = r$$

$$\therefore \quad \frac{x-1}{\cos\theta} = \frac{y-2}{\sin\theta} = \frac{\sqrt{6}}{3}$$

$$\Rightarrow \quad \frac{x-1}{\cos\theta} = \frac{\sqrt{6}}{3}, \frac{y-2}{\sin\theta} = \frac{\sqrt{6}}{3}$$

$$x = \frac{\sqrt{6}}{3}\cos\theta + 1, \; y = \frac{\sqrt{6}}{3}\sin\theta + 2$$

It satisfies $x + y = 4$

$$\therefore \quad \frac{\sqrt{6}}{3}\cos\theta + 1 + \frac{\sqrt{6}}{3}\sin\theta + 2 = 4$$

$$\Rightarrow \quad \frac{\sqrt{6}}{3}\cos\theta + \frac{\sqrt{6}}{3}\sin\theta = 1$$

$\Rightarrow \quad \sqrt{6}\cos\theta + \sqrt{6}\sin\theta = 3$

$\Rightarrow \quad 6\cos^2\theta + 6\sin^2\theta + 2\sqrt{6}\sqrt{6}\cos\theta\sin\theta = 9$

$\Rightarrow \quad 6(\cos^2\theta + \sin^2\theta) + 2\times 6\cos\theta\sin\theta = 9$

$\Rightarrow \quad 6 + 6\sin 2\theta = 9$

$\Rightarrow \quad 6\sin 2\theta = 9 - 6 \Rightarrow \sin 2\theta = \frac{3}{6}$

$\Rightarrow \quad \sin 2\theta = \frac{1}{2} = \sin 30°$

$\Rightarrow \quad 2\theta = 30° \Rightarrow \theta = 15°$

or $\quad \sin 2\theta = \sin(180° - 30°)$

$\Rightarrow \quad 2\theta = 150° \Rightarrow \theta = 75°$

43. Two sides $x - 3y = 0$ and $3x + y = 0$ are perpendicular to each other. Therefore, its orthocentre is the point of intersection of

$$x - 3y = 0$$

and $\quad 3x + y = 0$ *i.e.*, $(0, 0)$

So, the line $3x - 4y = 0$ passes through the orthocentre of triangle.

44. The vertices of triangle are the intersection points of the lines

$$x + y = 0 \quad \ldots(i)$$

$$3x + y = 4 \quad \ldots(ii)$$

and $\quad x + 3y = 4 \quad \ldots(iii)$

On solving Eqs. (i) and (ii), (ii) and (iii), (iii) and (i), we get the vertices of triangles are $A(-2, 2)$, $B(1, 1)$ and $C(2, -2)$.

Now, $\quad AB = \sqrt{(1+2)^2 + (1-2)^2} = \sqrt{9+1} = \sqrt{10}$

$BC = \sqrt{(2-1)^2 + (-2-1)^2} = \sqrt{1^2 + (-3)^2} = \sqrt{10}$

$AC = \sqrt{(2+2)^2 + (-2-2)^2} = \sqrt{16+16} = 4\sqrt{2}$

$\because \quad AB = BC$

So, triangle is isosceles.

45. The equation of lines are

$$y - y_1 = \frac{m_1 \pm m_2}{1 \mp m_1 m_2}(x - x_1)$$

Since, $\quad m_1 = 1, \quad m_2 = 1$

$\therefore \quad y - 4 = \frac{1 \pm 1}{1 \mp 1}(x - 3)$

$\Rightarrow \quad y = 4 \quad \text{or} \quad x = 3$

Hence, the lines which make the triangle are $x - y = 2$, $x = 3$ and $y = 4$.

The intersection points of these lines are (6, 4), (3, 1) and (3, 4).

$\therefore$ Area of triangle

$= \frac{1}{2}|6(1-4) + 3(4-4) + 3(4-1)| = \frac{1}{2}|6(-3) + 3(0) + 3(3)|$

$= \frac{1}{2}|-18 + 0 + 9| = \frac{9}{2}$ sq units

46. Mid-point of the line joining the points $(4, -5)$ and $(-2, 9)$ is $\left(\frac{4-2}{2}, \frac{-5+9}{2}\right)$ *i.e.*, $(1, 2)$.

$\therefore$ Inclination of straight line passing through point $(-3, 6)$ and mid-point $(1, 2)$ is

$$m = \frac{2-6}{1+3} = \frac{-4}{4} = -1$$

$\therefore \quad \tan\theta = -1 \Rightarrow \theta = \frac{3\pi}{4}$

47. Given equation of lines are

$$5x + 3y - 7 = 0 \quad \ldots(i)$$

and $\quad 15x + 9y + 14 = 0 \quad \text{or} \quad 5x + 3y + \frac{14}{3} = 0 \quad \ldots(ii)$

$\because$ Lines (i) and (ii) are parallel and c_1 and c_2 are of opposite signs, therefore these lines are on opposite sides of the origin.

So, the distance between them is

$$\left|\frac{c_1}{\sqrt{a_1^2 + b_1^2}}\right| + \left|\frac{c_2}{\sqrt{a_2^2 + b_2^2}}\right| = \left|-\frac{7}{\sqrt{5^2 + 3^2}}\right| + \left|\frac{14}{3\sqrt{5^2 + 3^2}}\right|$$

$$= \left|-\frac{7}{\sqrt{34}}\right| + \left|\frac{14}{3\sqrt{34}}\right| = \frac{35}{3\sqrt{34}}$$

48. On solving the equations $2x - 3y + 5 = 0$ and $3x + 4y = 0$, we get

$$x = \frac{-60}{51}, y = \frac{15}{17}$$

Point of intersection is $\left(\frac{-60}{51}, \frac{15}{17}\right)$

$\therefore \quad$ Distance $= \dfrac{\left|5\left(\frac{-60}{51}\right) - 2\left(\frac{15}{17}\right)\right|}{\sqrt{25+4}} = \frac{130}{17\sqrt{29}}$

49. Let the foot be $A(\alpha, \beta)$.

$$\beta = 3\alpha + 4 \quad \ldots(i)$$

and $\quad m_1 \times m_2 = -1$

$$\frac{\beta - 3}{\alpha - 2} \times 3 = -1$$

$\Rightarrow \quad 3\beta = -\alpha + 11 \quad \ldots(ii)$

On solving Eqs. (i) and (ii), we get

$$\alpha = -\frac{1}{10}, \beta = \frac{37}{10}$$

50. Lines are

$$L_1 : 4x + 3y + 10 = 0, L_2 : 5x - 12y + 26 = 0$$

$$L_3 : 7x + 24y - 50 = 0$$

By option method,

Distance of lines from (0, 0) are equal.

i.e., $\left|\frac{0+0+10}{5}\right| = \left|\frac{0+0+26}{13}\right| = \left|\frac{0+0-50}{25}\right|$

$\Rightarrow \quad 2 = 2 = 2$

51. The given line is $x \tan\alpha - y + c = 0$

or $\quad x \sin\alpha - y \cos\alpha + c \cos\alpha = 0$

$\therefore$ Length of perpendicular from $(a \cos\alpha, a \sin\alpha)$

$$= \frac{a \cos\alpha \sin\alpha - a \sin\alpha \cos\alpha + c \cos\alpha}{\sqrt{\sin^2\alpha + \cos^2\alpha}}$$

$$= \frac{c \cos\alpha}{1} = c \cos\alpha$$

52. Let the equation of line parallel to $x - 2y = 1$ is

$$x - 2y + \lambda = 0$$

Since, it is passes through (3, 5).

$\therefore \quad 3 - 10 + \lambda = 0$

$\Rightarrow \quad \lambda = 7$

$\therefore$ Line is $x - 2y + 7 = 0$

The point of intersection $2x + 3y - 14 = 0$ and $x - 2y + 7 = 0$ is (1, 4).

$\therefore$ The distance between (3, 5) and (1, 4)

$$= \sqrt{(3-1)^2 + (5-4)^2}$$

$$= \sqrt{4+1} = \sqrt{5}$$

53. Slope of a line $y = 3x - 1$ is $m = 3 \Rightarrow$ slope of a line parallel to it is, $m_1 = 3$

$\therefore$ Equation of a line is

$$y - 2 = 3(x - 1)$$

54. Given that, $\quad y = \sqrt{3}\,|x| + 2$

and $\quad PQ = 5$, so $QR = \frac{5\sqrt{3}}{2}$

So, coordinates of R are $\left(0, 2 + \frac{5\sqrt{3}}{2}\right)$ or $\left(0, \frac{4 + 5\sqrt{3}}{2}\right)$.

55. Let $B(x_1, y_1)$ and $C(x_2, y_2)$ are the vertices of a triangle.

$P\left(\frac{x_1+1}{2}, \frac{y_1-2}{2}\right)$ lies on the line $x - y + 5 = 0$.

$\therefore \quad \frac{x_1+1}{2} - \frac{y_1-2}{2} = -5$

$\Rightarrow \quad x_1 - y_1 = -13 \quad \ldots(i)$

Also, $\quad PN \perp AB$

$\therefore \quad \frac{y_1+2}{x_1-1} = -1$

$\Rightarrow \quad y_1 + 2 = -x_1 + 1$

$\Rightarrow \quad x_1 + y_1 = -1 \quad \ldots(ii)$

On solving Eqs. (i) and (ii), we get

$$x_1 = -7 \quad \text{and} \quad y_1 = 6$$

$\therefore$ Coordinates of B are $(-7, 6)$.

Similarly, the coordinates of C are $\left(\frac{11}{5}, \frac{2}{5}\right)$.

$\therefore$ Equation of BC is

$$(y - 6) = \frac{\frac{2}{5} - 6}{\frac{11}{5} + 7}(x + 7) \Rightarrow 14x + 23y - 40 = 0$$

56. Equation of the straight lines are

$3x - 4y + 7 = 0 \quad \ldots(i)$

and $\quad 12x + 5y - 2 = 0 \quad \ldots(ii)$

The equation of bisectors of the acute angle between these lines are

$$\frac{3x - 4y + 7}{\sqrt{3^2 + 4^2}} = \frac{12x + 5y - 2}{\sqrt{12^2 + 5^2}}$$

$\Rightarrow \quad \frac{3x - 4y + 7}{5} = \frac{12x + 5y - 2}{13}$

$\Rightarrow \quad 39x - 52y + 91 = 60x + 25y - 10$

$\Rightarrow \quad 21x + 77y - 101 = 0$

57. The equation of lines are $x + y = 0$ and $x - y = 0$.

$\therefore$ The equation of bisectors of the angles between these lines are

$$\frac{x+y}{\sqrt{1+1}} = \pm \frac{x-y}{\sqrt{1+1}}$$

$\Rightarrow \quad x + y = \pm (x - y)$

Taking positive sign, $x + y = (x - y)$

$\Rightarrow \quad y = 0$

Taking negative sign, $x + y = -(x - y)$

$\Rightarrow \quad x = 0$

Hence, the equation of bisectors are $x = 0$ and $y = 0$.

58. Equation belonging to both families will pass through two fixed points. First intersection point of lines $x + 2y = 0$ and $3x + 2y + 1 = 0$, is $\left(-\frac{1}{2}, \frac{1}{4}\right)$ and second intersection point of lines $x - 2y = 0$ and $x - y + 1 = 0$, is $(-2, -1)$.

Line passing through $\left(-\frac{1}{2}, \frac{1}{4}\right)$ and $(-2, -1)$ is

$$y - \frac{1}{4} = \frac{-1 - \frac{1}{4}}{-2 + \frac{1}{2}}\left(x + \frac{1}{2}\right) \Rightarrow 5x - 6y + 4 = 0$$

59. Equation of diagonal OB is $y = x$

And equation of diagonal AC is

$$y - 0 = \frac{1-0}{0-1}(x-1)$$

$$x + y = 1$$

60. Since, $2x + y = 1$ and $2x + y = 7$ are parallel lines. $(2x + y - 1)(2x + y - 7)$ is positive at point $\left(0, \frac{1}{2}\right)$. So, lines are in the same side of a point.

61. The family of lines $(x - 2y + 3) + \lambda(2x - 3y + 4) = 0$ are concurrent at point $P(1, 2)$.

If image of point $A(2, 3)$ in the above variable line is $B(h, k)$, then $AP = BP$

$\Rightarrow \quad (h-1)^2 + (k-2)^2 = (2-1)^2 + (3-2)^2$

Hence, locus of point P is $x^2 + y^2 - 2x - 4y + 4 = 0$

62. Each side of square is 5 units, distance between given lines is 5 units,

i.e., $\quad \left|\frac{k_1 - k_2}{5}\right| = 5$

$\Rightarrow \quad |k_1 - k_2| = 25$

63. Let the coordinates of the third vertex A be (h, k).

Also, $\quad AD \perp BC$

$\therefore \quad \frac{k-0}{h-0} \times \left(\frac{4}{-7}\right) = -1$

$\Rightarrow \quad 7h = 4k \quad$ ...(i)

and $\quad OB \perp AC$

$\Rightarrow \quad \frac{k-3}{h+2} \times \left(-\frac{1}{5}\right) = -1$

$\Rightarrow \quad 5h - k + 13 = 0 \quad$ ...(ii)

On solving Eqs. (i) and (ii), we get

$$h = -4, \quad k = -7$$

Hence, the coordinates of third vertex are $(-4, -7)$.

64. Now, we take $BD \perp AC$ and $AE \perp BC$.

Slope of $BD = -\frac{3}{4}$

Equation of BD, $y - 0 = \frac{-3}{4}(x - 4)$

$\Rightarrow \quad 4y = -3x + 12$

$\Rightarrow \quad 3x + 4y - 12 = 0 \quad$ ...(i)

and $\quad$ slope of $AE = \frac{1}{4}$

$\therefore$ Equation of AE, $y - 0 = \frac{1}{4}(x - 0)$

$\Rightarrow \quad x - 4y = 0 \quad$ ...(ii)

On solving Eqs. (i) and (ii), we get

$$x = 3, \quad y = \frac{3}{4}$$

$\therefore$ Orthocentre of the triangle is $\left(3, \frac{3}{4}\right)$.

65. We have, $\quad x + y = 1 \quad$ ...(i)

and $\quad xy = 0 \quad$ ...(ii)

On putting $x = 1 - y$ from Eq. (i) into Eq. (ii), we get

$$(1 - y)\, y = 0$$

$\Rightarrow \quad y = 0, 1$

At $y = 0 \Rightarrow x = 1$

and at $y = 1 \Rightarrow x = 0$

So, coordinates of the vertices of a triangle are (0, 0), (1, 0) and (0, 1).

Since, the triangle is right angled at $O(0, 0)$.

So, point (0, 0) is its orthocentre.

66. Since, t_1, t_2 are the roots of the equation $t^2 + \lambda t + 1 = 0$.

$\therefore \quad t_1 + t_2 = -\lambda, \quad t_1 t_2 = 1$

The equation of a line passing through $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$ is

$$y - 2at_2 = \frac{2}{t_1 + t_2}(x - at_2^2) \Rightarrow y - 2at_2 = -\frac{2}{\lambda}(x - at_2^2)$$

$$\Rightarrow \lambda y - 2a\lambda t_2 = -2x + 2at_2^2 \Rightarrow \lambda y + 2x = 2a(\lambda t_2 + t_2^2)$$

$$\Rightarrow \quad \lambda y + 2x = 2a(-1) \Rightarrow 2(x + a) + \lambda y = 0$$

So, fixed point is $(-a, 0)$.

67. Let the locus of point be (x, y).

Area of triangle with points $(x, y), (1, 5)$ and $(3, -7)$ is 21 sq units.

$$\therefore \quad \frac{1}{2}\begin{vmatrix} x & y & 1 \\ 1 & 5 & 1 \\ 3 & -7 & 1 \end{vmatrix} = 21$$

$$\Rightarrow \quad \frac{1}{2}[x(5+7) - y(1-3) + 1(-7-15)] = 21$$

$$\Rightarrow \quad \frac{1}{2}[12x + 2y - 22] = 21 \Rightarrow 6x + y - 32 = 0$$

Round II

1. Lines are $y = 1, y = 0$

$$y = -x, \quad y = -x + 2$$
$$y = x + 1, \quad y = x - 1$$

Area of $OABCDE$ = Area of $OBGF$

$$= \frac{3}{2} \times 1 = \frac{3}{2} \text{ sq units}$$

2. The perpendicular distance of $(1, 3)$ from the line $3x + 4y = 5$ is 2 units while

$$\sec^2\theta + 2\,\text{cosec}^2\theta \geq 3 \quad (\text{as } \sec^2\theta, \text{cosec}^2\theta \geq 1)$$

So, there will be two such points on the line.

3. Any line through A is given by

$$(px + qy - 1) + \lambda(qx + py - 1) = 0$$

which is passing through (p, q).

Hence, $$\lambda = -\frac{(p^2 + q^2 - 1)}{2pq - 1}$$

Thus, the required line is

$$(px + qy - 1) - \frac{(p^2 + q^2 - 1)}{(2pq - 1)} \cdot (qx + py - 1) = 0$$

$$\Rightarrow (2pq - 1)(px + qy - 1) - (p^2 + q^2 - 1)(qx + py - 1) = 0$$

4. From figure refracted ray makes an angle of 75° with positive direction of x-axis and passes through the point $(1, 0)$.

$\therefore$ Its equation is

$$(y - 0) = \tan(45° - 30°)(x - 1)$$

or $$y = (2 - \sqrt{3})(x - 1)$$

5. Equation of line $\frac{ax}{c-1} + \frac{by}{c-1} + 1 = 0$ has two independent parameters. It can pass through a fixed point, if it contains only one independent parameter. Now, there must be one relation between $\frac{a}{c-1}$ and $\frac{b}{c-1}$ independent of a, b and c so that $\frac{a}{c-1}$ can be expressed in terms of $\frac{b}{c-1}$ and straight line contains only one independent parameter. Now, that given relation can be expressed as $\frac{5a}{c-1} + \frac{4b}{c-1} = \frac{t - 20c}{c-1}$

RHS in independent of c, if $t = 20$

6. The family of lines

$$(x + y - 1) + \lambda(2x + 3y - 5) = 0$$

passes through a point such that

$$x + y - 1 = 0$$
$$2x + 3y - 5 = 0$$

i.e., $(-2, 3)$ and family of lines

$$(3x + 2y - 4) + \mu(x + 2y - 6) = 0$$

passes through a point such that

$$3x + 2y - 4 = 0$$

and $x + 2y - 6 = 0$ *i.e.*, $(-1, 7/2)$

$\therefore$ Equation of the straight line that belongs to both the families passes through $(-2, 3)$ and $(-1, 7/2)$ is

$$y-3=\frac{\frac{7}{2}-3}{-1+2}(x+2)$$

$\Rightarrow \quad y-3=\frac{x+2}{2} \quad \Rightarrow \quad x-2y+8=0$

7. $d(x,y)=\max\{|x|,|y|\}$ ...(i)

but $d(x,y)=a$ ...(ii)

From Eqs. (i) and (ii),

$$a=\max\{|x|,|y|\}$$

if $|x|>|y|$, then $a=|x|$

$\therefore \quad x=\pm a$

and if $|y|>|x|$, then $a=|y|$

$\therefore \quad y=\pm a$

Therefore, locus represents a straight line.

8. If the line meets the x and y-axes at A and B, then $A\equiv(-c/a,0), B\equiv(0,-c/b)$. The line will pass through the first quadrant, if

$$-c/a>0 \text{ and /or } -c/b>0$$

$\Rightarrow \quad ac<0$ and /or $bc<0$

9.

On solving the given lines, we get

$$A=\left(\frac{1}{1+m_1},\frac{m_1}{1+m_1}\right), C=\left(\frac{1}{1+m_3},\frac{m_3}{1+m_3}\right)$$

If $AB=BC$, then mid-point of AC lies on

$$y=m_2x$$

$$\Rightarrow \quad \frac{\frac{m}{1+m_1}+\frac{m_3}{1+m_3}}{2}=m_2\left[\frac{\frac{1}{1+m_1}+\frac{1}{1+m_3}}{2}\right]$$

$\Rightarrow m_1(1+m_3)+m_3(1+m_1)=m_2[1+m_3+1+m_1]$

$\Rightarrow (1+m_1)(m_3-m_2)=(1+m_2)(m_2-m_1)$

10. Slope of BD is 8/15 and angle made by BD with DC and BC is 45°. So, let slope of DC be m. Then,

$$\tan 45°=\pm\frac{m-\frac{8}{15}}{1+\frac{8}{15}m}$$

$\Rightarrow \quad (15+8m)=\pm(15m-8)$

$\Rightarrow \quad m=\frac{23}{7}$ and $-\frac{7}{23}$

Hence, the equations of DC and BC are

$$y-2=\frac{23}{7}(x-1)\Rightarrow 23x-7y-9=0$$

and $\quad y-2=-\frac{7}{23}(x-1)\Rightarrow 7x+23y-53=0$

11. $ax+by=1$ will be one of the bisectors of the given line. Equation of bisectors of the given lines are

$$\frac{3x+4y-5}{5}=\pm\left(\frac{5x-12y-10}{13}\right)$$

$\Rightarrow \quad 64x-8y=115$ or $14x+112y=15$

$\Rightarrow \quad a=\frac{64}{115}, b=-\frac{8}{115}$ or $a=\frac{14}{15}, b=\frac{12}{115}$

12. The set of lines is $4ax+3by+c=0$, where $a+b+c=0$. Eliminating c, we get

$$4ax+3by-(a+b)=0$$

$\Rightarrow \quad a(4x-1)+b(3y-1)=0$

This passes through the intersection of the lines $4x-1=0$ and $3y-1=0$, *i.e.*, $x=1/4$, $y=1/3$, *i.e.*, (1/4, 1/3).

13. As $\quad (a+b)x+(a-b)y-2ab=0$

and $\quad (a-b)x+(a+b)y-2ab=0$

The equations of the angle bisectors are

$$(a+b)x+(a-b)y-2ab=\pm\{(a-b)x+(a+b)y-2ab\}$$

$\Rightarrow \quad 2bx-2by=0$ *i.e.*, $x=y$ ...(i)

and $\quad 2ax+2ay-4ab=0$ *i.e.*, $x+y=2b$ ...(ii)

$\therefore$ Equation of third side as given by Eq. (i) is

$x-y=k$ satisfying the point $(b-a, a-b)$

$\therefore \quad k=2b-2a$

$\therefore$ The line is $x-y=2(b-a)$

From Eq. (ii), $x+y-2b=k$ is passing through the point $(b-a, a-b)$

$\therefore \quad k=-2b$

$\therefore$ The line is $x+y=0$.

14. $bx+cy=a \quad \Rightarrow \quad \frac{x}{(a/b)}+\frac{y}{(a/c)}=1$

Area of $\Delta OAB=\frac{1}{8}$ (given)

$\Rightarrow \quad \frac{1}{2}\cdot\frac{a}{b}\cdot\frac{a}{c}=\pm\frac{1}{8}$

$\Rightarrow \quad \dfrac{a^2}{bc} = \pm \dfrac{1}{4}$

$\Rightarrow \quad (2a)^2 = \pm bc$

So, $b, \pm 2a, c$ are in GP.

15. Given lines are $x + 2y + 4 = 0$ and $4x + 2y - 1 = 0$

$\Rightarrow \quad x + 2y + 4 = 0$ and $-4x - 2y + 1 = 0$

Here, $(1)(-4) + (2)(-2) = -8 < 0$

So, bisector of the angle is acute angle bisector including origin.

Its equation is

$$\frac{x + 2y + 4}{\sqrt{5}} = \frac{(-4x - 2y + 1)}{2\sqrt{5}} \Rightarrow 6x + 6y + 7 = 0$$

16. Given lines $(x + y + 1) + b(2x - 3y - 8) = 0$ are concurrent at point of intersection of the lines $x + y + 1 = 0$ and $2x - 3y - 8 = 0$, which is $(1, -2)$. Now, line through $A(1, -2)$ which is farthest from the point $B(2, 2)$, is perpendicular to AB. Now, slope of AB is 4. Then, the required line is $y + 2 = -(1/4)(x - 1)$ or $x + 4y + 7 = 0$

17. Also, this line $x + 4y + 7 = 0$ meets axis at $C(-7, 0)$ and $D(0, -7/4)$. Then, area of ΔOCD is $1/2\,|(-7)(-7/4)|$ or 49/8.

18. Lines $x + 4y + 7 = 0$ and $x - 2y + 1 = 0$ intersect at $(-3, -1)$ which must satisfy the line $3x - 4y + \lambda = 0$. Then, $-9 + 4 + \lambda = 0 \Rightarrow \lambda = 5$.

19. First, let the equation $ax + by + c = 0$ represent a family of straight lines passing through (a, b) for different values of a, b and c.

Then, we have to show that there is a linear relation between a, b and c and have to prove that the equation $ax + by + c = 0$ represents a family of lines passing through a fixed point. Let the linear relation be

$$la + mb + nc = 0$$

$$\Rightarrow \quad \left(\frac{l}{n}\right)a + \left(\frac{m}{n}\right)b + c = 0$$

$\Rightarrow ax + by + c = 0$ always passes through a fixed point $\left(\dfrac{l}{n}, \dfrac{m}{n}\right)$.

$\therefore \quad 3a + 2b + 4c = 0$

$$\Rightarrow \quad \left(\frac{3}{4}\right)a + \left(\frac{2}{4}\right)b + c = 0$$

and $ax + by + c = 0$ represents a system of concurrent lines passing through $\left(\dfrac{3}{4}, \dfrac{1}{2}\right)$.

Thus, statement I is false and II is true.

20. Equation of bisector of $4y + 3x - 12 = 0$ and $3y + 4x - 24 = 0$ is

$$\frac{4y + 3x - 12}{\sqrt{16 + 9}} = \pm \frac{3y + 4x - 24}{\sqrt{9 + 16}}$$

$\Rightarrow \quad y - x + 12 = 0$ and $7y + 7x - 36 = 0$

So, the line $y - x + 12 = 0$ is the angular bisector.

21. Let $f(x, y) \equiv 3x - 5y + \lambda$

$\because$ Points (1, 2) and (3, 4) be on the same side of the line $3x - 5y + \lambda = 0$, then

$$\frac{f(1,2)}{f(3,4)} > 0 \Rightarrow \frac{3 - 10 + \lambda}{9 - 20 + \lambda} > 0$$

$$\Rightarrow \quad \frac{\lambda - 7}{\lambda - 11} > 0$$

$\therefore \quad \lambda < 7$ or $\lambda > 11$

22. As $x + y = |a|$ and $ax - y = 1$, intersect in first quadrant.

$\therefore x$ and y- intercepts are positive.

$$\therefore \quad x = \frac{1 + |a|}{1 + a} \geq 0$$

and $\quad y = \dfrac{a|a| - 1}{a + 1} \geq 0$

$\Rightarrow \quad 1 + a \geq 0$ and $a|a| - 1 \geq 0$

$\Rightarrow \quad a \geq -1$ and $a|a| \geq 1 \quad$ ...(i)

If $\quad -1 \leq a < 0$

$\Rightarrow \quad -a^2 > 1 \quad$ (not possible)

If $\quad a \geq 0 \Rightarrow a^2 \geq 1$

$\Rightarrow \quad a \geq 1$

$\therefore \quad a > 1$ or $a \in [1, \infty) \quad$ ...(ii)

23. Since, the line L is passing through the point (13, 32).

Therefore,

$$\frac{13}{5} + \frac{32}{b} - 1 \Rightarrow \frac{32}{b} = \frac{8}{5} \Rightarrow b = -20$$

The line K is parallel to the line L, its equation must be

$$\frac{x}{5} - \frac{y}{20} = a \text{ or } \frac{x}{5a} - \frac{y}{20a} = 1$$

On comparing with $\dfrac{x}{c} + \dfrac{y}{3} = 1$, we get

$$20a = -3,\ c = 5a = -\frac{3}{4}$$

Hence, the distance between lines

$$= \frac{|a - 1|}{\sqrt{\dfrac{1}{25} + \dfrac{1}{400}}} = \left|\frac{-3}{20} - 1\right| \Big/ \sqrt{\frac{17}{400}} = \frac{23}{\sqrt{17}}$$

24. Line perpendicular to same line are parallel to each other.

$\therefore \quad -p(p^2 + 1) = p^2 + 1 \Rightarrow p = -1$

So, there is exactly one value of p.

25. Since, slope of $PQ = \dfrac{4 - 3}{1 - k} = \dfrac{1}{1 - k}$

Slope of $AM = (k-1)$

$\therefore$ Equation of AM is

$$y - \frac{7}{2} = (k-1)\left[x - \left(\frac{k+1}{2}\right)\right]$$

For y-intercept, $x = 0, y = -4$

$$-4 - \frac{7}{2} = -(k-1)\left(\frac{k+1}{2}\right)$$

$$\Rightarrow \quad \frac{15}{2} = \frac{k^2-1}{2}$$

$$\Rightarrow \quad k^2 - 1 = 15$$

$$\Rightarrow \quad k^2 = 16$$

$$\Rightarrow \quad k = \pm 4$$

26. Now, slope of $QR = \dfrac{3\sqrt{3}-0}{3-0} = \sqrt{3} = \tan\theta \Rightarrow \theta = \dfrac{\pi}{3}$

$\therefore$ The angle between $\angle PQR$ is $\dfrac{2\pi}{3}$, so the line QM makes an angle $\dfrac{2\pi}{3}$ from positive direction of x-axis. Slope of the line $QM = \tan\dfrac{2\pi}{3} = -\sqrt{3}$

Hence, equation of line QM is $y = -\sqrt{3}x$

$$\Rightarrow \quad \sqrt{3}x + y = 0$$

27. Since, A is the mid-point of line PQ.

$$\therefore \quad 3 = \frac{a+0}{2} \Rightarrow a = 6$$

and $$4 = \frac{0+b}{2} \Rightarrow b = 8$$

Hence, the equation of line is

$$\frac{x}{6} + \frac{y}{8} = 1 \Rightarrow 4x + 3y = 24$$

28. The point (a, a^2) lies in the sector bounded by the lines $x - 2y = 0$ and $3x - y = 0$

$$\therefore \quad (a - 2a^2)(3a - a^2) < 0$$

$$\Rightarrow \quad \left[a - \frac{1}{2}\right](a-3) < 0 \therefore a \in \left(\frac{1}{2}, 3\right)$$

29. Since, a, b and c are in HP. Then, $\dfrac{1}{a}, \dfrac{1}{b}$ and $\dfrac{1}{c}$ are in AP.

$$\therefore \quad \frac{2}{b} = \frac{1}{a} + \frac{1}{c}$$

$$\Rightarrow \quad \frac{1}{a} - \frac{2}{b} + \frac{1}{c} = 0$$

Hence, straight line $\dfrac{x}{a} + \dfrac{y}{b} + \dfrac{1}{c} = 0$ is always passes through a fixed point $(1, -2)$.

30. Equation of a line passing through the intersection of lines $ax + 2by + 3b = 0$ and $bx - 2ay - 3a = 0$ is

$$(ax + 2by + 3b) + \lambda(bx - 2ay - 3a) = 0 \quad \ldots(i)$$

Now, this line is parallel to x-axis, so coefficient of $x = 0$

$$\Rightarrow \quad a + \lambda b = 0 \Rightarrow \lambda = -\frac{a}{b}$$

On putting this value in Eq. (i), we get

$$b(ax + 2by + 3b) - a(bx - 2ay - 3a) = 0$$

$$\Rightarrow \quad 2b^2y + 3b^2 + 2a^2y + 3a^2 = 0$$

$$\Rightarrow \quad 2(b^2 + a^2)y + 3(b^2 + a^2) = 0 \Rightarrow y = -\frac{3}{2}$$

Therefore, the required line is below x-axis, at a distance $\dfrac{3}{2}$ from it.

31. Given lines are $3x - 4y + 7 = 0$

$$\Rightarrow \quad y = \frac{3}{4}x + \frac{7}{4} \quad \ldots(i)$$

and $$12x + 5y - 2 = 0$$

$$\Rightarrow \quad y = -\frac{12}{5}x + \frac{2}{5} \quad \ldots(ii)$$

The equation of the bisectors of the angles between these lines are

$$\frac{3x - 4y + 7}{\sqrt{3^2 + 4^2}} = \pm\frac{12x + 5y - 2}{\sqrt{12^2 + 5^2}}$$

$\therefore$ Required equation of the bisector of the acute angle between these lines is

$$\frac{3x - 4y + 7}{5} = \frac{12x + 5y - 2}{13}$$

$$\Rightarrow \quad 39x - 52y + 91 = 60x + 25y - 10$$

$$\therefore \quad 21x + 77y - 101 = 0$$

32. Let the coordinates of vertex C is (x, y) and the coordinates of centroid of the triangle is (x_1, y_1).

$$\therefore \quad x_1 = \frac{x+2-2}{3} \text{ and } y_1 = \frac{y-3+1}{3}$$

$$\Rightarrow \quad x_1 = \frac{x}{3} \text{ and } y_1 = \frac{y-2}{3}$$

Since, the centroid lies on the line $2x + 3y = 1$.

$$\therefore \quad 2x_1 + 3y_1 = 1 \Rightarrow 2\frac{x}{3} + 3\frac{(y-2)}{3} = 1$$

$$\Rightarrow \quad 2x + 3y - 6 = 3 \Rightarrow 2x + 3y = 9$$

33. Let the line intercept the x-axis at a and y-axis at b distance.

Since, $$a + b = -1 \Rightarrow b = -(a+1)$$

$\therefore$ Equation of line is $\dfrac{x}{a} + \dfrac{y}{a+1} = 1$

$$\therefore \quad \frac{4}{a} + \frac{3}{a+1} = 1 \Rightarrow \frac{4a + 4 - 3a}{a(a+1)} = 1$$

$$\Rightarrow \quad a + 4 = a^2 + a \Rightarrow a = \pm 2$$

Hence, equation of lines are

$$\frac{x}{2} + \frac{y}{3} = 1 \text{ and } \frac{x}{-2} + \frac{y}{1} = 1$$

13.1 Definition

A circle is defined as the locus of all such points in a plane, which remains at constant distance from a fixed point. Here, the fixed point (C) is called the **centre** of the circle and the constant distance is called its **radius**.

*A **circle** is a simple shape of Euclidean geometry that is the set of all points in a plane which are at fixed distance (radius) from a point (centre) but it also a simple closed curve which divides the plane into two regions : an interior and an exterior.*
Also, it may be defined as a special ellipse in which the two foci are coincident and the eccentricity is 0.

13.2 Standard Form of Equation of Circle

(i) Equation of Circle in General Form

The general equation of second degree may represents a circle. If the coefficient of x^2 and coefficient of y^2 are identical and the coefficient of xy becomes zero.

i.e., $$ax^2 + by^2 + 2hxy + 2gx + 2fy + c = 0 \quad \text{...(i)}$$

represents a circle, if

(a) $a = b$, *i.e.*, coefficient of x^2 = coefficient of y^2

(b) $h = 0$, *i.e.*, coefficient of $xy = 0$, then Eq. (i) reduces as,

$x^2 + y^2 + 2gx + 2fy + c = 0$, whose centre and radius are $(-g, -f)$ and $\sqrt{g^2 + f^2 - c}$, respectively.

Nature of the Circle

If $g^2 + f^2 - c > 0$, then the radius of circle will be real and real circle is possible.

If $g^2 + f^2 - c = 0$, then the radius of circle is zero and the circle is called a point circle.

If $g^2 + f^2 - c < 0$, then the radius of circle will be imaginary, so in this case, no real circle is possible.

(ii) Equation of Circle in Standard Form

Let $C(h, k)$ be the centre of circle and $CP(= r)$ be the radius of circle, then equation of circle is

$$(x - h)^2 + (y - k)^2 = r^2 \quad \text{...(i)}$$

Which is the equation of the circle in central form.

Now, if origin (0, 0) be the centre of circle, then Eq. (i) becomes,

$$x^2 + y^2 = r^2 \quad \text{...(ii)}$$

(iii) Equation of Circle in Diameter Form

Let $A(x_1, y_1)$ and $B(x_2, y_2)$ be the end points of a diameter of the given circle and let $P(x, y)$ be any point on the circle.

$\therefore \quad \angle APB = 90°$

Slope of AP, $\quad m_1 = \left(\dfrac{y - y_1}{x - x_1}\right)$

and slope of BP, $\quad m_2 = \left(\dfrac{y - y_2}{x - x_2}\right)$

For perpendicular, $m_1 \cdot m_2 = -1 \therefore AP \cdot BP = -1$

$$\Rightarrow \quad \left(\frac{y - y_1}{x - x_1}\right)\left(\frac{y - y_2}{x - x_2}\right) = -1$$

$$\Rightarrow \quad (x - x_1)(x - x_2) + (y - y_1)(y - y_2) = 0$$

Which is the required equation of circle in diameter form.

(iv) Equation of Circle in Parametric Form

A general point $P(x, y)$ on the circle in terms of parameters r and θ can be expressed as

$$x = h + r\cos\theta \text{ and } y = k + r\sin\theta$$

$$\Rightarrow \quad x - h = r\cos\theta \text{ and } y - k = r\sin\theta$$

On squaring and then adding, we get

$$(x - h)^2 + (y - k)^2 = r^2(\cos^2\theta + \sin^2\theta) = r^2$$

which is the central equation of the circle satisfied by each fixed value of r (*i.e.*, radius) and varying θ.

If the circle is centered at origin, then the coordinates of centre are $C(0, 0)$, then the parametric coordinates are $x = r\cos\theta$ and $y = r\sin\theta$.

(v) Equation of Circle through Three Non-collinear Points

Let $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ are three non-collinear points, then the equation of circle through these three non-collinear points is given by

$$\begin{vmatrix} x^2 + y^2 & x^2 & y^2 & 1 \\ x_1^2 + y_1^2 & x_1^2 & y_1^2 & 1 \\ x_2^2 + y_2^2 & x_2^2 & y_2^2 & 1 \\ x_3^2 + y_3^2 & x_3^2 & y_3^2 & 1 \end{vmatrix} = 0$$

***Sample* Problem 1** *Find the centre and radius of the circle.* **[NCERT]**

(a) $(2, -4), \sqrt{65}$ (b) $(2, 4), \sqrt{65}$
(c) $(-2, -4), \sqrt{65}$ (d) *None of these*

Interpret (*b*) Given equation of circle is

$$x^2 + y^2 - 4x - 8y - 45 = 0$$

Comparing it with

$$x^2 + y^2 + 2gx + 2fy + c = 0$$

We get $\quad 2g = -4, 2f = -8, c = -45$

$\Rightarrow \quad g = -2, f = -4, c = -45$

$\because$ As centre and radius of circle $x^2 + y^2 + 2gx + 2fy + c = 0$ is

$$C(-g, -f) \text{ and } r = \sqrt{g^2 + f^2 - c}$$

$\therefore$ Centre $= (-g, -f) = (2, 4)$

and radius $= \sqrt{g^2 + f^2 - c} = \sqrt{(2)^2 + (4)^2 - (-45)}$

$= \sqrt{4 + 16 + 45} = \sqrt{65}$

***Sample* Problem 2** *Find the equation of circle having centre* $\left(\frac{1}{2}, \frac{1}{4}\right)$ *and radius* $\frac{1}{12}$. **[NCERT]**

(a) $36x^2 + 36y^2 - 36x - 18y - 11 = 0$

(b) $36x^2 + 36y^2 + 36x + 18y + 11 = 0$

(c) $36x^2 + 36y^2 - 36x - 18y + 11 = 0$

(d) *None of the above*

Interpret (c) Given centre $= (h, k) = \left(\frac{1}{2}, \frac{1}{4}\right)$ and radius $r = \frac{1}{12}$

$\therefore$ Equation of circle by using $(x-h)^2 + (y-k)^2 = r^2$ is

$$\left(x - \frac{1}{2}\right)^2 + \left(y - \frac{1}{4}\right)^2 = \left(\frac{1}{12}\right)^2$$

$$\Rightarrow \quad x^2 + \frac{1}{4} - 2 \cdot \frac{1}{2} x + y^2 + \frac{1}{16} - 2 \cdot \frac{y}{4} = \frac{1}{144}$$

$[\because (a-b)^2 = a^2 + b^2 - 2ab]$

$$\Rightarrow \quad x^2 + y^2 - x - \frac{y}{2} + \frac{1}{4} + \frac{1}{16} - \frac{1}{144} = 0$$

$$\Rightarrow \quad x^2 + y^2 - x - \frac{y}{2} + \frac{36 + 9 - 1}{144} = 0$$

$$\Rightarrow \quad x^2 + y^2 - x - \frac{y}{2} + \frac{44}{144} = 0 \Rightarrow x^2 + y^2 - x - \frac{y}{2} + \frac{11}{36} = 0$$

$$\Rightarrow \quad 36x^2 + 36y^2 - 36x - 18y + 11 = 0$$

Some Particular Cases of the Central Form

***Case* I** When the circle passes through the origin (0, 0) Let the equation of circle be

$$(x-h)^2 + (y-k)^2 = r^2 \quad \text{...(i)}$$

$\because$ It passes through origin (0, 0).

$$\therefore \quad h^2 + k^2 = r^2 \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$(x-h)^2 + (y-k)^2 = h^2 + k^2$$

$$\Rightarrow \quad x^2 + h^2 - 2hx + y^2 - 2ky + k^2 = h^2 + k^2$$

$$\Rightarrow \quad x^2 + y^2 - 2hx - 2ky = 0$$

***Case* II** When the circle touches abscissa (x-axis) Let the centre of circle be $C(h, k)$ and it touches x-axis at point P, then the radius of circle is $CP = k$.

$\therefore$ Equation of circle is

$$(x-h)^2 + (y-k)^2 = (CP)^2 = k^2$$

$$\Rightarrow \quad x^2 + y^2 - 2hx - 2ky + h^2 = 0$$

***Case* III** When the circle touches ordinate (y-axis) Let the centre of circle be $C(h, k)$ and it touches y-axis at point P with radius $CP = h$

$\therefore$ Equation of circle is

$$(x-h)^2 + (y-k)^2 = (CP)^2 = h^2$$

$$\Rightarrow \quad x^2 + y^2 - 2hx - 2ky + k^2 = 0$$

***Case* IV** When the circle touches both abscissa and ordinate (x-axis and y-axis) In this case $h = k = \alpha$.

$\therefore$ Equation of circle is

$$(x-\alpha)^2 + (y-\alpha)^2 = \alpha^2$$

$$\Rightarrow \quad x^2 + y^2 - 2\alpha x - 2\alpha y + \alpha^2 = 0$$

***Case* V** When the circle passes through O (0, 0) and centre lies on abscissa (x-axis) In this case $k = 0$, then equation of circle is

$$(x-h)^2 + (y-0)^2 = h^2$$

$$\Rightarrow \quad x^2 + y^2 - 2hx = 0$$

***Case* VI** When the circle passes through O (0, 0) *and centre lies on ordinate* (y-axis)

In this case $h = 0$, then equation of circle is

$$(x-0)^2 + (y-k)^2 = k^2$$

$$\Rightarrow \quad x^2 + y^2 - 2ky = 0$$

***Case* VII** When the circle touches x-axis and cut off an intercepts on y-axis of length 2l.

In ΔCMQ, $\quad k^2 = h^2 + l^2$

$$\Rightarrow \quad h = \sqrt{k^2 - l^2}$$

$\therefore$ Equation of circle is

$$[x - \sqrt{(k^2 - l^2)}]^2 + (y-k)^2 = k^2$$

Case VIII When the circle touches y-axis and cut off an intercept on x-axis of length 2m.

In ΔCPQ, $\quad h^2 = k^2 + m^2$

$$\Rightarrow \quad k = \sqrt{h^2 - m^2}$$

$\therefore$ Equation of circle is

$$(x-h)^2 + [y - \sqrt{(h^2 - m^2)}]^2 = h^2$$

Note The length of intercepts cut by the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ on x-axis is $2\sqrt{g^2 - c}$ and on y-axis is $2\sqrt{f^2 - c}$.

***Sample* Problem 3** *The equation of the circle which passes through the origin and makes intercepts of length a and b on the x and y axes respectively, are* [NCERT]

(a) $x^2 + y^2 \pm ax \pm by = 0$ (b) $x^2 \pm y^2 = 0$

(c) $x^2 \pm ax \pm by = 0$ (d) *None of these*

Interpret (a) Let the equation of the circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \ldots(i)$$

Since, the circle passes through the origin, we get $c = 0$ and given the intercepts on x and y axes are a and b.

Then, $2\sqrt{g^2 - c} = a$

$\Rightarrow$ $2\sqrt{g^2 - 0} = a$

$\therefore$ $g = \pm \frac{a}{2}$

and $2\sqrt{f^2 - c} = b$

$\Rightarrow$ $2\sqrt{f^2 - 0} = b$

$\therefore$ $f = \pm \frac{b}{2}$

Hence, the equation of circle from Eq.(i) is

$$x^2 + y^2 \pm ax \pm by = 0$$

Hot Spot 1 Central Form of Circle

In this types of problem some central form of conditions are given and we have to find the equation of circle. These types of problems are directly asked in various years of JEE (Main) 2013, 2011, 2005, 2004. To solve such types of problem following steps are given below.

Step I Firstly write the given condition.

Step II Using the appropriate case which is defined in heading 13.3 *i.e.*, some particular cases of the central form.

Step III Simplify it and get the result.

***Sample* Problem 4** *Find the equation of the circle which touches x-axis and whose centre is* (1, 2). [NCERT Exemplar]

(a) $x^2 + y^2 - 2x + 4y + 1 = 0$ (b) $x^2 + y^2 - 2x - 4y + 1 = 0$

(c) $x^2 + y^2 - 2x - 4y - 1 = 0$ (d) *None of these*

Interpret (b) **Step I** Write the given condition.

Given centre of circle is (1, 2).

Since, the required circle touches x-axis, so radius should be $r = 2$

Step II Using appropriate case

$\therefore$ Required equation of circle is

$$(x - 1) + (y - 2)^2 = 2^2$$

Step III Simplify it.

$\Rightarrow$ $x^2 - 2x + 1 - y^2 - 4y + 4 = 4$

$\Rightarrow$ $x^2 + y^2 - 2x - 2y + 1 = 0$

13.3 Cyclic Quadrilateral

Quadrilateral, whose all four vertices lie on a circle is called a cyclic quadrilateral as shown in figure. The four vertices are said to be concyclic.

13.4 Position of a Point with Respect to a Circle

Let $S \equiv x^2 + y^2 + 2gx + 2fy + c = 0$ is the equation of the circle and $P(x_1, y_1)$ is any point in the plane of the circle, then $S_1 \equiv x_1^2 + y_1^2 + 2gx_1 + 2fy_1 + c = 0$

***Case* I** If $S_1 > 0$, then the point lies outside the circle.

***Case* II** If $S_1 = 0$, then the point lies on the circle.

***Case* III** If $S_1 < 0$, then the point lies inside the circle.

Maximum and Minimum Distance of a Point from a Circle

Let any point $P(x_1, y_1)$ and circle $x^2 + y^2 + 2gx + 2fy + c = 0$

The centre and radius of the circle are $(-g, -f)$ and $\sqrt{g^2 + f^2 - c}$, respectively.

The maximum and minimum distance from $P(x_1, y_1)$ to the given circle are

$$PB = CB + PC = r + PC$$

and $PA = |CP - CA| = |PC - r|$ (P inside or outside)

where $r = \sqrt{(g^2 + f^2 - c)}$

Note If $PC < r$, then P inside, $PC > r$, then P outside.

***Sample* Problem 5** *Find the position of a point* (–2.5, 3.5) *with respect to the circle* $x^2 + y^2 = 25$. **[NCERT]**

(a) *inside* (b) *outside*
(c) *on* (d) *None of these*

Interpret (a) Given equation of circle is

$$x^2 + y^2 = 25$$

Let $S = x^2 + y^2 - 25$ ...(i)

Put $(x, y) = (-2.5, 3.5)$ in Eq. (i), we get

$$\Rightarrow \quad S = (-2.5)^2 + (3.5)^2 - 25$$
$$= 6.25 + 12.25 - 25$$
$$= 18.50 - 25 = -6.50 < 0$$

$\therefore$ Point lies inside the circle.

Hot Spot 2

Intersection of a Line and a Circle

Let $y = mx + c$ and $x^2 + y^2 = r^2$ be the equation of a line and a circle, respectively.

$$\therefore \quad x^2 + (mx + c)^2 = r^2 \quad (\because y = mx + c)$$
$$\Rightarrow \quad (1 + m^2)x^2 + 2mcx + (c^2 - r^2) = 0 \quad ...(i)$$

Which is quadratic in x, then **three cases arises.**

***Case* I** Roots of Eq. (i) are real and distinct, if

$$D = r^2(1 + m^2) - c^2 > 0$$

i.e., if $r > \dfrac{c}{\sqrt{1 + m^2}}$

Hence, the line meets the circle at two distinct points.

***Case* II** Roots of Eq. (i) are coincident, if

$$D = r^2(1 + m^2) - c^2 = 0,$$

i.e., if $r = \dfrac{c}{\sqrt{1 + m^2}}$

Hence, the line touches the circle.

***Case* III** Roots of Eq. (i) are imaginary, if

$$D = r^2(1 + m^2) - c^2 < 0,$$

i.e., if $r < \dfrac{c}{\sqrt{1 + m^2}}$

Hence, the line will not intersect the circle at all.

Note Length of perpendicular from (0, 0) on $y = mx + c$ is $\dfrac{c}{\sqrt{1 + m^2}}$

Condition of Tangency

(i) The line $y = mx + c$ touches the circle $x^2 + y^2 = r^2$, iff $c = \pm r\sqrt{1 + m^2}$

(ii) The line $lx + my + n = 0$ will touch the circle $x^2 + y^2 + 2gx + 2fy + c = 0$, iff

$$(l^2 + m^2)(g^2 + f^2 - c) = (lg + mf - n)^2$$

Note

- If $y = mx + c$ is the tangent to the circle $x^2 + y^2 = r^2$, then the coordinates of point of contact are $\left(-\dfrac{mr^2}{c}, \dfrac{r^2}{c}\right)$.
- If the line $ax + by + c = 0$ is the tangent to the circle $x^2 + y^2 = r^2$, then the coordinates of point of contact are $\left(-\dfrac{ar^2}{c}, -\dfrac{br^2}{c}\right)$.
- The length of the intercept cut off from the line $y = mx + c$ by the circle $x^2 + y^2 = r^2$ is $2\sqrt{\dfrac{a^2(1 + m^2) - c^2}{1 + m^2}}$

These types of problems are directly or indirectly asked in various years of AIEEE (JEE Main) 2010, 2005, 2004

To solve such types of problem following steps are given below.

Step I Firstly write the given equation of line and circle.

Step II Find the intersection point of line and circle.

Step III According to the given question we apply the other condition, if given.

Step IV Simplify it and get the result.

***Sample* Problem 6** *The range of values of m for which the line* $y = mx + 2$ *cuts the circle* $x^2 + y^2 = 1$ *at distance or coincident points is* **[NCERT]**

(a) $(-\infty, -\sqrt{3}] \cup [\sqrt{3}, \infty)$ (b) $[-\sqrt{3}, \sqrt{3}]$
(c) $[\sqrt{3}, \infty)$ (d) *None of these*

Interpret (a) **Step I** Write the given equations. Given equation of line is $y = mx + c$ and equation of circle is $x^2 + y^2 = 1$.

Step II We need to find the intersection point.

Step III Apply the other condition.

The length of the perpendicular from the centre (0, 0) to the line

$$= \frac{m(0) + (0) + 2}{\sqrt{1 + m^2}} = \frac{2}{\sqrt{1 + m^2}}$$

$\therefore$ The radius of the circle $= 1$

Step IV Simplify it.

For the line to cut the circle at distinct or coincident points,

$$\frac{2}{\sqrt{1 + m^2}} < 1$$
$$\Rightarrow \quad 1 + m^2 \geq 4 \Rightarrow m^2 \geq 3$$

***Sample* Problem 7** *The line* $(x-2)\cos\theta + (y-2)\sin\theta = 1$ *touches a circle for all values of* θ*, then the equation of circle is*

(a) $x^2 + y^2 - 4x - 4y + 7 = 0$ (b) $x^2 + y^2 + 4x + 4y + 7 = 0$

(c) $x^2 + y^2 - 4x - 4y - 7 = 0$ (d) *None of the above*

Interpret (a) Given line is

$$(x-2)\cos\theta + (y-2)\sin\theta = 1 = \cos^2\theta + \sin^2\theta$$

On comparing, we get

$$x - 2 = \cos\theta \quad \ldots(i)$$

and

$$y - 2 = \sin\theta \quad \ldots(ii)$$

On squaring and then adding Eqs. (i) and (ii), we get

$$(x-2)^2 + (y-2)^2 = \cos^2\theta + \sin^2\theta$$

$$\Rightarrow \quad (x-2)^2 + (y-2)^2 = 1$$

$$\Rightarrow \quad x^2 + y^2 - 4x - 4y + 7 = 0$$

13.5 Tangent to a Circle

A straight line is a tangent to a circle, if the distance of the centre from the line equals the radius.

Different Forms of the Equation of Tangents

Point Form

The equation of tangent at the point $P(x_1, y_1)$ to the circle $x^2 + y^2 = r^2$ is

$$T \equiv xx_1 + yy_1 = r^2$$

Also, the equation of tangent to the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ at the point $P(x_1, y_1)$ is

$$T \equiv xx_1 + yy_1 + g(x + x_1) + f(y + y_1) + c = 0$$

Note When we convert a carterian equation into a tangent equation, we replace. x^2 by xx_1, y^2 by yy_1, x by $\frac{x + x_1}{2}$, y by $\frac{y + y_1}{2}$

Slope Form

The equation of a tangent of slope m to the circle $x^2 + y^2 = r^2$ is $T \equiv y = mx \pm r\sqrt{(1 + m^2)}$ and the coordinates of the point of contact are $\left(\pm \frac{rm}{\sqrt{1+m^2}}, \mp \frac{r}{\sqrt{1+m^2}}\right)$.

Parametric Form

The equation of tangent to the circle $x^2 + y^2 = r^2$ at the point $(r\cos\theta, r\sin\theta)$ is $T \equiv x\cos\theta + y\sin\theta = r$

T=0 is Possible Only

(i) if points is on the curve $\rightarrow$ Tangent

(ii) if point is outside $\rightarrow$ Chord of contact

(iii) if point is outside/inside $\rightarrow$ Pole and poler

***Sample* Problem 8** *The equation of tangent to the circle* $x^2 + y^2 - 2ax = 0$ *at the point* $[a(1+\cos\alpha), a\sin\alpha]$ *is*

(a) $x\cos\alpha + y\sin\alpha = a$

(b) $x\cos\alpha + y\sin\alpha = 1 + \cos\alpha$

(c) $x\cos\alpha + y\sin\alpha = a(1 + \cos\alpha)$

(d) *None of the above*

Interpret (c) The equation of tangent of $x^2 + y^2 - 2ax = 0$ at $[a(1+\cos\alpha), a\sin\alpha]$ is

$$xa(1+\cos\alpha) + ya\sin\alpha - a[x + a(1+\cos\alpha)] = 0$$

$$\Rightarrow \quad ax\cos\alpha + ay\sin\alpha - a^2(1+\cos\alpha) = 0$$

$$\Rightarrow \quad x\cos\alpha + y\sin\alpha = a(1+\cos\alpha)$$

13.6 Normal to a Circle

The normal to a circle at any point is a straight line which is perpendicular to the tangent at that point and always passes through the centre of the circle.

Different Forms of the Equation of Tangents

Point Form

The equation of tangent at the point $P(x_1, y_1)$ to the circle $x^2 + y^2 = r^2$ is

$$\frac{x}{x_1} = \frac{y}{y_1}$$

OR

The equation of tangent at the point $P(x_1, y_1)$ to the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ is

$$\frac{x - x_1}{x_1 + g} = \frac{y - y_1}{y_1 + f}$$

Slope Form

The equation of a normal of slope m to the circle $x^2 + y^2 = r^2$ is

$$my = -x \pm r\sqrt{1 + m^2}$$

Parametric Form

The equation of normal at the point $P(r\cos\theta, r\sin\theta)$ to the circle $x^2 + y^2 = r^2$ is

$$\frac{x}{r\cos\theta} = \frac{y}{r\sin\theta}$$

$$\Rightarrow \quad y = x\tan\theta$$

Note Normal always passes through the centre of the circle.

***Sample* Problem 9** *The equation of normal to the circle $x^2 + y^2 - 5x + 2y - 48 = 0$ at the point (5, 6) is*

(a) $14x - 5y + 40 = 0$ (b) $14x + 5y + 40 = 0$
(c) $14x - 5y - 40 = 0$ (d) $14x + 5y - 40 = 0$

Interpret (c) Equation of the normal to the given circle at (5, 6) is

$$\frac{x-5}{5-\frac{5}{2}} = \frac{y-6}{6+1}$$

$$\Rightarrow \quad \frac{x-5}{\frac{5}{2}} = \frac{y-6}{7}$$

$$\Rightarrow \quad \frac{2x-10}{5} = \frac{y-6}{7}$$

$$\Rightarrow \quad 14x - 70 = 5y - 30$$

$$\Rightarrow \quad 14x - 5y - 40 = 0$$

13.7 Equation of Pair of Tangents

Let $P(x_1, y_1)$ be any point lying outside the circle $x^2 + y^2 + 2gx + 2fy + c = 0$, then the equation of pair of tangents represented by PA and PB is $SS_1 = T^2$

where, $S = x^2 + y^2 + 2gx + 2fy + c$

$$S_1 = x_1^2 + y_1^2 + 2gx_1 + 2fy_1 + c$$

and $T = xx_1 + yy_1 + g(x + x_1) + f(y + y_1) + c$

Similarly, equation of pair of tangents at the point (x_1, y_1) to the circle $x^2 + y^2 = r^2$ is

$$SS_1 = T^2$$

where, $S = x^2 + y^2 - r^2$

$$S_1 = x_1^2 + y_1^2 - r^2$$

and $T = xx_1 + yy_1 - r^2$

Length of the Tangent

The length of the tangent drawn from the point (x_1, y_1) to the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ is

$$\sqrt{x_1^2 + y_1^2 + 2gx_1 + 2fy_1 + c}\,; \sqrt{S_1}$$

***Sample* Problem 10** *The equation of pair of tangents to the circle $x^2 + y^2 = 16$ drawn from the point (1, 4) is*

(a) $x^2 + y^2 - x - 4y = 0$ (b) $x^2 + y^2 + x - 4y = 0$
(c) $x^2 + y^2 - 2x - 8y = 0$ (d) *None of these*

Interpret (d) Equation of pair of tangents to the circle $x^2 + y^2 = 16$ at the point (1, 4) is

$$(x^2 + y^2 - 16)(1 + 16 - 16) = (x + 4y - 16)^2$$

$$\Rightarrow \quad x^2 + y^2 - 16 = (x + 4y - 16)^2$$

$$\Rightarrow \quad x^2 + y^2 - 16 = x^2 + 16y^2 + 256 + 8xy - 128 - 32x$$

$$\Rightarrow \quad 15y^2 + 8xy - 32x + 112 = 0$$

13.8 Director Circle

The locus of the point of intersection of two perpendicular tangents to a given circle is known as director circle.

If the equation of circle is $x^2 + y^2 = a^2$, then the equation of the director circle to this circle is $x^2 + y^2 = 2a^2$

***Sample* Problem 11** *The locus of the point of intersection of two perpendicular tangents to the circle $x^2 + y^2 = 16$ is*

(a) $x^2 + y^2 = 20$ (b) $x^2 + y^2 = 32$
(c) $x^2 + y^2 = 16$ (d) *None of these*

Interpret (b) The required equation of circle is

$$x^2 + y^2 = 2(16) = 32$$

13.9 Chord of Contact

From any external point, two tangents can be drawn to a given circle. The chord joining the points of contact of the two tangents is called the chord of contact of tangents.

The equation of the chord of contact of tangents drawn from the point (x_1, y_1) to the circle $x^2 + y^2 = r^2$ is $xx_1 + yy_1 = r^2$ and to the circle

$$x^2 + y^2 + 2gx + 2fy + c = 0 \text{ is}$$

$$xx_1 + yy_1 + g(x + x_1) + f(y + y_1) + c = 0$$

***Sample* Problem 12** *The chord of contact of tangents drawn from a point on the circle $x^2 + y^2 = a^2$ to the circle $x^2 + y^2 = b^2$ touches the circle $x^2 + y^2 = c^2$. Then, a, b and c are in*

(a) *AP* (b) *HP*
(c) *GP* (d) *None of these*

Interpret (c) Let $P(a\cos\theta, a\sin\theta)$ be any point on the circle $x^2 + y^2 = a^2$

Then, equation of chord of contact of tangents drawn from $P(a\cos\theta, a\sin\theta)$ to the circle $x^2 + y^2 = b^2$ is

$$ax\cos\theta + ay\sin\theta = b^2 \quad \text{...(i)}$$

This touches the circle $x^2 + y^2 = c^2$ ...(ii)

$\therefore$ Length of perpendicular from (0, 0) to Eq. (i) = radius of Eq. (ii)

$$\Rightarrow \quad \frac{|0 + 0 - b^2|}{\sqrt{(a^2 \cos^2\theta + a^2 \sin^2\theta)}} = c \quad \Rightarrow \quad b^2 = ac$$

$\Rightarrow$ a, b and c are in GP.

13.10 Equation of the Chord Bisected at a Given Point

Let $P(x_1, y_1)$ is the mid-point of chord AB of the circle $x^2 + y^2 + 2gx + 2fy + c = 0$, then the equation of the chord of circle bisected at the point $P(x_1, y_1)$ is

$$T = S_1$$

$$\Rightarrow \quad xx_1 + yy_1 + g(x + x_1) + f(y + y_1) = x_1^2 + y_1^2 + 2gx_1 + 2fy_1$$

Similarly, for the circle $x^2 + y^2 = r^2$, equation of chord is

$$T = S_1 \Rightarrow xx_1 + yy_1 - r^2 = x_1^2 + y_1^2 - r^2$$

***Sample* Problem 13** *The middle point of the chord intercepted on the line $lx + my + n = 0$ by the circle $x^2 + y^2 = a^2$ is*

(a) $\left(-\frac{nl}{l^2 + m^2}, -\frac{nm}{l^2 + m^2}\right)$ (b) $\left(\frac{nl}{l^2 + m^2}, \frac{nm}{l^2 + m^2}\right)$

(c) $\left(-\frac{l}{l^2 + m^2}, \frac{m}{l^2 + m^2}\right)$ (d) *None of these*

Interpret (a) Let (x_1, y_1) be the middle point of the chord intercepted by the circle $x^2 + y^2 = a^2$ on the line $lx + my + n = 0$. Then, equation of the chord of the circle $x^2 + y^2 = a^2$, whose middle point is (x_1, y_1), is

$$xx_1 + yy_1 - a^2 = x_1^2 + y_1^2 - a^2$$

$$\Rightarrow \quad xx_1 + yy_1 = x_1^2 + y_1^2 \quad \text{...(i)}$$

Clearly, $lx + my + n = 0$ and Eq. (i) represent the same line.

$$\therefore \quad \frac{x_1}{l} = \frac{y_1}{m} = -\frac{x_1^2 + y_1^2}{n} = \lambda \quad \text{(say)}$$

$$\Rightarrow \quad \left.\begin{aligned} x_1 &= l\lambda \\ y_1 &= m\lambda \end{aligned}\right\} \quad \text{...(ii)}$$

and $$x_1^2 + y_1^2 = -n\lambda$$

$$\Rightarrow \quad l^2\lambda^2 + m^2\lambda^2 = -n\lambda \quad \text{[from Eq. (ii)]}$$

$$\therefore \quad \lambda = -\frac{n}{l^2 + m^2}$$

$\therefore$ From Eq. (ii), we get

$$x_1 = -\frac{nl}{l^2 + m^2}, \quad y_1 = -\frac{mn}{l^2 + m^2}$$

Hence, the required point is $\left(-\frac{nl}{l^2 + m^2}, -\frac{nm}{l^2 + m^2}\right)$

13.11 Diameter of a Circle

The locus of the middle points of a system of parallel chords of a circle is called a diameter of the circle.

The equation of the diameter bisecting parallel chords $y = mx + c$ (c is a parameter) of the circle $x^2 + y^2 = a^2$ is

$$x + my = 0$$

Note The diameter corresponding to a system of parallel chords always passes through the centre of the circle and perpendicular to the parallel chords.

***Sample* Problem 14** *The equation of the diameter of the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ which corresponds to the chord $ax + by + d = 0$ is*

(a) $bx - ay + bg - af = 0$ (b) $ax - by - bg + af = 0$

(c) $bx + ay - bg + af = 0$ (d) *None of these*

Interpret (a) The diameter of circle perpendicular to the chord $ax + by + d = 0$ is

$$bx - ay + \lambda = 0 \quad \text{...(i)}$$

Which passes through centre $(-g, -f)$ of the circle, then

$$-bg + af + \lambda = 0$$

$$\Rightarrow \quad \lambda = bg - af$$

From Eq. (i), the equation of the diameter is

$$bx - ay + bg - af = 0$$

13.12 Pole and Polar

If through a point $P(x_1, y_1)$ (within or without a circle) there can be drawn any straight line to meet the given circle at Q and R, then locus of the point of intersection of the tangents at Q and R is called the polar of P and P is called the **pole** of the **polar**.

The polar of point $P(x_1, y_1)$ with respect to the circle

$$x^2 + y^2 = r^2 \text{ is } xx_1 + yy_1 = r^2$$

and to the circle

$$x^2 + y^2 + 2gx + 2fy + c = 0 \text{ is}$$

$$xx_1 + yy_1 + g(x + x_1) + f(y + y_1) + c = 0$$

Conjugate Points

Two points A and B are conjugate points with respect to a given circle if each lies on the polar of the other with respect to the circle.

Conjugate Lines

If two lines be such that the pole of one lies on the other, then they are called conjugate lines with respect to the given circle.

***Sample* Problem 15** *The polar drawn from (–1, 2) to the circles $S_1 = x^2 + y^2 + 6y + 7 = 0$ and $S_2 = x^2 + y^2 + 6x + 1 = 0$ are*

(a) *parallel* (b) *equal*
(c) *perpendicular* (d) *None of these*

Interpret (*d*) The equation of polar to circle S_1 is $x - 5y - 13 = 0$ and circle S_2 is $x + y - 1 = 0$
It is clear that they do not parallel, it means they are intersecting.

Check Point 1

1. The equation $x^2 + y^2 + 2gx + 2fy + c = 0$ will represent a real circle, if
(a) $g^2 + f^2 - c < 0$ (b) $g^2 + f^2 - c \geq 0$
(c) always (d) None of these

2. The tangents to $x^2 + y^2 = a^2$ having inclinations α and β intersect at P. If $\cot\alpha + \cot\beta = 0$, then the locus of P is
(a) $x + y = 0$ (b) $x - y = 0$
(c) $xy = 0$ (d) None of these

3. If the points (2, 0), (0, 1), (4, 5) and (0, c) are concyclic, then the value of c is
(a) 1 (b) $\frac{14}{3}$
(c) 5 (d) None of these

4. The equation of circle which touches the axes of coordinates and the line $\frac{x}{3} + \frac{y}{4} = 1$ and whose centre lies in the first quadrant is $x^2 + y^2 - 2cx - 2cy + c^2 = 0$, where c is
(a) 1 (b) 2
(c) 3 (d) None of these

5. The coordinates of the middle point of the chord cut off $2x - 5y + 18 = 0$ by the circle $x^2 + y^2 - 6x + 2y - 54 = 0$, are
(a) (1, 4) (b) (2, 4)
(c) (4, 1) (d) (1, 1)

6. The tangents drawn from the origin to the circle $x^2 + y^2 - 2rx - 2hy + h^2 = 0$ are perpendicular, if
(a) $h = r$ (b) $h = -r$
(c) $r^2 = h^2$ (d) All of these

7. The tangent to $x^2 + y^2 = 9$ which is parallel to y-axis and does not lie in the third quadrant touches the circle at the point
(a) (3, 0) (b) (–3, 0)
(c) (0, 3) (d) (0, –3)

8. Equation of the circle with centre on the y-axis and passing through the origin and (2, 3) is
(a) $x^2 + y^2 + 13y = 0$ (b) $3x^2 + 3y^2 - 13y = 0$
(c) $x^2 + y^2 + 13x + 3 = 0$ (d) $6x^2 + 6y^2 - 13x = 0$

9. Tangents drawn from the point (4, 3) to the circle $x^2 + y^2 - 2x - 4y = 0$ are inclined at an angle
(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

10. Polar of origin (0, 0) with respect to the circle $x^2 + y^2 + 2\lambda x + 2\mu y + c = 0$ touches the circle $x^2 + y^2 = r^2$, if
(a) $c = r(\lambda^2 + \mu^2)$ (b) $r = c(\lambda^2 + \mu^2)$
(c) $c^2 = r^2(\lambda^2 + \mu^2)$ (d) $r^2 = c^2(\lambda^2 + \mu^2)$

13.13 Family of Circles

(i) Family of circles passing through the point of intersection of line $P \equiv lx + my + n = 0$ and circle $S \equiv x^2 + y^2 + 2gx + 2fy + c = 0$ is $S + \lambda P = 0$

(ii) Family of circles passing through the points of intersection of two given circles

$$S_1 \equiv x^2 + y^2 + 2g_1x + 2f_1y + c_1 = 0$$

and $$S_2 \equiv x^2 + y^2 + 2g_2x + 2f_2y + c_2 = 0$$

is $S_1 + \lambda S_2 = 0$

(iii) Equation of family of circles passing through two points (x_1, y_1) and (x_2, y_2) is

$$(x - x_1)(x - x_2) + (y - y_1)(y - y_2) + \lambda \begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} = 0$$

(iv) The equation of the family of circles touching the circle $S \equiv x^2 + y^2 + 2gx + 2fy + c = 0$ at point $P(x_1, y_1)$ is

$$x^2 + y^2 + 2gx + 2fy + c + \lambda\{xx_1 + yy_1 + g(x + x_1) + f(y + y_1) + c\} = 0$$

or $$S + \lambda T = 0$$

where, $T = 0$ is the equation of the tangent to $S = 0$ at (x_1, y_1) and $\lambda \in R$.

***Sample* Problem 16** *The equation of the circle through points of intersection of the circle $x^2 + y^2 - 2x - 4y + 4 = 0$ and the line $x + 2y = 4$ which touches the line $x + 2y = 0$, is*

(a) $x^2 + y^2 + x + 2y = 0$ (b) $x^2 + y^2 - x - 2y = 0$
(c) $x^2 + y^2 - x + 2y = 0$ (d) *None of these*

Interpret (*b*) Equation of any circle through points of intersection of the given circle and the line is

$$(x^2 + y^2 - 2x - 4y + 4) + \lambda(x + 2y - 4) = 0$$

$$\Rightarrow \quad x^2 + y^2 + (\lambda - 2)x + (2\lambda - 4)y + 4(1 - \lambda) = 0 \quad \ldots(i)$$

It will touch the line $x + 2y = 0$, if the solution of Eq. (i) and $x = -2y$ be unique.

Hence, the roots of the equation

$$(-2y)^2 + y^2 + (\lambda - 2)(-2y) + (2\lambda - 4)y + 4(1 - \lambda) = 0$$

or $5y^2 + 4(1 - \lambda) = 0$ must be equal.

Then, $$0 = 4 \cdot 5 \cdot 4 \cdot (1 - \lambda) \Rightarrow \lambda = 1$$

$\therefore$ From Eq. (i), the required circle is

$$x^2 + y^2 - x - 2y = 0$$

13.14 Concentric Circles

Two circles having the same centre but different radii r_1 and r_2 respectively, are called concentric circles. Thus, the circles $x^2 + y^2 + 2gx + 2fy + c = 0$ and $x^2 + y^2 + 2gx + 2fy + \mu = 0$ are concentric circles. Therefore, the equations of concentric circles differ only in constant term.

***Sample* Problem 17** *If (–3, 2) lies on the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ which is concentric with the circle $x^2 + y^2 + 6x + 8y - 5 = 0$, then c is equal to*

(a) 11 (b) –11 (c) 24 (d) 100

Interpret (*b*) Equation of family of concentric circles to the circle $x^2 + y^2 + 6x + 8y - 5 = 0$

$$x^2 + y^2 + 6x + 8y + \lambda = 0$$

which is similar to $x^2 + y^2 + 2gx + 2fy + c = 0$

Thus, the point (– 3, 2) lies on the circle

$$x^2 + y^2 + 6x + 8y + c = 0$$

$$\therefore \quad (-3)^2 + (2)^2 + 6(-3) + 8(2) + c = 0$$

$$\Rightarrow \quad 9 + 4 - 18 + 16 + c = 0 \quad \therefore \quad c = -11$$

13.15 Common Tangents to Two Circles

(i) Circles Neither Touching Nor Intersecting

If the distance between the centres is more than the sum of their radii, then geometrically the two circles neither touch nor intersect each other.

Mathematically, $|C_1C_2| > r_1 + r_2$

In such a case there are two direct common tangents and two transverse common tangents.

(ii) Circles Touching Each Other Externally

If the distance between the centres equals the sum of their radii, then geometrically the two circles touch each other externally. The point P where the two circles touch each other is called the point of contact. P divides the line joining centres internally in the ratio of their radii *i.e.*, $\frac{C_1P}{C_2P} = \frac{r_1}{r_2}$

Mathematically, $|C_1C_2| = r_1 + r_2$

In such a case, there are 3 common tangents to two touching circles.

(iii) Circles Intersecting Each Other

If the distance between centres is less than the sum of their radii, then geometrically, the two circles intersect each other.

Mathematically,

$$|C_1C_2| < r_1 + r_2$$

In such a case, there are two direct common tangents.

(iv) Circles Touching Each Other Internally

If the distance between centres equals the difference of the radii, then geometrically, the two circles touch each other internally. The point of contact P divides the line joining the centres externally in the ratio of their radii

i.e., $$\frac{C_1P}{C_2P} = \frac{r_1}{r_2}$$

Mathematically, $|C_1C_2| = |r_1 - r_2|$

In such a case, there is one common tangent to two circles.

(V) One Circle Lies Inside Another

If distance between centres is less than the difference of the radii, then geometrically, one circle lies inside the another.

Mathematically, $|C_1C_2| < |r_1 - r_2|$

In such a case, there is no common tangent.

Note Length of an external common tangent and internal common tangent to two circles is given by length of external common tangent

$$L_{ex} = \sqrt{d^2 - (r_1 - r_2)^2}$$

and length of internal common tangent.

$L_{in} = \sqrt{d^2 - (r_1 + r_2)^2}$, where d is the common distance between centres of two circles Q_1 and r_1 and r_2 are the radii of two circles, where $|C_1C_2| = d$.

***Sample* Problem 18** *The circles* $x^2 + y^2 - 10x + 16 = 0$ *and* $x^2 + y^2 = r^2$ *intersect each other at two distinct points, if*

(a) $r < 2$ (b) $r > 8$ (c) $2 < r < 8$ (d) $2 \le r \le 8$

Interpret (c) The centre and radii of two circles are $C_1(1, -3)$, $C_2(0, 0)$

and $r_1 = \sqrt{25 + 0 - 16} = 3,\ r_2 = r$

Now, $C_1C_2 = 5$

For intersection of two circles

$$r_2 - r_1, < C_1C_2 < r_1 + r_2 \Rightarrow r - 3 < 5 < 3 + r$$

$$\Rightarrow \quad r < 8 \text{ and } r > 2 \Rightarrow 2 < r < 8$$

13.16 Angle of Intersection of Two Circles

The angle of intersection of two intersecting circles is the angle between their tangents at the point of intersection,

$$\cos\alpha = \left|\frac{r_1^2 + r_2^2 - d^2}{2r_1r_2}\right|$$

where, d is distance between centres of the circles.

Condition of Orthogonality

If the angle between the circles is 90°, then the circles are said to be orthogonal circle. Let $S_1 = 0$ and $S_2 = 0$ be any two circles, then condition of orthogonality is $2(g_1g_2 + f_1f_2) = c_1 + c_2$

***Sample* Problem 19** *The angle between the circles*

$$S : x^2 + y^2 - 4x + 6y + 11 = 0$$

and $S' : x^2 + y^2 - 2x + 8y + 13 = 0$ *is*

(a) 45° (b) 90°
(c) 60° (d) *None of these*

Interpret (a) Centres and radii of circles S and S' are $C_1(2, -3)$, $r_1 = \sqrt{2}$; $C_2(1, -4), r_2 = 2$.

Distance between centres,

$$d = |C_1C_2| = \sqrt{(2-1)^2 + (-3+4)^2} = \sqrt{2}$$

If angle between the circles is θ, then

$$\cos\theta = \left|\frac{2 + 4 - 2}{2\sqrt{2}\cdot 2}\right| = \frac{1}{\sqrt{2}} \therefore \theta = 45°$$

13.17 Common Chord of Two Circles

The common chord joining the point of intersection of two given circles is called their common chord.

The equation of the common chord of two circles

$$S_1 \equiv x^2 + y^2 + 2g_1x + 2f_1y + c_1 = 0$$

and $$S_2 \equiv x^2 + y^2 + 2g_2x + 2f_2y + c_2 = 0$$

is $$2(g_1 - g_2)x + 2(f_1 - f_2)y + c_1 - c_2 = 0$$

i.e., $$S_1 - S_2 = 0$$

Length of Common Chord

Length of common chord $= PQ = 2(PM)$

$$= 2\sqrt{[(C_1P)^2 - (C_1M)^2]}$$

where, C_1P = radius of circle $S_1 = 0$

and C_1M = length of perpendicular from C_1 on common chord PQ.

***Sample* Problem 20** *The equation of the circle whose diameter is the common chord of the circles $x^2 + y^2 + 2x + 3y + 2 = 0$ and $x^2 + y^2 + 2x - 3y - 4 = 0$ is*

(a) $x^2 + y^2 + 2x + 2y + 2 = 0$ (b) $x^2 + y^2 + 2x + 2y - 1 = 0$

(c) $x^2 + y^2 + 2x + 2y + 1 = 0$ (d) $x^2 + y^2 + 2x + 2y + 3 = 0$

Interpret (c) Equation of common chord is

$$S_1 - S_2 = 0$$

$$\Rightarrow \quad x^2 + y^2 + 2x + 3y + 2 - (x^2 + y^2 + 2x - 3y - 4) = 0$$

$$\Rightarrow \quad 6y + 6 = 0 \Rightarrow y = -1$$

On putting $y = -1$ in first circle, we get

$$x^2 + 1 + 2x - 3 + 2 = 0$$

$$\Rightarrow \quad x^2 + 2x = 0 \Rightarrow x = 0, -2$$

$\therefore$ End points of diameter are (0, – 1) and (– 2, – 1)

$\therefore$ Equation of circle is

$$(x - 0)(x + 2) + (y + 1)(y + 1) = 0$$

$$\Rightarrow \quad x^2 + 2x + y^2 + 2y + 1 = 0$$

13.18 Radical Axis

The radical axis of two circles is the locus of a point which moves in such a way that the length of the tangents drawn from it to the two circles are equal. The radical axis of two circles $S_1 = 0$ and $S_2 = 0$ is given by $S_1 - S_2 = 0$.

Properties of Radical Axis

(i) The equation of radical axis and the common chord of two circles are identical.

(ii) Radical axis is perpendicular to the straight line which joins the centres of the circles.

(iii) The radical axis bisects common tangents of two circles.

(iv) The radical axis of three circles taken in pairs are concurrents.

(v) **Radical centre** The point of intersection of radical axes of three circles whose centres are non-collinear, taken in pairs, is called their radical centre. The circle with centre at the radical centre and radius equal to the length of the tangent drawn from it to one of the circles, intersects all the three circles orthogonally.

Note

- Coordinates of radical centre can be found by solving the equations
$$S_1 = S_2 = S_3 = 0$$
- A system of circles (or family of circles) is said to be coaxial system of circles if every pair of the circles in the system has the same radical axis.

***Sample* Problem 21** *The equation of the three circles are given $x^2 + y^2 = 1$, $x^2 + y^2 - 8x + 15 = 0$, $x^2 + y^2 + 10y + 24 = 0$. Find the coordinates of the point P such that the tangents drawn from it to the circles are equal in length.* **[NCERT]**

(a) $(6, -1)$ *and* $\left(2, -\frac{5}{2}\right)$ (b) $(6, 1)$ *and* $\left(2, -\frac{5}{2}\right)$

(c) $(6, -1)$ *and* $\left(2, \frac{5}{2}\right)$ (d) *None of these*

Interpret (a) We know that, point from which lengths of tangents are equal in length is radical centre of the given three circles. Now, radical axis of the first two circles is

$$(x^2 + y^2 - 1) - (x^2 + y^2 - 8x + 15) = 0 \text{ i.e., } x - 2 = 0 \quad \ldots(i)$$

and radical axis of the second and third circles is

$$(x^2 + y^2 - 8x + 15) - (x^2 + y^2 + 10y + 24) = 0$$

i.e., $$8x + 10y + 9 = 0 \quad \ldots(ii)$$

On solving Eqs. (i) and (ii), the coordinates of the radical centre *i.e.*, of point P are $P(2, -5/2)$.

Now, centre of the circle touching the line $x + y = 5$ at $(6, -1)$ lie on the line $\perp$ to $x + y = 5$ at $(6, -1)$ *i.e.*, on $x - y = 7$. Let centre be (h, k) Then, $h - k = 7$ *i.e.*, $h = k + 7$. Also, circles passes through the points $(6, -1)$ and $P(2, -5/2)$.

13.19 Coaxial System of Circles

A system (or a family) of circles, every pair of which have the same radical axis, are called coaxial circles.

(i) The equation of a system of coaxial circles, when the equation of the radical axis and of one circle of the system are

$$P \equiv lx + my + n = 0$$

and $S \equiv x^2 + y^2 + 2gx + 2fy + c = 0$ respectively, is

$S + \lambda P = 0$ (λ is an arbitrary constant)

(ii) The equation of a coaxial system of circles, where the equation of any two circles of the system are

$$S_1 \equiv x^2 + y^2 + 2g_1x + 2f_1y + c_1 = 0$$

and $$S_2 \equiv x^2 + y^2 + 2g_2x + 2f_2y + c_2 = 0$$

respectively, is $S_1 + \lambda(S_1 - S_2) = 0$ $(\lambda \neq -1)$

or $S_2 + \lambda_1(S_1 - S_2) = 0$ $(\lambda_1 \neq -1)$

Other form $S_1 + \lambda S_2 = 0$ $(\lambda \neq -1)$

(iii) The equation of a system of coaxial circles in the simplest form is

$$x^2 + y^2 + 2gx + c = 0$$

where, g is variable and c is a constant.

The common radical axis is the y-axis (since, centre on x-axis) and the equation of a system of other coaxial circles in the simplest form is

$$x^2 + y^2 + 2fy + c = 0$$

where, f is variable and c, a constant (since centre on y-axis). The common radical axis is the x-axis.

***Sample* Problem 22** *The equation of the system of circle coaxial with the circles*

$$x^2 + y^2 + 4x + 2y + 1 = 0 \text{ and } x^2 + y^2 - 2x + 6y - 6 = 0$$

Find the equation of that particular circle whose centre lies on the radical axis.

(a) $13(x^2 + y^2) - 98x + 56y + 9 = 0$

(b) $26(x^2 + y^2) + 98x + 56y + 9 = 0$

(c) $26(x^2 + y^2) - 98x - 56y + 9 = 0$

(d) *None of the above*

Interpret (b) Given circles are

$$S_1 \equiv x^2 + y^2 + 4x + 2y + 1 = 0$$

and $$S_2 \equiv x^2 + y^2 - 2x + 6y - 6 = 0$$

$\therefore$ Radical axis is $S_1 - S_2 = 0$

i.e., $$6x - 4y + 7 = 0 \quad \ldots(i)$$

Now, system of coaxial circle is

$$S_1 + \lambda(S_1 - S_2) = 0$$

$$\Rightarrow \quad (x^2 + y^2 + 4x + 2y + 1) + \lambda(6x - 4y + 7) = 0$$

$$\Rightarrow \quad x^2 + y^2 + 2x(2 + 3\lambda) + 2y(1 - 2\lambda) + 1 = 7\lambda = 0 \quad \ldots(ii)$$

Its centre $[-(2 + 3\lambda), -(1 - 2\lambda)]$ lies on Eq. (i), we get

$$\therefore \quad 6 \times -(2 + 3\lambda) - 4 \times -(1 - 2\lambda) + 7 = 0$$

$$\Rightarrow \quad -12 - 18\lambda + 4 - 8\lambda + 7 = 0$$

$$\Rightarrow \quad -26\lambda - 1 = 0$$

$$\therefore \quad \lambda = -\frac{1}{26}$$

Substituting the value of λ in Eq. (ii), the equation of circle is

$$x^2 + y^2 + 2x\left(2 - \frac{3}{26}\right) + 2y\left(1 + \frac{2}{26}\right) + 1 - \frac{7}{26} = 0$$

$$\Rightarrow \quad 26(x^2 + y^2) + 98x + 56y + 9 = 0$$

13.20 Image of the Circle by the Line Mirror

Let the circle be $x^2 + y^2 + 2gx + 2fy + c = 0$ and line mirror is $lx + my + n = 0$ in this condition, radius of circle remains unchanged but centres changes. Let the centre of imaged circle be (x_1, y_1).

Then,

$$\frac{x_1 - (-g)}{l} = \frac{y_1 - (-f)}{m}$$

$$= \frac{-2(-lg - mf + c)}{(l^2 + m^2)}$$

we get $$x_1 = \frac{(l^2g - m^2g + 2mlf - 2nl)}{(l^2 + m^2)}$$

and $$y_1 = \frac{(m^2f - l^2f + 2mlg - 2mn)}{(l^2 + m^2)}$$

$\therefore$ Required imaged circle is

$$(x - x_1)^2 + (y - y_1)^2 = r^2$$

where, $$r = \sqrt{(g^2 + f^2 - c)}$$

***Sample* Problem 23** *Find the equation of the image of the circle* $x^2 + y^2 + 16x - 24y + 183 = 0$ *by the line mirror* $4x + 7y + 13 = 0$.

(a) $x^2 + y^2 + 32x + 4y + 235 = 0$

(b) $x^2 + y^2 - 32x - 4y + 235 = 0$

(c) $x^2 + y^2 + 32x + 4y - 235 = 0$

(d) *None of the above*

Interpret (a) The given circle and line are

$$x^2 + y^2 + 16x - 24y + 183 = 0 \quad \ldots(i)$$

and $$4x + 7y + 13 = 0 \quad \ldots(ii)$$

Centre and radius of cirde (i) are (– 8, 12) and 5, respectively. Let the centre of the imaged circle be (x_1, y_1).

Hence, (x_1, y_1) be the image of the point (– 8, 12) with respect to the line $4x + 7y + 13 = 0$, then

$$\frac{x_1 - (-8)}{4} = \frac{y_1 - 12}{7} = \frac{-2[4(-8) + 7(12) + 13]}{(4^2 + 7^2)}$$

$$\Rightarrow \quad \frac{x_1 + 8}{4} = \frac{y_1 - 12}{7} = -2$$

$$\therefore \quad x_1 = -16, y_1 = -2$$

$\therefore$ Equation of the imaged circle is

$$(x + 16)^2 + (y + 2)^2 = 5^2$$

$$\Rightarrow \quad x^2 + y^2 + 32x + 4y + 235 = 0$$

Check Point **2**

1. The number of common tangents to the circles
$$x^2 + y^2 + 2x + 8y - 23 = 0$$
and $x^2 + y^2 - 4x - 10y + 19 = 0$ are
(a) 4 (b) 2 (c) 3 (d) 1

2. The equation of the unit circle concentric with $x^2 + y^2 - 8x + 4y - 8 = 0$ is
(a) $x^2 + y^2 - 8x + 4y - 8 = 0$ (b) $x^2 + y^2 - 8x + 4y + 8 = 0$
(c) $x^2 + y^2 - 8x + 4y - 28 = 0$ (d) $x^2 + y^2 - 8x + 4y + 19 = 0$

3. If a circle passes through the point (1, 2) and cuts the circle $x^2 + y^2 = 4$ orthogonally, then the equation of the locus of its centre is
(a) $x^2 + y^2 - 3x - 8y + 1 = 0$ (b) $x^2 + y^2 - 2x - 6y - 7 = 0$
(c) $2x + 4y - 9 = 0$ (d) $2x + 4y - 1 = 0$

4. The locus of the centre of a circle which touches externally the circle $x^2 + y^2 - 6x - 6y + 14 = 0$ and also touches the y-axis is given by the equation
(a) $x^2 - 6x - 10y + 14 = 0$ (b) $x^2 - 10x - 6y + 14 = 0$
(c) $y^2 - 6x - 10y + 14 = 0$ (d) $y^2 - 10x - 6y + 14 = 0$

5. If the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ bisects the circumference of the circle $x^2 + y^2 + 2g'x + 2f'y + c' = 0$, then the length of the common chord of these two circles is
(a) $2\sqrt{g^2 + f^2 - c}$ (b) $2\sqrt{g'^2 + f'^2 - c'}$
(c) $2\sqrt{g^2 + f^2 + c}$ (d) $2\sqrt{g'^2 + f'^2 + c'}$

6. If the radical axis of the circles $x^2 + y^2 + 2gx + 2fy + c = 0$ and $2x^2 + 2y^2 + 3x + 8y + 2c = 0$ touches the circle $x^2 + y^2 + 2x + 2y + 1 = 0$, then
(a) $g = \frac{3}{4}$ and $f \neq 2$ (b) $g \neq \frac{3}{4}$ and $f = 2$
(c) $g = \frac{3}{4}$ or $f = 2$ (d) None of these

7. The common chord of $x^2 + y^2 - 4x - 4y = 0$ and $x^2 + y^2 = 16$ subtends at the origin an angle equal to
(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

8. The circles whose equations are $x^2 + y^2 + c^2 = 2ax$ and $x^2 + y^2 + c^2 = 2by$ will touch one another externally, if
(a) $\frac{1}{b^2} + \frac{1}{c^2} = \frac{1}{a^2}$ (b) $\frac{1}{c^2} + \frac{1}{a^2} = \frac{1}{b^2}$
(c) $\frac{1}{a^2} + \frac{1}{b^2} = \frac{1}{c^2}$ (d) None of these

9. The radical axis of the co axial system of circles with limiting point (1, 2) and (–2, 1) is
(a) $x + 3y = 0$
(b) $3x + y = 0$
(c) $2x + 3y = 0$
(d) $3x + 2y = 0$

WORKED OUT Examples

Example 1 *The equation of circle whose centre and radius are* (1, –1) *and* 4 *respectively, is*

(*a*) $x^2 + y^2 - 2x - 2y - 14 = 0$

(*b*) $x^2 + y^2 - 2x + 2y - 14 = 0$

(*c*) $x^2 + y^2 - 2x + 2y + 14 = 0$

(*d*) *None of the above*

Solution (*b*) We know that, equation of circle is

$$(x-h)^2 + (y-k)^2 = r^2 \quad \ldots(\text{i})$$

Here, centre is (1, –1) and radius is 4.

∴Eq. (i) becomes

$$(x-1)^2 + (y+1)^2 = 4^2$$

$$\Rightarrow \quad x^2 - 2x + 1 + y^2 + 2y + 1 = 16$$

$$\Rightarrow \quad x^2 + y^2 - 2x + 2y - 14 = 0$$

Example 2 *Find the equation of circle which passes through the three points* (0, 1), (2, 0) *and* (5, 6) *is*

(*a*) $x^2 + y^2 - 5x - 7y + 6 = 0$ (*b*) $x^2 + y^2 + 5x - 7y + 6 = 0$

(*c*) $x^2 + y^2 - 5x + 7y - 6 = 0$ (*d*) *None of these*

Solution (*a*) Let the general equation of circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \ldots(\text{i})$$

Since, the given points satisfy this equation, we have

$$1 + 2f + c = 0 \quad \ldots(\text{ii})$$

$$4 + 4g + c = 0 \quad \ldots(\text{iii})$$

and $$61 + 10g + 12f + c = 0 \quad \ldots(\text{iv})$$

On subtracting Eq. (ii) from Eq. (iii), we get

$$3 + 4g - 2f = 0 \quad \ldots(\text{v})$$

On subtracting Eq. (iii) from Eq. (iv), we get

$$57 + 6g + 12f = 0 \quad \ldots(\text{vi})$$

On multiplying Eq. (v) by 6 and adding Eqs. (v) and (vi), we get

$$\begin{array}{r} 57 + 6g + 12f = 0 \\ 18 + 24g - 12f = 0 \\ \hline 75 + 30g \quad = 0 \end{array}$$

$$\Rightarrow \quad g = -\frac{75}{30} = -\frac{5}{2}$$

and $$f = -\frac{7}{2}$$

∴ From Eq. (iv), we get

$$61 + 10\left(-\frac{5}{2}\right) + 12\left(-\frac{7}{2}\right) + c = 0$$

$$\Rightarrow \quad 61 - 25 - 42 + c = 0$$

$$\therefore \quad c = 6$$

On putting all these values in Eq. (i), we get required equation of circle which is

$$x^2 + y^2 - 5x - 7y + 6 = 0$$

Example 3 *One of the equation of a circle of radius* 13 *whose centre lies on x-axis and passes through the point* (4, 5), *is*

(*a*) $x^2 + y^2 - 32x + 37 = 0$ (*b*) $x^2 + y^2 + 16x + 87 = 0$

(*c*) $x^2 + y^2 - 32x - 105 = 0$ (*d*) $x^2 + y^2 + 16x - 105 = 0$

Solution (*d*) ∵ Centre lies on *x*-axis, therefore centre of circle is $C(r, 0)$ which passes through $P(4, 5)$.

∴ Equation of circle is $(r-4)^2 + (0-5)^2 = 13^2$

$$\Rightarrow \quad r^2 - 8r + 16 + 25 = 169$$

$$\Rightarrow \quad r^2 - 8r + 16 = 144$$

$$\Rightarrow \quad r - 4 = \pm 12 \quad \Rightarrow \quad r = 16, -8$$

Thus, the coordinates of centre are (16, 0), (–8, 0).

Hence, the equation of the required circle are

$$(x-16)^2 + (y-0)^2 = 13^2$$

and $$(x+8)^2 + (y-0)^2 = 13^2$$

$$\Rightarrow \quad x^2 + y^2 - 32x + 87 = 0$$

and $$x^2 + y^2 + 16x - 105 = 0$$

Example 4 *The equation of the circle, which touches both the axes and whose radius is* 4, *is*

(*a*) $x^2 + y^2 \pm 8x \pm 8y + 16 = 0$

(*b*) $x^2 + y^2 \pm x \pm y + 16 = 0$

(*c*) $x^2 + y^2 \pm x \pm y - 16 = 0$

(*d*) *None of the above*

Solution (*a*) Equation of required circle is

$$(x-4)^2 + (y-4)^2 = 4^2$$

$$\Rightarrow \quad x^2 + y^2 - 8x - 8y + 16 = 0$$

$\because$ The circle may lie in any one of the four quadrants. So, there are four circles and equation of these circles are given by

$$x^2 + y^2 \pm 8x \pm 8y + 16 = 0$$

Example 5 *The equation of circle which passes through the origin and cuts off intercepts 5 and 6 from the positive parts of the axes respectively is* $\left(x - \frac{5}{2}\right)^2 + (y-3)^2 = \lambda$, *where* λ *is*

(*a*) $\frac{61}{4}$ (*b*) $\frac{6}{4}$

(*c*) $\frac{1}{4}$ (*d*) 0

Solution (*a*) From figure, we have

$$OP = 5, \quad OQ = 6$$

and $$OM = \frac{5}{2}, \quad CM = 3$$

$\therefore$ In ΔOMC, $OC^2 = OM^2 + MC^2$

$$\Rightarrow \quad OC^2 = \left(\frac{5}{2}\right)^2 + (3)^2$$

$$\Rightarrow \quad OC = \frac{\sqrt{61}}{2}$$

Thus, the required circle has its centre $\left(\frac{5}{2}, 3\right)$ and radius $\frac{\sqrt{61}}{2}$.

Hence, its equation is $\left(x - \frac{5}{2}\right)^2 + (y-3)^2 = \left(\frac{61}{4}\right)$.

Hence, $$\lambda = \frac{61}{4}$$

Example 6 *If* $y = 5x$ *is a chord of the circle* $x^2 + y^2 + 20x = 0$, *the equation of a circle with this chord as diameter is*

(*a*) $3x^2 + 3y^2 + 10x + 50y = 0$

(*b*) $13x^2 + 13y^2 + 10x + 50y = 0$

(*c*) $13x^2 + 13y^2 + x + y = 0$

(*d*) *None of the above*

Solution (*b*) We have, $y = 5x$ and $x^2 + y^2 + 20x = 0$

$\therefore$ The point of intersection of the given chord and the given circle are obtained by solving

$$y = 5x$$

and $$x^2 + y^2 + 20x = 0$$

$$\therefore \quad x^2 + 25x^2 + 20x = 0$$

$$\Rightarrow \quad x = 0, -\frac{10}{13}$$

$$\therefore \quad y = 0, -\frac{50}{13}$$

Required equation of the circle is

$$(x-0)\left(x + \frac{10}{13}\right) + (y-0)\left(y + \frac{50}{13}\right) = 0$$

$$\Rightarrow \quad 13x^2 + 10x + 13y^2 + 50y = 0$$

$$\Rightarrow \quad 13x^2 + 13y^2 + 10x + 50y = 0$$

Example 7 *The parametric equations of the circle* $x^2 + y^2 + mx + my = 0$ *are*

(*a*) $x = -\frac{m}{2} + \frac{m}{\sqrt{2}}\cos\theta, \quad y = \frac{m}{2} + \frac{m}{\sqrt{2}}\sin\theta$

(*b*) $x = -\frac{m}{2} + \frac{m}{\sqrt{2}}\cos\theta, \quad y = -\frac{m}{2} + \frac{m}{\sqrt{2}}\sin\theta$

(*c*) $x = 0, y = 0$

(*d*) *None of the above*

Solution (*b*) Here, $$x^2 + y^2 + mx + my = 0$$

$$\Rightarrow \quad (x^2 + mx) + (y^2 + my) = 0$$

$$\Rightarrow \quad \left(x^2 + mx + \frac{m^2}{4}\right) + \left(y^2 + my + \frac{m^2}{4}\right) = \frac{m^2}{2}$$

$$\Rightarrow \quad \left[x - \left(-\frac{m}{2}\right)\right]^2 + \left[y - \left(-\frac{m}{2}\right)\right]^2 = \left(\frac{m}{\sqrt{2}}\right)^2$$

So, the parametric equations of the circles are

$$x = -\frac{m}{2} + \frac{m}{\sqrt{2}}\cos\theta$$

and $$y = -\frac{m}{2} + \frac{m}{\sqrt{2}}\sin\theta$$

Example 8 *The equation of a circle which cuts the three circles* $x^2 + y^2 - 3x - 6y + 14 = 0$, $x^2 + y^2 - x - 4y + 8 = 0$, $x^2 + y^2 + 2x - 6y + 9 = 0$ *orthogonally is*

(*a*) $x^2 + y^2 - 2x - 4y + 1 = 0$

(*b*) $x^2 + y^2 + 2x + 4y + 1 = 0$

(*c*) $x^2 + y^2 - 2x + 4y + 1 = 0$

(*d*) $x^2 + y^2 - 2x - 4y - 1 = 0$

Solution (*a*) The circle having centre at the radical centre of three given circles and radius equal to the length of the tangent from it to any one of three circles cuts all the three circles orthogonally. The given circles are

$$x^2 + y^2 - 3x - 6y + 14 = 0 \quad \text{...(i)}$$

$$x^2 + y^2 - x - 4y + 8 = 0 \quad \text{...(ii)}$$

$$x^2 + y^2 + 2x - 6y + 9 = 0 \quad \text{...(iii)}$$

The radical axis of Eqs. (i), (ii) and (iii) are respectively.

$$x + y - 3 = 0 \quad \ldots(iv)$$

and $$3x - 2y + 1 = 0 \quad \ldots(v)$$

On solving Eqs. (iv) and (v), we get $x = 1, y = 2$

Thus, the coordinates of the radical centre are (1, 2).

The length of the tangent from (1, 2) to Eq. (i) is

$$r = \sqrt{1 + 4 - 3 - 12 + 14} = 2$$

Hence, the required circle is $(x-1)^2 + (y-2)^2 = 2^2$

$$\Rightarrow \quad x^2 + y^2 - 2x - 4y + 1 = 0$$

Example 9 *Centre of the circle whose radius is 3 and which touches internally the circle $x^2 + y^2 - 4x - 6y - 12 = 0$ at the point $(-1, -1)$, is*

(a) $\left(\frac{7}{5}, \frac{-4}{5}\right)$ (b) $\left(\frac{4}{5}, \frac{7}{5}\right)$ (c) $\left(\frac{3}{5}, \frac{4}{5}\right)$ (d) $\left(\frac{7}{5}, \frac{3}{5}\right)$

Solution (b) The given circle is

$$x^2 + y^2 - 4x - 6y - 12 = 0 \quad \ldots(i)$$

whose centre is $C_1(2, 3)$ and radius $r_1 = C_1A = 5$

If $C_2(h, k)$ is the centre of the circle of radius 3 which touches the circle (i) internally at the point $A(-1, -1)$, then $C_2A = 3$

and $$C_1C_2 = C_1A - C_2A = 5 - 3 = 2$$

Thus, $C_2(h, k)$ divide C_1A in the ratio 2 : 3 internally.

$$\therefore \quad h = \frac{2(-1) + 3 \cdot 2}{2 + 3} = \frac{4}{5} \text{ and } k = \frac{2(-1) + 3 \cdot 3}{2 + 3} = \frac{7}{5}$$

Hence, required centre is $\left(\frac{4}{5}, \frac{7}{5}\right)$.

Example 10 *Find the radical centre of three circles described on the three sides $4x - 7y + 10 = 0$, $x + y - 5 = 0$ and $7x + 4y - 15 = 0$ of a triangle as diameters.*

(a) (1, 2) (b) (1, – 2)

(c) (– 1, 2) (d) *None of these*

Solution (a) Since, the radical centre of three circles described on the sides of a triangle as diameters is the orthocentre of the triangle.

$\therefore$ Radical centre = orthocentre

Given sides are $$4x - 7y + 10 = 0 \quad \ldots(i)$$

$$x + y - 5 = 0 \quad \ldots(ii)$$

and $$7x + 4y - 15 = 0 \quad \ldots(iii)$$

Since, lines (i) and (iii) are perpendiculars the point of intersection of (i) and (iii) is (1, 2) the orthocentre of the triangle. Hence, radical centre is (1, 2).

Example 11 *A ΔPQR is inscribed in the circle $x^2 + y^2 = 25$. If Q and R have coordinates (3, 4) and (– 4, 3) respectively, then $\angle QPR$ is equal to*

(a) $\pi/2$ (b) $\pi/3$

(c) $\pi/6$ (d) $\pi/4$

Solution (d) We know that in circle, $\angle QPR = \frac{1}{2}\angle QOR$; $O(0, 0)$ being the centre of the given circle $x^2 + y^2 = 25$

Let m_1 = slope of $OQ = 4/3$ and m_2 = slope of $OR = -3/4$

As, $$m_1m_2 = -1, \angle QOR = \pi/2$$

$$\Rightarrow \quad \angle QPR = \frac{1}{2}(\angle QOR) = \pi/4$$

Example 12 *Which of the following is not the circles which pass through the origin and cut off chords of length a from each of the lines y = x and y = – x.*

(a) $x^2 + y^2 \pm \sqrt{2}ax = 0$ (b) $x^2 + y^2 \pm \sqrt{2}ax \pm \sqrt{2}ay = 0$

(c) $x^2 + y^2 \pm \sqrt{2}ay = 0$ (d) *None of these*

Solution (c) Coordinates of point A are $\left(\frac{a}{\sqrt{2}}, \frac{a}{\sqrt{2}}\right)$

and coordinates of point B are $\left(\frac{a}{\sqrt{2}}, -\frac{a}{\sqrt{2}}\right)$

Now, from the geometry A and B are end points of diameter of the circle.

Then, the equation of circle is

$$\left(x - \frac{a}{\sqrt{2}}\right)\left(x - \frac{a}{\sqrt{2}}\right) + \left(y - \frac{a}{\sqrt{2}}\right)\left(y + \frac{a}{\sqrt{2}}\right) = 0$$

$$\Rightarrow \quad x^2 + y^2 - \sqrt{2}ax = 0$$

Similarly, circle with C and D as end points of diameter is

$$x^2 + y^2 + \sqrt{2}ax = 0$$

With similar arguments circles with A and C and B and D as end points of diameter are given by

$$x^2 + y^2 \pm \sqrt{2}ay = 0$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Standard Form of Equation of Circle

1. If $2(x^2 + y^2) + 4\lambda x + \lambda^2 = 0$ represents a circle of meaningful radius, then the range of real values of λ is

(a) R (b) $(0, +\infty)$
(c) $(-\infty, 0)$ (d) None of these

2. Find the equation of circle with centre $(-a, -b)$ and radius $\sqrt{a^2 - b^2}$. [NCERT]

(a) $x^2 + y^2 - 2ax - 2by - 2b^2 = 0$
(b) $x^2 + y^2 + 2ax + by + 2b^2 = 0$
(c) $x^2 + y^2 + 2ax + 2by + 2b^2 = 0$
(d) None of the above

3. Find the equation of the circle which touches the both axes in first quadrant and whose radius is a. [NCERT Exemplar]

(a) $x^2 + y^2 - 2ax - 2ay + a^2 = 0$
(b) $x^2 + y^2 - 2ax + 2ay - a^2 = 0$
(c) $x^2 + y^2 + 2ax - 2ay + a^2 = 0$
(d) None of the above

4. If one end of a diameter of the circle $x^2 + y^2 - 4x - 6y + 11 = 0$ is (3, 4), then find the coordinate of the other end of the diameter.

(a) (2, 1) (b) (1, 2)
(c) (1, 1) (d) None of these

5. The centre of a circle is (2, – 3) and the circumference is 10π. Then, the equation of the circle is

(a) $x^2 + y^2 + 4x + 6y + 12 = 0$
(b) $x^2 + y^2 - 4x + 6y + 12 = 0$
(c) $x^2 + y^2 - 4x + 6y - 12 = 0$
(d) $x^2 + y^2 - 4x - 6y - 12 = 0$

6. The circle $x^2 + y^2 - 8x + 4y + 4 = 0$ touches

(a) x-axis (b) y-axis
(c) both axis (d) neither x-axis nor y-axis

7. Equation of a circle which passes through (3, 6) and touches the axes is [NCERT Exemplar]

(a) $x^2 + y^2 + 6x + 6y + 3 = 0$
(b) $x^2 + y^2 - 6x - 6y - 9 = 0$
(c) $x^2 + y^2 - 6x - 6y + 9 = 0$
(d) None of the above

8. Equation of the circle with centre on the y-axis and passing through the origin and the point (2, 3) is [NCERT Exemplar]

(a) $x^2 + y^2 + 13y = 0$
(b) $3x^2 + 3y^2 + 13x + 3 = 0$
(c) $6x^2 + 6y^2 - 26y = 0$
(d) $x^2 + y^2 + 13x + 3 = 0$

9. If the lines $2x - 3y = 5$ and $3x - 4y = 7$ are the diameters of a circle of area 154 sq units, then find the equation of the circle. [NCERT Exemplar]

(a) $x^2 + y^2 - 2x + 2y = 40$
(b) $x^2 + y^2 - 2x - 2y = 47$
(c) $x^2 + y^2 - 2x + 2y = 47$
(d) None of the above

10. Circle $x^2 + y^2 - 2x - \lambda x - 1 = 0$ passes through two fixed points, coordinates of the points are

(a) $(0, \pm 1)$ (b) $(\pm 1, 0)$
(c) (0, 1) and (0, 2) (d) (0, – 1) and (0, – 2)

11. Find the equation of the circle which passes through the points (2, 3) and (4, 5) and the centre lies on the straight line $y - 4x + 3 = 0$. [NCERT Exemplar]

(a) $x^2 + y^2 - 4x - 10y + 25 = 0$
(b) $x^2 + y^2 - 4x - 10y - 25 = 0$
(c) $x^2 + y^2 - 4x + 10y - 25 = 0$
(d) None of the above

12. The circle $x^2 + y^2 - 10x - 14y + 24 = 0$ cuts an intercepts on y-axis of length
(a) 5 (b) 10
(c) 1 (d) None of these

Intersection of Line and Circle

13. If the line $3x - 4y - k = 0, (k > 0)$ touches the circle $x^2 + y^2 - 4x - 8y - 5 = 0$ at (a, b), then $k + a + b$ is equal to
(a) 20 (b) 22
(c) -30 (d) -28

14. The line $3x - 2y = k$ meets the circle $x^2 + y^2 = 4r^2$ at only one point, if k^2 is
(a) $20r^2$ (b) $52r^2$
(c) $\frac{52}{9}r^2$ (d) $\frac{20}{9}r^2$

15. A line through (0, 0) cuts the circle $x^2 + y^2 - 2ax = 0$ at A and B, then locus of the centre of the circle drawn AB as diameter is
(a) $x^2 + y^2 - 2ay = 0$ (b) $x^2 + y^2 + ay = 0$
(c) $x^2 + y^2 + ax = 0$ (d) $x^2 + y^2 - ax = 0$

16. If the line $\frac{x}{a} + \frac{y}{b} = 1$ moves such that $\frac{1}{a^2} + \frac{1}{b^2} = \frac{1}{c^2}$, where c is a constant, then the locus of the foot of the perpendicular from the origin to the line is
(a) straight line (b) circle
(c) parabola (d) ellipse

17. A line through $P(1, 4)$ intersect a circle $x^2 + y^2 = 16$ at A and B, then $PA \cdot PB$ is equal to
(a) 1 (b) 2 (c) 3 (d) 4

18. If a circle passes through the point of intersection of the coordinate axes with the lines $\lambda x - y + 1 = 0$ and $x - 2y + 3 = 0$, then the value of λ is
(a) 2 (b) 4
(c) 6 (d) 3

Tangent and Normal to the Circle

19. The equation of the tangents to the circle $x^2 + y^2 = 4$, which are parallel to $x + 2y + 3 = 0$, are
(a) $x - 2y = 2$ (b) $x + 2y = \pm 2\sqrt{3}$
(c) $x + 2y = \pm 2\sqrt{5}$ (d) $x - 2y = \pm 2\sqrt{5}$

20. If $a > 2b > 0$, then the positive value of m for which $y = mx - b\sqrt{1 + m^2}$ is a common tangent to $x^2 + y^2 = b^2$ and $(x - a)^2 + y^2 = b^2$, is
(a) $\frac{2b}{\sqrt{a^2 - 4b^2}}$ (b) $\frac{\sqrt{a^2 - 4b^2}}{2b}$
(c) $\frac{2b}{a - 2b}$ (d) $\frac{b}{a - 2b}$

21. The tangent at (1, 7) to the curve $x^2 = y - 6$ touches the circle $x^2 + y^2 + 16x + 12y + c = 0$ at
(a) (6, 7) (b) (– 6, 7)
(c) (6, – 7) (d) (– 6, – 7)

22. The square of the length of the tangent from (3, – 4) to the circle $x^2 + y^2 - 4x - 6y + 3 = 0$, is
(a) 20 (b) 30 (c) 40 (d) 50

23. The length of the tangent drawn from any point on the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ to the circle $x^2 + y^2 + 2gx + 2fy + c_1 = 0$ is
(a) $c_1 - c$ (b) $c - c_1$ (c) $\sqrt{c - c_1}$ (d) $\sqrt{c_1 - c}$

24. Centre of circle whose normals are
$$x^2 - 2xy - 3x + 6y = 0, \text{ is}$$
(a) $\left(3, \frac{3}{2}\right)$ (b) $\left(3, -\frac{3}{2}\right)$
(c) $\left(\frac{3}{2}, 3\right)$ (d) None of these

25. The equation of normal to the circle $2x^2 + 2y^2 - 2x - 5y + 3 = 0$ at (1, 1) is
(a) $2x + y = 3$ (b) $x - 2y = 3$
(c) $x + 2y = 3$ (d) None of these

26. The normal at the point (3, 4) on a circle cuts the circle at the point (–1, –2). Then, the equation of the circle is
(a) $x^2 + y^2 + 2x - 2y - 13 = 0$
(b) $x^2 + y^2 - 2x - 2y - 11 = 0$
(c) $x^2 + y^2 - 2x + 2y + 12 = 0$
(d) $x^2 + y^2 - 2x - 2y + 14 = 0$

27. If line $ax + by = 0$ touches $x^2 + y^2 + 2x + 4y = 0$ and is a normal to the circle $x^2 + y^2 - 4x + 2y - 3 = 0$, then value of (a, b) will be
(a) (2,1) (b) (1, –2) (c) (1, 2) (d) (–1, 2)

28. The area of the triangle formed by the positive x-axis and the normal and tangent to the circle $x^2 + y^2 = 4$ at $(1, \sqrt{3})$ is
(a) $2\sqrt{3}$ sq units (b) $3\sqrt{2}$ sq units
(c) $\sqrt{6}$ sq unit (d) None of these

29. If the lines $3x - 4y + 4 = 0$ and $6x - 8y - 7 = 0$ are tangents to a circle, then find the radius of the circle. [NCERT Exemplar]
(a) 3/4 (b) 4/3 (c) 1/4 (d) 7/4

30. Find the equation of a circle which touches both the axes and the line $3x - 4y + 8 = 0$ and lies in the third quadrant. [NCERT Exemplar]
(a) $x^2 + y^2 + 4x + 4y - 4 = 0$
(b) $x^2 + y^2 - 4x - 4y + 4 = 0$
(c) $x^2 + y^2 + 4x + 4y + 4 = 0$
(d) None of the above

31. The value of c, for which the line $y = 2x + c$ is a tangent to the circle $x^2 + y^2 = 16$, is
(a) $-16\sqrt{5}$ (b) $4\sqrt{5}$
(c) $16\sqrt{5}$ (d) 20

32. Two perpendicular tangents to the circle $x^2 + y^2 = a^2$ meet at P. Then, the locus of P has the equation
(a) $x^2 + y^2 = 2a^2$ (b) $x^2 + y^2 = 3a^2$
(c) $x^2 + y^2 = 4a^2$ (d) None of these

33. From a point on the circle $x^2 + y^2 = a^2$, two tangents are drawn to the circle $x^2 + y^2 = a^2 \sin^2 \alpha$. The angle between them is
(a) α (b) $\frac{\alpha}{2}$
(c) 2α (d) None of these

34. Let AB be a chord of the circle $x^2 + y^2 = r^2$ subtending a right angle at the centre. Then, the locus of the centroid of the ΔPAB as P moves on the circle is
(a) a parabola (b) a circle
(c) an ellipse (d) None of these

35. The locus of a point which moves so that the ratio of the length of the tangents to the circles $x^2 + y^2 + 4x + 3 = 0$ and $x^2 + y^2 - 6x + 5 = 0$ is 2 : 3, is
(a) $5x^2 + 5y^2 + 60x - 7 = 0$
(b) $5x^2 + 5y^2 - 60x - 7 = 0$
(c) $5x^2 + 5y^2 + 60x + 7 = 0$
(d) $5x^2 + 5y^2 + 60x + 12 = 0$

Chord of Contact and Diameter

36 Radius of circle in which a chord of length $\sqrt{2}$ makes an angle $\frac{\pi}{2}$ at the centre, is
(a) 1 (b) $\sqrt{3}$
(c) $\frac{\sqrt{3}}{2}$ (d) None of these

37. The condition that the chord $x \cos \alpha + y \sin \alpha - p = 0$ of $x^2 + y^2 - a^2 = 0$ may subtend a right angle at the centre of circle, is
(a) $a^2 = 2p^2$ (b) $p^2 = 2a^2$
(c) $a = 2p$ (d) $p = 2a$

38. Which of the following is a point on the common chord of the circles $x^2 + y^2 + 2x - 3y + 6 = 0$ and $x^2 + y^2 + x - 8y - 13 = 0$?
(a) $(1, -2)$ (b) $(1, 4)$ (c) $(1, 2)$ (d) $(1, -4)$

39. The locus of the middle point of the chords of the circle $x^2 + y^2 = a^2$ such that the chords pass through a given point (x_1, y_1), is
(a) $x^2 + y^2 - xx_1 - yy_1 = 0$
(b) $x^2 + y^2 = x_1^2 + y_1^2$
(c) $x + y = x_1 + y_1$
(d) $x + y = x_1^2 + y_1^2$

40. If two distinct chords drawn from the point (p, q) on the circle $x^2 + y^2 = px + qy$ (where, $pq \neq 0$) are bisected by the x-axis, then
(a) $p^2 = q^2$ (b) $p^2 = 8q^2$
(c) $p^2 < 8q^2$ (d) $p^2 > 8q^2$

41. If the chord of contact of tangents drawn from a point on the circle $x^2 + y^2 = a^2$ to the circle $x^2 + y^2 = b^2$ touches the circle $x^2 + y^2 = c^2$, then a, b and c are in
(a) AP (b) GP
(c) HP (d) None of these

42. The equation of the circle on the common chord of the circles $(x - a)^2 + y^2 = a^2$ and $x^2 + (y + b)^2 = b^2$ as diameter, is
(a) $x^2 + y^2 = 2ab(bx + ay)$
(b) $x^2 + y^2 = bx + ay$
(c) $(a^2 + b^2)(x^2 + y^2) = 2ab(bx - ay)$
(d) $(a^2 + b^2)(x^2 + y^2) = 2(bx + ay)$

43. The equation of the circle and its chord are respectively $x^2 + y^2 = a^2$ and $x \cos \alpha + y \sin \alpha = p$. The equation of the circle of which this chord is a diameter is
(a) $x^2 + y^2 - 2px \cos \alpha - 2py \sin \alpha + 2p^2 - a^2 = 0$
(b) $x^2 + y^2 - 2px \cos \alpha - 2py \sin \alpha + p^2 - a^2 = 0$
(c) $x^2 + y^2 + 2px \cos \alpha + 2py \sin \alpha + 2p^2 - a^2 = 0$
(d) None of the above

44. Consider the circle $x^2 + (y - 1)^2 = 9, (x - 1)^2 + y^2 = 25$. They are such that
(a) these circles touch each other
(b) one of these circles lies entirely inside the other
(c) each of these circles lies outside the other
(d) they intersect in two points

Family of Circles

45. If the circle $x^2 + y^2 + 4x + 22y + c = 0$ bisects the circumference of the circle $x^2 + y^2 - 2x + 8y - d = 0$, then $c + d$ is equal to
(a) 60 (b) 50 (c) 40 (d) 30

46. The equation of the circle passing through (1, 1) and the points of intersection of $x^2 + y^2 + 13x - 3y = 0$ and $2x^2 + 2y^2 + 4x - 7y - 25 = 0$ is
(a) $4x^2 + 4y^2 - 30x - 10y = 25$
(b) $4x^2 + 4y^2 + 30x - 13y - 25 = 0$
(c) $4x^2 + 4y^2 - 17x - 10y + 25 = 0$
(d) None of the above

47. The equation of the circle which passes through the intersection of $x^2 + y^2 + 13x - 3y = 0$ and $2x^2 + 2y^2 + 4x - 7y - 25 = 0$ and whose centre lies on $13x + 30y = 0$, is
(a) $x^2 + y^2 + 30x - 13y - 25 = 0$
(b) $4x^2 + 4y^2 + 30x - 13y - 25 = 0$
(c) $2x^2 + 2y^2 + 30x - 13y - 25 = 0$
(d) $x^2 + y^2 + 30x - 13y + 25 = 0$

48. If $(-3, 2)$ lies on the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ which is concentric with the circle $x^2 + y^2 + 6x + 8y - 5 = 0$, then c is equal to
(a) 11 (b) -11 (c) 24 (d) 100

49. Find the equation of a circle concentric with the circle $x^2 + y^2 - 6x + 12y + 15 = 0$ and has double of its area. [NCERT Exemplar]
(a) $x^2 + y^2 - 6x + 12y - 15 = 0$
(b) $x^2 + y^2 - 6x - 12y + 15 = 0$
(c) $x^2 + y^2 - 6x + 12y + 15 = 0$
(d) None of the above

50. Two circles with centres (2, 3) and (5, 6) cut orthogonally. If radius of both circles are equal, then radius is equal to
(a) 1 (b) 2 (c) 3 (d) 4

51. If P is a point such that the ratio of the squares of the lengths of the tangents from P to the circles $x^2 + y^2 + 2x - 4y - 20 = 0$ and $x^2 + y^2 - 4x + 2y - 44 = 0$ is 2 : 3, then the locus of P is a circle with centre
(a) $(7, -8)$ (b) $(-7, 8)$
(c) $(7, 8)$ (d) $(-7, -8)$

52. Equation of the circle passing through the point (3, 4) and concentric with the circle $x^2 + y^2 - 2x - 4y + 1 = 0$ is
(a) $x^2 + y^2 - 2x - 4y = 0$
(b) $x^2 + y^2 - 2x - 4y + 3 = 0$
(c) $x^2 + y^2 - 2x - 4y - 3 = 0$
(d) None of the above

53. The length of the transversal common tangent to the circle $x^2 + y^2 = 1$ and $(x - t)^2 + y^2 = 1$ is $\sqrt{21}$, then t is equal to
(a) ± 2 (b) ± 5
(c) ± 3 (d) None of these

54. Tangents drawn from the point $P(1, 8)$ to the circle $x^2 + y^2 - 6x - 11 = 0$ touch the circle at the points A and B. The equation of the circumcircle of the ΔPAB is
(a) $x^2 + y^2 + 4x - 6y + 19 = 0$
(b) $x^2 + y^2 - 4x - 10y + 19 = 0$
(c) $x^2 + y^2 - 2x + 6y - 29 = 0$
(d) $x^2 + y^2 - 6x - 4y + 19 = 0$

55. If two circles, each of radius 5 units, touch each other at (1, 2) and the equation of their common tangent is $4x + 3y = 10$, then equation of the circle a portion of which lies in all the quadrants, is
(a) $x^2 + y^2 - 10x - 10y + 25 = 0$
(b) $x^2 + y^2 + 6x + 2y - 15 = 0$
(c) $x^2 + y^2 + 2x + 6y - 15 = 0$
(d) $x^2 + y^2 + 10x + 10y + 25 = 0$

56. C_1 and C_2 are circles of unit radius with centres at (0, 0) and (1, 0) respectively. C_3 is a circle of unit radius, passes through the centres of the circles C_1 and C_2 and have its centre above x-axis. Equation of the common tangent to C_1 and C_2 which does not pass through C_2, is
(a) $x - \sqrt{3}y + 2 = 0$ (b) $\sqrt{3}x - y + 2 = 0$
(c) $\sqrt{3}x - y - 2 = 0$ (d) $x + \sqrt{3}y + 2 = 0$

57. The locus of centre of a circle $x^2 + y^2 - 2x - 2y + 1 = 0$, which rolls outside the circle $x^2 + y^2 - 6x + 8y = 0$, is
(a) $x^2 + y^2 - 2x - 2y - 34 = 0$
(b) $x^2 + y^2 - 6x - 8y + 11 = 0$
(c) $x^2 + y^2 - 6x + 8y - 11 = 0$
(d) None of the above

58. The locus of the centre of a circle which cuts orthogonally the circle $x^2 + y^2 - 20x + 4 = 0$ and which touches $x = 2$, is
(a) $y^2 = 16x + 4$ (b) $x^2 = 16y$
(c) $x^2 = 16y + 4$ (d) $y^2 = 16x$

59. The centre of the circle, which cuts orthogonally each of the three circles $x^2 + y^2 + 2x + 17y + 4 = 0$ and $x^2 + y^2 + 7x + 6y + 11 = 0$, $x^2 + y^2 - x + 22y + 3 = 0$, is
(a) (3, 2) (b) (1, 2)
(c) (2, 3) (d) (0, 2)

60. The locus of centres of family of circle passing through the origin and cutting the circle $x^2 + y^2 + 4x - 6y - 13 = 0$ orthogonally, is
(a) $4x + 6y + 13 = 0$ (b) $4x - 6y + 13 = 0$
(c) $4x + 6y - 13 = 0$ (d) $4x - 6y - 13 = 0$

61. The locus of the centre of circle which cuts the circles $x^2 + y^2 + 4x - 6y + 9 = 0$ and $x^2 + y^2 - 4x + 6y + 4 = 0$ orthogonally, is
(a) $12x + 8y + 5 = 0$ (b) $8x + 12y + 5 = 0$
(c) $8x - 12y + 5 = 0$ (d) None of these

62. If the circles $x^2 + y^2 + 2x + 2ky + 6 = 0$ and $x^2 + y^2 + 2ky + k = 0$ intersect orthogonally, then k is
(a) 2 or $-\frac{3}{2}$ (b) -2 or $\frac{3}{2}$
(c) 2 or $\frac{3}{2}$ (d) -2 or $\frac{3}{2}$

63. The circles $x^2 + y^2 + 2g_1x - a^2 = 0$ and $x^2 + y^2 + 2g_2x - a^2 = 0$ cut each other orthogonally. If p_1 and p_2 are perpendiculars from $(0, a)$ and $(0, -a)$ on a common tangent of these circles, then p_1p_2 is equal to

(a) $\frac{a^2}{2}$ (b) a^2
(c) $2a^2$ (d) $a^2 + 2$

64. If the circle $S_1 : x^2 + y^2 = 16$ intersects another circle S_1 of radius 5 in such a manner that the common chord is of maximum length and has a slope equal to $\frac{3}{4}$, the coordinates of the centre of S_2 are

(a) $\left(-\frac{9}{5}, \frac{12}{5}\right), \left(\frac{9}{5}, -\frac{12}{5}\right)$ (b) $\left(-\frac{9}{5}, -\frac{12}{5}\right), \left(\frac{9}{5}, \frac{12}{5}\right)$
(c) $\left(\frac{12}{5}, \frac{9}{5}\right), \left(-\frac{12}{5}, \frac{9}{5}\right)$ (d) None of these

Miscellaneous

65. The locus of the mid-point of the chord of the circle $x^2 + y^2 - 2x - 2y - 2 = 0$, which makes an angle of $120°$ at the centre, is

(a) $x^2 + y^2 - 2x - 2y + 1 = 0$
(b) $x^2 + y^2 + x + y - 1 = 0$
(c) $x^2 + y^2 - 2x - 2y - 1 = 0$
(d) None of the above

66. The lengths of the tangents from any point on the circle $15x^2 + 15y^2 - 48x + 64y = 0$ to the two circles $5x^2 + 5y^2 - 24x + 32y + 75 = 0$, $5x^2 + 5y^2 - 48x + 64y + 300 = 0$ are in the ratio

(a) 1 : 2 (b) 2 : 3
(c) 3 : 4 (d) None of these

67. If the radical axis of the circles $x^2 + y^2 + 2gx + 2fy + c = 0$ and $2x^2 + 2y^2 + 3x + 8y + 2c = 0$ touches the circle $x^2 + y^2 + 2x + 2y + 1 = 0$, then

(a) $g = \frac{3}{4}$ and $f \neq 2$ (b) $g \neq \frac{3}{4}$ and $f = 2$
(c) $g = \frac{3}{4}$ or $f = 2$ (d) None of these

68. $P(a, b)$ be any point such that the length of tangents from P to both the circles $x^2 + y^2 - 6x - 8y = 0$ and $x^2 + y^2 - 12x - 16y + 12 = 0$ are equal, then

(a) $3a + 4b - 6 = 0$ (b) $3a - 4b + 6 = 0$
(c) $6a - 8b + 12 = 0$ (d) $4a - 3b + 7 = 0$

69. If the area of the circle $4x^2 + 4y^2 - 8x + 16y + k = 0$ is 9π sq units, then the value of k is

(a) 4 (b) 16
(c) -16 (d) ± 16

70. The area of the circle centred at (1, 2) and passing through (4, 6) is [NCERT Exemplar]

(a) 5π (b) 10π
(c) 25π (d) None of these

71. If a circle passes through the point (0, 0), $(a, 0)$ and $(0, b)$, then find the coordinates of its centre. [NCERT Exemplar]

(a) $\left(-\frac{a}{2}, -\frac{b}{2}\right)$ (b) $\left(\frac{a}{2}, -\frac{b}{2}\right)$
(c) $\left(-\frac{a}{2}, \frac{b}{2}\right)$ (d) None of these

72. The area of square inscribed in a circle $x^2 + y^2 - 6x - 8y = 0$ is

(a) 100 sq units (b) 50 sq units
(c) 25 sq units (d) None of these

73. The distinct points $A(0, 0), B(0, 1), C(1, 0)$ and $D(2a, 3a)$ are concyclic, then

(a) 'a' can attain only rational values
(b) a is irrational
(c) cannot be concyclic for any a
(d) None of the above

74. The equation of a circle with origin as centre and passing through the vertices of an equilateral triangle whose median is of length $3a$ is [NCERT Exemplar]

(a) $x^2 + y^2 = 9a^2$
(b) $x^2 + y^2 = 16a^2$
(c) $x^2 + y^2 = 4a^2$
(d) $x^2 + y^2 = a^2$

75. If $\left(m_i, \frac{1}{m_i}\right), i = 1, 2, 3, 4$ are concyclic points, then the value of $m_1 m_2 m_3 m_4$ is

(a) 1 (b) -1
(c) 0 (d) None of these

76. If the tangent at the point P on the circle $x^2 + y^2 + 6x + 6y = 2$ meets the straight line $5x - 2y + 6 = 0$ at a point Q on the y-axis, then the length of PQ is

(a) 4 (b) $2\sqrt{5}$
(c) 5 (d) $3\sqrt{5}$

77. If the abscissae and ordinates of two points P and Q are roots of the equations $x^2 + 2ax - b^2 = 0$ and $y^2 + 2py - q^2 = 0$ respectively, then the equation of the circle with PQ as diameter, is

(a) $x^2 + y^2 + 2ax + 2py - b^2 - q^2 = 0$
(b) $x^2 + y^2 - 2ax - 2py + b^2 + q^2 = 0$
(c) $x^2 + y^2 - 2ax - 2py - b^2 - q^2 = 0$
(d) $x^2 + y^2 + 2ax + 2py + b^2 + q^2 = 0$

78. Let PQ and PS be tangents at the extremities of the diameter PR of a circle of radius r. If PS and RQ intersect at a point x on the circumference of the circle, then $2r$ equals

(a) $\sqrt{PQ \cdot RS}$ (b) $\frac{PQ + RS}{2}$

(c) $\frac{2PQ \cdot RS}{PQ + RS}$ (d) $\sqrt{\frac{PQ^2 + RS^2}{2}}$

79. If $(a \cos \theta_i, a \sin \theta_i)$, $i = 1, 2, 3$ represent the vertices of an equilateral triangle inscribed in a circle, then

(a) $\cos \theta_1 + \cos \theta_2 + \cos \theta_3 = 0$
(b) $\sec \theta_1 + \sec \theta_2 + \sec \theta_3 = 0$
(c) $\tan \theta_1 + \tan \theta_2 + \tan \theta_3 = 0$
(d) $\cot \theta_1 + \cot \theta_2 + \cot \theta_3 = 0$

80. The range of α, for which the point (α, α) lies inside the region bounded by the curves $y = \sqrt{1 - x^2}$ and $x + y = 1$ is

(a) $\frac{1}{2} < \alpha < \frac{1}{\sqrt{2}}$ (b) $\frac{1}{2} < \alpha < \frac{1}{3}$

(c) $\frac{1}{3} < \alpha < \frac{1}{\sqrt{3}}$ (d) $\frac{1}{4} < \alpha < \frac{1}{2}$

81. A line meets the coordinate axes in A and B. A circle is circumscribed about the ΔOAB. The distances from the points A and B of the side AB to the tangent at O are equal to m and n respectively. Then, the diameter of the circle is

(a) $m(m + n)$ (b) $n(m + n)$
(c) $m - n$ (d) None of these

82. Let L_1 be a straight line passing through the origin and L_2 be the straight line $x + y = 1$. If the intercepts made by the circle $x^2 + y^2 - x + 3y = 0$ on L_1 and L_2 are equal, then L_1 can be represented by

(a) $x + y = 0$ (b) $x - y = 0$
(c) $7x + y = 0$ (d) $x - 7y = 0$

83. If the area of the quadrilateral formed by the tangent from the origin to the circle $x^2 + y^2 + 6x - 10y + c = 0$ and the pair of radii at the points of contact of these tangents to the circle is 8 sq units, then c is a root of the equation

(a) $c^2 - 32c + 64 = 0$ (b) $c^2 - 34c + 64 = 0$
(c) $c^2 + 2c - 64 = 0$ (d) $c^2 + 34c - 64 = 0$

84. Consider the following statements

I. Circle $x^2 + y^2 - x - y - 1 = 0$ is completely inside the circle $x^2 + y^2 - 2x + 2y - 7 = 0$.

II. Number of common tangents of the circles

$$x^2 + y^2 + 14x + 12y + 21 = 0$$

and $$x^2 + y^2 + 2x - 4y - 4 = 0 \text{ is } 4.$$

Which of these is/are correct?

(a) Only I (b) Only II
(c) Both I and II (d) None of these

Round II (Mixed Bag)

Only One Correct Option

1. The set of values of c so that the equations $y = |x| + c$ and $x^2 + y^2 - 8|x| - 9 = 0$ have no solution, is

(a) $(-\infty, -3) \cup (3, \infty)$ (b) $(-3, 3)$
(c) $(-\infty, 5\sqrt{2}) \cup (5\sqrt{2}, \infty)$ (d) $(5\sqrt{2} - 4, \infty)$

2. Points $(-6, 0)$, $(0, 6)$ and $(-7, 7)$ are the vertices of ΔABC. The incircle of the triangle has the equation

(a) $x^2 + y^2 - 9x - 9y + 36 = 0$
(b) $x^2 + y^2 + 9x - 9y + 36 = 0$
(c) $x^2 + y^2 + 9x + 9y - 36 = 0$
(d) $x^2 + y^2 + 18x - 18y + 36 = 0$

3. Two rods of lengths a and b slide along the x-axis and y-axis respectively in such a manner that their ends are concyclic. The locus of the centre of the circle passing through the end points is

(a) $4(x^2 + y^2) = a^2 + b^2$
(b) $x^2 + y^2 = a^2 + b^2$
(c) $4(x^2 - y^2) = a^2 - b^2$
(d) $x^2 - y^2 = a^2 - b^2$

4. The range of values of a such that the angle θ between the pair of tangents drawn from $(a, 0)$ to the circle $x^2 + y^2 = 1$ satisfies $\frac{\pi}{2} < \theta < \pi$, is

(a) $(1, 2)$ (b) $(1, \sqrt{2})$
(c) $(-\sqrt{2}, -1)$ (d) $(-\sqrt{2}, -1) \cup (1, \sqrt{2})$

5. Two points P and Q are taken on the line joining the points $A(0, 0)$ and $B(3a, 0)$ such that $AP = PQ = QB$. Circles are drawn on AP, PQ and QB as diameters.

The locus of the points, the sum of the squares of the tangents from which to the three circles is equal to b^2, is

(a) $x^2 + y^2 - 3ax + 2a^2 - b^2 = 0$
(b) $3(x^2 + y^2) - 9ax + 8a^2 - b^2 = 0$
(c) $x^2 + y^2 - 5ax + 6a^2 - b^2 = 0$
(d) $x^2 + y^2 - ax - b^2 = 0$

6. The equations of the sides AB, BC and CA of a ΔABC are $x + y = 1$, $4x - y + 4 = 0$ and $2x + 3y = 6$. Circles are drawn on AB, BC and CA as diameters. The point of concurrence of the common chord is

(a) centroid of the triangle (b) orthocentre
(c) circumcentre (d) incentre

7. An isosceles right angled triangle is inscribed in the circle $x^2 + y^2 = r^2$. If the coordinates of an end of the hypotenuse are (a, b), the coordinates of the vertex are
(a) $(-a, -b)$ (b) $(b, -a)$
(c) (b, a) (d) $(-b, -a)$

8. If OA and OB are equal perpendicular chord of the circles $x^2 + y^2 - 2x + 4y = 0$, then equations of OA and OB are (where, O is origin)
(a) $3x + y = 0$ and $3x - y = 0$
(b) $3x + y = 0$ and $3y - x = 0$
(c) $x + 3y = 0$ and $y - 3x = 0$
(d) $x + y = 0$ or $x - y = 0$

9. Equation of chord of the circle $x^2 + y^2 - 3x - 4y - 4 = 0$, which passes through the origin such that the origin divides it in the ratio 4 : 1, is
(a) $x = 0$ (b) $24x + y = 0$
(c) $7x + 24y = 0$ (d) $7x - 24y = 0$

10. In a ΔABC, right angled at A, on the leg AC as diameter, a semi-circle is described. If a chord joins A with the point of intersection D of the hypotenuse and the semi-circle, then the length of AC equal to
(a) $\dfrac{AB \times AD}{\sqrt{AB^2 + AD^2}}$ (b) $\dfrac{AB \times AD}{AB + AD}$
(c) $\sqrt{AB \times AD}$ (d) $\dfrac{AB \times AD}{\sqrt{AB^2 - AD^2}}$

11. A rhombus is inscribed in the region common to the two circles $x^2 + y^2 - 4x - 12 = 0$ and $x^2 + y^2 + 4x - 12 = 0$ with two of its vertices on the line joining the centres of the circles. The area of the rhombus is
(a) $8\sqrt{3}$ sq units (b) $4\sqrt{3}$ sq units
(c) $6\sqrt{3}$ sq units (d) None of these

12. A pair of tangents are drawn to a unit circle with centre at the origin and these tangents intersect at A enclosing an angle of 60°. The area enclosed by these tangents and the arc of the circle is
(a) $\dfrac{2}{\sqrt{3}} - \dfrac{\pi}{6}$ (b) $\sqrt{3} - \dfrac{\pi}{3}$
(c) $\dfrac{\pi}{3} - \dfrac{\sqrt{3}}{6}$ (d) $\sqrt{3}\left(1 - \dfrac{\pi}{6}\right)$

13. A straight line with slope 2 and y-intercept 5 touches the circle, $x^2 + y^2 + 16x + 12y + c = 0$ at a point Q. Then, the coordinates of Q are
(a) $(-6, 11)$ (b) $(-9, -13)$
(c) $(-10, -15)$ (d) $(-6, -7)$

14. Two circles with radii a and b touch each other externally such that θ is the angle between the direct common tangents $(a > b \geq 2)$, then
(a) $\theta = 2\cos^{-1}\left(\dfrac{a-b}{a+b}\right)$ (b) $\theta = 2\tan^{-1}\left(\dfrac{a+b}{a-b}\right)$
(c) $\theta = 2\sin^{-1}\left(\dfrac{a+b}{a-b}\right)$ (d) $\theta = 2\sin^{-1}\left(\dfrac{a-b}{a+b}\right)$

15. The equation of a line inclined at an angle $\pi/4$ to the x-axis, such that the two circles $x^2 + y^2 = 4$, $x^2 + y^2 - 10x - 14y + 65 = 0$ intercept equal lengths on it, is
(a) $2x - 2y - 3 = 0$ (b) $2x - 2y + 3 = 0$
(c) $x - y + 6 = 0$ (d) $x - y - 6 = 0$

More Than One Correct Option

16. The equation of a circle C_1 is $x^2 + y^2 = 4$. The locus of the intersection of orthogonal tangents to the circle is the curve C_2 and the locus of the intersection of perpendicular tangents to the curve C_2 is the curve C_3. Then,
(a) C_3 is a circle
(b) the area enclosed by the curve C_3 is 8π
(c) C_2 and C_3 are circles with the same centre
(d) None of the above

17. The equation of the tangents drawn from the origin to the circle $x^2 + y^2 - 2rx - 2hy + h^2 = 0$, are
(a) $x = 0$ (b) $y = 0$
(c) $(h^2 - r^2)x - 2rhy = 0$ (d) $(h^2 - r^2)x + 2rhy = 0$

18. $A\left(\dfrac{1}{\sqrt{2}}, \dfrac{1}{\sqrt{2}}\right)$ is a point on the circle $x^2 + y^2 = 1$ and B is another point on the circle such that arc length $AB = \dfrac{\pi}{2}$ units. Then, coordinates of B can be
(a) $\left(\dfrac{1}{\sqrt{2}}, -\dfrac{1}{\sqrt{2}}\right)$ (b) $\left(-\dfrac{1}{\sqrt{2}}, \dfrac{1}{\sqrt{2}}\right)$
(c) $\left(-\dfrac{1}{\sqrt{2}}, -\dfrac{1}{\sqrt{2}}\right)$ (d) None of these

Comprehension Based Questions

Passage

Directions (Q. Nos. 19 and 20) *P is a variable point on the line $L = 0$. Tangents are drawn to the circle $x^2 + y^2 = 4$ from P to touch it at Q and R. The parallelogram PQSR is completed.*

19. If $L \equiv 2x + y = 6$, then the locus of circumcentre of ΔPQR is
(a) $2x - y = 4$ (b) $2x + y = 3$
(c) $x - 2y = 4$ (d) $x + 2y = 3$

20. If $P \equiv (2, 3)$, then the centre of circumcircle of ΔQRS is

(a) $\left(\frac{2}{13}, \frac{7}{26}\right)$ (b) $\left(\frac{2}{13}, \frac{3}{26}\right)$

(c) $\left(\frac{3}{13}, \frac{9}{26}\right)$ (d) $\left(\frac{3}{13}, \frac{2}{13}\right)$

Assertion and Reason

Directions (Q. Nos. 21- 27) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*) and (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.

(c) Statement I is true; Statement II is false.

(d) Statement I is false; Statement II is true.

21. **Statement I** Circle $x^2 + y^2 - 6x - 4y + 9 = 0$ bisects the circumference of the circle $x^2 + y^2 - 8x - 6y + 23 = 0$.

Statement II Centre of first circle lie on the second circle.

22. Let C_1 and C_2 be two circles with C_2 lying inside C_1.

Statement I A circle C lying inside C_1 touches C_1 internally and C_2 externally. Then, the locus of the centre of C is an ellipse.

Statement II If A and B are foci and P be any point on the ellipse, then $AP + BP =$ constant.

23. **Statement I** A ray of light incident at the point $(-3, -1)$ gets reflected from the tangent at $(0, -1)$ to the circle $x^2 + y^2 = 1$. If the reflected ray touches the circle, then equation of the reflected ray is $4y - 3x = 5$.

Statement II The angle of incidence = angle of reflection *i.e.*, $\angle i = \angle r$

24. Consider two circles

$$S \equiv x^2 + y^2 + 2gx + 2fy = 0$$

and $$S' \equiv x^2 + y^2 + 2g'x + 2f'y = 0$$

Statement I If two circles S and S' touch each other, then $f'g = fg'$.

Statement II Two circles touch each other, if line joining their centres is perpendicular to all possible common tangents.

25. **Statement I** Number of circles passing through $(-2, 1), (-1, 0), (-4, 3)$ is 1.

Statement II Through three non-collinear points in a plane only one circle can be drawn.

26. **Statement I** Circles $x^2 + y^2 = 4$ and $x^2 + y^2 - 8x + 7 = 0$ intersect each other at two distinct points.

Statement II Circles with centres C_1 and C_2 and radii r_1 and r_2 intersect at two distinct points, if $|C_1C_2| < r_1 + r_2$.

27. Consider $L_1 : 2x + 3y + p - 3 = 0$ and $L_2 : 2x + 3y + p + 3 = 0$, where p is a real number and $C : x^2 + y^2 + 6x - 10y + 30 = 0$.

Statement I If line L_1 is a chord of circle C, then L_2 is not always a diameter of circle C.

Statement II If line L_1 is a diameter of circle C, then L_2 is not a chord of circle C.

Previous Years' Questions

28. The circle passing through (1, –2) and touching the axis to x at (3, 0) also passes through the point [JEE Main 2013]

(a) $(-5, 2)$ (b) $(2, -5)$ (c) $(5, -2)$ (d) $(-2, 5)$

29. The length of the diameter of the circle which touches the x-axis at the point (1, 0) and passes through the point (2, 3) is [AIEEE 2012]

(a) $\frac{10}{3}$ (b) $\frac{3}{5}$ (c) $\frac{6}{5}$ (d) $\frac{5}{3}$

30. The two circles $x^2 + y^2 = ax$ and $x^2 + y^2 = c^2$, $(c > 0)$ touch each other if [AIEEE 2011]

(a) $|a| = c$ (b) $a = 2c$ (c) $|a| = 2c$ (d) $2|a| = c$

31. The equation of the circle passing through the points (1, 0) and (0, 1) and having the smallest radius is [AIEEE 2011]

(a) $x^2 + y^2 + x + y - 2 = 0$

(b) $x^2 + y^2 - 2x - 2y + 1 = 0$

(c) $x^2 + y^2 - x - y = 0$

(d) $x^2 + y^2 + 2x + 2y - 7 = 0$

32. The circle $x^2 + y^2 = 4x + 8y + 5$ intersects the line $3x - 4y = m$ at two distinct points, if [AIEEE 2010]

(a) $-85 < m < -35$ (b) $-35 < m < 15$

(c) $15 < m < 65$ (d) $35 < m < 85$

33. If P and Q are the points of intersection of the circles $x^2 + y^2 + 3x + 7y + 2p - 5 = 0$ and $x^2 + y^2 + 2x + 2y - p^2 = 0$, then there is a circle passing through P, Q and (1, 1) and [AIEEE 2009]

(a) all values of p

(b) all except one value of p

(c) all except two values of p

(d) exactly one value of p

34. The point diameterically opposite to the point $P(1, 0)$ on the circle $x^2 + y^2 + 2x + 4y - 3 = 0$ is [AIEEE 2008]
(a) (3, 4) (b) (3, – 4)
(c) (– 3, 4) (d) (– 3, – 4)

35. Consider a family of circles which are passing through the point (– 1, 1) and are tangent to x-axis. If (h, k) is the centre of circle, then [AIEEE 2007]
(a) $k \geq 1/2$ (b) $-1/2 \leq k \leq 1/2$
(c) $k \leq 1/2$ (d) $0 < k < 1/2$

36. Any chord of the circle $x^2 + y^2 = 25$ subtends a right angle at the centre. Then, the locus of the centroid of the triangle made by the chord and a moving point P on the circle is [AIEEE 2007]
(a) parabola
(b) circle
(c) rectangular hyperbola
(d) ellipse

37. Let C be the circle with centre (0, 0) and radius 3. The equation of the locus of the mid-points of the chords of the circle C that subtend an angle $2\pi/3$ at its centre is [AIEEE 2006]
(a) $x^2 + y^2 = \frac{27}{4}$ (b) $x^2 + y^2 = \frac{9}{4}$
(c) $x^2 + y^2 = \frac{3}{2}$ (d) $x^2 + y^2 = 1$

38. If the lines $3x - 4y - 7 = 0$ and $2x - 3y - 5 = 0$ are two diameters of a circle of area 49π sq units, the equation of the circle is [AIEEE 2006]
(a) $x^2 + y^2 + 2x - 2y - 62 = 0$
(b) $x^2 + y^2 - 2x + 2y - 62 = 0$
(c) $x^2 + y^2 - 2x + 2y - 47 = 0$
(d) $x^2 + y^2 + 2x - 2y - 47 = 0$

39. If the pair of lines $ax^2 + 2(a + b)xy + by^2 = 0$ lie along diameters of a circle and divide the circle into four sectors such that the area of one of the sectors is thrice the area of another sector, then [AIEEE 2005]
(a) $3a^2 + 2ab + 3b^2 = 0$
(b) $3a^2 + 10ab + 3b^2 = 0$
(c) $3a^2 - 2ab + 3b^2 = 0$
(d) $3a^2 - 10ab + 3b^2 = 0$

40. A circle touches the x-axis and also touches the circle with centre at (0, 3) and radius 2. The locus of the centre of the circle is [AIEEE 2005]
(a) a parabola (b) a hyperbola
(c) a circle (d) an ellipse

41. If the circles $x^2 + y^2 + 2ax + cy + a = 0$ and $x^2 + y^2 - 3ax + dy - 1 = 0$ intersect in two distinct points P and Q, then the line $5x + by - a = 0$ passes through P and Q for [AIEEE 2005]
(a) no value of a
(b) exactly one value of a
(c) exactly two values of a
(d) infinitely many values of a

42. If a circle passes through the point (a, b) and cuts the circle $x^2 + y^2 = 4$ orthogonally, then the locus of its centre is [AIEEE 2004]
(a) $2ax + 2by + (a^2 + b^2 + 4) = 0$
(b) $2ax + 2by - (a^2 + b^2 + 4) = 0$
(c) $2ax - 2by + (a^2 + b^2 + 4) = 0$
(d) $2ax - 2by - (a^2 + b^2 + 4) = 0$

43. The smallest circle with centre on y-axis and passing through the point (7, 3) has radius [AIEEE 2004]
(a) $\sqrt{58}$ (b) 7
(c) 3 (d) 4

44. If the lines $2x + 3y + 1 = 0$ and $3x - y - 4 = 0$ lie along diameters of a circle of circumference 10π, then the equation of the circle is [AIEEE 2004]
(a) $x^2 + y^2 - 2x + 2y - 23 = 0$
(b) $x^2 + y^2 - 2x - 2y - 23 = 0$
(c) $x^2 + y^2 + 2x + 2y - 23 = 0$
(d) $x^2 + y^2 + 2x - 2y - 23 = 0$

45. The intercept on the line $y = x$ by the circle $x^2 + y^2 - 2x = 0$ is AB. Equation of the circle on AB as a diameter is [AIEEE 2004]
(a) $x^2 + y^2 - x - y = 0$
(b) $x^2 + y^2 - x + y = 0$
(c) $x^2 + y^2 + x + y = 0$
(d) $x^2 + y^2 + x - y = 0$

46. How many common tangents can be drawn to the following circles $x^2 + y^2 = 6x$ and

$$x^2 + y^2 + 6x + 2y + 1 = 0\,?$$ [AIEEE 2004]

(a) 4 (b) 3
(c) 2 (d) 1

47. A variable circle passes through the fixed point $A(p, q)$ and touches x-axis. The locus of the other end of the diameter through A is [AIEEE 2004]
(a) $(x - p)^2 = 4qy$ (b) $(x - q)^2 = 4py$
(c) $(y - p)^2 = 4qx$ (d) $(y - q)^2 = 4px$

the Guidance

Round I

1. Since, $x^2 + y^2 + 2\lambda x + \frac{\lambda^2}{2} = 0$ is a circle representing meaningful radius.

$$\Rightarrow \quad \lambda^2 - \frac{\lambda^2}{2} \geq 0 \qquad \left(\because r = \sqrt{\lambda^2 - \frac{\lambda^2}{2}}\right)$$

$$\Rightarrow \quad \lambda^2 \geq 0$$

which is always true, $\forall\ \lambda \in R$.

2. Given centre $= (h, k) = (-a, -b)$ and radius $r = \sqrt{a^2 - b^2}$

$\therefore$ Equation of circle by using $(x-h)^2 + (y-k)^2 = r^2$ is

$$(x + a)^2 + (y + b)^2 = (\sqrt{a^2 - b^2})^2$$

$$\Rightarrow \quad x^2 + a^2 + 2ax + y^2 + b^2 + 2by = a^2 - b^2$$

$$\Rightarrow \quad x^2 + y^2 + 2ax + 2by + 2b^2 = 0$$

3. Let the centre of circle in first quadrant $be(a, a)$.

$\therefore$ Equation of circle is

$$(x - a)^2 + (y - a)^2 = a^2$$

$$\Rightarrow \quad x^2 + a^2 - 2ax + y^2 + a^2 - 2ay = a^2$$

$$\Rightarrow \quad x^2 + y^2 - 2ax - 2ay + a^2 = 0$$

4. The centre of the given circle $x^2 + y^2 - 4x - 6y + 11 = 0$ is (2, 3).

Let the other end of diameter is (x_1, y_1).

Since, $\quad$ centre $= \left(\frac{x_1 + 3}{2}, \frac{y_1 + 4}{2}\right)$

$$\therefore \quad (2, 3) = \left(\frac{x_1 + 3}{2}, \frac{y_1 + 4}{2}\right)$$

$$\Rightarrow \quad 2 = \frac{x_1 + 3}{2}$$

$$3 = \frac{y_1 + 4}{2} \Rightarrow x_1 = 1, y_1 = 2$$

$\therefore$ Coordinates of other end of the diameter is (1, 2).

5. It is given, centre is (2, –3) and circumference of circle $= 10\pi$

$$\Rightarrow \quad 2\pi r = 10\pi$$

$$\Rightarrow \quad r = 5$$

The equation of circle, if centre is (2, –3) and radius is 5, is

$$(x - 2)^2 + (y + 3)^2 = 5^2$$

$$\Rightarrow \quad x^2 + y^2 - 4x + 6y + 13 = 25$$

$$\Rightarrow \quad x^2 + y^2 - 4x + 6y - 12 = 0$$

6. We have equation of circle is

$$x^2 + y^2 - 8x + 4y + 4 = 0$$

On comparing with standard equation of circle

$$x^2 + y^2 + 2gx + 2fy + c = 0, \text{ we get}$$

$$g = -4, \quad f = 2 \quad \text{and} \quad c = 4$$

$\therefore$ Coordinates of the centre $= (-g, -f) = (4, -2)$

$\therefore$ Radius of the circle $= \sqrt{g^2 + f^2 - c}$

$$= \sqrt{(4)^2 + (-2)^2 - 4}$$

$$= \sqrt{16 + 4 - 4} = 4$$

Here, radius of circle is equal to x-coordinate of the centre.

$\therefore$ Circle touches y-axis.

7. Let the equation of circle, which touches both the axes is

$$(x - a)^2 + (y - a)^2 = a^2$$

$\Rightarrow$ $x^2 + y^2 - 2ax - 2ay + 2a^2 = a^2$

$\Rightarrow$ $x^2 + y^2 - 2ax - 2ay + a^2 = 0$ ...(i)

Since, it is passes through (3, 6).

$\therefore$ $(3)^2 + (6)^2 - 2a(3) - 2a(6) + a^2 = 0$

$\Rightarrow$ $9 + 36 - 18a + a^2 = 0$

$\Rightarrow$ $a^2 - 18a + 45 = 0$

$\Rightarrow$ $a^2 - 15a - 3a + 45 = 0$

$\Rightarrow$ $a(a - 15) - 3(a - 15) = 0$

$\Rightarrow$ $(a - 3)(a - 15) = 0$

$\Rightarrow$ $a = 3, 15$

On putting $a = 3$ in Eq. (i), we get

$$x^2 + y^2 - 2(3)x - 2(3)y + 3^2 = 0$$

$\Rightarrow$ $x^2 + y^2 - 6x - 6y + 9 = 0$

8. Let the centre of circle be $(0, k)$.

Let equation of circle be

$$x^2 + y^2 - 2(0)x - 2ky + c = 0$$

$\Rightarrow$ $x^2 + y^2 - 2ky + c = 0$ ...(i)

Since, it is passes through (0, 0) and (2, 3).

$\therefore$ $0^2 + 0^2 - 2k(0) + c = 0$

$\Rightarrow$ $c = 0$

and $(2)^2 + (3)^2 - 2k(3) + c = 0$

$\Rightarrow$ $13 - 6k + c = 0$

$\Rightarrow$ $13 - 6k + 0 = 0$

$\Rightarrow$ $k = \frac{13}{6}$

On putting the value of k and c in Eq. (i), we get

$$x^2 + y^2 - 2\left(\frac{13}{6}\right)y + 0 = 0$$

$\Rightarrow$ $6x^2 + 6y^2 - 26y = 0$

9. The intersection point of the lines $2x - 3y = 5$ and $3x - 4y = 5$ is $(1, -1)$, which is equal to the centre of the circle.

Since, area of circle $= \pi r^2$

$\therefore$ $154 = \frac{22}{7} r^2$

$\Rightarrow$ $r^2 = 7^2 \Rightarrow r = 7$

$\therefore$ Equation of circle is

$$(x - 1)^2 + (y + 1)^2 = 7^2$$

$\Rightarrow$ $x^2 - 2x + 1 + y^2 + 2y + 1 = 49$

$\Rightarrow$ $x^2 + y^2 - 2x + 2y = 47$

10. $(x^2 + y^2 - 2x - 1) + \lambda x = 0$, they pass through intersection points of line $x = 0$ and circle $x^2 + y^2 - 2x - 1 = 0$.

$\Rightarrow$ $y = \pm 1$

$\therefore$ Required points are $(0, \pm 1)$.

11. Let the equation of circle be

$$x^2 + y^2 + 2gx + 2fg + c = 0 \quad \text{...(i)}$$

Since, it is passing through the points (2, 3) and (4, 5).

$\therefore$ $2^2 + 3^2 + 2g(2) + 2f(3) + c = 0$

$\Rightarrow$ $4g + 6f + c + 13 = 0$ ...(ii)

and $4^2 + 5^2 + 2g(4) + 2f(5) + c = 0$

$\Rightarrow$ $8g + 10f + c + 41 = 0$ ...(iii)

On subtracting Eq. (ii) from Eq. (iii), we get

$$4g + 4f + 28 = 0$$

$\Rightarrow$ $g + f + 7 = 0$ ...(iv)

Also, centre $(-g, -f)$ lies on line $y - 4x + 3 = 0$

$\therefore$ $-f + 4g + 3 = 0$ ...(v)

On solving Eqs. (iv) and (v), we get

$$g = -2, f = -5$$

On putting $g = -2$, $f = -5$ in Eq. (ii), we get

$$4(-2) + 6(-5) + c + 13 = 0 \Rightarrow c = 25$$

$\therefore$ From Eq. (i),

$$x^2 + y^2 - 4x - 10y + 25 = 0$$

12. If circle $x^2 + y^2 - 10x - 14y + 24 = 0$ cuts an intercept on y-axis, then

length of intercept $= 2\sqrt{f^2 - c} = 2\sqrt{49 - 24} = 10$

13. Since, the given line touches the given circle, the length of the perpendicular from the centre (2, 4) of the circle to the line $3x - 4y - k = 0$ is equal to the radius $\sqrt{4 + 16 + 5} = 5$ of the circle.

$\therefore$ $\frac{3 \times 2 - 4 \times 4 - k}{\sqrt{9 + 16}} = \pm 5$

$\Rightarrow$ $k = 15$ $(\because k > 0)$

Now, equation of the tangent at (a, b) to the given circle is

$$xa + yb - 2(x + a) - 4(y + b) - 5 = 0$$

$\Rightarrow \quad (a-2)x + (b-4)y - (2a + 4b + 5) = 0$

If it represents the given line $3x - 4y - k = 0$

Then, $\dfrac{a-2}{3} = \dfrac{b-4}{-4} = \dfrac{2a+4b+5}{k} = l$ (say)

$\Rightarrow \quad a = 3l + 2, \quad b = 4 - 4l$

and $\quad 2a + 4b + 5 = kl$

$\Rightarrow \quad 2(3l + 2) + 4(4 - 4l) + 5 = 15l \quad (\because k = 15)$

$\Rightarrow \quad l = 1 \Rightarrow a = 5, \quad b = 0$

$\therefore \quad k + a + b = 15 + 5 + 0 = 20$

14. Given equation of line is

$$3x - 2y = k \quad \ldots(i)$$

and equation of circle is

$$x^2 + y^2 = 4r^2 \quad \ldots(ii)$$

Eq. (i) can be rewritten as $y = \dfrac{3}{2}x - \dfrac{k}{2}$

$\Rightarrow \quad m = \dfrac{3}{2}, \quad c = -\dfrac{k}{2}$

The line will meet the circle in one point, if

$$c = a\sqrt{1 + m^2}$$

$\Rightarrow \quad -\dfrac{k}{2} = (2r)\sqrt{1 + \left(\dfrac{3}{2}\right)^2}$

On squaring, we get

$\Rightarrow \quad \dfrac{k^2}{4} = 4r^2 \times \dfrac{13}{4} \Rightarrow k^2 = 52r^2$

15. Let AB is a chord and its equation is $y = mx$. ...(i)

Equation of CM which is perpendicular to AB, is

$$x + my = \lambda$$

It passes through the centre $(a, 0)$.

$\Rightarrow \quad x + my = a \quad \ldots(ii)$

On eliminating m from Eqs. (i) and (ii), we get

$$x^2 + y^2 = ax$$

$\Rightarrow x^2 + y^2 - ax = 0$ is the locus of the centre of the required circle.

16. Equation of line is $\dfrac{x}{a} + \dfrac{y}{b} = 1$ ...(i)

Let P be the foot of the perpendicular drawn from the origin to the line whose coordinates are (x_1, y_1).

Since, $\quad OP \perp AB$.

$\therefore$ Slope of $OP \times$ Slope of $AB = -1$

$\Rightarrow \quad \left(\dfrac{y_1}{x_1}\right)\left(\dfrac{b}{-a}\right) = -1$

$\Rightarrow \quad by_1 = ax_1 \quad \ldots(ii)$

Since, P lies on the line AB, then

$$\frac{x_1}{a} + \frac{y_1}{b} = 1$$

$\Rightarrow \quad bx_1 + ay_1 = ab \quad \ldots(iii)$

From Eqs. (ii) and (iii), we get

$$x_1 = \frac{ab^2}{a^2 + b^2}$$

and $\quad y_1 = \dfrac{a^2b}{a^2 + b^2}$

Now, $\quad x_1^2 + y_1^2 = \left(\dfrac{ab^2}{a^2 + b^2}\right)^2 + \left(\dfrac{a^2b}{a^2 + b^2}\right)^2$

$\Rightarrow \quad x_1^2 + y_1^2 = \dfrac{a^2b^4}{(a^2 + b^2)^2} + \dfrac{a^4b^2}{(a^2 + b^2)^2}$

$\Rightarrow \quad x_1^2 + y_1^2 = \dfrac{a^2b^2(a^2 + b^2)}{(a^2 + b^2)^2}$

$\Rightarrow \quad x_1^2 + y_1^2 = \dfrac{a^2b^2}{(a^2 + b^2)}$

$\Rightarrow \quad x_1^2 + y_1^2 = \dfrac{1}{\dfrac{1}{a^2} + \dfrac{1}{b^2}}$

But $\quad \dfrac{1}{a^2} + \dfrac{1}{b^2} = \dfrac{1}{c^2}$ (given)

$\therefore \quad x_1^2 + y_1^2 = c^2$

Thus, the locus of $P(x_1, y_1)$ is $x^2 + y^2 = c^2$ which is the equation of circle.

17. Since, $PA \cdot PB = PT^2$, where PT is length of tangent.

Here, $\quad PT = \sqrt{S_1} = \sqrt{1^2 + 4^2 - 16} = 1$

$\therefore \quad PA \cdot PB = 1$

18. Using the result $a_1a_2 = b_1b_2$, we get

$$\lambda \cdot 1 = (-1) \cdot (-2) \Rightarrow \lambda = 2$$

19. Centre of circle is (0, 0).

Equation of tangent which is parallel to $x + 2y + 3 = 0$ is

$x + 2y + \lambda = 0 \quad \ldots(i)$

As we know perpendicular distance from centre (0, 0) to $x + 2y + \lambda = 0$ should be equal to radius.

$\therefore \quad \dfrac{0 + 2 \times 0 + \lambda}{\sqrt{1^2 + 2^2}} = \pm 2$

$\Rightarrow \quad \lambda = \pm 2\sqrt{5}$

On putting the value of λ in Eq. (i), we get $x + 2y = \pm 2\sqrt{5}$ which represents the required equation of tangents.

20. Given that, any tangent to the circle $x^2 + y^2 = b^2$ is $y = mx - b\sqrt{1 + m^2}$. It touches the circle $(x - a)^2 + y^2 = b^2$, then

$$\frac{ma - b\sqrt{1 + m^2}}{\sqrt{m^2 + 1}} = b$$

$\Rightarrow \quad ma = 2b\sqrt{1 + m^2}$

$\Rightarrow \quad m^2a^2 = 4b^2 + 4b^2m^2$

$\therefore \quad m = \pm \dfrac{2b}{\sqrt{a^2 - 4b^2}}$

21. The tangent at (1, 7) to the parabola $x^2 = y - 6$ is

$$x = \frac{1}{2}(y + 7) - 6$$

$\Rightarrow \quad 2x = y + 7 - 12$

$\Rightarrow \quad y = 2x + 5$

which is also tangent to the circle

$$x^2 + y^2 + 16x + 12y + c = 0$$

$\therefore \quad x^2 + (2x + 5)^2 + 16x + 12(2x + 5) + c = 0$

$\Rightarrow \quad 5x^2 + 60x + 85 + c = 0$

must have equal roots.

Let α and β are the roots of the equation.

$\Rightarrow \quad \alpha + \beta = -12 \Rightarrow \alpha = -6 \qquad (\because \alpha = \beta)$

$\therefore \quad x = -6$

and $\quad y = 2x + 5 = -7$

$\Rightarrow$ Point of contact is (– 6, – 7).

22. Required length of tangent from the point (3, – 4) to the circle

$$x^2 + y^2 - 4x - 6y + 3 = 0$$

$$= \sqrt{3^2 + 4^2 - 4(3) - 6(-4) + 3}$$

$$= \sqrt{40}$$

$\therefore$ Square of length of tangent = 40

23. Let $P(\alpha, \beta)$ be a point on

$$x^2 + y^2 + 2gx + 2fy + c = 0$$

Then, the length of the tangent from $P(\alpha, \beta)$ to the circle $\quad x^2 + y^2 + 2gx + 2fy + c_1 = 0$ is

$$|T| = \sqrt{\alpha^2 + \beta^2 + 2g\alpha + 2f\beta + c_1} \qquad \ldots(i)$$

Since, $P(\alpha, \beta)$ lies on

$$x^2 + y^2 + 2gx + 2fy + c = 0$$

$\therefore \quad \alpha^2 + \beta^2 + 2g\alpha + 2f\beta = -c$

On substituting respective value, we have

$$|T| = \sqrt{-c + c_1}$$

$\therefore$ Length of the tangent $= \sqrt{c_1 - c}$

24. Given equation can be rewritten as

$x(x - 2y) - 3(x - 2y) = 0 \Rightarrow x = 3$ and $x = 2y$ are two normals. Their intersection point is the centre $\left(3, \dfrac{3}{2}\right)$.

25. The equation of tangent to the given circle $2x^2 + 2y^2 - 2x - 5y + 3 = 0$ at point (1, 1) is

$$2x + 2y - (x + 1) - \frac{5}{2}(y + 1) + 3 = 0$$

$\Rightarrow \quad x - \dfrac{1}{2}y - \dfrac{1}{2} = 0$

$\Rightarrow \quad 2x - y - 1 = 0$

$\Rightarrow \quad y = 2x - 1$

Slope of tangent = 2 , therefore slope of normal $= -\dfrac{1}{2}$.

Hence, equation of normal at point (1, 1) and having slope $\left(-\dfrac{1}{2}\right)$ is

$$y - 1 = -\frac{1}{2}(x - 1)$$

$\Rightarrow \quad 2y - 2 = -x + 1 \Rightarrow x + 2y = 3$

26. Since, normal passes through the centre of the circle.

$\therefore$ The required circle is the circle with ends of diameter as (3, 4) and (– 1, – 2).

$\therefore$ It's equation is

$$(x - 3)(x + 1) + (y - 4)(y + 2) = 0$$

$\Rightarrow \quad x^2 - 2x - 3 + y^2 - 2y - 8 = 0$

$\Rightarrow \quad x^2 + y^2 - 2x - 2y - 11 = 0$

27. Since, the line $ax + by = 0$ touches the circle $x^2 + y^2 + 2x + 4y = 0$, distance of the centre (– 1, – 2) from the line = radius

$\therefore \quad \left| \dfrac{-a - 2b}{\sqrt{a^2 + b^2}} \right| = \sqrt{(-1)^2 + (-2^2)}$

$\Rightarrow \quad (a + 2b)^2 = 5(a^2 + b^2)$

$\Rightarrow \quad a^2 + 4b^2 + 4ab = 5a^2 + 5b^2$

$\Rightarrow \quad (2a - b)^2 = 0 \Rightarrow b = 2a$

Also, $ax + by = 0$ is normal to the circle $x^2 + y^2 - 4x + 2y - 3 = 0$, the centre (2, – 1) should lie on $ax + by = 0$

$\therefore \quad 2a - b = 0 \Rightarrow b = 2a$

Hence, $\quad a = 1, b = 2$

28.

Equation of tangent to $x^2 + y^2 = 4$ at $(1, \sqrt{3})$ on the circle is

$$x + \sqrt{3}y = 4 \quad \ldots(i)$$

Now, any line perpendicular to Eq. (i) and passing through $(1, \sqrt{3})$ or centre (0, 0) is normal to circle at $(1, \sqrt{3})$.

$\therefore$ Equation of normal is

$$\sqrt{3}x - y + \lambda = 0$$

$$\lambda = 0$$

Since, this line passes through origin.

$$\therefore \quad \sqrt{3}(0) - (0) + \lambda = 0$$

$$\Rightarrow \quad \lambda = 0$$

$\Rightarrow$ Equation of normal is

$$\sqrt{3}x - y = 0$$

Intercept of tangent on x-axis $A(4, 0)$

Now, $\quad \text{ar}(\Delta OAP) = \frac{1}{2}(AP)(OP)$

$$\therefore \quad \text{ar}(\Delta OAP) = \frac{1}{2} \times 2\sqrt{12} = 2\sqrt{3}$$

29. Given lines $\quad 3x - 4y + 4 = 0$

and $\quad 6x - 8y - 7 = 0$ or $3x - 4y - \frac{7}{2} = 0$

are tangent to the circle.

Also, given lines are parallel.

$$\therefore \quad \text{Radius} = \frac{1}{2}(\text{Distance between two parallel lines})$$

$$= \frac{1}{2} \frac{\left|4 + \frac{7}{2}\right|}{\sqrt{3^2 + 4^2}}$$

$$= \frac{1}{2} \frac{\left|\frac{15}{2}\right|}{\sqrt{9 + 16}} = \frac{7}{4\sqrt{25}} = \frac{15}{4 \times 5} = \frac{3}{4}$$

30. Let a be the radius of the circle and centre of circle will be $(-a, -a)$.

Since, the perpendicular distance from centre to the tangent is equal to the radius of the circle.

$$\therefore \quad a = \frac{3(-a) - 4(-a) + 8}{\sqrt{3^2 + (-4)^2}}$$

$$\Rightarrow \quad a = \frac{a + 8}{5}$$

$$\Rightarrow \quad 4a = 8$$

$$\Rightarrow \quad a = 2$$

$\therefore$ Equation of circle is

$$(x + 2)^2 + (y + 2)^2 = 2^2$$

$$\Rightarrow \quad x^2 + 4x + 4 + y^2 + 4y + 4 = 4$$

$$\Rightarrow \quad x^2 + y^2 + 4x + 4y + 4 = 0$$

31. Given that, $\quad y = 2x + c \quad \ldots(i)$

and $\quad x^2 + y^2 = 16 \quad \ldots(ii)$

We know that, if $y = mx + c$ is tangent to the circle $x^2 + y^2 = a^2$, then $c = \pm a\sqrt{1 + m^2}$, here $m = 2$, $a = 4$

$$\therefore \quad c = \pm 4\sqrt{1 + 2^2} = \pm 4\sqrt{5}$$

32. We know that, if two perpendicular tangents to the circle $x^2 + y^2 = a^2$ meet at P, then the point P lies on a director circle.

Thus, the equation of director circle to the circle $x^2 + y^2 = a^2$ is $x^2 + y^2 = 2a^2$.

which is the required locus of point P.

33. Let PQ and RP be the two tangents and P be the point on the circle $x^2 + y^2 = a^2$ whose coordinates are $(a \cos t, a \sin t)$ and $\angle OPQ = \theta$

Now, PQ = Length of tangent from P on the circle

$$x^2 + y^2 = a^2 \sin^2 \alpha$$

$$\therefore \quad PQ = \sqrt{a^2 \cos^2 t + a^2 \sin^2 t - a^2 \sin^2 \alpha}$$

$$= \sqrt{a^2(\cos^2 t + \sin^2 t) - a^2 \sin^2 \alpha}$$

$$= a \cos \alpha \quad (\because \cos^2 t + \sin^2 t = 1)$$

and $\quad OQ$ = Radius of the circle $(x^2 + y^2 = a^2 \sin^2 \alpha)$

$$\Rightarrow \quad OQ = a \sin \alpha$$

$$\therefore \quad \tan \theta = \frac{OQ}{PQ}$$

$$= \frac{a \sin \alpha}{a \cos \alpha} = \tan \alpha$$

$$\Rightarrow \quad \theta = \alpha$$

$\therefore$ Angle between tangents $= \angle QPR = 2\theta = 2\alpha$

34. Given equation of circle is $x^2 + y^2 = r^2$. Let any point on the circle is $P(r \cos \theta, r \sin \theta)$ and let the coordinates of centroid of the triangle be (α, β).

Then, $\quad \alpha = \frac{r + r \cos \theta}{3}$

$\Rightarrow \quad \frac{r}{3}\cos\theta = \alpha - \frac{r}{3}$

and $\quad \beta = \frac{r + r\sin\theta}{3}$

$\Rightarrow \quad \frac{r}{3}\sin\theta = \beta - \frac{r}{3}$

Now, $\quad \left(\alpha - \frac{r}{3}\right)^2 + \left(\beta - \frac{r}{3}\right)^2 = \frac{r^2}{9}$

$\therefore$ The locus is $\left(x - \frac{r}{3}\right)^2 + \left(y - \frac{r}{3}\right)^2 = \left(\frac{r}{3}\right)^2$ which is a circle.

35. Let $P(x_1, y_1)$ be any point outside the circle. Length of tangent to the circle $x^2 + y^2 + 4x + 3 = 0$ is

$$\sqrt{x_1^2 + y_1^2 + 4x_1 + 3}$$

and length of tangent of the circle $x^2 + y^2 - 6x + 5 = 0$ is

$$\sqrt{x_1^2 + y_1^2 - 6x_1 + 5}$$

$\therefore$ According to question,

$$\frac{\sqrt{x_1^2 + y_1^2 + 4x_1 + 3}}{\sqrt{x_1^2 + y_1^2 - 6x_1 + 5}} = \frac{2}{3}$$

$\Rightarrow \quad 9x_1^2 + 9y_1^2 + 36x_1 + 27 - 4x_1^2 - 4y_1^2 + 24x_1 - 20 = 0$

$\Rightarrow \quad 5x_1^2 + 5y_1^2 + 60x_1 + 7 = 0$

$\therefore$ Locus of point is $5x^2 + 5y^2 + 60x + 7 = 0$.

36. In $\Delta\, ADB$, $\quad AD = \frac{1}{\sqrt{2}}\operatorname{cosec} 45° = 1$

37. The combined equation of the lines joining the origin to the points of intersection of $x\cos\alpha + y\sin\alpha = p$ and $x^2 + y^2 - a^2 = 0$ is a homogeneous equation of second degree given by

$$x^2 + y^2 - a^2\left(\frac{x\cos\alpha + y\sin\alpha}{p}\right)^2 = 0$$

$\Rightarrow \quad [x^2(p^2 - a^2\cos^2\alpha) + y^2(p^2 - a^2\sin^2\alpha)$
$\qquad - 2xya^2\sin\alpha\cos\alpha = 0]$

The lines given by this equation are at right angle, if

$$(p^2 - a^2\cos^2\alpha) + (p^2 - a^2\sin^2\alpha) = 0$$

$\Rightarrow \quad 2p^2 = a^2(\sin^2\alpha + \cos^2\alpha)$

$\Rightarrow \quad a^2 = 2p^2$

38. Let the equation of circles are

$$S_1 \equiv x^2 + y^2 + 2x - 3y + 6 = 0 \quad \ldots(i)$$

$$S_2 \equiv x^2 + y^2 + x - 8y - 13 = 0 \quad \ldots(ii)$$

$\therefore$ Equation of common chord is

$$S_1 - S_2 = 0$$

$\Rightarrow \quad (x^2 + y^2 + 2x - 3y + 6) - (x^2 + y^2 + x - 8y - 13) = 0$

$\Rightarrow \quad x + 5y + 19 = 0 \quad \ldots(iii)$

In the given option only the point (1, – 4) satisfied the Eq. (iii).

39. Let $P(x_1, y_1)$ be the point, then the chord of contact of tangents drawn from P to the circle $x^2 + y^2 = a^2$ is $xx_1 + yy_1 = a^2$.

$\therefore \quad x^2 + y^2 = a^2\left(\frac{xx_1 + yy_1}{a^2}\right)$

$\Rightarrow \quad x^2 + y^2 - xx_1 - yy_1 = 0$

40. Suppose AB is a chord of the circle through $A(p, q)$ having $M(h, 0)$ as its mid-point. The coordinates of B are $(-p + 2h, -q)$.

As, B lies on the circle

$x^2 + y^2 = px + qy$, we have

$$(-p + 2h)^2 + (-q)^2$$

$$= p(-p + 2h) + q(-q)$$

$\Rightarrow \quad 2p^2 + 2q^2 - 6ph + 4h^2 = 0$

$\Rightarrow \quad 2h^2 - 3ph + p^2 + q^2 = 0 \quad \ldots(i)$

As, there are two distinct chords from $A(p, q)$ which are bisected on x-axis, there must be two distinct values of h satisfying Eq. (i).

$$D = 9p^2 - (4)(2)(p^2 + q^2) > 0 \Rightarrow p^2 > 8q^2$$

41. Let the point on $x^2 + y^2 = a^2$ is $(a\cos\theta, a\sin\theta)$

Equation of chord of contact is

$$ax\cos\theta + ay\sin\theta = b^2$$

It touches circle $x^2 + y^2 = c^2$

$\therefore \quad \left|\frac{-b^2}{\sqrt{a^2\cos^2\theta + a^2\sin^2\theta}}\right| = c$

$\Rightarrow \quad b^2 = ac$

$\therefore a$, b and c are in GP.

42. The equation of the common chord of the circles $(x - a)^2 + y^2 = a^2$ and $x^2 + (y + b)^2 = b^2$ is

$$\mathrm{I} \equiv S_1 - S_2 = 0$$

$\Rightarrow \quad x^2 + a^2 - 2ax + y^2 - a^2 - x^2 - y^2 - b^2 - 2by + b^2 = 0$

$\Rightarrow \quad ax + by = 0 \quad \ldots(i)$

Now, the equation of required circle is

$$S_1 + \lambda L = 0$$

$\therefore \quad \{(x - a)^2 + y^2 - a^2\} + \lambda\{ax + by\} = 0$

$\Rightarrow \quad x^2 + y^2 + x(a\lambda - 2a) + \lambda by = 0 \quad \ldots(ii)$

Since, Eq. (i) is a diameter of Eq. (ii), then

$$a\left(-\frac{a\lambda - 2a}{2}\right) + b\left(-\frac{\lambda b}{2}\right) = 0$$

$\Rightarrow \quad \lambda = \frac{2a^2}{a^2 + b^2}$

On putting the value of λ in Eq. (ii), we get

$$(a^2 + b^2)(x^2 + y^2) = 2\,ab(bx - ay)$$

which is the required equation of circle.

43. The equation of the required circle passing through $x^2 + y^2 = a^2$

and $$x \cos\alpha + y \sin\alpha - p = 0$$

$$x^2 + y^2 - a^2 + \lambda(x \cos\alpha + y \sin\alpha - p) = 0 \quad \ldots(i)$$

The centre of this circle is $\left(-\frac{\lambda}{2}\cos\alpha, -\frac{\lambda}{2}\sin\alpha\right)$. Since, the centre lies on $x \cos\alpha + y \sin\alpha = p$

$\therefore$ $$\lambda = -2p$$

On putting the value of λ in Eq. (i), equation of the required circle is

$$x^2 + y^2 - a^2 - 2px\cos\alpha - 2py\sin\alpha + 2p^2 = 0$$

44. Centres and radii of the given circles are

Centres : $C_1(0, 1), C_2(1, 0)$

Radii : $r_1 = 3, r_2 = 5$

Clearly, $C_1C_2 = \sqrt{2} < r_2 - r_1$. Therefore, one circle lies entirely inside the other.

45. Given that, circle $S_1 \equiv x^2 + y^2 + 4x + 22y + c = 0$ bisects the circumference of the circle

$$S_2 \equiv x^2 + y^2 - 2x + 8y - d = 0.$$

The common chord of the given circles is

$$S_1 - S_2 = 0$$

$\Rightarrow$ $x^2 + y^2 + 4x + 22y + c - x^2 - y^2 + 2x - 8y + d = 0$

$\Rightarrow$ $$6x + 14y + c + d = 0 \quad \ldots(i)$$

So, Eq. (i) passes through the centre of the second circle, *i.e.*, (1, – 4).

$\therefore$ $$6 - 56 + c + d = 0$$

$\Rightarrow$ $$c + d = 50$$

46. The required equation of circle is

$$(x^2 + y^2 + 13x - 3y) + \lambda\left(11x + \frac{1}{2}y + \frac{25}{2}\right) = 0 \quad \ldots(i)$$

It passes through (1, 1).

$\therefore$ $$12 + \lambda(24) = 0$$

$\Rightarrow$ $$\lambda = -\frac{1}{2}$$

On putting in Eq. (i), we get

$$x^2 + y^2 + 13x - 3y - \frac{11}{2}x - \frac{1}{4}y - \frac{25}{4} = 0$$

$\Rightarrow$ $4x^2 + 4y^2 + 52x - 12y - 22x - y - 25 = 0$

$\Rightarrow$ $$4x^2 + 4y^2 + 30x - 13y - 25 = 0$$

47. Let the equation of circles be

$$S_1 \equiv x^2 + y^2 + 13x - 3y = 0 \quad \ldots(i)$$

and $$S_2 \equiv 2x^2 + 2y^2 + 4x - 7y - 25 = 0 \quad \ldots(ii)$$

The equation of intersecting circle is $\lambda S_1 + S_2 = 0$.

$\Rightarrow$ $\lambda(x^2 + y^2 + 13x - 3y) + \left(x^2 + y^2 + 2x - \frac{7y}{2} - \frac{25}{2}\right) = 0$

$\Rightarrow$ $\left[x^2(1 + \lambda) + y^2(1 + \lambda) + x(2 + 13\lambda) - y\left(\frac{7}{2} + 3\lambda\right) - \frac{25}{2}\right]$

$= 0 \quad \ldots(iii)$

$\therefore$ $$\text{Centre} = \left[-\frac{(2 + 13\lambda)}{2(1 + \lambda)}, \frac{(7/2) + 3\lambda}{2(1 + \lambda)}\right]$$

$\because$ Centre lies on $13x + 30y = 0$.

$\Rightarrow$ $$-13\left(\frac{2 + 13\lambda}{2}\right) + 30\left[\frac{(7/2) + 3\lambda}{2}\right] = 0$$

$\Rightarrow$ $$-26 - 169\lambda + 105 + 90\lambda = 0 \Rightarrow \lambda = 1$$

Hence, putting the value of x in Eq. (iii), then required equation of circle is

$$4x^2 + 4y^2 + 30x - 13y - 25 = 0$$

48. Equation of family of concentric circles to the circle $x^2 + y^2 + 6x + 8y - 5 = 0$ is $x^2 + y^2 + 6x + 8y + \lambda = 0$.

which is similar to $x^2 + y^2 + 2gx + 2fy + c = 0$. Since, it is equation of concentric circle to the circle $x^2 + y^2 + 6x + 8y - 5 = 0$. Thus, the point (–3, 2) lies on the circle $x^2 + y^2 + 6x + 8y + c = 0$.

$\Rightarrow$ $$(-3)^2 + (2)^2 + 6(-3) + 8(2) + c = 0$$

$\Rightarrow$ $$9 + 4 - 18 + 16 + c = 0$$

$\Rightarrow$ $$c = -11$$

49. Centre of given circle $x^2 + y^2 - 6x + 12y + 15 = 0$ is (3, –6).

$\therefore$ $$\text{Radius} = \sqrt{(3)^2 + (-6)^2 - 15} = \sqrt{30}$$

$$\text{Area of circle} = \pi r^2 = \pi(\sqrt{30})^2 = 30\pi$$

Area of require circle = 2 (Area of given circle)

$\therefore$ $$\pi R^2 = 2 \times 30\pi = 60\pi$$

$\Rightarrow$ $$R^2 = 60 \Rightarrow R = 2\sqrt{15}$$

$\therefore$ Equation of required circle is

$$(x - 3)^2 + (y + 6)^2 = (2\sqrt{15})^2$$

$\Rightarrow$ $$x^2 + 9 - 6x + y^2 + 36 + 12y = 60$$

$\Rightarrow$ $$x^2 + y^2 - 6x + 12y - 15 = 0$$

50. Using the result $(C_1C_2)^2 = r_1^2 + r_2^2$, we get

$$(2 - 5)^2 + (3 - 6)^2 = r^2 + r^2$$

$\Rightarrow$ $$2r^2 = 18 \Rightarrow r^2 = 9$$

$\Rightarrow$ $$r = 3$$

51. Let $P(x_1, y_1)$ be the point outside the circle. From the given condition

$$\frac{x_1^2 + y_1^2 + 2x_1 - 4y_1 - 20}{x_1^2 + y_1^2 - 4x_1 + 2y_1 - 44} = \frac{2}{3}$$

$\Rightarrow$ $$3x_1^2 + 3y_1^2 + 6x_1 - 12y_1 - 60$$

$$= 2x_1^2 + 2y_1^2 - 8x_1 + 4y_1 - 88$$

$$\Rightarrow \quad x_1^2 + y_1^2 + 14x_1 - 16y_1 + 28 = 0$$

Thus, the locus of point is

$$x^2 + y^2 + 14x - 16y + 28 = 0$$

$\therefore$ Coordinates of centre of circle are (–7, 8).

52. Let the equation of the concentric circles be $x^2 + y^2 - 2x - 4y + \lambda = 0$, it passes through (3, 4).

$$\therefore \quad 3^2 + 4^2 - 2(3) - 4(4) + \lambda = 0$$

$$\Rightarrow \quad \lambda = -3$$

Thus, the equation of concentric circle is

$$x^2 + y^2 - 2x - 4y - 3 = 0.$$

53. Given two circles are

$$C_1 : x^2 + y^2 = 1 \quad \text{and} \quad C_2 : (x - t)^2 + y^2 = 1$$

$\Rightarrow$ Centre of $C_1(0, 0)$, centre of $C_2(t, 0)$.

Radius, $r_1 = 1$, radius, $r_2 = 1$

$\therefore$ Length, $\sqrt{(t)^2 - (1+1)^2} = \sqrt{21}$

$$\Rightarrow \quad t^2 - 4 = 21$$

$$\Rightarrow \quad t^2 = 25 \Rightarrow t = \pm 5$$

54. For required circle, $P(1, 8)$ and $O(3, 2)$ will be the end points of its diameter.

$$\therefore \quad (x-1)(x-3) + (y-8)(y-2) = 0$$

$$\Rightarrow \quad x^2 + y^2 - 4x - 10y + 19 = 0$$

55. The centres of the two circles will lie on the line through $P(1, 2)$ perpendicular to the common tangent $4x + 3y = 10$. If C_1 and C_2 are the centres of these circles, then $PC_1 = 5 = r_1$, $PC_2 = -5 = r_2$. Also, C_1, C_2 lie on the line $\frac{x-1}{\cos\theta} = \frac{y-2}{\sin\theta} = r$, where $\tan\theta = \frac{3}{4}$. When $r = r_1$ the coordinates of C_1 are $(5\cos\theta + 1, 5\sin\theta + 2)$ or (5, 5) as $\cos\theta = \frac{4}{5}$, $\sin\theta = \frac{3}{5}$.

When $r = r_2$, the coordinates of C_2 are (–3, –1).

The circle with centre $C_1(5, 5)$ and radius 5 touches both the coordinate axes and hence lies completely in the first quadrant.

Therefore, the required circle is with centre (–3, –1) and radius 5, so its equation is

$$(x+3)^2 + (y+1)^2 = 5^2$$

$$\Rightarrow \quad x^2 + y^2 + 6x + 2y - 15 = 0$$

Since, the origin lies inside the circle, a portion of the circle lies in all the quadrants.

56. Equation of any circle through (0, 0) and (1, 0) is

$$(x-0)(x-1) + (y-0)(y-0) + \lambda \begin{vmatrix} x & y & 1 \\ 0 & 0 & 1 \\ 1 & 0 & 1 \end{vmatrix} = 0$$

$$\Rightarrow \quad x^2 + y^2 - x + \lambda y = 0$$

If it represents C_3, its radius = 1

$$\Rightarrow \quad 1 = \left(\frac{1}{4}\right) + \left(\frac{\lambda^2}{4}\right) \Rightarrow \lambda = \pm\sqrt{3}$$

As, the centre of C_3, lies above the x-axis, we take $\lambda = -\sqrt{3}$ and thus an equation of C_3 is $x^2 + y^2 - x - \sqrt{3}y = 0$.

Since, C_1 and C_3 intersect and are of unit radius, their common tangents are parallel to the line joining their centres (0, 0) and $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$.

So, let the equation of a common tangent be

$$\sqrt{3}x - y + k = 0$$

It will touch C_1, if $\left|\frac{k}{\sqrt{3+1}}\right| = 1 \Rightarrow k = \pm 2$

From the figure, we observe that the required tangent makes positive intercept on the y-axis and negative on the x-axis and hence its equation is $\sqrt{3}x - y + 2 = 0$.

which is the equation of required locus.

57. Centre of required circle = (3, – 4)

Radius of required circle = 5 + 1 = 6

$\therefore$ Locus of circle is

$$(x-3)^2 + (y+4)^2 = 36$$

$$\Rightarrow \quad x^2 - 6x + 9 + y^2 + 16 + 8y = 36$$

$$\Rightarrow \quad x^2 + y^2 - 6x + 8y - 11 = 0$$

58. Let the general equation of circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \text{...(i)}$$

It cuts the circle $x^2 + y^2 - 20x + 4 = 0$ orthogonally, then by the condition, $2(g_1g_2 + f_1f_2) = c_1 + c_2$

$$2(-10g + 0 \times f) = c + 4 \Rightarrow -20g = c + 4 \quad \text{...(ii)}$$

$\because$ Circle (i) touches the line $x = 2$ or $x + 0y - 2 = 0$

$\therefore$ Perpendicular distance from centre to the tangent = radius.

$$\Rightarrow \quad \left|\frac{-g + 0 - 2}{\sqrt{1^2 + 0^2}}\right| = \sqrt{g^2 + f^2 - c}$$

$$\Rightarrow \quad (g+2)^2 = g^2 + f^2 - c$$

$$\Rightarrow \quad g^2 + 4 + 4g = g^2 + f^2 - c$$

$$\Rightarrow \quad 4g + 4 = f^2 - c \quad \text{...(iii)}$$

On eliminating c from Eqs. (ii) and (iii), we get

$$-16g + 4 = f^2 + 4 \Rightarrow f^2 + 16g = 0$$

Hence, the locus of $(-g, -f)$ is $y^2 - 16x = 0$.

(replacing $-f$ and $-g$ by x and y)

59. Let general equation of a circle is

$$x^2 + y^2 + 2gx + 2fy + c = 0 \quad \text{...(i)}$$

If the circle (i) cuts orthogonally each of the given three circles.

Then, condition is

$$2g_1g_2 + 2f_1f_2 = c_1 + c_2$$

Applying the condition one by one, we get

$$2g + 17f = c + 4 \quad \text{...(ii)}$$

$$7g + 6f = c + 11 \quad \text{...(iii)}$$

and $$-g + 22f = c + 3 \quad \text{...(iv)}$$

On solving Eqs. (ii), (iii) and (iv), we get

$$g = -3, \quad f = -2$$

Therefore, the centre of the circle is (3, 2).

60. Let the family of circles passing through origin be

$$x^2 + y^2 + 2gx + 2fy = 0$$

They intersect circle $x^2 + y^2 + 4x - 6y - 13 = 0$ orthogonally.

So, $2g(2) - 2f(3) = -13$

Hence, locus of $(-g, -f)$ is

$$-4x + 6y + 13 = 0$$

$$\Rightarrow \quad 4x - 6y - 13 = 0$$

61. Let the equation of circle be

$$x^2 + y^2 + 2hx + 2ky + c = 0 \quad \text{...(i)}$$

The locus of whose centre is to be obtained, since the circle cuts

$$x^2 + y^2 + 4x - 6y + 9 = 0 \quad \text{...(ii)}$$

and $$x^2 + y^2 - 4x + 6y + 4 = 0 \quad \text{...(iii)}$$

Orthogonally, then

$$2h(2) + 2k(-3) = c + 9$$

$$\Rightarrow \quad 4h - 6k = c + 9 \quad \text{...(iv)}$$

and $$2h(-2) + 2k(3) = c + 4$$

$$\Rightarrow \quad -4h + 6k = c + 4 \quad \text{...(v)}$$

On solving Eqs. (iv) and (v), we get

$$c + 9 = -c - 4$$

$$\Rightarrow \quad 2c = -13 \quad \text{...(vi)}$$

On putting the value of c in Eq. (iv), we get

$$\Rightarrow \quad 8h - 12k = 5 \quad \text{...(vii)}$$

Centre of the given circle is $(-h, -k)$.

$\therefore$ Locus of $(-h, -k)$ from Eq. (vii) is

$$8(-x) - 12(-y) = 5$$

$$\Rightarrow \quad 8x - 12y + 5 = 0$$

62. Given equations of circles are $x^2 + y^2 + 2x + 2ky + 6 = 0$ and $x^2 + y^2 + 2ky + k = 0$. They intersect each other orthogonally.

$$\therefore \quad 2 \cdot 1 \cdot 0 + 2 \cdot k \cdot k = 6 + k$$

$$\Rightarrow \quad 2k^2 - k - 6 = 0$$

$$\Rightarrow \quad (2k + 3)(k - 2) = 0 \Rightarrow k = 2, -\frac{3}{2}$$

63. Since, the given circles cut each other orthogonally.

$$\therefore \quad g_1g_2 + a^2 = 0 \quad \text{...(i)}$$

If $lx + my = 1$ is a common tangent of these circles, then

$$\frac{-lg_1 - 1}{\sqrt{l^2 + m^2}} = \pm\sqrt{g_1^2 + a^2}$$

$$\Rightarrow \quad (lg_1 + 1)^2 = (l^2 + m^2)(g_1^2 + a^2)$$

$$\Rightarrow \quad m^2g_1^2 - 2lg_1 + a^2(l^2 + m^2) - 1 = 0$$

Similarly, $$m^2g_2^2 - 2lg_2 + a^2(l^2 + m^2) - 1 = 0$$

So that g_1 and g_2 are the roots of the equation

$$m^2g^2 - 2lg + a^2(l^2 + m^2) - 1 = 0$$

$$\Rightarrow \quad g_1g_2 = \frac{a^2(l^2 + m^2) - 1}{m^2} = -a^2 \quad \text{[from Eq. (i)]}$$

$$\Rightarrow \quad a^2(l^2 + m^2) = 1 - a^2m^2 \quad \text{...(ii)}$$

Now, $$p_1p_2 = \frac{|ma - 1|}{\sqrt{l^2 + m^2}} \cdot \frac{|-ma - 1|}{\sqrt{l^2 + m^2}}$$

$$= \frac{|1 - m^2a^2|}{l^2 + m^2} = a^2 \quad \text{[from Eq. (ii)]}$$

64. Let $P(h, k)$ be the coordinates of the centre of circle S_2. Then, its equation is

$$(x - h)^2 + (y - k)^2 = 5^2$$

The equation of S_1 is $x^2 + y^2 = 4^2$ and so the equation of the common chord of S_1 and S_2 is

$$S_1 - S_2 = 0$$

$$\Rightarrow \quad 2hx + 2ky = h^2 + k^2 - 9 \quad \text{...(i)}$$

Let p be the length of the perpendicular from the centre (0, 0) of S_1 to common chord

$$\therefore \quad p = \left|\frac{h^2 + k^2 - 9}{\sqrt{4h^2 + 4k^2}}\right|$$

Now, the length of the comon chord $= 2\sqrt{4^2 - p^2}$

It will be of maximum length if $p = 0$

$$\Rightarrow \quad h^2 + k^2 - 9 = 0 \quad \text{...(ii)}$$

The slope of Eq. (i) is $\frac{3}{4}$ (given)

$$\therefore \quad -\frac{h}{k} = \frac{3}{4} \Rightarrow k = -\frac{4h}{3} \quad \text{...(iii)}$$

On substituting the respective value of k in Eq. (ii), we have

$$h = \pm\frac{9}{5} \text{ and } k = \pm\frac{12}{5} \quad \text{[using Eq. (iii)]}$$

$\therefore$ The centres of circle C_2 are

$$C\left(\frac{9}{5}, -\frac{12}{5}\right) \text{ or } C\left(-\frac{9}{5}, \frac{12}{5}\right)$$

65. Now, the coordinates of the centre and radius of the given circle are (1, 1) and 2 respectively.

Let AB be the chord subtending an angle of $\left(\frac{2\pi}{3}\right)$ at the centre.

Also, $M(h, k)$ be the mid-point of AB.

$\therefore$ In ΔOAM,

$$AM = OA \cdot \sin\frac{\pi}{3} = 2\left(\frac{\sqrt{3}}{2}\right) = \sqrt{3}$$

$\therefore$ $OM^2 = OA^2 - AM^2 = 4 - (\sqrt{3})^2 = 1$

But $OM^2 = (h-1)^2 + (k-1)^2$

$\Rightarrow$ $(h-1)^2 + (k-1)^2 = 1$

$\therefore$ The locus of (h, k) is $(x-1)^2 + (y-1)^2 = 1$

$\Rightarrow$ $x^2 + y^2 - 2x - 2y + 1 = 0$

66. Let $P(h, k)$ be a point on the circle

$$15x^2 + 15y^2 - 48x + 64y = 0$$

Then, the lengths PT_1 and PT_2 of the tangents from $P(h, k)$ to

$$5x^2 + 5y^2 - 24x + 32y + 75 = 0$$

and $5x^2 + 5y^2 - 48x + 64y + 300 = 0$

respectively are

$$PT_1 = \sqrt{h^2 + k^2 - \frac{24}{5}h + \frac{32}{5}k + 15}$$

and $$PT_2 = \sqrt{h^2 + k^2 - \frac{48}{5}h + \frac{64}{5}k + 60}$$

Since, (h, k) lies on

$$15x^2 + 15y^2 - 48x + 64y = 0$$

$\therefore$ $h^2 + k^2 = \frac{48}{15}h - \frac{64}{15}k$

$\Rightarrow$ $PT_1 = \sqrt{\frac{48}{15}h - \frac{64}{15}k - \frac{24}{5}h + \frac{32}{5}k + 15}$

$\therefore$ $PT_1 = \sqrt{\frac{32}{15}k - \frac{24}{15}h + 15}$

Similarly,

$$PT_2 = \sqrt{\frac{48}{15}h - \frac{64}{15}k - \frac{48}{5}h + \frac{64}{5}k + 60}$$

$\Rightarrow$ $PT_2 = \sqrt{-\frac{96}{15}h + \frac{128}{15}k + 60}$

$\therefore$ $PT_2 = 2\sqrt{-\frac{24}{15}h + \frac{32}{15}k + 15} = 2(PT_1)$

Hence, $PT_1 : PT_2 = 1 : 2$

67. The radical axis of the two given circles

$$S_1 : x^2 + y^2 + 2gx + 2fy + c = 0$$

and $$S_2 : x^2 + y^2 + \frac{3}{2}x + 4y + c = 0$$

is $$2x\left(g - \frac{3}{4}\right) + 2y(f-2) = 0$$

$\Rightarrow$ $$x\left(g - \frac{3}{4}\right) + y(f-2) = 0$$

It touches the circle $x^2 + y^2 + 2x + 2y + 1 = 0$

$\therefore$ $r = d$ (condition to touch)

$\Rightarrow$ $$\left|\frac{-\left(g - \frac{3}{4}\right) - (f-2)}{\sqrt{\left(g - \frac{3}{4}\right)^2 + (f-2)^2}}\right| = 1$$

$\Rightarrow$ $$\left(g - \frac{3}{4}\right)^2 + (f-2)^2 + 2\left(g - \frac{3}{4}\right)(f-2) = \left(g - \frac{3}{4}\right)^2 + (f-2)^2$$

$\Rightarrow$ $\left(g - \frac{3}{4}\right)(f-2) = 0$

$\therefore$ $g = \frac{3}{4}$ and $f = 2$

68. Since, $S_1 : x^2 + y^2 - 6x - 8y = 0$

$$S_2 : x^2 + y^2 - 12x - 16y + 12 = 0$$

Now, according to given condition, we have

$$|PT_1| = |PT_2|$$

$\Rightarrow$ $\sqrt{a^2 + b^2 - 6a - 8b} = \sqrt{a^2 + b^2 - 12a - 16b + 12}$

$\Rightarrow$ $a^2 + b^2 - 6a - 8b = a^2 + b^2 - 12a - 16b + 12$

$\therefore$ $6a + 8b = 12$

$\Rightarrow$ $3a + 4b - 6 = 0$

69. Given equation of circle can be rewritten as

$$x^2 + y^2 - 2x + 4y + \frac{k}{4} = 0$$

$\therefore$ Radius of circle $= \sqrt{1 + 4 - \frac{k}{4}} = \sqrt{5 - \frac{k}{4}}$

Area of circle $= 9\pi$ (given)

$\Rightarrow$ $\pi\left(5 - \frac{k}{4}\right) = 9\pi$

$\Rightarrow$ $5 - 9 = \frac{k}{4} \Rightarrow k = -16$

70. Let equation of circle having centre (1, 2) is

$$(x-1)^2 + (y-2)^2 = r^2$$

Since, it passes through (4, 6).

$\therefore$ $(4-1)^2 + (6-2)^2 = r^2$

$\Rightarrow$ $r^2 = 9 + 16 = 25$

$\Rightarrow$ $r = 5$

$\therefore$ Area of circle $= \pi r^2$

$= \pi(5)^2 = 25\pi$

71. Let the equation of circle be

$$x^2 + y^2 + 2gx + 2fy + c = 0$$

Since, it is passes through (0, 0), $(a, 0)$ and $(0, b)$.

$\therefore \quad 0^2 + 0^2 + 2g(0) + 2f(0) + c = 0 \Rightarrow c = 0$

and $\quad a^2 + 0^2 + 2g(a) + 2f(0) + c = 0$

$\Rightarrow \quad a^2 + 2g(a) + 0 = 0$

$\Rightarrow \quad g = -\dfrac{a}{2}$

and $\quad 0^2 + b^2 + 2g(0) + 2f(b) + 0 = 0$

$\Rightarrow \quad b^2 + 2f(b) = 0$

$\Rightarrow \quad f = -\dfrac{b}{2}$

$\therefore$ Equation of centre is $= (-g, -f) = \left(\dfrac{a}{2}, \dfrac{b}{2}\right)$.

72. Diameter of circle is diagonal of square.

Radius of the circle = 5

or diameter of the circle = 10

$\therefore \quad$ Area of square $= \dfrac{(10)^2}{2} = 50$ sq units

73. Since, B and C are the ends of diameter as $\angle BAC$ is $90°$.

$\therefore$ Equation of circle is

$$x(x-1) + y(y-1) = 0$$

$\Rightarrow \quad x^2 + y^2 - x - y = 0$

Now, point D satisfies this equation.

$\Rightarrow \quad 4a^2 + 9a^2 - 5a = 0$

$\Rightarrow \quad a(13a - 5) = 0$

$\Rightarrow \quad a = 0, \quad a = \dfrac{5}{13}$

74. Let equation of circle be

$$x^2 + y^2 = r^2$$

Since, in an equilateral triangle, the centroid coincides with the centre of the circle.

$\therefore$ Radius of circle, $\quad r = \dfrac{2}{3}(3a) = 2a$

On putting $r = 2a$ in Eq. (i), we get

$$x^2 + y^2 = (2a)^2$$

$\Rightarrow \quad x^2 + y^2 = 4a^2$

75. Let the equation of circle is

$$x^2 + y^2 + 2gx + 2fy + c = 0$$

Since, $\left(m, \dfrac{1}{m}\right)$ lies on this circle.

$\therefore \quad m^2 + \dfrac{1}{m^2} + 2gm + \dfrac{2f}{m} + c = 0$

$\Rightarrow \quad m^4 + 2gm^3 + cm^2 + 2fm + 1 = 0$

$\Rightarrow \quad m_1 m_2 m_3 m_4 = 1$

76. Let any point $P(x_1, y_1)$ outside the circle. Then, equation of tangent to the circle $x^2 + y^2 + 6x + 6y = 2$ at the point P is

$$xx_1 + yy_1 + 3(x + x_1) + 3(y + y_1) - 2 = 0 \quad \ldots(i)$$

The Eq. (i) and the line $5x - 2y + 6 = 0$ intersect at a point Q on y-axis *i.e.*, $x = 0$.

$\Rightarrow \quad 5(0) - 2y + 6 = 0 \Rightarrow y = 3$

$\therefore$ Coordinates of Q are (0, 3).

Point Q satisfies Eq. (i).

$\therefore \quad 3x_1 + 6y_1 + 7 = 0 \quad \ldots(ii)$

Distance between P and Q is given by

$$PQ^2 = x_1^2 + (y_1 - 3)^2$$

$$= x_1^2 + y_1^2 - 6y_1 + 9 = 11 - 6x_1 - 12y_1$$

$$(\because x_1^2 + y_1^2 + 6x_1 + 6y_1 - 2 = 0)$$

$$= 11 - 2(3x_1 + 6y_1)$$

$$= 11 - 2(-7) = 25 \quad \text{[from Eq. (ii)]}$$

$\therefore \quad PQ = 5$

77. Let x_1 and x_2 are the roots of the equation

$$x^2 + 2ax - b^2 = 0.$$

$\therefore \quad x_1 + x_2 = -2a$ and $x_1 x_2 = -b^2$

Also, y_1 and y_2 are roots of the equation

$$y^2 + 2py - q^2 = 0.$$

$\therefore \quad y_1 + y_2 = -2p$ and $y_1 y_2 = -q^2$

The equation of the circle with $P(x_1, y_1)$ and $Q(x_2, y_2)$ as the end points of diameter is

$$(x - x_1)(x - x_2) + (y - y_1)(y - y_2) = 0$$

$\Rightarrow \quad x^2 + y^2 - x(x_1 + x_2) - y(y_1 + y_2) + x_1 x_2 + y_1 y_2 = 0$

$\Rightarrow \quad x^2 + y^2 + 2ax + 2py - b^2 - q^2 = 0$

78. Let RS and PQ are the tangents at the extremities of diameter of circle.

In ΔRQP, $\tan\theta = \dfrac{PQ}{PR} = \dfrac{PQ}{2r} \quad \ldots(i)$

Also, in ΔSRP

$$\tan\left(\frac{\pi}{2} - \theta\right) = \frac{RS}{RP} = \frac{RS}{2r}$$

$\Rightarrow \quad \cot\theta = \dfrac{RS}{2r} \quad \ldots(ii)$

From Eqs. (i) and (ii), we get

$$\tan\theta \cdot \cot\theta = \frac{PQ \cdot RS}{4r^2}$$

$\Rightarrow \quad 4r^2 = PQ \cdot RS \Rightarrow 2r = \sqrt{(PQ)(RS)}$

79. Given points lie on a circle $x^2 + y^2 = a^2$ and in case of an equilateral triangle centroid is same as circumcentre. Circumcentre of given triangle is at origin or centroid is at origin.

$$\frac{a\cos\theta_1 + a\cos\theta_2 + a\cos\theta_3}{3} = 0$$

and $$\frac{a\sin\theta_1 + a\sin\theta_2 + a\sin\theta_3}{3} = 0$$

$$\Sigma\cos\theta_1 = 0, \quad \Sigma\sin\theta_1 = 0$$

80. The point should lies on the opposite side of the origin of the line $x + y - 1 = 0$

Then, $\alpha + \alpha - 1 > 0$

$\Rightarrow$ $2\alpha > 1 \Rightarrow \alpha > \frac{1}{2}$ ...(i)

Also, $(\alpha^2 + \alpha^2) < 1$

$\Rightarrow$ $\left(-\frac{1}{\sqrt{2}}\right) < \alpha < \left(\frac{1}{\sqrt{2}}\right)$ ...(ii)

From Eqs. (i) and (ii), we get

$$\frac{1}{2} < \alpha < \frac{1}{\sqrt{2}}$$

81. Let the equation of circle be

$x^2 + y^2 + 2gx + 2fgy = 0$ (passing through origin)

$$\text{Radius} = \sqrt{g^2 + f^2}$$

Now, equation of tangent at $O(0, 0)$ is

$$x(0) + y(0) + g(x) + f(y) = 0$$

$\Rightarrow$ $gx + fy = 0$

Distance from

$$A(2g, 0) = \frac{2g^2}{\sqrt{g^2 + f^2}} = m$$

and distance from B

$$(0, 2f) = \frac{2f^2}{\sqrt{g^2 + f^2}} = n$$

$\Rightarrow$ $\frac{2r^2}{r} = m + n \Rightarrow 2r = m + n$

82. Let the equation of L_1 be $y = mx$. Since, the intercepts made by the circle on L_1 and L_2 are equal, their distances from the centre of the circle are also equal.

The centre of the given circle is $\left(\frac{1}{2}, -\frac{3}{2}\right)$.

$\therefore$ $$\left|\frac{\frac{1}{2} - \frac{3}{2} - 1}{\sqrt{1+1}}\right| = \left|\frac{m \times \frac{1}{2} + \frac{3}{2}}{\sqrt{m^2 + 1}}\right|$$

$\Rightarrow$ $$\frac{2}{\sqrt{2}} = \frac{|m + 3|}{2\sqrt{m^2 + 1}}$$

$\Rightarrow$ $8(m^2 + 1) = (m + 3)^2$

$\Rightarrow$ $7m^2 - 6m - 1 = 0$

$\Rightarrow$ $(m - 1)(7m + 1) = 0$

$\Rightarrow$ $m = 1$ or $m = -\frac{1}{7}$

So, the equations representing L_1 are

$$y = x \text{ or } y = \left(-\frac{1}{7}\right)x$$

$\Rightarrow$ $x - y = 0$ or $x + 7y = 0$

83. Let OA and OB be the tangents from the origin to the given circle with centre $C(-3, 5)$ and radius

$$\sqrt{9 + 25 - c} = \sqrt{34 - c}.$$

Then, area of the quadrilateral,

$$OACB = 2 \times \text{Area of the } \Delta OAC = 2 \times \left(\frac{1}{2}\right) \times OA \times AC$$

Now, OA = Length of the tangent from the origin to the given circle $= \sqrt{c}$

and AC = Radius of the circle $= \sqrt{34 - c}$

So, that $\sqrt{c}\sqrt{34 - c} = 8$ (given)

$\Rightarrow$ $c(34 - c) = 64$

$\Rightarrow$ $c^2 - 34c + 64 = 0$

84. **Statement I** The centre and radius of circle

$$x^2 + y^2 - x - y - 1 = 0$$

are $\left(\frac{1}{2}, \frac{1}{2}\right)$ and $\sqrt{\frac{3}{2}}$ respectively and the centre and radius of circle

$$x^2 + y^2 - 2x + 2y - 7 = 0$$

are (1, –1) and 3 respectively.

Distance between the centres is $\sqrt{\frac{5}{2}} < 3 - \sqrt{\frac{3}{2}}$

$(\because C_1C_2 < r_1 - r_2)$

$\therefore$ First circle is completely inside the second circle.

Statement II The centre and radius of circle

$$x^2 + y^2 + 14x + 12y + 21 = 0$$

are (–7, 6) and 8 respectively and the centre and radius of circle

$$x^2 + y^2 + 2x - 4y - 4 = 0$$

are (–1, 2) and 1 respectively.

Distance between the centres is $2\sqrt{13} > 8 + 1$

$(\because C_1C_2 > r_1 + r_2)$

These two circles intersect each other, therefore the number of common tangents is 2.

Hence, only first statements is correct.

Round II

1. Since, $y = |x| + c$ and $x^2 + y^2 - 8|x| - 9 = 0$ both are symmetrical about y-axis for $x > 0, y = x + c$. Equation of tangent to circle $x^2 + y^2 - 8x - 9 = 0$ which is parallel to

$$y = x + c \text{ is } y = (x - 4) + 5\sqrt{1+1}$$

$$\Rightarrow \quad y = x + (5\sqrt{2} - 4)$$

For no solution $c > 5\sqrt{2} - 4$,

$$\therefore \quad c \in (5\sqrt{2} - 4, \infty)$$

2. The triangle is isosceles and therefore the median through C is the bisector of $\angle C$. The equation of the angle bisector can be taken as $y = -x$ and $l = (-a, a)$, where a is positive.

Equation of AC is $y - 0 = -7(x + 6)$ or $7x + y + 42 = 0$ and equation of AB is $x - y + 6 = 0$.

The length of the perpendicular from l to AB and AC are equal.

$$\therefore \quad \left|\frac{-7a + a + 42}{\sqrt{50}}\right| = \left|\frac{-a - a + 6}{\sqrt{2}}\right|$$

Giving the positive value $a = \frac{9}{2}$

$\therefore$ Centre is $\left(-\frac{9}{2}, \frac{9}{2}\right)$ and radius $= \frac{3}{\sqrt{2}}$

The equation of the circle is

$$\left(x + \frac{9}{2}\right)^2 + \left(y - \frac{9}{2}\right)^2 = \frac{9}{2}$$

$$\Rightarrow \quad x^2 + y^2 + 9x - 9y + 36 = 0$$

3. Let $C(h, k)$ be the centre of the circle passing through the end points of the rod AB and PQ of lengths a and b respectively. CL and CM be perpendiculars drawn from C on AB and PQ respectively. Then, $CA = CP$ (radii of the same circle)

$$\Rightarrow \quad k + \frac{a^2}{4} = h^2 + \frac{b^2}{4} \qquad \left(\because AL = \frac{a}{2} \text{ and } MP = \frac{b}{2}\right)$$

$$\Rightarrow \quad 4(h^2 - k^2) = a^2 - b^2$$

Hence, locus of (h, k) is

$$4(x^2 - y^2) = a^2 - b^2.$$

4. Equation of pair of tangents is

$$(a^2 - 1)y^2 - x^2 + 2ax - a^2 = 0$$

If θ be the angle between the tangents, then

$$\tan\theta = \frac{2\sqrt{(h^2 - ab)}}{a + b}$$

$$= \frac{2\sqrt{-(a^2 - 1)(-1)}}{a^2 - 2} = \frac{2\sqrt{a^2 - 1}}{a^2 - 2}$$

$\because$ θ lies in II quadrant, then $\tan\theta < 0$

$$\therefore \quad \frac{2\sqrt{a^2 - 1}}{a^2 - 2} < 0$$

$$\Rightarrow \quad a^2 - 1 > 0 \quad \text{and} \quad a^2 - 2 < 0$$

$$\Rightarrow \quad 1 < a^2 < 2$$

$$\Rightarrow \quad a \in (-\sqrt{2}, -1) \cup (1, \sqrt{2})$$

5. Since, $AP = PQ = QB$. The coordinates of P are $(a, 0)$ and of Q are $(2a, 0)$ the centre of the circles on AP, PQ and QB as diameters are respectively

$C_1\left(\frac{a}{2}, 0\right)$, $C_2\left(\frac{3a}{2}, 0\right)$ and $C_3\left(\frac{5a}{2}, 0\right)$ and the radius of each one of them is $\left(\frac{a}{2}\right)$.

Hence, the equations of the circles with centre C_1, C_2 and C_3 are respectively

$$\left(x - \frac{a}{2}\right)^2 + y^2 = \frac{a^2}{4}; \quad \left(x - \frac{3a}{2}\right)^2 + y^2 = \frac{a^2}{4}$$

and $$\left(x - \frac{5a}{2}\right)^2 + y^2 = \frac{a^2}{4}.$$

So that, if $S(h, k)$ be any point on the locus, then

$$\left(h - \frac{a}{2}\right)^2 + \left(h - \frac{3a}{2}\right)^2 + \left(h - \frac{5a}{2}\right)^2 + 3\left(k^2 - \frac{a^2}{4}\right) = b^2$$

$$\Rightarrow \quad 3(h^2 + k^2) - 9ah + 8a^2 = b^2$$

Hence, the locus of $S(h, k)$ is

$$3(x^2 + y^2) - 9ax + 8a^2 - b^2 = 0$$

6. Since, $\angle ADB = \angle ADC = 90°$, circles on AB and AC as diameters pass through D and therefore the altitude AD is the common chord. Similarly, the other two common chords are the other two altitudes and hence they concur at the orthocentre.

7. Since, the hypotenuse of a right angled triangle inscribed in a circle is a diameter of the circle. If the coordinates of the end C of the hypotenuse BC are (a, b), the coordinates of B

are $(-a, -b)$. Equation of BC is $\frac{y}{x} = \frac{b}{a}$. If A is the vertex of the isosceles triangle, then OA is perpendicular to BC and the equation of AO is $\frac{y}{x} = -\frac{a}{b}$ which meets the circle $x^2 + y^2 = r^2$ at points for which

$$\left(\frac{a^2}{b^2} + 1\right) x^2 = r^2 = a^2 + b^2$$

$$[\because (a, b) \text{ lies on } x^2 + y^2 = r^2]$$

$\Rightarrow \quad x^2 = b^2 \Rightarrow x = \pm b$

$\Rightarrow \quad y = \mp a$

$\therefore$ Coordinates of A are $(-b, a)$ or $(b, -a)$.

8. Let the equation of the chord OA of the circle

$$x^2 + y^2 - 2x + 4y = 0 \quad \text{...(i)}$$

by $\quad y = mx \quad$ ...(ii)

On solving Eqs. (i) and (ii), we get

$\Rightarrow \quad x^2 + m^2x^2 - 2x + 4mx = 0$

$\Rightarrow \quad (1 + m^2)x^2 - (2 - 4m)x = 0$

$\Rightarrow \quad x = 0$ and $x = \frac{2 - 4m}{1 + m^2}$

Hence, the points of intersection are

$$(0, 0) \text{ and } A\left(\frac{2 - 4m}{1 + m^2}, \frac{m(2 - 4m)}{1 + m^2}\right).$$

$$\Rightarrow \quad OA^2 = \left(\frac{2 - 4m^2}{1 + m^2}\right)^2 (1 + m^2)$$

$$= \frac{(2 - 4m)^2}{1 + m^2}$$

Since, OAB is an isosceles right-angled triangle

$$OA^2 = \frac{1}{2} AB^2,$$

where AB is a diameter of the given circle $OA^2 = 10$

$$\Rightarrow \quad \frac{(2 - 4m)^2}{1 + m^2} = 10$$

$\Rightarrow \quad 4 - 16m + 16m^2 = 10(1 + m)^2$

$\Rightarrow \quad 3m^2 - 8m - 3 = 0$

$\Rightarrow \quad m = 3$ or $-\frac{1}{3}$

Hence, the required equation are $y = 3x$ or $x + 3y = 0$.

9. $y = mx$ be the chord.

Then, point of intersection are given by

$$x^2(1 + m^2) - x(3 + 4m) - 4 = 0.$$

Therefore, $x_1 + x_2 = \frac{3 + 4m}{1 + m^2}$ and $x_1x_2 = \frac{-4}{1 + m^2}$

Since, (0, 0) divides the chord in the ratio 1 : 4.

Therefore, $\quad x_2 = -4x_1$

$\therefore \quad -3x_1 = \frac{3 + 4m}{1 + m^2}$ and $4x_1^2 = -\frac{-4}{1 + m^2}$

$\therefore \quad 9 + 9m^2 = 9 + 16m^2 + 24m$

i.e., $\quad m = 0, -\frac{24}{7}$

Therefore, the lines are $y = 0$ and $y + 24x = 0$.

10.

ΔABC and ΔDBA are similar

$\Rightarrow \quad lx = y\sqrt{l^2 + x^2}$

$\Rightarrow \quad l^2x^2 = y^2(l^2 + x^2)$

$\Rightarrow \quad l^2(x^2 - y^2) = x^2y^2$

$\Rightarrow \quad l = \frac{xy}{\sqrt{x^2 - y^2}} = \frac{AB \times AD}{\sqrt{AB^2 - AD^2}}$

11.

Circles with centres (2, 0) and (–2, 0) each with radius 4.

$\Rightarrow y$-axis is their common chord.

ΔABC is equilateral.

Hence, area of $ADBC$ is $\frac{2\sqrt{3}}{4}(4)^2 = 8\sqrt{3}$.

12. $r = 1; L = \sqrt{3}$

Area of quadrilateral $= \sqrt{3}$

Sector $= \frac{1}{2} \cdot 1 \cdot \frac{2\pi}{3} = \frac{\pi}{3}$

Shaded region $= \sqrt{3} - \frac{\pi}{3}$

13. From the figure, we have

$$y_1 = 2x_1 + 5 \text{ and } \frac{y_1 + 6}{x_1 + 8} \times 2 = -1$$

$$\Rightarrow \quad x_1 = -6 \text{ and } y_1 = -7$$

14.

From ΔMLN,

$$\sin\alpha = \frac{a-b}{a+b}$$

$$\therefore \quad \alpha = \sin^{-1}\left(\frac{a-b}{a+b}\right)$$

$\therefore$ Angle between AB and AD

$$= 2\alpha = \sin^{-1}\left(\frac{a-b}{a+b}\right).$$

15.

Let equation of line be $y = x - c$ or $y - x = c$ ...(i)

Perpendicular from (0, 0) on line (i) is $\left|\frac{-c}{\sqrt{2}}\right| = \frac{c}{\sqrt{2}}$

In ΔAON, $\sqrt{2^2 - \left(\frac{c}{\sqrt{2}}\right)^2} = AN$

and in ΔCPM, $\sqrt{3^2 - \left(\frac{2-c}{\sqrt{2}}\right)^2} = CM$

Given, $AN = CM$

$$\Rightarrow \quad 4 - \frac{c^2}{2} = 9 - \frac{(2-c)^2}{2}$$

$$\Rightarrow \quad c = -\frac{1}{2}$$

Therefore, equation of the line is $y = x - \frac{3}{2}$ or

$$2x - 2y - 3 = 0.$$

16. $\because C_2$ is the director circle of C_1.

$\therefore$ Equation of C_2 is $x^2 + y^2 = 2(2)^2 = 8$

Again, C_3 is the director circle of C_2. Hence, the equation of C_3 is

$$x^2 + y^2 = 2(8) = 16$$

17. The given equation is

$$(x-r)^2 + (y-h)^2 = r^2$$

Tangents are $x = 0$

and $\quad y = x\tan\left(\frac{\pi}{2} - 2\alpha\right)$

$$= x\cot 2\alpha$$

$$= \frac{x(1-\tan^2\alpha)}{2\tan\alpha}$$

$$\Rightarrow \quad y = \frac{x\left(1 - \frac{r^2}{h^2}\right)}{2\left(\frac{r}{h}\right)} \qquad \left(\because \text{in } \Delta ODC, \tan\alpha = \frac{r}{h}\right)$$

$$\Rightarrow \quad (h^2 - r^2)x - 2rhy = 0$$

18. Let $O \equiv (0, 0)$ be the centre of the circle.

$\because$ Arc length $AB = \frac{\pi}{2} = \frac{1}{4}$ (circumference of the circle)

$$\therefore \quad \angle AOB = \frac{\pi}{2}$$

$$\text{Slope of } OB = -\frac{1}{\text{Slope of } OA}$$

$$\Rightarrow \quad \text{Slope of } OB = -\frac{1}{1} = -1 \qquad \text{...(i)}$$

Let $B \equiv (a, \pm\sqrt{1-a^2})$

$$\therefore \quad \pm\frac{\sqrt{1-a^2}}{a} = -1 \qquad \text{[from Eq. (i)]}$$

$\therefore$ B can be $\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right), \left(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right), \left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$ and $\left(-\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$ but possible points are $\left(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$ and $\left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$.

19. $\because \quad L \equiv 2x + y = 6$

Let $\quad P \equiv (\lambda, 6 - 2\lambda)$

$$\because \quad \angle PQO = \angle PRO = \frac{\pi}{2}$$

$\therefore$ OP is diameter of circumcircle PQR, then centre is $\left(\frac{\lambda}{2}, 3 - \lambda\right)$.

$$\therefore \quad x = \frac{\lambda}{2} \Rightarrow \lambda = 2x \text{ and } y = 3 - \lambda,$$

then $\quad 2x + y = 3$

which is the required locus.

20. $\because P \equiv (2, 3)$

$\therefore$ Equation of QR is $2x + 3y = 4$

Let $S \equiv (\lambda, \beta)$

$$\Rightarrow \quad \frac{\alpha - 2}{2} = \frac{\beta - 3}{3} = \frac{-2(4 + 9 - 4)}{(4 + 9)}$$

$$= -\frac{18}{13}$$

$$\therefore \quad \alpha = \frac{10}{-13}, \quad \beta = \frac{-15}{13}$$

Now, equation of circumcircle of ΔQRS is

$$(x^2 + y^2 - 4) + \lambda(2x + 3y - 4) = 0$$

$\because$ It passes through $S = \left(\frac{-10}{13}, \frac{-15}{13}\right)$, then

$$\left(\frac{100}{169} + \frac{225}{169} - 4\right) + \lambda\left(-\frac{20}{13} - \frac{45}{13} - 4\right) = 0$$

$$\Rightarrow \quad \left(-\frac{351}{169}\right) + \lambda(-9) = 0$$

$$\therefore \quad \lambda = -\frac{39}{169} = -\frac{3}{13}$$

$\therefore$ Circumcentre is $\left(-\lambda, -\frac{3\lambda}{2}\right) \equiv \left(\frac{3}{13}, \frac{9}{26}\right)$.

21. Equation of common chord of these circles is

$$(x^2 + y^2 - 6x - 4y + 9) - (x^2 + y^2 - 8x - 6y + 23) = 0$$

$$\Rightarrow \quad 2x + 2y - 14 = 0$$

$$\Rightarrow r \quad x + y - 7 = 0$$

Since, centre of the second circle *i.e.*, (4, 3) lie on it. Hence, $x + y - 7 = 0$ is a diameter of second circle and hence first circle bisects the circumference of the second circle.

22. Let the given circles C_1 and C_2 have centres O_1 and O_2 with radii r_1 and r_2 respectively. Let centre of circle C is at O radius is r.

$\because \quad OO_2 = r + r_2$

$OO_1 = r_1 - r$

$\Rightarrow \quad OO_1 + OO_2 = r_1 + r_2$

which is greater than O_1O_2 as $O_1O_2 < r_1 + r_2$.

$\therefore$ Locus of O is an ellipse with foci O_1 and O_2.

23. Equation of tangent of the given circle is

$$y = mx \pm \sqrt{(1 + m^2)}$$

If it passes through (–3, –1), then we have

$$-1 = -3m \pm \sqrt{(1 + m^2)}$$

$$\Rightarrow \quad 1 + m^2 = (3m - 1)^2 \Rightarrow 8m^2 - 6m = 0$$

$$\therefore \quad m = 0, \quad m = \frac{3}{4}$$

Thus, reflected ray is $y + 1 = \frac{3}{4}(x + 3) \Rightarrow 4y - 3x = 5$

24. Let $C_1 \equiv (-g, -f)$, $r_1 = \sqrt{(g^2 + f^2)}$

and $C_2 \equiv (-g', -f')$, $r_2 = \sqrt{(g'^2 + f'^2)}$

$\therefore \quad |C_1C_2| = r_1 \pm r_2$

$$\Rightarrow \sqrt{(g - g')^2 + (f - f')^2} = \sqrt{(g^2 + f^2)} \pm \sqrt{(g'^2 + f'^2)}$$

$$\Rightarrow \quad (g - g')^2 + (f - f')^2 = g^2 + f^2 + g'^2 + f'^2 \pm 2\sqrt{(g^2 + f^2)(g'^2 + f'^2)}$$

$$(-gg' - ff')^2 = (g^2 + f^2)(g'^2 + f'^2)$$

$$\Rightarrow \quad g^2f'^2 + g'^2f^2 - 2gg'ff' = 0 \quad (gf' - g'f)^2 = 0$$

$$\Rightarrow \quad gf' = g'f$$

and line joining centres may not be parallel to common tangents.

25. Statement II is true.

Now, $\begin{vmatrix} -2 & 1 & 1 \\ -1 & 0 & 1 \\ -4 & 3 & 1 \end{vmatrix} = -2(0 - 3) - 1(-1 + 4) + 1(-3 - 0)$

$$= 6 - 3 - 3 = 0$$

$\therefore$ Given points are collinear.

$\Rightarrow$ No circle will pass through the given points.

26. The two circles having centres at C_1 and C_2 and radii r_1 and r_2 respectively intersect at two distinct points, if

$$|r_1 - r_2| < C_1C_2 < r_1 + r_2$$

$\Rightarrow$ Statement II is not true.

Here, $C_1 = (0, 0), C_2 = (4, 0)$ and $r_1 = 2, \quad r_2 = 3$

$\therefore \quad C_1C_2 = 4, \quad |r_1 - r_2| = 1, \quad r_1 + r_2 = 5$

that satisfies above condition.

27. Distance between two parallel lines L_1 and L_2 is

$$d = \left|\frac{p - 3 - p - 3}{\sqrt{4 + 9}}\right| = \frac{6}{\sqrt{13}}$$

And radius of given circle $= q$ clearly, $d < 2$

$\Rightarrow$ Statement II is false and statement I is true.

28. Let the equation of circle be

$$(x - 3)^2 + (y - 0)^2 + \lambda y = 0$$

As it passes through (1, –2)

$$\therefore \quad (1 - 3)^2 + (-2)^2 + \lambda(-2) = 0$$

$$\Rightarrow \quad 4 + 4 - 2\lambda = 0$$

$$\Rightarrow \quad \lambda = 4$$

$\therefore$ Equation of circle is

$$(x - 3)^2 + y^2 + 4y = 0$$

By hit and trial method, we see that point (5, –2) satisfies equation of circle.

29. Let us assume that the coordinates of the centre of the circle are $C(h, k)$ and its radius is r.

Since, the circle touches x-axis at (1, 0), hence its radius should be equal to ordinate of centre.

$$\Rightarrow \quad r = k$$

Hence, the equation of the circle is

$$(x-h)^2+(y-k)^2=k^2$$

Also, given that the circle passes through the points (1, 0) and (2, 3). Hence, substituting them in the equation of the circle, we get

$$(1-h)^2+(0-k)^2=k^2 \quad \ldots(i)$$

$$(2-h)^2+(3-k)^2=k^2 \quad \ldots(ii)$$

From Eq. (i), we get

$$h=1$$

On substituting in Eq. (ii), we get

$$(2-1)^2+(3-k)^2=k^2$$

$$\Rightarrow \quad k=\frac{5}{3}$$

$\therefore$ The diameter of the circle is $2k=\frac{10}{3}$.

30. $x^2+y^2-ax=0$ and $x^2+y^2=c^2$ touch each other.

(i) If circles touch internally,

$$\left|c-\frac{a}{2}\right|=\frac{a}{2}$$

$$\Rightarrow \quad c-\frac{a}{2}=\frac{a}{2}$$

$$\Rightarrow \quad c=a, c>0$$

$$\therefore \quad |a|=c$$

(ii) If circles touches externally,

$$\left|c+\frac{a}{2}\right|=\frac{a}{2}$$

$$\Rightarrow \quad c+\frac{a}{2}=\frac{a}{2}$$

$\therefore$ $c=0$, *i.e.*, not possible as $c>0$

$\therefore$ The circles should touch internally and $|a|=c$.

31. Circle whose diametric end points are (1, 0) and (0, 1) will be of smallest radius.

$\Rightarrow (x-1)(x-0)+(y-0)(y-1)=0 \Rightarrow x^2+y^2-x-y=0$

32. Since, the coordinates of the centre of the circle are (2, 4).

Also, $\quad r^2=4+16+5=25$

The line will intersect the circle at two distinct points, if the distance of (2, 4) from $3x-4y=m$ is less than radius of the circle.

$$\therefore \quad \frac{|6-16-m|}{5}<5 \Rightarrow -25<10+m<25$$

$$\therefore \quad -35<m<15$$

33. Let $\quad S\equiv x^2+y^2+3x+7y+2p-5=0$

and $\quad S'\equiv x^2+y^2+2x+2y-p^2=0$

Equation of the required circle is $S+\lambda S'=0$

As, it passes through (1, 1), the value of

$$\lambda=-(7+2p)/(6-p^2)$$

Here, λ is not defined at $p=\pm\sqrt{6}$

Hence, it is true for all except two values of p.

34. Given equation can be rewritten as

$$(x+1)^2+(y+2)^2=(2\sqrt{2})^2$$

Let required point be $Q(\alpha,\beta)$.

Then, mid-point of $P(1,0)$ and $Q(\alpha,\beta)$ is the centre of the circle.

i.e., $\quad \frac{\alpha+1}{2}=-1$

and $\quad \frac{\beta+0}{2}=-2$

$\Rightarrow \quad \alpha=-3$ and $\beta=-4$

$\therefore$ Required point is $(-3,-4)$.

35. Circle with centre (h,k) and touching x-axis is

$$x^2+y^2-2hx-2ky+h^2=0$$

Since, $(-1,1)$ lies on it.

$$\Rightarrow \quad 2+2h-2k+h^2=0 \Rightarrow k=\frac{(h+1)^2+1}{2}\geq\frac{1}{2}$$

36. Let the centroid of the triangle be (h,k). Then, $h=\frac{0+5\cos\theta+5}{3}$ and $k=\frac{5+5\sin\theta+0}{3}$

$$\Rightarrow \quad 3h=5(1+\cos\theta) \text{ and } 3k=5(1+\sin\theta)$$

$$\Rightarrow \quad \frac{(3h-5)}{5}=\cos\theta \text{ and } \frac{(3k-5)}{5}=\sin\theta$$

$$\Rightarrow \quad \frac{9h^2+25-30h}{25}+\frac{9k^2+25-30k}{25}=1$$

$$\Rightarrow \quad 9h^2+9k^2+50-30h-30k-25=0$$

$$\Rightarrow \quad 9(x^2+y^2)-30x-30y+25=0$$

Hence, it represents a circle.

37. The locus is the circle with centre $(0, 0)$ and radius $3\cos\frac{\pi}{3} = \frac{3}{2}$

Its equation is $x^2 + y^2 = \frac{9}{4}$.

38. The given equations of diameters are

$$3x - 4y - 7 = 0 \quad \ldots(i)$$

and $$2x - 3y - 5 = 0 \quad \ldots(ii)$$

On solving Eqs. (i) and (ii), we get

$$x = 1 \text{ and } y = -1$$

$\therefore$ Centre of circle is $(1, -1)$.

Let r be the radius of circle, then

$$\pi r^2 = 49\pi$$

$\Rightarrow$ $r = 7$ unit

$\therefore$ Equation of required circle is

$$(x-1)^2 + (y+1)^2 = 49$$

$\Rightarrow$ $x^2 + y^2 - 2x + 2y + 1 + 1 = 49$

$\Rightarrow$ $x^2 + y^2 - 2x + 2y - 47 = 0$

39. Equation of pair of lines is $ax^2 + 2(a+b)xy + by^2 = 0$

Since, $4\theta = \pi \Rightarrow \theta = \frac{\pi}{4}$ ...(i)

Angle between lines is given by

$$\tan\theta = 2\frac{\sqrt{H^2 - AB}}{|A+B|}$$

$\Rightarrow$ $1 = \frac{2\sqrt{(a+b)^2 - ab}}{|a+b|}$ [from Eq. (i)]

$\Rightarrow$ $a^2 + b^2 + 2ab = 4(a^2 + b^2 + ab)$

$\Rightarrow$ $3a^2 + 3b^2 + 2ab = 0$

40. Since, circle touches the x-axis and also touches circle with the centre at (0, 3) and radius 2, then

$$C_1C_2 = r_1 + r_2$$

$\Rightarrow$ $h^2 + (k-3)^2 = (|k| + 2)^2$

$\Rightarrow$ $h^2 + k^2 + 9 - 6k = k^2 + 4 + 4|k|$

$\therefore$ Locus of centre of circle is

$$x^2 = -5 + 6y + 4|y|$$

$\Rightarrow$ $x^2 = 10y - 5$ $(\because y > 0)$

This equation represents a parabola. Thus, locus of the centre of the circle is a parabola.

41. The common chord of the circles is $S - S' = 0$

$\Rightarrow$ $5ax + (c-d)y + a + 1 = 0$

But it is same as $5x + by - a = 0$

$\therefore$ $\frac{5a}{5} = \frac{c-d}{b} = \frac{a+1}{-a}$

$\Rightarrow a^2 + a + 1 = 0$ has no real value of a.

42. Let the circle be $x^2 + y^2 + 2gx + 2fy + c = 0$. The orthogonality gives $c - 4 = 0, c = 4$.

The circle passes through (a, b).

$\Rightarrow$ $a^2 + b^2 + 2ga + 2fb + 4 = 0$.

Replacing g by $-x$ and f by $-y$, we get the locus of the centre $2ax + 2by - (a^2 + b^2 + 4) = 0$

43. Let the centre of circle on y-axis be $(0, k)$.

Let $d = \sqrt{(7-0)^2 + (3-k)^2}$

$\Rightarrow$ $d^2 = 7^2 + (3-k)^2 = D$ (say)

On differentiating w.r.t. k, we get

$$\frac{dD}{dk} = 0 + 2(3-k)(-1)$$

Put $\frac{dD}{dk} = 0 \Rightarrow k = 3$

Now, $\frac{d^2D}{dk^2} = 2 < 0$ minima,

$\therefore$ Minimum value at $k = 3$ is $d = 7$

Hence, the radius of smallest circle is 7.

44. The lines $2x + 3y + 1 = 0$ and $3x - y - 4 = 0$ are diameters of circle.

On solving these equations, we get

$$x = 1 \text{ and } y = -1$$

Therefore, the centre of circle is $(1, -1)$ and circumference of circle $= 10\pi$

$\Rightarrow$ $2\pi r = 10\pi \Rightarrow r = 5$

$\therefore$ Equation of circle is

$$(x - x_1)^2 + (y - y_1)^2 = r^2$$

$\Rightarrow$ $(x-1)^2 + (y+1)^2 = 5^2$

$\Rightarrow$ $x^2 + 1 - 2x + y^2 + 2y + 1 = 25$

$\Rightarrow$ $x^2 + y^2 - 2x + 2y - 23 = 0$

45. The equation of line is $y = x$ ...(i)

and equation of circle is

$$x^2 + y^2 - 2x = 0 \quad \ldots(ii)$$

On solving Eqs. (i) and (ii), we get

$$x^2 + x^2 - 2x = 0$$

$$\Rightarrow \quad 2x^2 - 2x = 0$$

$$\Rightarrow \quad 2x(x-1) = 0$$

$$\Rightarrow \quad x = 0, \ x = 1$$

When, $x = 0, y = 0$ and when $x = 1, y = 1$

Let coordinates of A are (0, 0) and coordinates of B are (1, 1).

$\therefore$ Equation of circle (AB as a diameter) is

$$(x - x_1)(x - x_2) + (y - y_1)(y - y_2) = 0$$

$$\Rightarrow \quad (x-0)(x-1) + (y-0)(y-1) = 0$$

$$\Rightarrow \quad x(x-1) + y(y-1) = 0$$

$$\Rightarrow \quad x^2 - x + y^2 - y = 0$$

$$\Rightarrow \quad x^2 + y^2 - x - y = 0$$

46. Given circles are $x^2 + y^2 = 6x$ ...(i)

and $x^2 + y^2 + 6x + 2y + 1 = 0$ ...(ii)

From Eq. (i), $x^2 - 6x + y^2 = 0$

$$\Rightarrow \quad (x-3)^2 + y^2 = 3^2$$

$\therefore$ Centre (3, 0), $r = 3$

From Eq. (ii), $x^2 + 6x + y^2 + 2y + 1 + 3^2 = 3^2$

$$\Rightarrow \quad (x+3)^2 + (y+1)^2 = 3^2$$

$\therefore$ Centre (–3, 1), radius = 3.

Now, distance between centres

$$= \sqrt{(3+3)^2 + 1} = \sqrt{37} > r_1 + r_2 = 6$$

$\therefore$ Circles do not cut each other.

$\Rightarrow$ 4 tangents (two direct and two transversal) are possible.

47. In a circle AB is as a diameter where the coordinates of A are (p, q) and let the coordinates of B are (x_1, y_1).

Equation of circle in diameter form is

$$(x - p)(x - x_1) + (y - q)(y - y_1) = 0$$

$$\Rightarrow \quad x^2 - (p + x_1)x + px_1 + y^2 - (y_1 + q)y + qy_1 = 0$$

$$\Rightarrow \quad x^2 - (p + x_1)x + y^2 - (y_1 + q)y + px_1 + qy_1 = 0$$

Since, the circle touches x-axis. $\therefore \ y = 0$

$$\Rightarrow \quad x^2 - (p + x_1)x + px_1 + qy_1 = 0$$

Also, the discriminant of above equation will be equal to zero because circle touches x-axis.

$$\therefore \quad (p + x_1)^2 = 4(px_1 + qy_1)$$

$$\Rightarrow \quad p^2 + x_1^2 + 2px_1 = 4px_1 + 4qy_1$$

$$\Rightarrow \quad x_1^2 - 2px_1 + p^2 = 4qy_1$$

$$\Rightarrow \quad (x_1 - p)^2 = 4qy_1$$

Therefore, the locus of point B is

$$(x - p)^2 = 4qy$$

14.1 Conic Section

The locus of a point P which moves in a plane such that its distance from a fixed point is always in a constant ratio to its perpendicular distance from a fixed straight line, is known as conic section.

The fixed point is called the **focus** of the conic and this fixed line is called the directrix of the conic. Also, this constant ratio is called the eccentricity of the conic and is denoted by e. Thus,

$$\frac{PS}{PM} = \text{Constant} = e \Rightarrow PS = ePM$$

Eccentricity	Shape
$e = 0$	Circle
$0 < e < 1$	Ellipse
$e = 1$	Parabola
$e > 1$	Hyperbola
$e = \infty$	Pair of straight lines

A parabola is a two dimensional, minor symmetrical curve, which is approximately U-shaped.

A parabola is as a conic section, created from the intersection of a right circular conical surface and a plane, which is parallel to a straight line on the conical surface and perpendicular to another plane which includes both the axis of the cone and also the same straight line on its surface.

14.2 Equation of Conic Section

If the focus is (α, β) and the directrix is $ax + by + c = 0$, then the equation of the conic section whose eccentricity is e, is

$$\sqrt{(x-\alpha)^2+(y-\beta)^2} = e\frac{|ax+by+c|}{\sqrt{a^2+b^2}}$$

$$\Rightarrow \qquad (x-\alpha)^2+(y-\beta)^2 = e^2\frac{(ax+by+c)^2}{a^2+b^2}$$

Some Important Definitions

(i) Centre

The point which bisects every chord of the conic passing through it, is called the centre of the conic section.

(ii) Axis

The straight line passing through the focus and perpendicular to the directrix, is called axis of the conic section.

(iii) Vertex

The points of intersection of the conic section and the axis, is called the vertex of conic section.

(iv) Latusrectum

The chord passing through the focus and perpendicular to the axis is called latusrectum of conic section.

(v) Focal Chord

A chord of a conic passing through the focus is called a focal chord.

(vi) Double Ordinate

A straight line drawn perpendicular to the axis and terminated at both ends of the curve is a double ordinate of the conic section.

14.3 Recognisation of Conics

The equation of conics represented by general equation of second degree

$$ax^2+2hxy+by^2+2gx+2fy+c=0 \qquad \text{...(i)}$$

can be recognised easily by the condition given below.

***Case* I** When $\Delta = abc+2fgh-af^2-bg^2-ch^2=0$

In this case Eq. (i) represents the degenerate conic.

Condition	Nature of Conic
$\Delta = 0$ and $ab-h^2=0$	A pair of straight lines or empty set
$\Delta = 0$ and $ab-h^2 \neq 0$	A pair of intersecting straight lines
$\Delta = 0$ and $ab-h^2 < 0$	Real or imaginary pair of straight lines
$\Delta = 0$ and $ab-h^2 > 0$	Point

***Case* II** $\Delta = abc+2fgh-af^2-bg^2-ch^2 \neq 0$

In this case Eq. (i) represents the non-degenerate conic.

Condition	Nature of Conic
$\Delta \neq 0, h=0, a=b$	A circle
$\Delta \neq 0, ab-h^2=0$	A parabola
$\Delta \neq 0, ab-h^2>0$	An ellipse or empty set
$\Delta \neq 0, ab-h^2<0$	A hyperbola
$\Delta \neq 0, ab-h^2<0$ and $a+b=0$	A rectangular hyperbola

(a) **Circle :** plane perpendicular to cone axis

(b) **Ellipse :** plane not perpendicular to axis not parallel to side of cone

(c) **Parabola :** plane parallel to side of cone

(d) **Hyperbola :** plane parallel to cone axis

14.4 Centre of Conics

Centre of the conic is the point which bisect every chord of the conic passing through it. If the equation of conic is $ax^2+2hxy+by^2+2gx+2fy+c=0$, then the coordinates of centre of conic are $\left(\frac{hf-bg}{ab-h^2}, \frac{gh-af}{ab-h^2}\right)$.

***Sample* Problem 1** *The centre of conic*

$$14x^2-4xy+11y^2-44x-58y+71=0 \text{ is}$$

(a) (2, 3) (b) (3, 2)
(c) (−2 , −3) (d) *None of these*

Interpret (a) The equation of conic is

$$14x^2-4xy+11y^2-44x-58y+71=0$$

On comparing with

$$ax^2+2hxy+by^2+2gx+2fy+c=0,$$

we get

$a=14, \quad b=11, \quad c=71, \quad h=-2, \quad g=-22, \quad f=-29$

$\therefore$ Centre of conic is

$$\left[\frac{(-2)(-29)-(11)(-22)}{(14)(11)-(-2)^2}, \frac{(-22)(-2)-(14)(-29)}{(14)(11)-(-2)^2}\right]$$

i.e., (2, 3).

14.5 Parabola

A parabola is the locus of a point which moves in a plane such that its distance from a fixed point (*i.e.*, focus) is always equal to its distance from a fixed straight line (*i.e.*, directrix).

Mathematically, $\frac{|PS|}{|PM|} = e = 1$

where, e is called eccentricity.

Note If the vertex of the parabola is (h, k), then generalised form of the parabola is $(y-k)^2 = 4a(x-h)^2$. Its focus is at $(a+h, k)$ equation of directrix is $x + a - h = 0$ and parametric equations are $x = h + at^2$, $y = k + 2at$.

***Sample* Problem 2** *Find the equation of parabola having focus at (−1, − 2) and directrix $x - 2y + 3 = 0$.* **[NCERT]**

(*a*) $4x^2 + y^2 + 4xy + 2x + 32y - 16 = 0$

(*b*) $4x^2 + y^2 + 4xy + 4x + 32y + 16 = 0$

(*c*) $x^2 + 4y^2 + 4xy + 4x + 32y + 16 = 0$

(*d*) $4x^2 + y^2 + 4xy - 4x + 32y + 16 = 0$

Interpret (*b*) By definition of parabola, if P is any point on the parabola, S be the focus and M is a point on directrix. Use $SP = PM$.

Given, $S = (-1, -2)$ and $P = (x, y)$

i.e., $\sqrt{(x+1)^2 + (y+2)^2} = \frac{x - 2y + 3}{\sqrt{1+4}}$

($\because$ distance between two points $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

$\Rightarrow$ $(x+1)^2 + (y+2)^2 = \frac{(x-2y+3)^2}{5}$ (squaring both sides)

$\Rightarrow$ $5x^2 + 5 + 10x + 5y^2 + 20 + 20y$

$= x^2 + 4y^2 + 9 - 4xy - 12y + 6x$

$\Rightarrow$ $4x^2 + y^2 + 4xy + 4x + 32y + 16 = 0$

14.6 Terms Related to all Parabolas (in Standard Form)

(a)	Equation of parabola	$y^2 = 4ax$	$y^2 = -4ax$	$x^2 = 4ay$	$x^2 = -4ay$
(b)	Graphs

(l)	Parametric coordinates of any point on parabola	$P(at^2, 2at)$	$P(-at^2, 2at)$	$P(2at, at^2)$	$P(2at, -at^2)$
(m)	Focal distance of any point $P(h, k)$ on the parabola	$h + a$	$h - a$	$k + a$	$k - a$
(n)	Equation of latusrectum	$x = a$	$x + a = 0$	$y = a$	$y + a = 0$

***Sample* Problem 3** *If the equation of parabola is $x^2 = 6y$, then the coordinates of focus and axis of the parabola are* **[NCERT]**

(a) $\left(0, \frac{3}{2}\right)$, *y-axis* (b) $\left(0, -\frac{3}{2}\right)$, *y-axis*

(c) $\left(0, \frac{3}{2}\right)$, *x-axis* (d) *None of these*

Interpret (a) Given parabola is $x^2 = 6y$, which is of the form $x^2 = 4ay$ *i.e.*, focus lies on the positive direction of y-axis.

Here, $4a = 6 \Rightarrow a = \frac{6}{4} = \frac{3}{2}$

$\therefore$ Focus $= (0, a) = \left(0, \frac{3}{2}\right)$

Axis $= y$-axis.

***Sample* Problem 4** *If focus $(0, -3)$ and directrix $y = 3$, then equation of parabola is* **[NCERT]**

(a) $y^2 = 12x$ (b) $x^2 = 12y$

(c) $y^2 = -12x$ (d) $x^2 = -12y$

Interpret (d) Given focus $= (0, -3)$ and directrix $y = 3$. Since, focus lies on the negative direction of y-axis *i.e.*, equation of parabola will be of the form $x^2 = -4ay$ with $a = 3$.

$\therefore$ Required equation is

$$x^2 = -4(3y) \Rightarrow x^2 = -12y$$

14.7 Position of a Point with Respect to the Parabola

Let $S \equiv y^2 = 4ax$ be the equation of the parabola and $P(x_1, y_1)$, be any point in the region of the parabola, then

$$S_1 \equiv y_1^2 - 4ax_1$$

If $S_1 > 0$, then P lies outside the parabola.
If $S_1 = 0$, then P lies on the parabola.
If $S_1 < 0$, then P lies inside the parabola.

***Sample* Problem 5** *The position of point $(1, 4)$ with respect to the parabola $y^2 + 9 - 6y = 5x$ is*

(a) *on the curve* (b) *inside the curve*

(c) *outside the curve* (d) *None of these*

Interpret (b) Let $S = y^2 + 9 - 6y - 5x$

At point $(1, 4)$

$$S_1 = (4)^2 + 9 - 6(4) - 5(1)$$

$$\Rightarrow \quad S_1 = 16 + 9 - 24 - 5$$

$$= -4 < 0$$

Hence, given point lies inside the curve.

14.8 Equation of Chord

Let $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ are two points on the parabola $y^2 = 4ax$ such that PQ is a focal chord. Then, the equation of chord is

$$y(t_1 + t_2) = 2x + 2at_1t_2$$

If the chord PQ is a focal chord of the parabola, then $(a, 0)$ must satisfy this equation

$$0 = 2a + 2at_1t_2 \Rightarrow t_1t_2 = -1$$

Thus, if t is the parameter for one end of a focal chord, then parameter for other end is $\frac{-1}{t}$ and the coordinates of the end points of a focal chord PQ of the parabola $y^2 = 4ax$ can be taken as $P(at^2, 2at)$ and $Q\left(\frac{a}{t^2}, \frac{-2a}{t}\right)$.

Length of Focal Chord

Let $P(at^2, 2at)$ be the one end of a focal chord PQ of the parabola $y^2 = 4ax$. Then, the lengths of focal chord is $a\left(t + \frac{1}{t}\right)^2$, where t is the parameter for one end of the chord.

If l_1 and l_2 are two lengths of focal segments.

Then, $$4a = \frac{l_1 l_2}{l_1 + l_2}$$

i.e., Length of latusrectum

$= 2$ (Harmonic mean of the focal segments)

Note The length of focal chord having parameters t_1 and t_2 for its end point is $a(t_2 - t_1)^2$.

***Sample* Problem 6** *The length of focal chord of parabola $y^2 = 4ax$ makes an angle α with the x-axis, is*

(a) $4a \operatorname{cosec} \alpha$ (b) $4 \operatorname{cosec}^2 \alpha$

(c) $4a \operatorname{cosec}^2 \alpha$ (d) *None of these*

Interpret (c) Let $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ be the end points of a focal chord PQ which makes an angle α with the axis of the parabola. Then,

$$PQ = a(t_2 - t_1)^2 = a[(t_2 + t_1)^2 - 4t_1t_2]$$

$$= a[(t_2 + t_1)^2 + 4] \quad (\because t_1t_2 = -1) \quad \ldots(i)$$

$$\because \quad \tan\alpha = \text{Slope of } PQ = \frac{2at_2 - 2at_1}{at_2^2 - at_1^2}$$

$$\Rightarrow \quad \tan\alpha = \frac{2}{t_2 + t_1}$$

$$\Rightarrow \quad t_2 + t_1 = 2\cot\alpha \quad \ldots(ii)$$

On substituting the value of $t_2 + t_1$ from Eq. (ii) in Eq. (i), we get

$$PQ = a(4\cot^2\alpha + 4) = 4a \operatorname{cosec}^2\alpha$$

Check Point **1**

1. The equation $\lambda x^2 + 4xy + y^2 + \lambda x + 3y + 2 = 0$ represents a parabola, if λ is
   (a) -4 (b) 4
   (c) 0 (d) None of these
2. If the vertex of a parabola is the point $(-3, 0)$ and the directrix is the line $x + 5 = 0$, then equation of parabola is
   (a) $y^2 = 8(x + 3)$ (b) $x^2 = 8(y + 3)$
   (c) $y^2 = -8(x + 3)$ (d) $y^2 = 8(x + 5)$
3. The focus of the parabola $y^2 = 4y - 4x$ is
   (a) (0, 2) (b) (1, 2) (c) (2, 0) (d) (2, 1)
4. If the point $P(4, -2)$ is one end of the focal chord PQ of the parabola $y^2 = x$, then the slope of the tangent at Q is
   (a) $-\frac{1}{4}$ (b) $\frac{1}{4}$ (c) 4 (d) -4
5. The length of latusrectum of the parabola $169\{(x-1)^2 + (y-3)^2\} = (5x - 12y + 17)^2$ is
   (a) 14/13 (b) 28/13
   (c) 12/13 (d) None of these
6. $x - 2 = t^2$, $y = 2t$ are the parametric equations of the parabola
   (a) $y^2 = 4x$ (b) $y^2 = -4x$
   (c) $x^2 = -4y$ (d) $y^2 = 4(x - 2)$
7. The latusrectum of the parabola $y^2 = 5x + 4y + 1$ is
   (a) 5/4 (b) 10 (c) 5 (d) 5/2
8. The equation of the parabola having vertex at the origin axis on the y-axis and passing through the point $(6, -3)$ is
   (a) $y^2 = 12x + 6$ (b) $x^2 = 12y$
   (c) $x^2 = -12y$ (d) $y^2 = -12x + 6$
9. The equation of parabola having vertex (0, 0), passing through (5, 2) and symmetric with respect to y-axis is
   (a) $3x^2 = 25y$ (b) $2x^2 = 25y$
   (c) $2y^2 = 25x$ (d) None of these

14.9 Intersection of Line and Parabola

Let the parabola be $y^2 = 4ax$ ...(i)

and the given line be $y = mx + c$ ...(ii)

On eliminating x from Eqs. (i) and (ii), then

$$y^2 = 4a\left(\frac{y - c}{m}\right)$$

$$\Rightarrow \quad my^2 - 4ay + 4ac = 0 \quad \text{...(iii)}$$

It is a quadratic equation in y.

Discriminant, $D = (-4a)^2 - 4(4ac)m = 16a(a - cm)$

(i) If $D > 0$ *i.e.*, $a > cm$, then line intersect the parabola at two distinct points.

(ii) If $D > 0$ *i.e.*, $a = cm$, then line intersect the parabola at two coincident points *i.e.*, at one point.

(iii) If $D < 0$ *i.e.*, $a < cm$, then line neither touch nor intersect the parabola.

Sample **Problem 7** *If the line $y - \sqrt{3}x + 3 = 0$ cuts the parabola $y^2 = x + 2$ at A and B, then $PA \cdot PB$ is equal to [where, $P = (\sqrt{3}, 0)$]*

(a) $\frac{4(\sqrt{3} + 2)}{3}$ (b) $\frac{4(2 - \sqrt{3})}{3}$

(c) $\frac{4\sqrt{3}}{3}$ (d) $\frac{2(\sqrt{3} + 2)}{3}$

Interpret (a) Given, $P = (\sqrt{3}, 0)$

$\therefore$ Equation of line AB is

$$\frac{x - \sqrt{3}}{\cos 60°} = \frac{y - 0}{\sin 60°} = r \text{ (say)}$$

$$\Rightarrow \quad x = \sqrt{3} + \frac{r}{2}$$

and $$y = \frac{r\sqrt{3}}{3}$$

$\therefore$ Point $\left(\sqrt{3} + \frac{r}{2}, \frac{r\sqrt{3}}{2}\right)$ lie on $y^2 = x + 2$.

$$\therefore \quad \frac{3r^2}{4} = \sqrt{3} + \frac{r}{2} + 2$$

$$\Rightarrow \quad \frac{3r^2}{4} - \frac{r}{2} - (2 + \sqrt{3}) = 0$$

Let the roots be r_1 and r_2.

$\therefore$ Product of roots $= PA \cdot PB = r_1 r_2 = \left|\frac{-(2 + \sqrt{3})}{3/4}\right|$

$$= \frac{4(2 + \sqrt{3})}{3}$$

14.10 Condition of Tangency

Let the line $y = mx + c$ is tangent to the parabola $y^2 = 4ax$.

$\therefore \quad (mx + c)^2 = 4ax$

$\Rightarrow \quad m^2x^2 + c^2 + 2mcx = 4ax$

$\Rightarrow \quad m^2x^2 + 2(mc - 2a)x + c^2 = 0$

Since, the line is a tangent to the parabola.

$\therefore \quad \Delta = 0$

$4[(mc - 2a)^2 - 4m^2c^2 = 0 \quad (\because \Delta = B^2 - 4AC)$

$\Rightarrow \quad 4[m^2c^2 + 4a^2 - 4amc] - 4m^2c^2 = 0$

$\Rightarrow \quad 4[4a^2 - 4amc] = 0$

$\Rightarrow \quad 4a^2 = 4amc$

$\Rightarrow \quad 4a(a - mc) = 0$

$\Rightarrow \quad mc = a$

$\Rightarrow \quad c = \dfrac{a}{m}$

***Sample* Problem 8** *If the line $y = mx + 1$ is tangent to the parabola $y^2 = 4x$, then the value of m is* **[NCERT Exemplar]**

(a) 1 (b) −1
(c) 2 (d) −2

Interpret (a) Given equation of line is

$y = mx + 1 \quad$ ...(i)

and equation of parabola is $y^2 = 4x \quad$ ...(ii)

From Eq. (i), $y = mx + 1$ put in Eq. (ii), we get

$(mx + 1)^2 = 4x$

$\Rightarrow \quad m^2x^2 + 1 + 2mx - 4x = 0$

$\Rightarrow \quad x^2(m^2) + x(2m - 4) + 1 = 0$

$\because$ For tangent, discriminant is zero *i.e.*, $D = 0$

$\therefore \quad (2m - 4)^2 - 4m^2 \times 1 = 0 \quad (\because D = b^2 - 4ac = 0)$

$\Rightarrow \quad 4m^2 + 16 - 16m - 4m^2 = 0$

$\Rightarrow \quad m = 1$

14.11 Tangent to the Parabola

A line which intersect the parabola at only one point is called the tangent to the parabola.

Equation of Tangent in Different Form

(i) Point Form

The equation of tangent to the parabola $y^2 = 4ax$ at the point (x_1, y_1) is $yy_1 = 2a(x + x_1)$. The equation of tangents to all standard forms of parabola at point (x_1, y_1) are given below.

Equation of parabola	Equation of tangent
$y^2 = 4ax$	$yy_1 = -2a(x + x_1)$
$x^2 = 4ay$	$xx_1 = 2a(y + y_1)$
$x^2 = -4ay$	$xx_1 = -2a(y + y_1)$

Note The equation of tangent at (x_1, y_1) to any second degree curve can also be obtained by replacing x^2 by xx_1, y^2 by yy_1, x by $\dfrac{x + x_1}{2}$, y by $\dfrac{y + y_1}{2}$ and xy by $\dfrac{xy_1 + x_1y}{2}$ and without changing the constant (if any) in the equation of the curve.

(ii) Slope Form

The equation of tangent to the parabola $y^2 = 4ax$ in slope form is $y = mx + \dfrac{a}{m}$, where m is the slope of the tangent.

The equation of tangent of slope m to the parabola $(y - k)^2 = 4a(x - h)$ is given by $y - k = m(x - h) + \dfrac{a}{m}$ and coordinates of point of contact are $\left(h + \dfrac{a}{m^2}, k + \dfrac{2a}{m}\right)$.

(iii) Parametric Form

The equation of tangent at the point $(at^2, 2at)$ or t to the parabola $y^2 = 4ax$ is $ty = x + at^2$. The parametric equation of tangents to all standard forms of parabola are given below.

Equation of parabola	Point of contact	Equation of tangent
$y^2 = -4ax$	$(-at^2, 2at)$	$ty = -x + at^2$
$x^2 = 4ay$	$(2at, at^2)$	$tx = y + at^2$
$x^2 = -4ay$	$(2at, -at^2)$	$tx = -y + at^2$

Point of Intersection of Tangents at Any Two Points on the Parabola

Let the parabola be $y^2 = 4ax$. Let two points on the parabola are $P \equiv (at_1^2, 2at_1)$ and $Q \equiv (at_2^2, 2at_2)$.

Equation of tangents at $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ are

$$t_1y = x + at_1^2$$

and

$$t_2y = x + at_2^2$$

On solving these equations, we get

$$x = at_1t_2, \quad y = a(t_1 + t_2)$$

Thus, the coordinates of the point of intersection of tangents at $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$ are $[at_1t_2, a(t_1+t_2)]$.

Note

- x-coordinate, at_1t_2 = GM of at_1^2, at_2^2
- y-coordinate, $a(t_1+t_2)$ = AM of $2at_1, 2at_2$

Important Results on Tangents

(i) The tangent at any point on a parabola bisects the angle between the focal distance of the point and the perpendicular on the directrix from the point.

(ii) The tangents at the extremities of a focal chord of a parabola intersect at right angle on the directrix.

(iii) The portion of the tangent to a parabola cut-off between the directrix and the curve subtends a right angle at the focus.

(iv) The perpendicular drawn from the focus on any tangent to a parabola intersect it at the point, where it cuts the tangent at the vertex.

(v) The orthocentre of any triangle formed by three tangents to a parabola lies on the directrix.

(vi) The tangent at any point of a parabola is equally inclined to the focal distance of the point and the axis of the parabola.

Sample **Problem 9** *If the line* $\frac{x}{l}+\frac{y}{m}=1$ *touches the parabola* $y^2 = 4a(x+b)$, *then* $m^2(l+b)$ *is equal to*

(a) al^2 (b) $-al^2$ (c) l^2 (d) $-a$

Interpret (b) The given parabola is

$$y^2 = 4a(x+b) \quad \text{...(i)}$$

Vertex of this parabola is $(-b, 0)$.

Now, shifting (0, 0) at $(-b, 0)$, then

$$x = X + (-b)$$

and $$y = Y + 0$$

$\Rightarrow$ $$x + b = X$$

and $$y = Y \quad \text{...(ii)}$$

From Eq. (i), $$Y^2 = 4aX \quad \text{...(iii)}$$

and the line $$\frac{x}{l}+\frac{y}{m}=1$$

reduces to $$\frac{X-b}{l}+\frac{Y}{m}=1$$

$$\Rightarrow \quad Y = m\left(1-\frac{X-b}{l}\right)$$

$$\Rightarrow \quad Y = \left(-\frac{m}{l}\right)X + m\left(1+\frac{b}{l}\right) \quad \text{...(iv)}$$

The line (iv) will touch the parabola (iii), if

$$m\left(1+\frac{b}{l}\right) = \frac{a}{\left(-\frac{m}{l}\right)}$$

$$\Rightarrow \quad \frac{m^2}{l}\left(1+\frac{b}{l}\right) = -a$$

$$\Rightarrow \quad m^2(l+b) + al^2 = 0$$

14.12 Normal to the Parabola

A line which is perpendicular to the tangent of the parabola is called the normal to the parabola.

Equation of Normal in Different Forms

(i) Point Form

The equation of normal at the point (x_1, y_1) to the parabola $y^2 = 4ax$ is

$$(y - y_1) = -\frac{y_1}{2a}(x - x_1)$$

(ii) Slope Form

The equation of normal to the parabola $y^2 = 4ax$ in the slope form is

$$y = mx - 2am - am^3$$

The equation of normals to various standard forms of the parabola in terms of the slope of the normal are as given below.

Equation of parabola	Equation of normal	Slope of normal	Point of contact
$y^2 = -4ax$	$y = mx + 2am + am^3$	m	$(-am^2, 2am)$
$x^2 = 4ay$	$x = my - 2am - am^3$	$1/m$	$(-2am, am^2)$
$x^2 = -4ay$	$x = my + 2am + am^3$	$1/m$	$(2am, -am^2)$

Note The line $y = mx + c$ will be a normal to the parabola $y^2 = 4ax$, if $c = -2am - am^3$ and point of contact are $(am^2, -2am)$.

(iii) Parametric Form

The equation of normal at the point $(at^2, 2at)$ or t to the parabola $y^2 = 4ax$ is $y + tx = 2at + at^3$.

Point of Intersection of Normals Drawn Any Two Points on the Parabola

If two normals are drawn to the parabola $y^2 = 4ax$ at the points $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ intersect at a point R, then coordinates of the point R are $[2a + a(t_1^2 + t_2^2 + t_1t_2), -at_1t_2(t_1 + t_2)]$.

Important Results on Normals

(i) The normal drawn at a point $P(at_1^2, 2at_1)$ to the parabola $y^2 = 4ax$ meets again the parabola at $Q(at_2^2, 2at_2)$, then $t_2 = -t_1 - \frac{2}{t_1}$.

(ii) The tangent at one extremity of the focal chord of a parabola is parallel to the normal at the other extremity.

(iii) If the normals at point $P(at_1^2, 2at_1)$ and $Q(at_2^2, 2at_2)$ on the parabola $y^2 = 4ax$ meet on the parabola, then $t_1t_2 = 2$.

(iv) If the normal chord at a point $P(at^2, 2at)$ to the parabola $y^2 = 4ax$ subtends a right angle at the vertex of the parabola, then $t^2 = 2$.

(v) The normal chord of a parabola at a point whose ordinate is equal to the abscissa, subtends a right angle at the focus.

(vi) The normal at any point of a parabola is equally inclined to the focal distance to the point and the axis of the parabola.

***Sample* Problem 10** *The normal meet the parabola $y^2 = 4ax$ at that point where the abscissae of the point is equal to the ordinate of the point is*

(a) $(6a, -9a)$ (b) $(-9a, 6a)$
(c) $(-6a, 9a)$ (d) $(9a, -6a)$

Interpret (d) If a normal drawn from the point $(at_1^2, 2at_1)$ to the parabola $y^2 = 4ax$ meets at point $(at_2^2, 2at_2)$ of same parabola, then $t_2 = -t_1 - \frac{2}{t_1}$.

Given condition is $x = y$ ...(i)

$\because$ $y^2 = 4ax$ (given)

$\therefore$ $y^2 = 4ay$ [$\because$ from Eq. (i)]

$\Rightarrow$ $y(y - 4a) = 0$

$\Rightarrow$ $y = 0$ or $y = 4a$

$\therefore$ Point $(0, 0)$ and $(4a, 4a)$

$\Rightarrow$ $2at_1 = 4a \Rightarrow t_1 = \frac{4a}{2a} = 2$

$t_2 = -2 - \frac{2}{2} = -3$

$\therefore$ Point $(at_2^2, 2at_2) = [a \times (-3)^2, 2a(-3)] = (9a, -6a)$

14.13 Conormal Points

The points on the parabola through which normals drawn are concurrent *i.e.*, pass through the same point are called conormal points. The conormal points are also called the feet of the normals. Points A, B, C in which the three normals from $P(h, k)$ meet the parabola are called conormal points.

Results on Conormal Points

(i) The algebraic sum of the slopes of the normals at conormal points is zero.

(ii) The sum of the ordinates of the conormal points is zero.

(iii) The centroid of the triangle formed by the conormal points on a parabola lies on its axis.

***Sample* Problem 11** *Find the locus of the point through which pass three normals to the parabola $y^2 = 4ax$ such that two of them make angles α and β respectively with the axis such that $\tan\alpha \tan\beta = 2$.*

(a) $x^2 - 4ay = 0$ (b) $y^2 - 4ax = 0$
(c) $x^2 + 4ay = 0$ (d) $y^2 + 4ax = 0$

Interpret (b) Let (h, k) be the point of intersection of three normals to the parabola $y^2 = 4ax$. The equation of any normal to $y^2 = 4ax$ is

$$y = mx - 2am - am^3$$

If it passes through (h, k), then $k = mh - 2am - am^3$

$\Rightarrow$ $am^3 + m(2a - h) + k = 0$ ...(i)

Let roots of Eq. (i) be m_1, m_2, m_3, then from Eq. (i),

$$m_1m_2m_3 = -\frac{k}{a} \quad ...(ii)$$

Also, $m_1 = \tan\alpha, m_2 = \tan\beta$ and $\tan\alpha \tan\beta = 2$ ...(iii)

$\therefore$ $m_1m_2 = 2$

From Eqs. (ii) and (iii), $2m_3 = -\frac{k}{a}$

$\Rightarrow \quad m_3 = -\frac{k}{2a}$

Which being a root of Eq. (i) must satisfy it

i.e., $\quad am_3^3 + m_3(2a - h) + k = 0$

$\Rightarrow \quad a\left(-\frac{k}{2a}\right)^3 - \frac{k}{2a}(2a - h) + k = 0$

$\Rightarrow \quad -\frac{k^3}{8a^2} - k + \frac{kh}{2a} + k = 0$

$\Rightarrow \quad k^2 - 4ah = 0$

$\therefore$ Required locus of (h, k) is $y^2 - 4ax = 0$

14.14 Pair of Tangents

Let $P(x_1, y_1)$ be any point outside the parabola $S = y^2 - 4ax$, then the equation of the pair of tangents drawn from the point P to the parabola is given by

$$SS_1 = T^2$$

where, $S = y^2 - 4ax$, $S_1 = y_1^2 - 4ax_1$ and $T = yy_1 - 2a(x + x_1)$

Hot Spot

Equation of Pair of Tangents

In this types of problems, sometimes we make a equation of pair of tangent from a given point and a curve. These types of problems are directly or indirectly asked in various years of AIEEE (JEE Main) 2010, 2008 following steps are given below.

Step I Use the formula $T^2 = SS_1$.

Step II Use the result, if and only if a pair of tangents are drawn from a directrix point to the parabola, then they are always perpendicular.

Step III Apply the suitable formula and simplify it.

***Sample* Problem 12** *If a point $P(1, 4)$ is outside the parabola $y^2 + 4y = 3x$, then equation of pair of tangent is*

(a) $76y^2 + 9x^2 - 72xy + 126x - 272y + 312 = 0$

(b) $76y^2 - 9x^2 + 72xy + 126x + 272y + 312 = 0$

(c) $76y^2 + 9x^2 + 72xy - 126x - 30y + 310 = 0$

(d) *None of the above*

Interpret (a) **Step I** Use the result $T^2 = SS_1$.

Let $\quad S = y^2 + 4y - 3x$

At point $P(1, 4)$,

$$S_1 = (4)^2 + 4(1) - 3(1) = 16 + 4 - 3 = 17$$

$$T = yy_1 + 2(y + y_1) - \frac{3}{2}(x + x_1)$$

$$T = y(4) + 2(y + 4) - \frac{3}{2}(x + 1)$$

$$= 4y + 2y + 8 - \frac{3}{2}x - \frac{3}{2}$$

$$= 6y + \frac{13}{2} - \frac{3}{2}x = \frac{1}{2}(12y - 3x + 13)$$

$\therefore$ Equation of pair of tangent is

$$SS_1 = T^2$$

$$(y^2 + 4y - 3x)(17) = \frac{1}{4}[(12y - 3x + 13)^2]$$

Step II Here, no need to use the result, that tangents are drawn from a directrix to the parabola are perpendicular.

Step III Simplify it,

$$68y^2 + 272y - 204x = 144y^2 + 9^2 + 169 - 72xy - 78x + 312$$

$$\Rightarrow \quad 76y^2 + 9x^2 - 72xy + 126x - 272y + 312 = 0$$

14.15 Chord of Contact

Let PQ and PR be tangents to the parabola $y^2 = 4ax$ drawn from any external point $P(h, k)$, then QR is called chord of contact of the parabola $y^2 = 4ax$.

Let $\quad Q \equiv (x_1, y_1)$ and $R \equiv (x_2, y_2)$

Equation of the tangent PQ is

$$yy_1 = 2a(x + x_1) \quad \text{...(i)}$$

and equation of the tangent PR is

$$yy_2 = 2a(x + x_2) \quad \text{...(ii)}$$

Since, lines (i) and (ii) pass through (h, k), then

$$ky_1 = 2a(h + x_1) \quad \text{...(iii)}$$

and $$ky_2 = 2a(h + x_2) \quad \text{...(iv)}$$

Hence, it is clear $Q(x_1, y_1)$ and $R(x_2, y_2)$ lie on $yk = 2a(x + h)$ which is chord of contact QR.

Equation of the Chord Bisected at a Given Point

The equation of the chord of the parabola $y^2 = 4ax$ which is bisected at (x_1, y_1) is

$$yy_1 - 2a(x + x_1) = y_1^2 - 4ax_1$$

$\Rightarrow$ $$T = S_1$$

where, $$T = yy_1 - 2a(x + x_1)$$

and $$S_1 = y_1^2 - 4ax_1$$

***Sample* Problem 13** *The area of the triangle formed by the tangents drawn from (x_1, y_1) to $y^2 = 4ax$ and their chord of contact is $\frac{(y_1^2 - 4ax_1)^{3/2}}{n}$, where n is*

(a) 2a (b) a
(c) a/2 (d) None of these

Interpret (a) Equation of QR (chord of contact) is

$$yy_1 = 2a(x + x_1)$$

$\Rightarrow$ $$yy_1 - 2a(x + x_1) = 0$$

$\because$ PM = length of perpendicular from $P(x_1, y_1)$ on QR

$$= \frac{|y_1y_1 - 2a(x_1 + x_1)|}{\sqrt{(y_1^2 + 4a^2)}} = \frac{(y_1^2 - 4ax_1)}{\sqrt{y_1^2 + 4a^2}}$$

$$\left[\begin{array}{l}\text{since, } P(x_1, y_1) \text{ lies outside the parabola} \\ \therefore \quad y_1^2 - 4ax_1 > 0\end{array}\right]$$

Now, area of $\Delta PQR = \frac{1}{2} \cdot QR \cdot PM$

$$= \frac{1}{2} \cdot \frac{1}{|a|} \cdot \sqrt{(y_1^2 - 4ax_1)(y_1^2 + 4a^2)} \cdot \frac{(y_1^2 - 4ax_1)}{\sqrt{(y_1^2 + 4a^2)}}$$

$$= \frac{(y_1^2 - 4ax_1)^{3/2}}{2a}, \text{ if } a > 0$$

14.16 Diameter

The locus of the mid-points of a system of parallel chords of a conic is known as its diameter.

Equation of Diameter of a Parabola

Let $y = mx + c$ be a system of parallel chords of the parabola $y^2 = 4ax$

Here, m is a constant and c is a variable.

The line $y = mx + c$ meets the parabola $y^2 = 4ax$ in the points say, P and Q whose ordinates (say y_1 and y_2) are the roots of the equation

$\therefore$ $$y^2 = 4a\left(\frac{y - c}{m}\right)$$

$\Rightarrow$ $$my^2 - 4ay + 4ac = 0$$

$\therefore$ $$y_1 + y_2 = \frac{4a}{m}$$

Let $M(h, k)$ be the mid-point of PQ. Then,

$$k = \frac{y_1 + y_2}{2}$$

$\Rightarrow$ $$k = \frac{2a}{m}$$

Hence, the locus of (h, k) is $y = \frac{2a}{m}$

Check Point **2**

1. A tangent to a parabola $y^2 = 4ax$ is inclined at $\frac{\pi}{3}$ with the axis of the parabola. The point of contact is
   (a) $\left(\frac{a}{3}, -\frac{2a}{\sqrt{3}}\right)$ (b) $(3a, -2\sqrt{3}a)$
   (c) $(3a, 2\sqrt{3}a)$ (d) None of these
2. The tangents and normals at the ends of the latusrectum of a parabola form a
   (a) cyclic quadrilateral (b) rectangle
   (c) square (d) None of these
3. If the normal to the parabola $y^2 = 4ax$ at the point $P(at^2, 2at)$ cuts the parabola again at $Q(aT^2, 2aT)$, then
   (a) $-2 \le T \le 2$ (b) $T \in (-\infty, -8) \cup (8, \infty)$
   (c) $T^2 < 8$ (d) $T^2 \ge 8$
4. If tangents at A and B on the parabola $y^2 = 4ax$ intersect at point C, then ordinates of A, C and B are
   (a) always in AP (b) always in GP
   (c) always in HP (d) None of these
5. The locus of the middle points of the focal chords of parabola $y^2 = 4ax$ is
   (a) $y^2 = a(x - a)$ (b) $y^2 = 2a(x - a)$
   (c) $y^2 = 4a(x - a)$ (d) None of these
6. The equation of tangent to the parabola $y^2 = 9x$ which goes through the point (4, 10), is
   (a) $x + 4y + 1 = 0$ (b) $9x + 4y + 4 = 0$
   (c) $x - 4y + 36 = 0$ (d) $9x + 4y + 9 = 0$
7. If the tangent at the point P(2, 4) to the parabola $y^2 = 8x$ meets the parabola $y^2 = 8x + 5$ at Q and R, then the mid-point of the QR is
   (a) (2, 4) (b) (4,2)
   (c) (7, 9) (d) None of these
8. The tangent to the parabola $y^2 = 4ax$ at the point (a, 2a) makes with x-axis an angle equal to
   (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{2}$ (d) $\frac{\pi}{6}$
9. The normals at three points P, Q, R of the parabola $y^2 = 4ax$ meet in (h, k). The centroid of ΔPQR lies on
   (a) $x = 0$ (b) $y = 0$ (c) $x = -a$ (d) $y = a$
10. At what point on the parabola $y^2 = 4x$, the normal makes equal angles with the coordinate axes?
    (a) (4, 4) (b) (9, 6) (c) $(4, -4)$ (d) $(1, -2)$
11. The circle $x^2 + y^2 = 5$ meets the parabola $y^2 = 4x$ at P and Q. Then, the length PQ is equal to
    (a) 2 (b) $2\sqrt{2}$
    (c) 4 (d) None of these

WORKED OUT Examples

Example 1 *The equation of parabola whose focus and vertex are the points* (0, 2) *and* (0, 4) *respectively is*

(*a*) $x^2 + y = 32$ (*b*) $x^2 + 8y = 2$

(*c*) $x^2 + 8y = 32$ (*d*) *None of these*

Solution (*c*) Since, the focus and vertex of the parabola are on y-axis, therefore its directrix is parallel to x-axis and axis of parabola is y-axis. Let the equation of the directrix be $y = k$. The directrix meets the axis of the parabola at $(0, k)$. But vertex is the mid-point of the line segment joining the focus to the point where directrix meets axis of the parabola.

$$\therefore \quad \frac{k+2}{2} = 4 \Rightarrow k = 6$$

Thus, the equation of directrix is $y = 6$.

Let (x, y) be a point on the parabola, then

$$(x-0)^2 + (y-2)^2 = \left(\frac{|y-6|}{\sqrt{1^2}}\right)^2$$

$$\Rightarrow \quad x^2 + 8y = 32$$

Example 2 *The focus of the parabola* $y^2 - x - 2y + 2 = 0$ *is*

(*a*) $\left(\frac{1}{4}, 1\right)$ (*b*) $\left(\frac{5}{4}, 1\right)$ (*c*) $\left(1, \frac{5}{4}\right)$ (*d*) $\left(\frac{5}{4}, 0\right)$

Solution (*b*) We have, $y^2 - 2y = x - 2$

$$\Rightarrow \quad (y-1)^2 = 1(x-1)$$

$$\Rightarrow \quad Y^2 = X$$

where, $Y = y - 1$ and $X = x - 1$

Here, $a = \frac{1}{4}$

$\therefore$ Focus is $X = a, Y = 0$

$$\Rightarrow \quad x - 1 = \frac{1}{4}, y - 1 = 0$$

$\Rightarrow$ Focus of parabola is $\left(\frac{5}{4}, 1\right)$.

Example 3 *The equation of the parabola, the extremities of whose latusrectum are* (1, 2) *and* (1, – 4), *is*

(*a*) $(x+1)^2 = 3(2y-5)$ (*b*) $(y+1)^2 = 3(2x-5)$

(*c*) $(y+1)^2 = -3(2x+5)$ (*d*) *None of these*

Solution (*d*) Let the extremities be $L = (1, 2)$ and $L' = (1, -4)$

$$\therefore \quad \text{Slope of } L'L = \frac{2+4}{1-1} = \frac{6}{0} = \infty$$

Hence, latusrectum $L'L$ is perpendicular to x-axis. Therefore, axis of the parabola will be parallel to x-axis and tangent at the vertex will be parallel to y-axis.

Let the equation of the parabola be

$$(y-\beta)^2 = 4a(x-\alpha)$$

Now, $L'L = |4a|$

$$\therefore \quad 6 = |4a| \Rightarrow 4a = \pm 6 \quad \text{...(i)}$$

Hence, from Eq. (i), equation of parabola becomes

$$(y-\beta)^2 = \pm 6(x-\alpha) \quad \text{...(ii)}$$

Since, L and L' lie on Eq. (ii), therefore

$$(2-\beta)^2 = \pm 6(1-\alpha) \quad \text{...(iii)}$$

and $$(4+\beta)^2 = \pm 6(1-\alpha) \quad \text{...(iv)}$$

From Eqs. (iii) and (iv), we get

$$(2-\beta)^2 = (4+\beta)^2$$

$$\Rightarrow \quad 12\beta = -12 \Rightarrow \beta = -1$$

$\therefore$ From Eq. (iii),

$$9 = \pm 6(1-\alpha) \Rightarrow \alpha = \frac{-1}{2}, \frac{5}{2}$$

On putting the values of α and β in Eq. (ii), we get

$$(y+1)^2 = 6\left(x + \frac{1}{2}\right) \Rightarrow (y+1)^2 = 3(2x+1)$$

and $$(y+1)^2 = -6\left(x - \frac{5}{2}\right) \Rightarrow (y+1)^2 = -3(2x-5)$$

Example 4 *If* $y = mx + c$ *touches the parabola* $y^2 = 4a(x + a)$, *then* $am + \frac{a}{m}$ *is equal to*

(*a*) y (*b*) x

(*c*) c (*d*) *None of these*

Solution (*c*) If the line $y = mx + c$ touches $y^2 = 4a(x+a)$, then the equation $(mx + c)^2 = 4a(x + a)$ has equal roots. By which, we get $c = am + \frac{a}{m}$.

Example 5 *The angle between the tangents drawn from the origin to the parabola $y^2 = 4a(x - a)$ is*

(a) 0 (b) $\pi/2$ (c) $\pi/4$ (d) $\pi/6$

Solution (b) Any line through origin is $y = mx$. Since, it is a tangent to $y^2 = 4a(x-a)$, it will cut it in two coincident points.

$\therefore$ Roots of $m^2x^2 - 4ax + 4a^2$ are equal.

i.e., $b^2 - 4ac = 0$

$\Rightarrow$ $16a^2 - 16a^2m^2 = 0$

$\Rightarrow$ $m^2 = 1$ or $m = 1, -1$

$\therefore$ Product of slopes $= -1$

Hence, required angle is right angle.

Example 6 *Any tangent to a parabola $y^2 = 4ax$ and perpendicular to it from the focus meet on the line $x = 0$, is*

(a) $x = 0$ (b) $y = 0$ (c) $x = a$ (d) $y = b$

Solution (a) Equation of tangent is

$$ty = x + at^2 \quad \text{...(i)}$$

Its slope $= \frac{1}{t}$

Any line perpendicular to tangent and passing through the focus, is $y - 0 = -t(x - a)$.

$$\Rightarrow \quad y = -tx + at \quad \text{...(ii)}$$

On solving Eqs. (i) and (ii), we find the coordinates of the point of intersection as $(0, at)$ and clearly it lies on the line $x = 0$.

Example 7 *The common tangents to the parabola $y^2 = 4ax$ and $x^2 = 4ay$ is*

(a) $x + y + a = 0$ (b) $x + y = a$

(c) $x + y = 0$ (d) *None of these*

Solution (a) The equation of any tangent to $y^2 = 4ax$ is $y = mx + \frac{a}{m}$. If it touches $x^2 = 4ay$, the equation $x^2 = 4a\left(mx + \frac{a}{m}\right)$ has equal roots.

$\Rightarrow$ $mx^2 - 4am^2x - 4a^2 = 0$ has equal roots.

$\Rightarrow$ $16a^2m^4 = -16a^2m \Rightarrow m = -1$

On putting $m = -1$ in $y = mx + \frac{a}{m}$, we get

$$y = -x - a \Rightarrow x + y + a = 0$$

Example 8 *If a chord which is normal to the parabola at one end subtend a right angle at the vertex, then angle to the axis is*

(a) $\tan^{-1}\sqrt{2}$ (b) 0

(c) π (d) $\pi/2$

Solution (a) The equation to any chord which is normal, is

$$y = mx - 2am - am^3$$

$$\Rightarrow \quad mx - y = 2am + am^3$$

Let the equation of parabola is $y^2 = 4ax$.

The straight lines joining the origin to the intersection of these two, given by the equation

$$y^2(2am + am^3) - 4ax(mx - y) = 0$$

If these be at right angles, then

$$2am + am^3 - 4am = 0$$

$$(\because \text{coefficient of } y^2 + \text{coefficient of } x^2 = 0)$$

$\Rightarrow$ $m = \pm\sqrt{2}$

$\Rightarrow$ $\tan\theta = \sqrt{2} \Rightarrow \theta = \tan^{-1}\sqrt{2}$

Example 9 *On the parabola $y^2 = 4ax$, three points E, F, G are taken, so that their ordinates are in geometrical progression. Then, the tangents at E and G intersect on the ordinate of*

(a) E (b) G

(c) F (d) *None of these*

Solution (c) Given parabola is

$$y^2 = 4ax \quad \text{...(i)}$$

Let the coordinates of E, F and G be respectively $(at_1^2, 2at_1)$, $(at_2^2, 2at_2)$ and $(at_3^2, 2at_3)$.

Since, ordinates of E, F and G are in GP.

$\therefore$ $(2at_2)^2 = (2at_1)(2at_3) \Rightarrow t_2^2 = t_1t_3$ ...(ii)

The tangents at E and G are

$$t_1y = x + at_1^2 \quad \text{...(iii)}$$

and $$t_3y = x + at_3^2 \quad \text{...(iv)}$$

From Eqs. (iii) and (iv), we get $x = at_1t_3 = at_2^2$. Since, the coordinate of the point of intersection is at_2^2, the point lies on line $x = at_2^2$ *i.e.,* on the ordinate of $F(at_2^2, 2at_2)$.

Example 10 *A variable chord PQ of the parabola $y^2 = 4ax$, subtends a right angle at the vertex, then the locus of the points of intersection of the normal at P and Q is*

(a) *a parabola* (b) *a hyperbola*

(c) *a circle* (d) *None of these*

Solution (a) Let P be $(at_1^2, 2at_1)$ and Q be $(at_2^2, 2at_2)$. Since, PQ subtends a right angle at the vertex (0, 0).

Hence, $$t_1t_2 = -4 \quad \text{...(i)}$$

If (h, k) be the point of intersection of normals at P and Q, then

$$h = 2a + a(t_1^2 + t_2^2 + t_1t_2) \quad \text{...(ii)}$$

and $$k = -at_1t_2(t_1 + t_2) \quad \text{...(iii)}$$

In order to find the locus of (h, k), we have to eliminate t_1 and t_2 between Eqs. (i), (ii) and (iii)

$$k = 4a(t_1 + t_2) \quad \text{...(iv)}$$

[from Eqs. (i) and (iii)]

and $$h - 2a = a[(t_1 + t_2)^2 - t_1t_2]$$

$$\Rightarrow \quad h - 2a = a\left[\frac{k^2}{16a^2} + 4\right] \quad \text{[from Eq. (iv)]}$$

$$\Rightarrow \quad h - 6a = \frac{k^2}{16a}$$

Hence, the required locus is $y^2 = 16a(x - 6a)$.

Round I (Topically Divided Problems)

Basic Terms of Parabola

1. Equation $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$ $(abc + 2fgh - af^2 - bg^2 - ch^2 \neq 0)$ represents a parabola, if

(a) $h^2 = ab$ (b) $h^2 > ab$
(c) $h^2 < ab$ (d) None of these

2. The equation $(x-2)^2 + (y-3)^2 = \left(\frac{3x+4y-2}{5}\right)^2$ represents

(a) a parabola (b) a pair of straight lines
(c) an ellipse (d) a hyperbola

3. The equation of latusrectum of a parabola is $x + y = 8$ and the equation of the tangent at the vertex is $x + y = 12$, then length of the latusrectum is

(a) $4\sqrt{2}$ (b) $2\sqrt{2}$
(c) 8 (d) $8\sqrt{2}$

4. The locus of the mid-point of the line segment joining the focus to a moving point on the parabola $y^2 = 4ax$ is another parabola with the directrix

(a) $x = -a$ (b) $x = -\frac{a}{2}$
(c) $x = 0$ (d) $x = \frac{a}{2}$

5. The coordinates of a point on the parabola $y^2 = 8x$ whose focal distance is 4, is [NCERT Exemplar]

(a) (– 2, – 4), (2, – 4) (b) (2, 4), (2, – 4)
(c) (1, 4), (2, – 4) (d) (2, – 4), (– 2, 4)

6. If the parabola $y^2 = 4ax$ passes through the point (3, 2), then the length of its latusrectum is [NCERT Exemplar]

(a) $\frac{2}{3}$ (b) $\frac{4}{3}$
(c) $\frac{1}{3}$ (d) 4

7. If the equation of parabola is $x^2 = -9y$, then equation of directrix and length of latusrectum are [NCERT]

(a) $y = -\frac{9}{4}, 8$ (b) $x = \frac{9}{4}, 9$
(c) $y = \frac{9}{4}, 9$ (d) None of these

8. If $(9a, 6a)$ is a point bounded in region formed by parabola $y^2 = 16x$ and $x = 9$, then

(a) $a \in (0, 1)$ (b) $a < \frac{1}{4}$
(c) $a < 1$ (d) $0 < a < 4$

9. The length of the latusrectum of the parabola $169\{(x-1)^2 + (y-3)^2\} = (5x - 12y + 17)^2$ is

(a) 14/13 (b) 12/13
(c) 28/13 (d) None of these

10. The equation $y^2 - 8y - x + 19 = 0$ represents

(a) a parabola whose focus is $\left(\frac{1}{4}, 0\right)$ and directrix is $x = \frac{-1}{4}$
(b) a parabola whose vertex is (3, 4) and directrix is $x = \frac{11}{4}$
(c) a parabola whose focus is $\left(\frac{13}{4}, 4\right)$ and vertex is (0, 0)
(d) a curve which is not a parabola

11. The parametric coordinates of any point on the parabola $y^2 = 4ax$ can be

(a) $(a - at^2, -2at)$ (b) $(a - at^2, 2at)$
(c) $(a\sin^2 t, -2a\sin t)$ (d) $(a\sin t, -2a\cos t)$

12. The parametric equation of a parabola is $x = t^2 + 1$, $y = 2t + 1$. The cartesian equation of its directrix is

(a) $x = 0$
(b) $x + 1 = 0$
(c) $y = 0$
(d) None of the above

13. The latusrectum of the parabola $y^2 = 4ax$ whose focal chord is PSQ such that $SP = 3$ and $SQ = 2$, is given by
(a) $\frac{24}{5}$ (b) $\frac{12}{5}$ (c) $\frac{6}{5}$ (d) $\frac{1}{5}$

14. If a focal chord of the parabola $y^2 = ax$ is $2x - y - 8 = 0$, then the equation of the directrix is
(a) $x + 4 = 0$ (b) $x - 4 = 0$
(c) $y - 4 = 0$ (d) $y + 4 = 0$

15. The position of the point $(-2, 2)$ with respect to the parabola $y^2 - 4y + 9x + 13 = 0$ is
(a) inside (b) outside
(c) on (d) None of these

16. The length of the chord of the parabola $x^2 = 4y$ passing through the vertex and having slope $\cot\alpha$ is
(a) $4\cos\alpha \operatorname{cosec}^2\alpha$ (b) $4\tan\alpha \sec\alpha$
(c) $4\sin\alpha \sec^2\alpha$ (d) None of these

17. The line $x - 1 = 0$ is the directrix of the parabola $y^2 - kx + 8 = 0$. Then, one of the value of k is
(a) $\frac{1}{8}$ (b) 8 (c) 4 (d) $\frac{1}{4}$

Equation of Parabola and Intersection of Two Curves

18. If the focus of a parabola is $(0, -3)$ and its directrix is $y = 3$ and its equation is [NCERT Exemplar]
(a) $x^2 = -12y$ (b) $x^2 = 12y$
(c) $y^2 = -12x$ (d) $y^2 = 12x$

19. If the vertex of the parabola is the point $(-3, 0)$ and the directrix is the line $x + 5 = 0$, then its equation is [NCERT Exemplar]
(a) $y^2 = 8(x + 3)$ (b) $x^2 = 8(y + 3)$
(c) $y^2 = -8(x + 3)$ (d) $y^2 = 8(x + 5)$

20. If the point $(0, 4)$ and $(0, 2)$ are respectively the vertex and focus of a parabola, then the equation of the parabola is [NCERT Exemplar]
(a) $x^2 + 8y = 16$ (b) $x^2 + 8y = 32$
(c) $x^2 + 16y = 30$ (d) $x^2 - 8y = 32$

21. The equation of parabola having vertex $(0, 0)$ passing through $(2, 3)$ and axis is along x-axis is [NCERT]
(a) $x^2 = \frac{9}{2}y$ (b) $y^2 = \frac{9}{2}x$
(c) $y^2 = -\frac{9}{2}x$ (d) $x^2 = -\frac{9}{2}y$

22. The angle made by a double ordinate of length $8a$ at the vertex of the parabola $y^2 = 4ax$ is
(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{6}$

23. The angle of intersection between the curves $x^2 = 4(y + 1)$ and $x^2 = -4(y + 1)$ is
(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) 0 (d) $\frac{\pi}{2}$

Tangent and Normal to the Parabola

24. If the line $x\cos\alpha + y\sin\alpha = p$ touches the parabola $y^2 = 4ax$, then point of contact is
(a) $(a\tan^2\alpha, -2a\tan\alpha)$ (b) $(a\tan^2\alpha, 2a\tan\alpha)$
(c) $(a\tan\alpha, 2a\tan\alpha)$ (d) None of these

25. Two perpendicular tangents to $y^2 = 4ax$ always intersect on the line, if
(a) $x = a$ (b) $x + a = 0$
(c) $x + 2a = 0$ (d) $x + 4a = 0$

26. The equation of the tangent to the parabola $y^2 = 9x$ which goes through the point $(4, 10)$, is
(a) $x + 4y + 1 = 0$ (b) $9x + 4y + 4 = 0$
(c) $x + 4y + 36 = 0$ (d) $9x - 4y + 4 = 0$

27. The tangents drawn from the ends of latusrectum of $y^2 = 12x$ meets at
(a) directrix (b) vertex
(c) focus (d) None of these

28. If tangents at A and B on the parabola $y^2 = 4ax$ intersect at point C, then ordinates of A, C and B are
(a) always in AP (b) always in GP
(c) always in HP (d) None of these

29. The number of real tangents that can be drawn to the curve $y^2 + 2xy + x^2 + 2x + 3y + 1 = 0$ from the point $(1, -2)$ is
(a) one (b) two
(c) zero (d) None of these

30. Number of common tangents to the parabola $y^2 = 4ax$ and $x^2 = 4by$ is
(a) 4 (b) 3 (c) 2 (d) 1

31. If the tangent to the parabola $y^2 = ax$ makes an angle of 45° with x-axis, then the point of contact is
(a) $\left(\frac{a}{2}, \frac{a}{2}\right)$ (b) $\left(\frac{a}{4}, \frac{a}{4}\right)$
(c) $\left(\frac{a}{2}, \frac{a}{4}\right)$ (d) $\left(\frac{a}{4}, \frac{a}{2}\right)$

32. Tangent at the vertex divides the distance between directrix and latusrectum in the ratio
(a) 1 : 1
(b) 1 : 2
(c) depends on directrix and focus
(d) None of the above

33. The tangent drawn at any point P to the parabola $y^2 = 4ax$ meets the directrix at the point K, then the angle which KP subtends at its focus is
(a) 30° (b) 45° (c) 60° (d) 90°

34. If the tangents at P and Q on the parabola meet in T, then SP, ST and SQ are in
(a) AP (b) GP
(c) HP (d) None of these

35. AB, AC are tangents to a parabola $y^2 = 4ax$; p_1, p_2, p_3 are the lengths of the perpendiculars from A, B, C on any tangent to the curve, then p_2, p_1, p_3 are in
(a) AP (b) GP
(c) HP (d) None of these

36. Consider the following statements
I. The equation of the parabola whose focus is at the origin is $y^2 = 4a(x + a)$.
II. The line $lx + my + n = 0$ will touch the parabola $y^2 = 4ax$, if $ln = am^2$.
Which of these is/are correct ?
(a) Only (I) (b) Only (II)
(c) Both of these (d) None of these

37. The number of distinct normals that can be drawn to parabola $y^2 = 16x$ from the point (2, 0), is
(a) 1 (b) 2 (c) 3 (d) 0

38. The normal to the parabola $y^2 = 8x$ at the point (2, 4) meets the parabola again at the point
(a) $(-18, -12)$ (b) $(-18, 12)$
(c) $(18, 12)$ (d) $(18, -12)$

39. Three distinct normals to the parabola $y^2 = x$ are drawn through a point $(c, 0)$, then
(a) $c = \frac{1}{4}$ (b) $c = \frac{1}{2}$
(c) $c > \frac{1}{2}$ (d) None of these

40. The arithmetic mean of the ordinates of the feet of the normals from (3, 5) to the parabola $y^2 = 8x$ is
(a) 4 (b) 0
(c) 8 (d) None of these

41. If the normals at two points P and Q of a parabola $y^2 = 4ax$ intersect at a third point R on the curve, then the product of ordinates of P and Q is
(a) $4a^2$ (b) $2a^2$
(c) $-4a^2$ (d) $8a^2$

42. If the tangent and normal at any point P of a parabola meet the axes in T and G respectively, then
(a) $ST \neq SG = SP$ (b) $ST - SG \neq SP$
(c) $ST = SG = SP$ (d) $ST = SG \cdot SP$

43. If two different tangents of $y^2 = 4x$ are the normals to $x^2 = 4by$, then
(a) $|b| > \frac{1}{2\sqrt{2}}$ (b) $|b| < \frac{1}{2\sqrt{2}}$
(c) $|b| > \frac{1}{\sqrt{2}}$ (d) $|b| < \frac{1}{\sqrt{2}}$

Chord of Contact and Diameter

44. Equation of chord of the parabola $y^2 = 16x$ whose mid-point is (1, 1), is
(a) $x + y = 2$ (b) $x - y = 0$
(c) $8x + y = 9$ (d) $8x - y = 7$

45. The chord AB of the parabola $y^2 = 4ax$ cuts the axis of the parabola at C. If $A = (at_1^2, 2at_1)$, $B = (at_2^2, 2at_2)$ and $AC : AB = 1 : 3$, then
(a) $t_2 = 2t_1$ (b) $t_2 + 2t_1 = 0$
(c) $t_1 + 2t_2 = 0$ (d) None of these

46. AB is a chord of the parabola $y^2 = 4ax$ with vertex A, BC is drawn perpendicular to AB meeting the axis at C. The projection of BC on the axis of the parabola is
(a) a (b) $2a$
(c) $4a$ (d) $8a$

47. The focal chord to $y^2 = 16x$ is tangent to $(x - 6)^2 + y^2 = 2$, then the possible values of the slope of this chord are
(a) $\{-1, 1\}$ (b) $\{-2, 2\}$
(c) $\left\{-2, \frac{1}{2}\right\}$ (d) $\left\{2, -\frac{1}{2}\right\}$

Miscellaneous

48. If a parabolic reflector is 20 cm in diameter and 5 cm deep, then the focus is [NCERT]
(a) (0, 5) (b) (5, 0)
(c) (0, –5) (d) (–5, 0)

49. Find the area of the triangle formed by the lines joining the vertex of the parabola $x^2 = 12y$ to the ends of its latusrectum. [NCERT]
(a) 19 sq units (b) 18 sq units
(c) 20 sq units (d) 17 sq units

50. Find the length of the line segment joining the vertex of the parabola $y^2 = 4ax$ and a point on the parabola where the line segment makes an angle θ to the x-axis. [NCERT Exemplar]
(a) $\frac{2a \cos\theta}{\sin^2\theta}$ (b) $\frac{4a \cos\theta}{\sin^2\theta}$
(c) $\frac{4a \cos\theta}{3 \sin^2\theta}$ (d) None of these

51. The equation of the parabola whose focus is the point (0, 0) and the tangent at the vertex is $x - y + 1 = 0$, is
(a) $x^2 + y^2 - 2xy - 4x + 4y - 4 = 0$
(b) $x^2 + y^2 - 2xy + 4x - 4y - 4 = 0$
(c) $x^2 + y^2 + 2xy - 4x + 4y - 4 = 0$
(d) $x^2 + y^2 + 2xy - 4x - 4y + 4 = 0$

52. The parabola $y^2 = 8x$ and the circle $x^2 + y^2 = 2$
(a) have only two common tangents which are mutually perpendicular
(b) have only two common tangents which are parallel to each other
(c) have infinitely many common tangents
(d) does not have any common tangent

53. On the parabola $y = x^2$, the point atleast distance from the straight line $y = 2x - 4$ is
(a) (1, 1) (b) (1, 0)
(c) (1, −1) (d) (0, 0)

54. Angle between the tangents drawn to $y^2 = 4x$ at the points where it is intersected by the line $y = x - 1$ is equal to
(a) $\frac{\pi}{4}$ (b) $\frac{\pi}{3}$ (c) $\frac{\pi}{6}$ (d) $\frac{\pi}{2}$

55. The circle $x^2 + y^2 + 2\lambda x = 0$, $\lambda \in R$, touches the parabola $y^2 = 4x$ externally. Then,
(a) $\lambda > 0$ (b) $\lambda < 0$
(c) $\lambda > 1$ (d) None of these

56. The shortest distance between the parabola $y^2 = 4x$ and the circle $x^2 + y^2 + 6x - 12y + 20 = 0$ is
(a) $4\sqrt{2} - 5$ (b) 0 (c) $3\sqrt{2} + 5$ (d) 1

57. The ends of a line segment are $P(1, 3)$ and $Q(1, 1)$. R is a point on the line segment PQ such that $PR : QR = 1 : \lambda$. If R is an interior point of the parabola $y^2 = 4x$, then
(a) $\lambda \in (0, 1)$ (b) $\lambda \in \left(-\frac{3}{5}, 1\right)$
(c) $\lambda \in \left(\frac{1}{2}, \frac{3}{5}\right)$ (d) None of these

Round II (Mixed Bag)

Only One Correct Option

1. The shortest distance between the parabolas $y^2 = 4x$ and $y^2 = 2x - 6$ is
(a) 2 (b) $\sqrt{5}$
(c) 3 (d) None of these

2. A parabola is drawn with focus at (3, 4) and vertex at the focus of the parabola $y^2 - 12x - 4y + 4 = 0$. The equation of the parabola is
(a) $x^2 - 6x - 8y + 25 = 0$ (b) $y^2 - 8x - 6y + 25 = 0$
(c) $x^2 - 6x + 8y - 25 = 0$ (d) $x^2 + 6x - 8y - 25 = 0$

3. The equation of the parabola whose focus is the point (0, 0) and the tangent at the vertex is $x - y + 1 = 0$ is
(a) $x^2 + y^2 - 2xy - 4x - 4y - 4 = 0$
(b) $x^2 + y^2 - 2xy + 4x - 4y - 4 = 0$
(c) $x^2 + y^2 + 2xy - 4x + 4y - 4 = 0$
(d) $x^2 + y^2 + 2xy - 4x - 4y + 4 = 0$

4. Axis of a parabola is $y = x$ and vertex and focus are at a distance $\sqrt{2}$ and $2\sqrt{2}$ respectively from the origin. Then, equation of the parabola is
(a) $(x - y)^2 = 8(x + y - 2)$ (b) $(x + y)^2 = 2(x + y - 2)$
(c) $(x - y)^2 = 4(x + y - 2)$ (d) $(x + y)^2 = 2(x - y + 2)$

5. If y_1, y_2 and y_3 are the ordinates of the vertices of a triangle inscribed in the parabola $y^2 = 4ax$, then its area is
(a) $\frac{1}{2a}(y_1 - y_2)(y_2 - y_3)(y_3 - y_1)$
(b) $\frac{1}{4a}(y_1 - y_2)(y_2 - y_3)(y_3 - y_1)$
(c) $\frac{1}{8a}(y_1 - y_2)(y_2 - y_3)(y_3 - y_1)$
(d) None of the above

6. The locus of a point on the variable parabola $y^2 = 4ax$, whose distance from focus is always equal to k, is equal to (a is parameter)
(a) $4x^2 + y^2 - 4kx = 0$ (b) $x^2 + y^2 - 4kx = 0$
(c) $2x^2 + 4y^2 - 8kx = 0$ (d) $4x^2 - y^2 + 4kx = 0$

7. The length of the chord of the parabola $y^2 = x$ which is bisected at the point (2, 1) is
(a) $2\sqrt{3}$ (b) $4\sqrt{3}$
(c) $3\sqrt{2}$ (d) $2\sqrt{5}$

8. The ΔPQR of area A is inscribed in the parabola $y^2 = 4ax$ such that the vertex P lies at the vertex of the parabola and the base QR is a focal chord. The modules of the difference of the ordinates of the points Q and R is
(a) $\frac{A}{2a}$ (b) $\frac{A}{a}$
(c) $\frac{2A}{a}$ (d) $\frac{4A}{a}$

More Than One Correct Option

9. Let P be a point whose coordinates differ by unity and the point does not lie on any of the axes of reference. If the parabola $y^2 = 4x + 1$ passes through P, then the ordinate of P may be
(a) 3 (b) −1
(c) 5 (d) 1

10. Parabola $y^2 = 4x$ and the circle having it's centre at (6, 5) intersect at right angle. Possible point of intersection of these curves can be
(a) (9, 6) (b) $(2, \sqrt{8})$ (c) (4, 4) (d) $(3, 2\sqrt{3})$

Comprehension Based Questions

Passage

Directions (Q. Nos. 11-13) *Tangent to the parabola $y = x^2 + ax + 1$, at the point of intersection of y-axis also touches the circle $x^2 + y^2 = r^2$. Also, no point of the parabola is below the x-axis.*

11. The radius of circle when a attains its maximum value
(a) $\frac{1}{\sqrt{10}}$ (b) $\frac{1}{\sqrt{5}}$ (c) 1 (d) $\sqrt{5}$

12. The slope of the tangent when radius of the circle is maximum is
(a) 1 (b) 1 (c) 0 (d) 2

13. The minimum area bounded by the tangent and the coordinate axes is
(a) 1 (b) $\frac{1}{3}$ (c) $\frac{1}{2}$ (d) $\frac{1}{4}$

Assertion and Reason

Directions (Q. Nos. 14-18) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*) *and* (*d*) *given below.*
(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

14. **Statement I** If normal at the ends of double ordinate $x = 4$ of parabola $y^2 = 4x$ meet the curve again at P and P' respectively, then $PP' = 12$ units.

Statement II If normal at t_1 of $y^2 = 4ax$ meet the parabola again at t_2, then $t_2 = t_1 - \frac{2}{t_1}$.

15. **Statement I** The lines from the vertex to the two extremities of a focal chord of the parabola $y^2 = 4ax$ are at an angle of $\frac{\pi}{2}$.

Statement II If extremities of focal chord of parabola are $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$, then $t_1t_2 = -1$.

16. **Statement I** The latusrectum of a parabola is 4 units, axis is the line $3x + 4y - 4 = 0$ and the tangent at the vertex is the line $4x - 3y + 7 = 0$, then the equation of directrix of the parabola is $4x - 3y + 8 = 0$.

Statement II If P be any point on the parabola and let PM and PN are perpendiculars from P on the axis and tangent at the vertex respectively, then $(PM)^2 = (\text{latusrectum})(PN)$

17. **Statement I** Slope of tangents drawn from (4, 10) to parabola $y^2 = 9x$ are $\frac{1}{4}, \frac{9}{4}$.

Statement II Two tangents can be drawn to parabola from any point lying outside parabola.

18. **Statement I** In parabola $y^2 = 4ax$, the circle drawn taking focal radii as diameter touches y-axis.

Statement II The portion of the tangent intercepted between point of contact and directrix subtends 90° angle at focus.

Previous Years' Questions

19. If two tangents drawn from a point P to the parabola $y^2 = 4x$ are at right angles, then the locus of P is **[AIEEE 2010]**
(a) $x = 1$ (b) $2x + 1 = 0$ (c) $x = -1$ (d) $2x - 1 = 0$

20. A parabola has the origin as its focus and the line $x = 2$ as the directrix. Then, the vertex of the parabola is at **[AIEEE 2008]**
(a) (2, 0) (b) (0, 2) (c) (1, 0) (d) (0, 1)

21. The equation of the tangent to the parabola $y^2 = 8x$ is $y = x + 2$. The point on this line from which the other tangent to the parabola is perpendicular to the given tangent is **[AIEEE 2007]**
(a) (0, 2) (b) (2, 4)
(c) (–2, 0) (d) (–1, 1)

22. The locus of the vertices of the family of parabolas $y = \frac{a^3x^2}{3} + \frac{a^2x}{2} - 2a$ is **[AIEEE 2006]**
(a) $xy = \frac{35}{36}$ (b) $xy = \frac{64}{105}$ (c) $xy = \frac{105}{64}$ (d) $xy = \frac{3}{4}$

23. Let P be the point (1, 0) and Q a point on the locus $y^2 = 8x$. The locus of mid-point of PQ is **[AIEEE 2005]**
(a) $x^2 - 4y + 2 = 0$ (b) $x^2 + 4y + 2 = 0$
(c) $y^2 + 4x + 2 = 0$ (d) $y^2 - 4x + 2 = 0$

24. If $a \neq 0$ and the line $2bx + 3cy + 4d = 0$ passes through the points of intersection of the parabolas $y^2 = 4ax$ and $x^2 = 4ay$, then **[AIEEE 2004]**
(a) $d^2 + (2b + 3c)^2 = 0$ (b) $d^2 + (3b + 2c)^2 = 0$
(c) $d^2 + (2b - 3c)^2 = 0$ (d) $d^2 + (3b + 2c)^2 = 0$

the Guidance

Round I

1. Equation $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$ represents parabola, if $h^2 = ab$.

2. Point (x, y) is the set of points equidistant from point (2, 3) and the line $3x + 4y - 2 = 0$. So, the given equation represents a parabola.

3. Since, the equation of latusrectum and equation of tangent both are parallel and they lie in the same side of the origin

$$\therefore \quad a = \left|\frac{-8+12}{\sqrt{1^2+1^2}}\right| = \frac{4}{\sqrt{2}} = 2\sqrt{2}$$

$\therefore$ Length of latusrectum $= 4a = 4(2\sqrt{2}) = 8\sqrt{2}$

4. Let any point on the parabola be $(at^2, 2at)$.

If the equation of parabola is $y^2 = 4ax$, then focus is $(a, 0)$.

Let the locus of a point be (α, β), if it is a mid-point.

$$\therefore \quad \alpha = \frac{at^2 + a}{2}, \quad \beta = \frac{2at + 0}{2}$$

$$\Rightarrow \quad 2\alpha = at^2 + a, \quad \beta = at$$

$$\therefore \quad 2\alpha = a\left(\frac{\beta}{a}\right)^2 + a$$

$$\Rightarrow \quad 2a\alpha = \beta^2 + a^2$$

$$\Rightarrow \quad \beta^2 = -a^2 + 2a\alpha$$

$$\Rightarrow \quad \beta^2 = \frac{4a}{2}\left(\alpha - \frac{a}{2}\right)$$

$\therefore$ The locus is $y^2 = \frac{4a}{2}\left(x - \frac{a}{2}\right)$.

The directrix is $X = -\frac{a}{2}$

$$\Rightarrow \quad x - \frac{a}{2} = -\frac{a}{2}$$

$$\Rightarrow \quad x = 0$$

5. The given equation of parabola is

$$y^2 = 8x$$

Here, $a = 2$

$\therefore$ Equation of directrix is $x + 2 = 0$

Let $P(x_1, y_1)$ be the point on the parabola.

$$\therefore \quad y_1^2 = 8x_1 \quad \ldots(i)$$

Also, $SP = 4 = PM$, where S and M are focus and point on directrix.

$$\therefore \quad x_1 + 2 = 4$$

$$\Rightarrow \quad x_1 = 2$$

On putting the value of x_1 in Eq. (i), we get

$$y_1^2 = 8 \times 2 = 16$$

$\Rightarrow$ $$y_1 = \pm 4$$

Hence, the coordinates of required points are (2, 4) and (2, – 4).

6. Since, the parabola $y^2 = 4ax$ passes through the point (3, 2).

$\therefore$ $$(2)^2 = 4a(3)$$

$\Rightarrow$ $$4 = 12a \Rightarrow a = \frac{1}{3}$$

$\therefore$ Length of latusrectum = $4a$

$$= 4 \times \frac{1}{3} = \frac{4}{3}$$

7. Given equation of parabola is $x^2 = -9y$, which is of the form $x^2 = -4ay$ *i.e.*, focus lies on the negative direction of y-axis

Here, $$4a = 9 \Rightarrow a = \frac{9}{4}$$

$\therefore$ Equation of directrix, $y = a$

$\Rightarrow$ $$y = \frac{9}{4}$$

and length of latusrectum = $4a = 9$

8. Since, the point $(9a, 6a)$ is bounded in the region formed by the parabola $y^2 = 16x$ and $x = 9$, then

$$y^2 - 16x < 0, \quad x - 9 < 0$$

$\Rightarrow$ $$36a^2 - 16 \cdot 9a < 0, \quad 9a - 9 < 0$$

$\Rightarrow$ $$36a(a-4) < 0, \quad a < 1$$

$$0 < a < 4, \quad a < 1 \Rightarrow 0 < a < 1$$

9. Given equation of parabola is rewritten as

$$169\{(x-1)^2 + (y-3)^2\} = (13)^2\left\{\left(\frac{5x-12y+17}{13}\right)^2\right\}$$

$\Rightarrow$ $$(x-1)^2 + (y-3)^2 = \left(\frac{5x-12y+17}{13}\right)^2$$

$\Rightarrow$ $$SP = PM$$

$\therefore$ Focus is (1, 3) and equation of directrix is

$$5x - 12y + 17 = 0$$

The distance of the focus from directrix $= \left|\frac{5-36+17}{\sqrt{25+144}}\right| = \frac{14}{13}$

$\therefore$ Length of latusrectum $= 2 \times \frac{14}{13} = \frac{28}{13}$

10. Given equation is

$$y^2 - 8y - x + 19 = 0$$

$\Rightarrow$ $$(y-4)^2 = x - 3$$

$\Rightarrow Y^2 = 4AX$, where $Y = y - 4$, $A = \frac{1}{4}$ and $X = x - 3$

$\therefore$ Focus is $(A, 0) = \left(\frac{1}{4}, 0\right) = \left(\frac{13}{4}, 4\right)$

Vertex is $(0, 0) = (3, 4)$

Directrix is $x = -A \Rightarrow x - 3 = -\frac{1}{4}$

$\Rightarrow$ $$x = \frac{11}{4}$$

11. If $x = a\sin^2 t \Rightarrow y^2 = 4a(a\sin^2 t)$

$\Rightarrow$ $$y = \pm 2a\sin t$$

$\therefore$ Option (c) is correct.

12. Given parametric equation of parabola is

$$x = t^2 + 1, \quad y = 2t + 1$$

$\Rightarrow$ $$x = \left(\frac{y-1}{2}\right)^2 + 1$$

$\Rightarrow$ $$(y-1)^2 = 4(x-1)$$

$\Rightarrow$ $$Y^2 = 4X$$

Vertex is (1, 1), length of latusrectum = 4

Clearly, equation of directrix is

$$X = -1 \Rightarrow x - 1 = -1 \Rightarrow x = 0$$

13. Since, the semi-latusrectum of a parabola is HM of segments of a focal chord.

$\therefore$ Semi-latusrectum $= \frac{2\,SP \cdot SQ}{SP + SQ} = \frac{2 \times 3 \times 2}{3+2} = \frac{12}{5}$

$\Rightarrow$ Latusrectum of the parabola $= 2 \times$ Semi-latusrectum $= \frac{24}{5}$

14. Since, focal chord of parabola $y^2 = ax$ is $2x - y - 8 = 0$

$\because$ This chord passes through focus *i.e.*, $\left(\frac{a}{4}, 0\right)$

$\therefore$ $$2 \cdot \frac{a}{4} - 0 - 8 = 0$$

$\Rightarrow$ $$a = 16$$

$\therefore$ Directrix is $x = -4 \Rightarrow x + 4 = 0$

15. Let $S \equiv y^2 - 4y + 9x + 13 = 0$

At point (– 2, 2),

$$S_1 = (2)^2 - 4(2) + 9(-2) + 13$$

$$= 4 - 8 - 18 + 13 = -9 < 0$$

Hence, given point lies inside the parabola.

16. Let A be the vertex of the parabola and AP is chord of parabola such that slope of AP is $\cot\alpha$.

Let coordinates of P be $(2t, t^2)$ which is a point on the parabola.

$\therefore$ $$\text{Slope of } AP = \frac{t}{2}$$

$\Rightarrow$ $$\cot\alpha = \frac{t}{2}$$

$\Rightarrow$ $$t = 2\cot\alpha$$

In ΔAPB, $AP = \sqrt{4t^2 + t^4}$

$$= t\sqrt{4 + t^2}$$

$$\therefore \quad AP = 2\cot\alpha\sqrt{4(1+\cot^2\alpha)}$$
$$= 2\cot\alpha\sqrt{4\,\text{cosec}^2\alpha} = 4\cot\alpha\,\text{cosec}\,\alpha$$
$$= 4\frac{\cos\alpha}{\sin\alpha}\text{cosec}\,\alpha = 4\cos\alpha\,\text{cosec}^2\alpha$$

17. **Hint** Given equation can be rewritten as
$$y^2 = \frac{4k}{4}\left(x - \frac{8}{k}\right).$$
The standard equation of parabola is
$$Y^2 = 4AX, \text{ where } A = \frac{k}{4}$$
$\therefore$ Equation of directrix is $X + \frac{k}{4} = 0$

18. Given focus, $S = (0, -3)$ and directrix $y - 3 = 0$. By definition of parabola,
$$PM^2 = PS^2$$
$$\therefore \quad \left[\frac{y-3}{\sqrt{1}}\right]^2 = (x-0)^2 + (y+3)^2$$
$$\Rightarrow \quad y^2 + 9 - 6y = x^2 + y^2 + 9 + 6y$$
$$\Rightarrow \quad x^2 = -12y$$

19. **Hint** Given vertex $(-3, 0)$ and directrix $x + 5 = 0$

Let the coordinate of focus be $5(a, 0)$.

We know vertex is the mid-point of directrix and focus.

$$\therefore \quad (-3, 0) = \left(\frac{-5+a}{2}, 0\right)$$
$$\Rightarrow \quad -3 = \frac{-5+a}{2} \Rightarrow a = -1$$
$\therefore$ Coordinate of focus is $(-1, 0)$.

By definition of parabola,
$$PM^2 = PS^2$$

20. Given, vertex $= (0, 4)$ and focus $= (0, 2)$

Here, we see that in both coordinates x-coordinate is zero. It means axis of parabola, is on y-axis and the parabola is open downward.

Let the equation of parabola be
$$(x-0)^2 = -4a(y-4) \quad \ldots(\text{i})$$
$\because a =$ distance between focus and vertex
$$= \sqrt{0^2 + (2-4)^2} = 2$$
On putting $a = 2$ in Eq. (i), we get
$$x^2 = -4 \times 2(y-4)$$
$$\Rightarrow \quad x^2 + 8y = 32 \text{ or } x^2 + 8y - 32 = 0$$

21. Given vertex $= (0, 0)$, point $= (2, 3)$ and axis $= x$-axis.

Since, point $(2, 3)$ lies in first quadrant and axis is x-axis.

Hence, equation of parabola will be of the form $y^2 = 4ax$, which passes through $(2, 3)$

i.e., $\quad (3)^2 = 4a \times (2) \Rightarrow a = \frac{9}{8}$

$\therefore$ Required equation of parabola is
$$y^2 = 4\left(\frac{9}{8}\right)x \Rightarrow y^2 = \frac{9}{2}x$$

22. Given equation of parabola is $y^2 = 4ax$. Since, $AB = 8a$, it means ordinate of A and B respectively $4a$ and $-4a$. General point on this parabola is $(at^2, 2at) \Rightarrow t = \pm 2$

So, $\quad at^2 = 4a$

$\therefore \quad OM = 4a, \quad AM = 4a$

So, $\quad \angle AOM = 45°$

$\therefore$ The $\angle AOB$ is $90°$.

23. The point of intersection between the curves $x^2 = 4(y+1)$ and $x^2 = -4(y+1)$ is $(0, -1)$.

The slopes of curve first and curve second at the point $(0, -1)$ are respectively
$$m_1 = \frac{2x}{4} = 0 \text{ and } m_2 = \frac{-2x}{4} = 0$$
$$\therefore \quad \tan\theta = \frac{m_1 - m_2}{1 + m_1 m_2} = 0 \Rightarrow \theta = 0°$$

24. Given equation of line is
$$x\cos\alpha + y\sin\alpha = p$$
or $\quad y = -x\cot\alpha + p\,\text{cosec}\,\alpha$

Here, $\quad m = -\cot\alpha$

We know that, the point of contact is $\left(\frac{a}{m^2}, \frac{2a}{m}\right)$
$$= \left[\frac{a}{(-\cot\alpha)^2}, \frac{2a}{-\cot\alpha}\right]$$
$$= (a\tan^2\alpha, -2a\tan\alpha)$$

25. Since, the tangent to the parabola at point t_1 and t_2 are $t_1y = x + at_1^2$ and $t_2y = x + at_2^2$.

Also, tangents are perpendicular to the parabola therefore,

$$\frac{1}{t_1}\cdot\frac{1}{t_2} = -1$$

or $$t_1t_2 = -1$$

We also know that their point of intersection is

$$[at_1t_2, a(t_1+t_2)] \text{ or } [-a, a(t_1+t_2)]$$

$\therefore$ Point of intersection lie on directrix $x = -a$ or $x + a = 0$

26. Given that equation of parabola is $y^2 = 9x$

On comparing with $y^2 = 4ax$, we get $a = \frac{9}{4}$

Now, equation of tangent to the parabola $y^2 = 9x$ is

$$y = mx + \frac{9/4}{m} \quad \text{...(i)}$$

If this tangent passing through the point (4, 10), then

$$10 = 4m + \frac{9}{4m}$$

$\Rightarrow$ $$16m^2 - 40m + 9 = 0$$

$\Rightarrow$ $$(4m-9)(4m-1) = 0$$

$\Rightarrow$ $$m = \frac{1}{4}, \frac{9}{4}$$

On putting the values of m in Eq. (i),

$$4y = x + 36 \quad \text{and} \quad 4y = 9x + 4$$

$\Rightarrow$ $x - 4y + 36 = 0$ and $9x - 4y + 4 = 0$

27. The coordinates of end point of latusrectum are $(a, 2a)$ and $(a, -2a)$ *i.e.*, (3, 6) and $(3, -6)$.

The equation of directrix is $x = -3$.

The equation of tangents from the above points are $6y = 6(x+3)$ and $-6y = 6(x+3)$

$\Rightarrow$ $$x - y + 3 = 0$$

and $$x + y + 3 = 0$$

The intersection point is $(-3, 0)$.

The equation of the directrix of the parabola $y^2 = 12x$ is $x = -3$

$\Rightarrow$ Intersection point $(-3, 0)$ lies on the directrix.

28. Let $A \equiv (at_1^2, 2at_1)$, $B \equiv (at_2^2, 2at_2)$.

Tangents at A and B will intersect at the point C, whose coordinate is given by $\{at_1t_2, a(t_1+t_2)\}$. Clearly, ordinates of A, C and B are always in AP.

29. Given equation of curve is $y^2 + 2xy + x^2 + 2x + 3y + 1 = 0$. Here, $h^2 = ab$, therefore the given curve is a parabola. The position of the point $(1, -2)$ with respect to the parabola is obtained as

$$(-2)^2 + 2(1)(-2) + (1)^2 + 2(1) + 3(-2) + 1 = -2 < 0$$

Since, point is inside the parabola therefore no tangent can be drawn to the parabola.

30. It is clear from the figure, that only one common tangent is possible.

31. Given parabola is $y^2 = ax$

i.e., $$y^2 = 4\left(\frac{a}{4}\right)x \quad \text{...(i)}$$

Let point of contact is (x_1, y_1), then equation of tangent is

$$yy_1 = \frac{a}{2}(x + x_1)$$

Here, $$m = \frac{a}{2y_1} = \tan 45° \Rightarrow \frac{a}{2y_1} = 1 \Rightarrow y_1 = \frac{a}{2}$$

From Eq. (i), $$x_1 = \frac{a}{4}$$

$\therefore$ Point of contact is $\left(\frac{a}{4}, \frac{a}{2}\right)$.

32. As we know that distance from vertex to the parabola is equal to the focus and directrix.

$\therefore$ The tangent at the vertex divide in the ratio 1 : 1.

33. Let $P(at^2, 2at)$ any point on the parabola and focus is $(a, 0)$.

The equation of tangent at P is $yt = x + at^2$.

Since, it meets the directrix $x = -a$ at K.

Then, the coordinate of K is $\left(-a, \frac{at^2 - a}{t}\right)$.

$$\text{Slope of } SP = m_1 = \frac{2at}{a(t^2-1)}$$

$$\text{Slope of } SK = m_2 = \frac{a(t^2-1)}{-2at}$$

$\therefore$ $$m_1m_2 = \frac{2at}{a(t^2-1)}\cdot\frac{a(t^2-1)}{(-2at)} = -1$$

$\therefore$ $$\angle PSK = 90°$$

34. Since, tangent at P and Q on the parabola meet in T.

If the coordinates of P and Q are $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$ respectively, then coordinates of T are $\{at_1t_2, a(t_1+t_2)\}$.

$\therefore \quad SP = a(1+t_1^2)$

$SQ = a(1+t_2^2)$

$ST^2 = a^2(1-t_1t_2)^2 + a^2(t_1+t_2)^2$

$= a^2(1+t_1^2+t_2^2+t_1^2t_2^2)$

$= a(1+t_1^2)\,a(1+t_2^2) = SP \cdot SQ$

Thus, SP, ST, SQ are in GP.

35. Let third tangent is tangent at vertices, then

$p_1 = |at_1t_2|, p_2 = at_1^2, p_3 = at_2^2$, clearly p_2, p_1, p_3 are in GP.

36. **Statement I** Given equation of parabola is

$y^2 = 4a(x+a)$ or $Y^2 = 4aX$

$\therefore$ Focus is $(a, 0)$

$\Rightarrow \quad x+a = a, \quad y = 0$

$\Rightarrow \quad x = 0, \quad y = 0$

$\therefore$ Focus is at origin (0, 0).

Statement II Given equation of line is $y = -\frac{lx}{m} - \frac{n}{m}$.

It will touch the parabola $y^2 = 4ax$, if

$$-\frac{n}{m} = \frac{a}{-\frac{l}{m}} \Rightarrow nl = am^2$$

$\therefore$ Both statements are true.

37. The equation of normal is

$y = mx - 8m - 4m^3 \qquad (\because y = mx - 2am - am^3)$

Since, it is passing through (2, 0).

$\therefore \quad 0 = 2m - 8m - 4m^3$

$\Rightarrow \quad m = 0$ and $2m^2 = -3$ (no real value exist)

Only one real value of m exist.

$\therefore$ One normal can be drawn.

38. Given that equation of parabola is $y^2 = 8x$.

$\Rightarrow \quad a = 2$

We know, if the normal at point $(at_1^2, 2at_1)$ is passing through the point on the parabola $(at_2^2, 2at_2)$, then $t_2 = -t_1 - \frac{2}{t_1}$

Given point is (2, 4).

$\Rightarrow \quad at_1^2 = 2$

$\Rightarrow \quad t_1 = 1$

$\therefore \quad t_2 = -1 - \frac{2}{1} = -3$

The other end will be $(at_2^2, 2at_2)$ *i.e.*, $(18, -12)$

39. Equation of normal is $y = mx - \frac{m}{2} - \frac{m^3}{4}\left(a = \frac{1}{4}\right)$. It passes through $(c, 0)$.

$\therefore \quad 0 = cm - \frac{m}{2} - \frac{m^3}{2} \Rightarrow m = 0$

and $\quad \frac{m^2}{4} = c - \frac{1}{2} \Rightarrow c > \frac{1}{2}$

Then, all values of m are real.

40. Sum of ordinates of feet of normals drawn from a point is zero.

So, there arithmetic mean is zero.

41. Let the coordinates of P and Q are $(at_1^2, 2at_1)$ and $(at_2^2, 2at_2)$ respectively. Then, the coordinates of R are $\{2a + a(t_1^2+t_2^2+t_1t_2), -at_1t_2(t_1+t_2)\}$.

Since, R lies on the parabola.

$\therefore \quad a^2t_1^2t_2^2(t_1+t_2)^2 = 4a[2a + a\{(t_1+t_2)^2 - t_1t_2\}]$

$\Rightarrow \quad (t_1+t_2)^2\{t_1^2t_2^2 - 4\} + 4(t_1t_2 - 2) = 0$

$\Rightarrow \quad t_1t_2 = 2$

$\Rightarrow \quad y_1y_2 = (2at_1)(2at_2) = 4a^2t_1t_2$

$\therefore \quad y_1y_2 = 8a^2$

42. Let $P(at^2, 2at)$ be any point on the parabola $y^2 = 4ax$, then equation of tangent and normal at $P(at^2, 2at)$ are $ty = x + at^2$ and $y = -tx + 2at + at^3$, respectively.

Since, tangent and normal meet its axis at T and G.

$\therefore$ Coordinates of T and G are $(-at^2, 0)$ and $(2a + at^2, 0)$ respectively.

From definition of parabola

$SP = PM = a + at^2$

Now, $\quad SG = VG - VS = 2a + at^2 - a = a + at^2$

and $\quad ST = VS + VT = a + at^2$

Hence, $\quad SP = SG = ST$

43. Let $y = mx + \frac{1}{m}$ is a tangent to $y^2 = 4ax$.

Equation of normal to the parabola $x^2 = 4by$ at (x_1, y_1) is

$$y - y_1 = -\frac{2b}{x_1}(x - x_1)$$

and $\quad x_1^2 = 4by_1$

$\Rightarrow \quad y-\frac{x_1^2}{4b}=-\frac{2b}{x_1}(x-x_1)$

$\Rightarrow \quad y=-\frac{2b}{x_1}x+\frac{x_1^2}{4b}+2b$

On comparing with $y=mx+\frac{1}{m}$, we get

$$m=-\frac{2b}{x_1} \quad \text{...(i)}$$

$$\frac{x_1^2}{4b}+2b=\frac{1}{m} \quad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{4b^2}{m^2 4b}+2b=\frac{1}{m}$$

$\Rightarrow \quad b+2bm^2=m$

$\Rightarrow \quad 2bm^2-m+b=0$

For real values of m, $D>0$

$\Rightarrow \quad 1-8b^2>0 \Rightarrow b^2<\frac{1}{8} \Rightarrow |b|<\frac{1}{2\sqrt{2}}$

44. Given equation of parabola is $y^2=16x$.

If (1, 1) is the mid-point of the chord, then its equation of chord is

$T=S_1$

$\therefore \quad y(1)-8(x+1)=1-16$

$\Rightarrow \quad y-8x-8=-15$

$\Rightarrow \quad 8x-y=7$

45. $\because A(at_1^2, 2at_1)$ and $B(at_2^2, 2at_2)$ are such that $AC:AB=1:3$

$\therefore$ Coordinates of C are $\left(\frac{2at_1^2+at_2^2}{3}, \frac{4at_1+2at_2}{3}\right)$.

Point C lies on x-axis, then

$$\frac{4at_1+2at_2}{3}=0$$

$\Rightarrow \quad t_2+2t_1=0$

46. Given equation of parabola is $y^2=4ax$.

Let the coordinates of B are $(at^2, 2at)$.

Slope of $AB=\frac{2}{t}$

Since, BC is perpendicular to AB.

So, slope of $BC=-\frac{t}{2}$

Equation of BC is $y-2at=-\frac{t}{2}(x-at^2)$.

This line meets to the x-axis at point C.

Put $\quad y=0 \Rightarrow x=4a+at^2$

So, distance $CD=4a+at^2-at^2=4a$

47. Given equation of circle is $(x-6)^2+y^2=(\sqrt{2})^2$

$BC=\text{Radius}=\sqrt{2}$

The length of the tangent from S to B.

$\therefore \quad SB=\sqrt{(4-6)^2+0-2}=\sqrt{2^2-2}=\sqrt{2}$

From figure, ΔCBS is an isosceles triangle.

$\Rightarrow \quad \theta=45° \Rightarrow m=1 \quad (\because BC=BS)$

Similarly, for ΔCSD, $m=-1$

48. Taking vertex of the parabolic reflector at origin, x-axis along the axis of parabola. The equation of the parabola is $y^2=4ax$.

Given depth is 5 cm, diameter is 20 cm.

$\because$ Point $P(5, 10)$ lies on parabola.

$\therefore \quad (10)^2=4a(5) \Rightarrow a=5$

Clearly, focus is at the mid-point of given diameter

i.e., $\quad S=(5, 0)$

49. Clearly, latusrectum is a line perpendicular to the axes and passing through focus whose length is $4a$.

Given, $x^2=12y$, which is of the form $x^2=4ay$

$\Rightarrow \quad 4a=12=\text{Length of } ABC$

$\therefore \quad \text{Focus } C=(0, 3)$

Area of $\Delta OAB=\frac{1}{2}\times AB\times OC$

$=\frac{1}{2}\times 12\times 3=6\times 3=18$ sq units

50. Let any point (h, k) will satisfy

$$y^2 = 4ax \text{ i.e., } k^2 = 4ah \quad \ldots(i)$$

Let a line OP makes an angle θ from the x-axis

$\therefore$ In ΔOAP, $\sin\theta = \dfrac{PA}{OP}$

$$\sin\theta = \frac{k}{l}$$

$\Rightarrow \quad k = l\sin\theta$ and $\cos\theta = \dfrac{OA}{OP}$

$\Rightarrow \quad \cos\theta = \dfrac{h}{l} \Rightarrow h = l\cos\theta$

Hence, from Eq. (i), we get

$$l^2\sin^2\theta = 4a \times l\cos\theta \quad (\text{put } k = l\sin\theta, h = l\cos\theta)$$

$$\Rightarrow \quad l = \frac{4a\cos\theta}{\sin^2\theta}$$

51. Given that focus is $S(0, 0)$.

Let A is the vertex of parabola. Take any point Z on the directrix such that $AS = AZ$. Since, the given tangent $x - y + 1 = 0$ is parallel to the directrix.

Equation of directrix is $x - y + \lambda = 0$.

$\because$ A is the mid-point of SZ.

$\therefore \quad SZ = 2\,SA$

$$\Rightarrow \quad \frac{|0 - 0 + \lambda|}{\sqrt{1^2 + 1^2}} = 2 \times \frac{|0 - 0 + 1|}{\sqrt{1^2 + 1^2}}$$

$\Rightarrow \quad |\lambda| = 2 \Rightarrow \lambda = 2$

$\therefore$ Equation of directrix is $x - y + 2 = 0$.

Now, P be any point on the parabola.

$\therefore \quad SP = PM \Rightarrow SP^2 = PM^2$

$$\Rightarrow \quad (x-0)^2 + (y-0)^2 = \left(\frac{|x - y + 2|}{\sqrt{2}}\right)^2$$

$$\Rightarrow \quad x^2 + y^2 + 2xy - 4x + 4y - 4 = 0$$

52. Let the equation $y = mx + c$ be the common tangents, so the curve $y^2 = 8x$ and $x^2 + y^2 = 2$.

Then, $\quad c = \dfrac{2}{m}$ and $c^2 = 2(1 + m^2)$

If $m^2 = t$, then

$$\frac{4}{t} = 2(1 + t) \Rightarrow t^2 + t - 2 = 0$$

$$\Rightarrow \quad (t + 2)(t - 1) = 0 \Rightarrow t = 1, -2$$

Thus, $\quad m = \pm 1 \quad (\because t \neq -2)$

Hence, tangents are $y = x + c$ and $y = -x + c$ which are perpendicular to each other.

53. Given equation of parabola is $y = x^2 \quad \ldots(i)$

Equation of straight line is $y = 2x - 4 \quad \ldots(ii)$

On solving Eqs. (i) and (ii), we get

$$x^2 - 2x + 4 = 0$$

Let $\quad z = x^2 - 2x + 4$

$\therefore \quad z' = 2x - 2$

For least value, $z' = 0 \Rightarrow 2x - 2 = 0 \Rightarrow x = 1$

z'' is positive at $x = 1$.

$\therefore$ It is minimum, putting $x = 1$ in Eq. (i), we get

$$y = 1$$

So, the required point at the least distance from the line is $(1, 1)$.

54. Since, the line $y = x - 1$ passes through focus $(1, 0)$

$\Rightarrow y = x - 1$ is a focal chord.

So, angle between tangent is $\dfrac{\pi}{2}$

55. Centre of circle must on negative x-axis for that λ must be positive as centre of circle is $(-\lambda, 0)$.

$\therefore$ Option (a) is correct.

56. Normal at a point $(m^2, -2m)$ on the parabola $y^2 = 4x$ is given by $y = mx - 2m - m^3$. If this is normal to the circle also, then it will passes through centre $(-3, 6)$ of the circle.

$\therefore \quad 6 = -3m - 2m - m^3 \Rightarrow m = -1$

Since, shortest distance between parabola and circle will occurs along common normal.

$\therefore$ Shortest distance = distance between $(m^2, -2m)$ and centre $(-3, 6)$ – radius of circle $= 4\sqrt{2} - 5$

57. Let any point on the line segment PQ is $R(\alpha, \beta)$, then

$$\alpha = \frac{\lambda(1) + 1}{\lambda + 1} = 1$$

and $\quad \beta = \dfrac{3\lambda + 1}{\lambda + 1} \quad (\because \lambda > 0 \text{ as } R \text{ is on segment } AB)$

A point is inside parabola $y^2 = 4x$, if

$$y^2 - 4x < 0$$

$$\Rightarrow \quad \left(\frac{3\lambda + 1}{\lambda + 1}\right)^2 - 4(1) < 0$$

$$\Rightarrow \quad \left(\frac{3\lambda + 1}{\lambda + 1} + 2\right)\left(\frac{3\lambda + 1}{\lambda + 1} - 2\right) < 0$$

$$\Rightarrow \quad (5\lambda + 3)(\lambda - 1) < 0$$

$$\Rightarrow \quad -\frac{3}{5} < \lambda < 1$$

So, $\quad 0 < \lambda < 1 \quad (\text{but } \lambda > 0)$

Round II

1. Shortest distance between two curves occured along the common normal.

Normal to $y^2 = 4x$ at $(m^2, 2m)$ is

$$y + mx - 2m - m^3 = 0$$

Normal to $y^2 = 2(x-3)$ at $\left(\frac{m^2}{2} + 3, m\right)$ is

$$y + m(x-3) - m - \frac{m^3}{2} = 0$$

Both normals are same, if $-2m - m^3 = -4m - \frac{1}{2}m^3$

$\Rightarrow \quad m = 0, \pm 2$

So, points will be (4, 4) and (5, 2) or $(4, -4)$ and $(5, -2)$.

Hence, shortest distance will be

$$\sqrt{(1+4)} = \sqrt{5}$$

2. $\because \quad y^2 - 12x - 4y + 4 = 0 \Rightarrow (y-2)^2 = 12x$

Its vertex is (0, 2) and $a = 3$,

its focus is (3, 2).

Hence, for the required parabola, focus is (3, 4),

vertex is (3, 2) and $a = 2$

Hence, the equation of the parabola is

$$(x-3)^2 = 4(2)(y-2)$$

or $\quad x^2 - 6x - 8y + 25 = 0$

3. Tangent at the vertex is

$$x - y + 1 = 0 \quad \ldots(i)$$

Therefore, equation of axis of the parabola is

$$x + y = 0 \quad \ldots(ii)$$

Now on solving Eqs. (i) and (ii), we get $A\left(-\frac{1}{2}, \frac{1}{2}\right)$

$\therefore Z$ is (– 1, 1).

Now, directrix is

$$x - y + k = 0$$

But this passes through $Z(-1, 1)$, so

$$k = 2$$

$\therefore$ Equation of directrix is $x - y + 2 = 0$.

Therefore, by definition equation of parabola is given by

$$OP = PM$$

$\Rightarrow \quad OP^2 = PM^2$

$\Rightarrow \quad \left(\frac{x-y+2}{\sqrt{2}}\right)^2 = x^2 + y^2$

$\Rightarrow \quad (x - y + 2)^2 = 2x^2 + 2y^2$

$\Rightarrow \quad x^2 + y^2 + 4 - 2xy + 4x - 4y = 2x^2 + 2y^2$

$\Rightarrow \quad x^2 + y^2 + 2xy - 4x + 4y - 4 = 0$

4. Since, distance of vertex and focus from origin are $\sqrt{2}$ and $2\sqrt{2}$, respectively.

$\therefore V(1, 1)$ and $F(2, 2)$ (*i.e.,* lying on $y = x$)

where, length of latusrectum

$$= 4a = 4\sqrt{2} \quad (\because a = \sqrt{2})$$

$\therefore$ By definition of parabola

$$PM^2 = (4a)(PN)$$

where, PN is length of perpendicular upon $x + y - 2 = 0$

(*i.e.,* tangent at vertex).

$\Rightarrow \quad \frac{(x-y)^2}{2} = 4\sqrt{2}\left(\frac{x+y-2}{\sqrt{2}}\right)$

$\Rightarrow \quad (x-y)^2 = 8(x+y-2)$

5. Let x_1, x_2 and x_3 be the abscissae of the points on the parabola whose ordinates are y_1, y_2 and y_3, respectively. Then, $y_1^2 = 4ax_1$, $y_2^2 = 4ax_2$ and $y_3^2 = 4ax_3$. Therefore, the area of the triangle whose vertices are (x_1, y_1), (x_2, y_2) and (x_3, y_3) is

$$\Delta = \frac{1}{2}\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

$$\Delta = \frac{1}{2}\begin{vmatrix} \frac{y_1^2}{4a} & y_1 & 1 \\ \frac{y_2^2}{4a} & y_2 & 1 \\ \frac{y_3^2}{4a} & y_3 & 1 \end{vmatrix} \Rightarrow \Delta = \frac{1}{8a}\begin{vmatrix} y_1^2 & y_1 & 1 \\ y_2^2 & y_2 & 1 \\ y_3^2 & y_3 & 1 \end{vmatrix}$$

$$= \frac{1}{8a}(y_1 - y_2)(y_2 - y_3)(y_3 - y_1)$$

6. Let the point be $P(at^2, 2at)$.

Then, according to question, $SP = at^2 + a = k$ ...(i)

Let (α, β) be the moving point, then $\alpha = at^2$, $\beta = 2at$

$\therefore$ $$\frac{\alpha}{\beta} = \frac{t}{2}$$

and $$a = \frac{\beta^2}{4\alpha} \quad [\because \text{point } (\alpha, \beta) \text{ lies on } y^2 = 4ax]$$

On putting these values in Eq. (i), we get

$$\frac{\beta^2}{4\alpha}\left(1 + \frac{4\alpha^2}{\beta^2}\right) = k$$

$\Rightarrow$ $$\beta^2 + 4\alpha^2 = 4k\alpha$$

Hence, locus of a point is

$$4x^2 + y^2 - 4kx = 0$$

7. Chord through (2, 1) is $\frac{x-2}{\cos\theta} = \frac{y-1}{\sin\theta} = r$ ...(i)

On solving Eq. (i) with parabola $y^2 = x$, we have

$$(1 + r\sin\theta)^2 = 2 + r\cos\theta$$

$\Rightarrow$ $$\sin^2\theta\, r^2 + (2\sin\theta - \cos\theta)r - 1 = 0$$

This equation has two roots $r_1 = AC$ and $r_2 = -BC$.

Then, sum of roots $r_1 + r = 0$

$\Rightarrow$ $$2\sin\theta - \cos\theta = 0 \Rightarrow \tan\theta = \frac{1}{2}$$

$$AB = |r_1 - r_2|$$

$$= \sqrt{(r_1 + r_2)^2 - 4r_1r_2}$$

$$= \sqrt{4\frac{1}{\sin^2\theta}} = 2\sqrt{5} \quad \left(\because \tan\theta = \frac{1}{2} \Rightarrow \sin\theta = \frac{1}{\sqrt{5}}\right)$$

8. Difference of the ordinate,

$$d = \left|2at + \frac{2a}{t}\right| = 2a\left|t + \frac{1}{t}\right|$$

Now area, $A = \frac{1}{2}\begin{vmatrix} at^2 & 2at & 1 \\ \frac{a}{t^2} & -\frac{2a}{t} & 1 \\ 0 & 0 & 1 \end{vmatrix} = a^2\left(t + \frac{1}{t}\right)$

$\Rightarrow$ $$2a\left(t + \frac{1}{t}\right) = \frac{2A}{a}$$

9. Let point be $P = (\alpha, \alpha + 1)$, where $\alpha \neq 0, -1$

or $$P = (\alpha, \alpha - 1)$$

where, $\alpha \neq 0, 1$

$$(\alpha, \alpha + 1) \text{ is on } y^2 = 4x + 1$$

$$(\alpha + 1)^2 = 4\alpha + 1$$

$\Rightarrow$ $$\alpha^2 - 2\alpha = 0 \Rightarrow \alpha = 2 \quad (\because \alpha \neq 0)$$

Therefore, ordinate of P is 3.

$$(\alpha, \alpha - 1) \text{ is on } y^2 = 4x + 1$$

$$(\alpha - 1)^2 = 4\alpha + 1$$

$\Rightarrow$ $$\alpha^2 - 6\alpha = 0$$

$\Rightarrow$ $$\alpha = 6 \quad (\because \alpha \neq 0)$$

Therefore, ordinate of P is 3 and 5.

10. Let the possible point be $(t^2, 2t)$. Equation of tangent at this point is $yt = x + t^2$.

It must pass through (6, 5). (since, normal to circle always passes through its centre)

$\Rightarrow$ $$t^2 - 5t + 6 = 0 \Rightarrow t = 2, 3$$

$\therefore$ Possible points are (4, 4), (9, 6).

11. Since, no point of the parabola is below the x-axis,

$$D = a^2 - 4 \leq 0$$

Therefore, maximum value of a is 2.

Equation of parabola, when $a = 2$, is $y = x^2 + 2x + 1$. It intersects y-axis at (0, 1). Equation of the tangent at (0, 1) is $y = 2x + 1$.

Since, $y = 2x + 1$ touches the circle $x^2 + y^2 = r^2$

$$r = \frac{1}{\sqrt{5}}$$

12. Equation of the tangent at (0, 1) to the parabola $y = x^2 + ax + 1$ is $y - 1 = a(x - 0)$ or $ax - y + 1 = 0$

As it touches the circle,

$$r = \frac{1}{\sqrt{a^2+1}}$$

Radius is maximum when $a = 0$.
Therefore, equation of the tangent is $y = 1$.
Therefore, slope of the tangent is 0.

13. Equation of tangent is $y = ax + 1$. Intercepts are $-1/a$ and 1. Therefore, area of the triangle bounded by tangent and the axes is

$$\frac{1}{2}\left|-\frac{1}{a}\times 1\right| = \frac{1}{2|a|}$$

It is minimum when $a = 2$. Therefore, minimum area is 1/4.

14. End points of double ordinate $x = 4$ of parabola $y^2 = 4x$ are $(4, \pm 4)$.

$$\Rightarrow \quad t_1 = \pm 2 \Rightarrow t_2 = -t_1 - \frac{2}{t_1} = \pm 3$$

$\Rightarrow P(9, 6)$ and $P'(9, -6)$

$\therefore \quad PP' = 12$ units

15. If $P \equiv (at_1^2, 2at_1)$ and $Q \equiv (at_2^2, 2at_2)$, vertex $A \equiv (0, 0)$

$\therefore$ Slope of $AP \times$ Slope of AQ

$$= \left(\frac{2at_1 - 0}{at_1^2 - 0}\right) \times \left(\frac{2at_2 - 0}{at_2^2 - 0}\right)$$

$$= \frac{2}{t_1} \times \frac{2}{t_2} = \frac{4}{-1} = -4 \neq -1 \qquad (\because t_1 t_2 = -1)$$

$$\therefore \quad \angle PAQ \neq \frac{\pi}{2}$$

16. Let $P(x, y)$ be any point on the parabola and let PM and PN are perpendiculars from P on the axis and tangent at the vertex respectively, then

$$(PM)^2 = (\text{latusrectum})\,(PN)$$

$$\Rightarrow \quad \left(\frac{3x + 4y - 4}{\sqrt{\{3^2 + 4^2\}}}\right)^2 = 4\left[\frac{4x + 3y + 7}{\sqrt{\{4^2 + (-3)^2\}}}\right]$$

$$\Rightarrow \quad Y^2 = 4\rho X$$

$$\therefore \quad \rho = 1, \quad Y = \frac{3x + 4y - 4}{5}, \quad X = \frac{4x - 3y + 7}{5}$$

$\therefore$ Directrix is $X + \rho = 0$

$$\Rightarrow \quad \frac{4x - 3y + 7}{5} + 1 = 0$$

or $\quad 4x - 3y + 12 = 0$

17. **Hint** Any tangent having slope m is

$$y = mx + \frac{l}{m} \text{ or } y = mx + \frac{914}{m}$$

18. Both the statements are true (see properties of focal chord), but statement II is not correct explanation of statement I.

19. We know that the locus of point P from which two perpendicular tangents are drawn to the parabola, is the directrix of the parabola.
Hence, the required locus is $x = -1$.

20. From the figure, it is clear that vertex of the parabola at (1, 0).

21. Perpendicular tangents can be drawn only from a point on the directrix, $x = -2$.

$\therefore$ The point is $(-2, 0)$.

22. $\frac{3y}{a^3} = x^2 + \frac{3x}{2a} - \frac{6}{a^2} = \left(x + \frac{3}{4a}\right)^2 - \frac{105}{16a^2}$

$$\Rightarrow \quad \left(x + \frac{3}{4a}\right)^2 = \frac{3}{a^3}\left(y + \frac{35a}{16}\right)$$

If (α, β) is the vertex, then $\alpha = -\frac{3}{4a}, \beta = -\frac{35a}{16}$

Hence, the locus of (α, β) is $xy = \frac{105}{64}$

23. The coordinates of P are (1, 0). A general point Q on $y^2 = 8x$ is $(2t^2, 4t)$. Mid-point of PQ is (h, k).

$\therefore \quad 2h = 2t^2 + 1 \qquad \ldots(i)$

and $\quad 2k = 4t \Rightarrow t = k/2$

Then, from Eq. (i), we get

$$2h = \frac{2k^2}{4} + 1$$

$$\Rightarrow \quad 4h = k^2 + 2$$

Hence, locus is $y^2 - 4x + 2 = 0$

24. The common chord is the line $x - y = 0$. But given line is

$$2bx + 3cy + 4d = 0$$

$$\therefore \quad d = 0, 2b + 3c = 0$$

- Some Useful Properties of an Ellipse

15.1 Ellipse

An ellipse is the set of points in a plane whose distances from two fixed points in the plane have a constant sum. The two fixed points are the foci of the ellipse.

OR

The locus of a point in a plane which moves in the plane in such a way that the ratio of its distance from a fixed point (*i.e.*, focus) in the same plane to its distance from a fixed straight line (*i.e.,* directrix) is always constant, which is always less than unity.

In Mathematics, an ellipse is a plane curve that results from the intersection of a cone by a plane in a way that produces a closed curve. Ellipse are closed curves and it is the bounded case of the conic sections.

Mathematically, $\frac{SP}{PM} = e$, where e is called **eccentricity** and $0 < e < 1$.

Standard Equations of an Ellipse

If the centre of the ellipse is origin and foci are on the x-axis or y-axis, then that types of equation are called standard equation of an ellipse. The two such possible orientations are shown below.

(i) $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1,\ a > b$

(ii) $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1,\ a < b$

15.2 Terms Related to an Ellipse

Vertices

The point A and A', where the curve meets the line joining the foci S and S', are called the vertices of an ellipse.

Major and Minor Axes

Major axis is the one which lie along the line passing through focus and perpendicular to directrix and minor axis is the one which is perpendicular to major axis and passes through the mid-point of the foci.

Centre

Since, all chords passing through C are bisected at C. Hence, $C(0, 0)$ is the centre of an ellipse.

Ordinate and Double Ordinate

Let P be a point on the ellipse and let PN be perpendicular to the major axis AA' such that PN produced meets the ellipse at P'. Then, PN is called the ordinate of P and PNP' the double ordinate of P.

Latusrectum

The double ordinate passing through the focus is called latusrectum.

Note

- The second degree equation $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$ represents an ellipse, if $abc + 2fgh - af^2 - bg^2 - ch^2 \neq 0$ and $h^2 - ab < 0$.
- The vertex divides the join of focus and point of intersection of directrix with axis internally and externally in the ratio of $e : 1$.
- Domain and range of an ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ are $[-a, a]$ and $[-b, b]$, respectively.

***Sample* Problem 1** *The equation of an ellipse whose focus is $(-1, 1)$, eccentricity is $\frac{1}{2}$ and the directrix is $x - y + 3 = 0$, is*

(*a*) $7x^2 + 7y^2 + 2xy + 10x + 10y + 7 = 0$

(*b*) $7x^2 + 7y^2 + 2xy + 10x - 10y + 7 = 0$

(*c*) $7x^2 + 7y^2 + 2xy - 10x + 10y + 7 = 0$

(*d*) *None of the above*

Interpret (*b*) Let $P(x, y)$ be any point on the ellipse whose focus is $S(-1, 1)$ and the directrix is $x - y + 3 = 0$. Draw PM perpendicular from $P(x, y)$ on the directrix $x - y + 3 = 0$. Then, by definition

$$SP = ePM \Rightarrow (SP)^2 = e^2(PM)^2$$

$$\Rightarrow \quad (x+1)^2 + (y-1)^2 = \frac{1}{4}\left\{\frac{x - y + 3}{\sqrt{2}}\right\}^2$$

$$\Rightarrow \quad 8(x^2 + y^2 + 2x - 2y + 2) = x^2 + y^2 + 9 - 2xy + 6x - 6y$$

$$\Rightarrow \quad 7x^2 + 7y^2 + 2xy + 10x - 10y + 7 = 0$$

which is the required equation of an ellipse.

Hot Spot

Determination of Eccentricity and its Application

In these types of problems sometimes eccentricity is already given, & we have to find other terms (as minor and major axis) and sometimes we have to find the eccentricity. These types of problems are directly or indirectly asked in various years of AIEEE (JEE Main) 2011, 2008, 2006, 2005, 2004, 2002. Following steps are given below can be followed to solve these types of problems.

Step I If equation of ellipse is given, then convert it in standard form and find eccentricity e by using the formula,

$$e = \sqrt{1 - \frac{b^2}{a^2}},\ a > b \text{ or } e = \sqrt{1 - \frac{a^2}{b^2}},\ b > a$$

Step II If e is given and any of the condition is given, then we can find a and b.

Step III To find other terms as foci, directrix etc., use the formula which gives relation between e and that term and simplifying it.

Above method can be explained by given illustrative examples.

***Sample* Problem 2** *The focus of an ellipse is at the origin. If the directrix is the line $x = 5$ and the eccentricity is $\frac{1}{3}$, then find the length of major axis.*

(a) $\frac{15}{4}$ (b) $\frac{15}{2}$

(c) $\frac{15}{8}$ (d) *None of these*

Interpret (a) **Step I** No need of step I.

Step II Here, e and other condition is given.

According to the given condition,

$$\frac{a}{e} - ae = 5$$

and $$e = \frac{1}{3}$$

$$\therefore \quad \frac{a}{1/3} - a \times \frac{1}{3} = 5$$

$$\Rightarrow \quad 3a - \frac{a}{3} = 5$$

$$\Rightarrow \quad \frac{8a}{3} = 5$$

$$\Rightarrow \quad a = \frac{15}{8}$$

Step III To find the length of major axis *i.e.*, $2a = 2 \times \frac{15}{8} = \frac{15}{4}$

***Sample* Problem 3** *The equation of ellipse having vertices* $(\pm 5, 0)$ *and foci* $(\pm 4, 0)$ *is* [NCERT]

(a) $\frac{x^2}{25} + \frac{y^2}{16} = 1$ (b) $\frac{x^2}{25} - \frac{y^2}{9} = 1$

(c) $\frac{x^2}{25} + \frac{y^2}{9} = 1$ (d) $\frac{x^2}{9} + \frac{y^2}{25} = 1$

Interpret (c) Since, vertices $(\pm 5, 0)$ and foci $(\pm 4, 0)$ are on x-axis, as y-coordinate of both points is zero. Hence, equation of ellipse will be of the form

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \ldots(i)$$

where, $a = 5$

and $ae = 4 \Rightarrow e = \frac{4}{5}$

$\because$ $b^2 = a^2(1 - e^2)$

$\therefore$ $b^2 = 25\left(1 - \frac{16}{25}\right)$

$\Rightarrow$ $b^2 = 9$

Put the values of $a^2 = 25$ and $b^2 = 9$ in Eq. (i), we get

$$\frac{x^2}{25} + \frac{y^2}{9} = 1$$

***Sample* Problem 4** *The equation of ellipse having centre at* (0, 0) *major axis on y-axis passes through the points* (3, 2) *and* (1, 6) *is* [NCERT]

(a) $\frac{x^2}{40} + \frac{y^2}{10} = 1$ (b) $\frac{x^2}{10} + \frac{y^2}{40} = 1$

(c) $\frac{x^2}{20} + \frac{y^2}{30} = 1$ (d) *None of these*

Interpret (b) Since, major axis is along y-axis.
Hence, equation of ellipse will be of the form

$$\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1 \quad \ldots(i)$$

Given that Eq. (i) passes through the points (3, 2) and (1, 6), *i.e.*, they will satisfy it.

$\therefore$ $\frac{3^2}{b^2} + \frac{2^2}{a^2} = 1$

$\Rightarrow$ $\frac{9}{b^2} + \frac{4}{a^2} = 1 \quad \ldots(ii)$

and $\frac{1^2}{b^2} + \frac{6^2}{a^2} = 1$

$\Rightarrow$ $\frac{1}{b^2} + \frac{36}{a^2} = 1 \quad \ldots(iii)$

On solving Eqs. (ii) and (iii), we get $a^2 = 40$, $b^2 = 10$

$\therefore$ Required equation of ellipse is

$$\frac{x^2}{10} + \frac{y^2}{40} = 1$$

15.3 Position of a Point with Respect to an Ellipse

Let $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ be the equation of an ellipse and $P(h, k)$ be any point in the plane of an ellipse, then

$$S_1 = \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1$$

***Case* I** When $S_1 > 0$, point (x_1, y_1) lies outside the ellipse.

***Case* II** $S_1 = 0$, point (x_1, y_1) lies on the ellipse.

***Case* III** $S_1 < 0$, point (x_1, y_1) lies inside the ellipse.

***Sample* Problem 5** *The position of the point* $(1, -2)$ *relative to an ellipse* $5x^2 + 7y^2 = 120$ *is*

(a) *outside* (b) *inside*

(c) *on the ellipse* (d) *cannot say*

Interpret (b) The equation of an ellipse is $5x^2 + 7y^2 = 120$.

$$S_1 = 5(1)^2 + 7(-2)^2 - 120$$
$$= 5 + 28 - 120 = -87 < 0$$

So, the point $(1, -2)$ lies inside the ellipse.

15.4 Auxiliary Circle

The circle described on the major axis of an ellipse as diameter is called an auxiliary circle of the ellipse.

If the equation of an ellipse is $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then equation of an auxiliary circle is $x^2 + y^2 = a^2$.

Eccentric Angle of a Point

Let P be any point on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$. Draw PM perpendicular from P on the major axis of the ellipse and produce MP to meet the auxiliary circle in Q Join CQ. The $\angle ACQ=\phi$ is called the eccentric angle of the point P on the ellipse.

***Sample* Problem 6** *If equation of ellipse is* $\frac{x^2}{16}+\frac{y^2}{9}=1$, *then equation of auxiliary circle is* [**NCERT**]

(a) $x^2+y^2=16$ (b) $x^2+y^2=9$

(c) $x^2+y^2=25$ (d) *None of these*

Interpret (a) Given equation of ellipse is $\frac{x^2}{16}+\frac{y^2}{9}=1$.

Here, $a>b$

$\therefore$ Equation of auxiliary circle

$$x^2+y^2=a^2$$

$$\therefore \quad x^2+y^2=16$$

Check Point 1

1. Let P be a variable point on the ellipse $\frac{x^2}{25}+\frac{y^2}{16}=1$ with foci at S and S′. If A be the area of ΔPSS′, then maximum value of A is
   (a) 24 sq units (b) 12 sq units
   (c) 36 sq units (d) None of these
2. If p, q are the segments of a focal chord of an ellipse $b^2x^2+a^2y^2=a^2b^2$, then
   (a) $a^2(p+q)=2bpq$ (b) $b^2(p+q)=2apq$
   (c) $a(p+q)=2b^2pq$ (d) $b(p+q)=2a^2pq$
3. The equation of the ellipse whose foci are $(\pm 2, 0)$ and eccentricity $\frac{1}{2}$, is
   (a) $\frac{x^2}{12}+\frac{y^2}{16}=1$ (b) $\frac{x^2}{16}+\frac{y^2}{12}=1$
   (c) $\frac{x^2}{16}+\frac{y^2}{8}=1$ (d) None of these
4. In an ellipse the distance between the foci is 8 and the distance between the directrices is 25. The length of major axis is
   (a) $10\sqrt{2}$ (b) $20\sqrt{2}$
   (c) $30\sqrt{2}$ (d) None of these
5. The distances from the foci of $P(x_1, y_1)$ on the ellipse $\frac{x^2}{9}+\frac{y^2}{25}=1$ are
   (a) $4\pm\frac{5}{4}y_1$ (b) $5\pm\frac{4}{5}x_1$
   (c) $5\pm\frac{4}{5}y_1$ (d) None of these
6. Find the equation of the ellipse whose foci are (2, 3), (−2, 3) and whose semi-minor axis is of length $\sqrt{5}$.
   (a) $5x^2+9y^2+54y+36=0$ (b) $5x^2+9y^2-54y+36=0$
   (c) $5x^2+9y^2-54y-36=0$ (d) None of these
7. The position of the point (4, − 3) relative to an ellipse $\frac{x^2}{28}+\frac{y^2}{20}=1$ is
   (a) inside (b) on the ellipse
   (c) outside (d) cannot say
8. The curve represented by $x=3(\cos t+\sin t)$ and $y=4(\cos t-\sin t)$ is
   (a) ellipse (b) parabola
   (c) hyperbola (d) circle

15.5 Intersection of a Line and an Ellipse

Let the ellipse be $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ ...(i)

and the given line be $y=mx+c$ ...(ii)

On eliminating y from Eqs. (i) and (ii), then

$$\frac{x^2}{a^2}+\frac{(mx+c)^2}{b^2}=1$$

$$\Rightarrow \quad (a^2m^2+b^2)x^2+2mca^2x^2+c^2a^2-a^2b^2=0$$

It is a quadratic equation in x which gives two values of x.

Discriminant, $D=4m^2c^2a^2-4(a^2m^2+b^2)(c^2a^2-a^2b^2)$

$$=-a^2b^2c^2+a^4b^2m^2+a^2b^4$$

$$=-a^2b^2(c^2-a^2m^2+b^2)$$

(i) If $D>0$, *i.e.*, $c^2>a^2m^2+b^2$, then line intersect the ellipse at two points.

(ii) If $D=0$, *i.e.*, $c^2=a^2m^2+b^2$, then the line intersect the ellipse at one point.

(iii) If $D<0$ *i.e.*, $c^2<a^2m^2+b^2$, then line intersect the ellipse at an imaginary point *i.e.*, the line neither touches nor intersects the ellipse.

15.6 Condition of Tangency

The line $y = mx + c$ will be a tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at any point on the ellipse, if

$$c^2 = a^2m^2 + b^2$$

and point of contact is $\left(\pm \frac{a^2m}{c}, \pm \frac{b^2}{c}\right)$.

***Sample* Problem 7** *The line $2x + 3y = 12$ touches the ellipse $\frac{x^2}{9} + \frac{y^2}{4} = 2$ at the point* **[NCERT Exemplar]**

(a) (3, 2) (b) (2, 3) (c) (−3, −2) (d) (3, 4)

Interpret (a) Given equation of line can be rewritten as

$$y = \frac{-2x}{3} + \frac{12}{3} = \frac{-2x}{3} + 4$$

Here, $m = -\frac{2}{3}, c = 4$

Also, equation of ellipse can be rewritten as

$$\frac{x^2}{18} + \frac{y^2}{8} = 1$$

Here, $a^2 = 18, b^2 = 8$

$\therefore$ Point of contact is $\left(\pm \frac{a^2m}{2}, \pm \frac{b^2}{c}\right)$

$$= \left[\pm \frac{18 \times (-2/3)}{4}, \pm \frac{8}{4}\right] = (\pm 3, 2)$$

***Sample* Problem 8** *The straight line $lx + my + n = 0$ touches the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, if $a^2l^2 + b^2m^2$ is equal to*

(a) n (b) n^2 (c) n^3 (d) n^4

Interpret (b) The equation of given line is $lx + my + n = 0$.

or $y = -\frac{l}{m}x - \frac{n}{m}$.

This line will touch the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, if

$$\frac{n^2}{m^2} = \frac{a^2l^2}{m^2} + b^2 \Rightarrow a^2l^2 + b^2m^2 = n^2$$

15.7 Tangent to the Ellipse

A line which intersect the ellipse at only one point is called the tangent to the ellipse.

Equation of Tangent in Different Forms

(i) Point Form

The equation of tangent at the point (x_1, y_1) to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is $\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1$, if point lies on the curve.

(ii) Slope Form

The equation of tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ in the slope form is $y = mx \pm \sqrt{a^2m^2 + b^2}$ and points of contact are $\left(\mp \frac{a^2m}{\sqrt{a^2m^2 + b^2}}, \pm \frac{b^2}{\sqrt{a^2m^2 + b^2}}\right)$.

(iii) Parametric Form

The equation of tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at the point $(a \cos\theta, b \sin\theta)$ is $\frac{x}{a}\cos\theta + \frac{y}{b}\sin\theta = 1$.

Note The intersection points of two tangents of the ellipse at points $(a \cos\theta_1, b \sin\theta_1)$ and $(a \cos\theta_2, b \sin\theta_2)$ is

$$\left(\frac{a\cos\left(\frac{\theta_1 + \theta_2}{2}\right)}{\cos\left(\frac{\theta_1 - \theta_2}{2}\right)}, \frac{b\sin\left(\frac{\theta_1 + \theta_2}{2}\right)}{\cos\left(\frac{\theta_1 - \theta_2}{2}\right)}\right).$$

***Sample* Problem 9** *The locus of the foot of the perpendicular drawn from the centre upon any tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, is*

(a) $(x^2 + y^2)^2 = ax^2 + by^2$ (b) $(x^2 + y^2) = a^2x^2 + b^2y^2$

(c) $(x^2 + y^2)^2 = a^2x^2 + b^2y^2$ (d) *None of these*

Interpret (c) The equation of any tangent to the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \text{ is } y = mx + \sqrt{a^2m^2 + b^2} \quad \text{...(i)}$$

Equation of line perpendicular to Eq. (i) and passing through (0, 0), is

$$y = -\frac{1}{m}x \Rightarrow m = -\frac{x}{y} \quad \text{(ii)}$$

On putting the value of m in Eq. (i), we get

$$y = -\frac{x^2}{y} + \sqrt{\left(a^2\frac{x^2}{y^2} + b^2\right)}$$

$$\Rightarrow \quad (x^2 + y^2)^2 = a^2x^2 + b^2y^2$$

15.8 Normal to the Ellipse

A line which is perpendicular to the tangent of the ellipse is called the normal to the ellipse.

Equation of Normal in Different forms

(i) Point Form

The equation of normal to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at the point (x_1, y_1) is $\frac{a^2x}{x_1} - \frac{b^2y}{y_1} = a^2 - b^2$

(ii) Slope Form

The equation of normal of slope m to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is $y = mx \mp \frac{m(a^2-b^2)}{\sqrt{a^2+b^2m^2}}$ and points of contact are

$$\left(\pm\frac{a^2}{\sqrt{a^2+b^2m^2}}, \pm\frac{mb^2}{\sqrt{a^2+b^2m^2}}\right).$$

Note If a line $y = mx + c$ be a normal to an ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, then

$$c^2 = \frac{m^2(a^2-b^2)^2}{(a^2+b^2m^2)}$$

(iii) Parametric Form

The equation of normal at the point $(a\cos\theta, b\sin\theta)$ to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is

$$ax\sec\theta - by\,\text{cosec}\,\theta = a^2-b^2$$

***Sample* Problem 10** *The straight line $lx + my + n = 0$ is a normal to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, if $\frac{a^2}{l^2}+\frac{b^2}{m^2}$ is equal to*

(a) $\frac{a^2-b^2}{n^2}$

(b) $\frac{(a^2-b^2)^2}{n^2}$

(c) $(a^2-b^2)^2$

(d) *None of the above*

Interpret (b) The equation of any normal to $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is

$$ax\sec\theta - by\,\text{cosec}\,\theta = a^2-b^2 \quad \ldots(i)$$

The straight line $lx + my + n = 0$ will be normal to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$.

$$\therefore \quad \frac{a\sec\theta}{l} = -\frac{b\,\text{cosec}\,\theta}{m} = \frac{a^2-b^2}{-n}$$

$$\Rightarrow \quad \cos\theta = \frac{-na}{l(a^2-b^2)}$$

and $$\sin\theta = \frac{nb}{m(a^2-b^2)}$$

Also, $$\sin^2\theta + \cos^2\theta = 1$$

$$\therefore \quad \left\{\frac{n^2b^2}{m^2(a^2-b^2)^2}\right\} + \left\{\frac{n^2a^2}{l^2(a^2-b^2)^2}\right\} = 1$$

$$\Rightarrow \quad \frac{a^2}{l^2}+\frac{b^2}{m^2} = \frac{(a^2-b^2)^2}{n^2}$$

15.9 Director Circle

The locus of the point of intersection of perpendicular tangents to an ellipse is known as its director circle.

The equation of the director circle is $x^2 + y^2 = a^2 + b^2$.

Clearly, it is a circle concentric to the ellipse and its radius is equal to $\sqrt{a^2+b^2}$.

Note The tangents drawn from any point on the director circle of a given ellipse are always at right angle.

***Sample* Problem 11** *The locus of the point of intersection of the perpendicular tangents to ellipse* **[NCERT Exemplar]**

$$\frac{x^2}{9}+\frac{y^2}{4}=1 \text{ is}$$

(a) $x^2 + y^2 = 4$ (b) $x^2 + y^2 = 9$

(c) $x^2 + y^2 = 5$ (d) $x^2 + y^2 = 13$

Interpret (d) The locus of the point of intersection of the perpendicular tangents to ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is a director circle and whose equation is given by $x^2 + y^2 = a^2 + b^2$

$\therefore$ The required equation of director circle is

$$x^2 + y^2 = 9 + 4 \Rightarrow x^2 + y^2 = 13$$

15.10 Number of Normal and Conormal Points

At a point on a given ellipse exactly one normal can be drawn. If there is a point not lying on a given ellipse, infinitely many lines can be drawn which intersect the ellipse. Out of these lines there are atmost four lines which are normal to the ellipse at the points where they cut the ellipse. Such points on the ellipse are called conormal points. Some points about the conormals points and various relation between their eccentric angle are as given below.

(i) The four normals can be drawn from a point to an ellipse.

(ii) **Conormal point** The point on the ellipse, the normal at which to the ellipse pass through a given point is called conormal point.

(iii) **Properties of eccentric angles of conormal points**

(a) The sum of the eccentric angles of the conormal points on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is an odd multiple of π.

(b) If $\theta_1, \theta_2, \theta_3$ and θ_4 be eccentric angles of four points on the ellipse, the normals at which are concurrent, then

(a) $\sum \cos(\theta_1+\theta_2)=0$ (b) $\sum \sin(\theta_1+\theta_2)=0$

(c) If θ_1, θ_2 and θ_3 are the eccentric angles of three points on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ such that

$$\sin(\theta_1+\theta_2)+\sin(\theta_2+\theta_3)+\sin(\theta_3+\theta_1)=0,$$

then the normals at these points are concurrent.

(d) If the normals at four points $P(x_1, y_1), Q(x_2, y_2)$, $R(x_3, y_3)$ and $S(x_4, y_4)$ on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ are concurrent, then

$$(x_1+x_2+x_3+x_4)\left(\frac{1}{x_1}+\frac{1}{x_2}+\frac{1}{x_3}+\frac{1}{x_4}\right)=4$$

***Sample* Problem 12** *If the normals at the points A, B, C and D of an ellipse meet in a point O, then $SA \cdot SB \cdot SC \cdot SD$ is equal to (where, S is one of the foci)*

(a) $\frac{b^2}{e^2}\cdot SO^2$ (b) $\frac{b^3}{e^3}\cdot SO^3$ (c) $\frac{2b^2}{e^2}\cdot SO^2$ (d) $\frac{b^2}{3e^2}\cdot 2SO^2$

Interpret (a) If S be the point $(-ae, 0)$, we have $SA = a + ex$, $SB = a + ex_2$, $SC = a + ex_3$ and $SD = a + ex_4$

$\therefore$ $SA \cdot SB \cdot SC \cdot SD = (a+ex_1)(a+ex_2)(a+ex_3)(a+ex_4)$

$$= a^4 + a^3e\sum x_1 + a^2e^2\sum x_1x_2 + ae^3\sum x_1x_2x_3 + e^4x_1x_2x_3x_4$$

$$= \frac{b^2}{e^2}\{(h+ae)^2+k\} \text{ (on substitution and simplification)}$$

$$= \frac{b^2}{e^2}\cdot SO^2$$

15.11 Pair of Tangents

The equation of pair of tangents drawn from an external point $P(x_1, y_1)$ to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, is

$$SS_1 = T^2$$

where, $S = \frac{x^2}{a^2}+\frac{y^2}{b^2}-1,$

$S_1 = \frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1$

and $T = \frac{xx_1}{a^2}+\frac{yy_1}{b^2}-1$

***Sample* Problem 13** *The equation of the pair of tangents drawn from the point (1, 2) to the ellipse $3x^2+2y^2=5$ is* [NCERT Exemplar]

(a) $9x^2-4y^2-24xy+40y+30x-55=0$

(b) $9x^2-4y^2-24xy+40y-30x+55=0$

(c) $9x^2+4y^2+24xy+40y+30x-55=0$

(d) *None of the above*

Interpret (a) The combined equation of the pair of tangents drawn from (1, 2) to the ellipse $3x^2+2y^2=5$ is

$$(3x^2+2y^2-5)(3+8-5) = (3x+4y-5)^2 \qquad (\because SS_1 = T^2)$$

$$\Rightarrow (3x^2+2y^2-5)(6) = 9x^2+16y^2+25+24xy-40y-30x$$

$$\Rightarrow 9x^2-4y^2-24xy+40y+30x-55=0$$

15.12 Chord of Contact

Let PQ and PR be tangents to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ drawn from any external point $P(h, k)$. Then, QR is called chord of contact of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, whose equation is $\frac{xx_1}{a^2}+\frac{yy_1}{b^2}=1$ or $T=0$.

***Sample* Problem 14** *If $\tan\theta_1 \tan\theta_2 = -\frac{a^2}{b^2}$, then the chord joining two points θ_1 and θ_2 on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ will subtend a right angle at*

(a) *focus* (b) *centre*

(c) *end of the major axis* (d) *end of minor axis*

Interpret (b) Let

$$P(a\cos\theta_1, b\sin\theta_1)$$

and $$Q(a\cos\theta_2, b\sin\theta_2)$$

be two points on the ellipse. Then,

$$m_1 = \text{slope of } OP = \frac{b}{a}\tan\theta_1$$

and $$m_2 = \text{slope of } OQ = \frac{b}{a}\tan\theta_2$$

$$\therefore \quad m_1 m_2 = \frac{b^2}{a^2}\tan\theta_1 \tan\theta_2 = \frac{b^2}{a^2}\times\left(-\frac{a^2}{b^2}\right) = -1$$

$$\therefore \quad \angle POQ = \frac{\pi}{2}$$

Hence, PQ makes a right angle at the centre of the ellipse.

Equation of Chord of the Ellipse whose Mid-point is (x_1, y_1)

The equation of chord of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ whose mid-point is (x_1, y_1) is $T = S_1$

where, $T = \frac{xx_1}{a^2}+\frac{yy_1}{b^2}-1$ and $S_1 = \frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1$

Note

- Equation of chord of the ellipse whose eccentric angles are θ and ϕ, is
$$\frac{x}{a}\cos\left(\frac{\theta+\phi}{2}\right)+\frac{y}{b}\sin\left(\frac{\theta+\phi}{2}\right)=\cos\left(\frac{\theta-\phi}{2}\right)$$
- If the chord passes through $(ae, 0)$, then
$$\tan\frac{\phi_1}{2}\tan\frac{\phi_2}{2}=\frac{e-1}{e+1}$$
- If the chord passes through $(-ae, 0)$, then
$$\tan\left(\frac{\phi_1}{2}\right)\tan\left(\frac{\phi_2}{2}\right)=\frac{e+1}{e-1}$$

***Sample* Problem 15** *The locus of the middle points of chords of an ellipse, which passes through a fixed point, is*

(a) *an ellipse* (b) *a circle*
(c) *a hyperbola* (d) *a parabola*

Interpret (a) Let $P(x_1, y_1)$ be the middle point of any chord AB of an ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, then equation of chord AB is

$$T = S_1$$

$$\Rightarrow \quad \frac{xx_1}{a^2}+\frac{yy_1}{b^2}-1=\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}-1$$

$$\Rightarrow \quad \frac{xx_1}{a^2}+\frac{yy_1}{b^2}=\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2} \quad \ldots(i)$$

But it passes through a fixed point $Q(h, k)$, so its coordinates must satisfy Eq. (i).

$$\therefore \quad \frac{hx_1}{a^2}+\frac{ky_1}{b^2}=\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}$$

This can be rewritten as

$$\frac{\left(x_1-\frac{h}{2}\right)^2}{a^2}+\frac{\left(y_1-\frac{k}{2}\right)^2}{b^2}=\frac{1}{4}\left(\frac{h^2}{a^2}+\frac{k^2}{b^2}\right)$$

Hence, locus of $P(x_1, y_1)$ is

$$\frac{\left(x-\frac{h}{2}\right)^2}{a^2}+\frac{\left(y-\frac{k}{2}\right)^2}{b^2}=\frac{1}{4}\left(\frac{h^2}{a^2}+\frac{k^2}{b^2}\right)$$

Its obviously an ellipse with centre at $\left(\frac{h}{2}, \frac{k}{2}\right)$ and axes parallel to coordinates axes.

15.13 Diameter

A line through the centre of an ellipse is called a diameter of the ellipse.

The equation of the diameter bisecting the chords $(y = mx + c)$ of slope m of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is $y = -\frac{b^2}{a^2 m}x$, which is passing through (0, 0).

Conjugate diameter Two diameters of an ellipse are said to be conjugate diameter, if each bisects all chords parallel to the other. The coordinates of the four extremities of two conjugate diameters are

$P(a\cos\phi, b\sin\phi)$;
$P'(-a\cos\phi, -b\sin\phi)$;
$Q(-a\sin\phi, b\cos\phi)$;
$Q'(a\sin\phi, -b\cos\phi)$

If $y = m_1 x$ and $y = m_2 x$ be two conjugate diameters of an ellipse, then $m_1 m_2 = \frac{-b^2}{a^2}$.

***Sample* Problem 16** *If $2y = x$ and $3y + 4x = 0$ are the equation of a pair of conjugate diameters of an ellipse, then eccentricity of the ellipse is*

(a) $\sqrt{\frac{2}{3}}$ (b) $\sqrt{\frac{2}{5}}$
(c) $\sqrt{\frac{1}{3}}$ (d) $\sqrt{\frac{1}{2}}$

Interpret (c) Slope of $2y = x$ is $\frac{1}{2}$ (m_1 say) and slope of $3y + 4x = 0$ is $-\frac{4}{3}$ (m_2 say)

$$\therefore \quad m_1 m_2 = -\frac{b^2}{a^2}$$

$$\therefore \quad \left(\frac{1}{2}\right)\left(-\frac{4}{3}\right) = -\frac{b^2}{a^2}$$

$$\Rightarrow \quad \frac{b^2}{a^2} = \frac{2}{3}$$

$$\because \quad e = \sqrt{1 - \frac{b^2}{a^2}}$$

$$\therefore \quad e = \sqrt{1 - \frac{2}{3}} = \frac{1}{\sqrt{3}}$$

15.14 Some Useful Properties of an Ellipse

(i) The tangent and normal at any point of an ellipse bisect the external and internal angles between the focal radii to the point.

(ii) If SM and $S'M'$ are perpendiculars from the foci upon the tangent at any point of the ellipse, then $SM \cdot S'M' = b^2$ and M, M' lie on the auxiliary circle.

(iii) If the tangent at any point P on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ meets the major axis in T and minor axis in T', then

$$CN \cdot CT = a^2, \quad CN' \cdot CT' = b^2,$$

where, N and N' are the feet of the perpendiculars from P on the respective axes.

(iv) If SM and $S'M'$ be perpendiculars from the foci S and S' respectively upon a tangent to the ellipse, then CM and CM' are parallel to $S'P$ and SP, respectively.

(v) The common chord of an ellipse and a circle are equally inclined to the axes of the ellipse.

***Sample* Problem 17** *An ellipse slides between two lines at right angle to one another. Then, the locus of its centre is*

(a) *a circle* (b) *a parabola*
(c) *an ellipse* (d) *a hyperbola*

Interpret (a) Let the two lines be taken as the x-axis and y-axis, respectively.

Let $C(a, b)$ be the centre of the ellipse.

Let a and b be the semi-major and semi-minor axes of the ellipse.

Let $S(x_1, y_1)$ and $S'(x_2, y_2)$ be the foci of the ellipse.

Then, $\quad x_1 + x_2 = 2\alpha \quad$ ...(i)

and $\quad y_1 + y_2 = 2\beta \quad$ ...(ii)

Again, since x-axis and y-axis are the tangents to the ellipse,

$\therefore \quad y_1 y_2 = b^2 \quad$ ...(iii)

and $\quad x_1 x_2 = b^2 \quad$ ...(iv)

Also, $\quad S'S^2 = 4a^2e^2$

$\Rightarrow \quad (x_1 - x_2)^2 + (y_1 - y_2)^2 = 4a^2e^2 \quad$ ...(v)

We have, to eliminate x_1, y_1, x_2, y_2 from the Eqs. (i), (ii), (iii), (iv) and (v).

Now, $\{(x_1 + x_2)^2 + (y_1 + y_2)^2\} - \{(x_1 - x_2)^2 + (y_1 - y_2)^2\}$

$$= 4(x_1x_2 + y_1y_2)$$

$\Rightarrow \quad 4\alpha^2 + 4\beta^2 - 4a^2e^2 = 4(b^2 + b^2) = 8b^2$

$\Rightarrow \quad \alpha^2 + \beta^2 - a^2e^2 = 2b^2$

$\Rightarrow \quad \alpha^2 + \beta^2 = 2b^2 + a^2e^2 = 2b^2 + a^2 - b^2 = a^2 + b^2$

Hence, the locus of (α, β) is

$$x^2 + y^2 = a^2 + b^2.$$

which is a circle.

Check Point **2**

1. On the ellipse $4x^2 + 9y^2 = 1$, the point at which the tangent is parallel to the line $8x = 9y$, is

(a) $\left(\frac{2}{5}, \frac{1}{5}\right)$ (b) $\left(-\frac{2}{5}, \frac{1}{5}\right)$

(c) $\left(-\frac{2}{5}, -\frac{1}{5}\right)$ (d) None of these

2. An equation of the normal to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at the positive end of the latusrectum is

(a) $x + ey + e^3a = 0$ (b) $x - ey - ae^3 = 0$

(c) $x - ey + e^3a = 0$ (d) $x + ey - e^3a = 0$

3. The circle $x^2 + y^2 = c^2$ contains the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, if

(a) $c < a$ (b) $c < b$ (c) $c > a$ (d) $c > b$

4. If Q be the point on the auxiliary circle corresponding to a point P on an ellipse. Then, the normals at P and Q meet on

(a) a fixed circle (b) an ellipse

(c) a hyperbola (d) None of these

5. If the tangent line to an ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ cuts intercepts h and k from axes, then $\frac{a^2}{h^2} + \frac{b^2}{k^2}$ is equal to

(a) 0 (b) 1 (c) -1 (d) 2

6. The locus of mid-points of chords of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ that touch the circle $x^2 + y^2 = b^2$, is

(a) $\left(\frac{x^2}{a^2} + \frac{y^2}{b^2}\right)^2 = \frac{x^2}{a^4} + \frac{y^2}{b^4}$ (b) $\left(\frac{x^2}{a^2} + \frac{y^2}{b^2}\right)^2 = b^2\left(\frac{x^2}{a^4} + \frac{y^2}{b^4}\right)$

(c) $\left(\frac{x^2}{a^2} + \frac{y^2}{b^2}\right)^2 = a^2\left(\frac{x^2}{a^4} + \frac{y^2}{b^4}\right)$ (d) None of these

7. The eccentric angles of the extremities of latusrectum of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ are given by

(a) $\tan^{-1}\left(\pm \frac{ae}{b}\right)$ (b) $\tan^{-1}\left(\pm \frac{be}{a}\right)$

(c) $\tan^{-1}\left(\pm \frac{b}{ae}\right)$ (d) $\tan^{-1}\left(\pm \frac{a}{be}\right)$

8. An ellipse is described by using endles string which is passed over two pins. If the axes are 6 cm and 4 cm, the necessary length of the string and distance between the pins respectively in cm, are

(a) $6, 2\sqrt{5}$ (b) $6, \sqrt{5}$

(c) $4, 2\sqrt{5}$ (d) None of these

9. An ellipse is sliding along the coordinate axes. If the foci of the ellipse are (1, 1) and (3, 3), then area of the director circle of the ellipse is

(a) 2π sq units (b) 4π sq units (c) 6π sq units (d) 8π sq units

10. If the normals at $P(\theta)$ and $Q\left(\frac{\pi}{2} + \theta\right)$ to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ meet the major axis at G and g respectivel,y the $PG^2 + Qg^2$ is equal to

(a) $b^2(1 - e^2)(2 - e^2)$ (b) $a^2(e^4 - e^2 + 2)$

(c) $a^2(1 + e^2)(2 + e^2)$ (d) $b^2(1 + e^2)(2 + e^2)$

WORKED OUT Examples

Example 1 *The equation of the ellipse where focus is* (2, 0) *and the directrix is* $x + y + 1 = 0$ *and eccentricity is equal to* $\frac{1}{\sqrt{2}}$, *is*

(a) $3x^2 + 3y^2 + 2xy + 18x + 2y + 15 = 0$
(b) $3x^2 + 3y^2 - 2xy + 18x + 2y + 15 = 0$
(c) $3x^2 + 3y^2 - 2xy - 18x - 2y + 15 = 0$
(d) *None of the above*

Solution (c) Let $S(2, 0)$ be the focus. Consider $P(x, y)$ be any point on the ellipse and PM be perpendicular from P on the directrix.

$\therefore \quad SP = e\,PM$ (by definition)

$\Rightarrow \quad SP^2 = e^2PM^2$

$$\Rightarrow \quad (x-2)^2 + (y-0)^2 = \left(\frac{1}{\sqrt{2}}\right)^2 \left[\frac{x+y+1}{\sqrt{1+1}}\right]^2$$

$\Rightarrow \quad 4[(x-2)^2 + y^2] = (x + y + 1)^2$

$\Rightarrow \quad 4x^2 - 16x + 16 + 4y^2 = x^2 + y^2 + 1 + 2xy + 2x + 2y$

$\Rightarrow \quad 3x^2 + 3y^2 - 2xy - 18x - 2y + 15 = 0$

This is the required equation of an ellipse.

Example 2 *The foci of the ellipse*

$$25(x+1)^2 + 9(y+2)^2 = 225 \text{ are}$$

(a) $(-1, 2)$ *and* $(-1, -6)$ (b) $(1, 2)$ *and* $(1, 6)$
(c) $(1, 2)$ *and* $(-1, -6)$ (d) $(-1, 2)$ *and* $(1, 6)$

Solution (a) The given equation of an ellipse can be rewritten as

$$\frac{(x+1)^2}{9} + \frac{(y+2)^2}{25} = 1$$

whose centre is $(-1, -2)$ and semi-major and semi-minor axes are 5 and 3 respectively *i.e.*,

$$b = 5 \quad \text{and} \quad a = 3$$

$\therefore$ The eccentricity of the ellipse is given by

$$a^2 = b^2(1 - e^2)$$

$$\Rightarrow \quad 9 = 25(1 - e^2) \quad \Rightarrow \quad e = \frac{4}{5}$$

On shifting the origin at $(-1, -2)$ the given equation reduces to

$$\frac{X^2}{9} + \frac{Y^2}{25} = 1 \quad \ldots(i)$$

where, $x = X - 1$ and $y = Y - 2$ ...(ii)

$\therefore$ Coordinates of the foci are $(X = 0, Y = \pm be)$ *i.e.*,

$$(-1, 2) \text{ and } (-1, -6).$$

Example 3 *The line* $lx + my + n = 0$ *cuts the ellipse* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ *in points whose eccentric angles differ by* $\frac{\pi}{2}$, *if* $a^2l^2 + b^2m^2$ *is equal to*

(a) n^2 (b) $2n^2$ (c) $2n$ (d) n

Solution (b) Suppose the line $lx + my + n = 0$ cuts the ellipse at $P(a\cos\theta, b\sin\theta)$ and $Q\left\{a\cos\left(\frac{\pi}{2} + \theta\right), b\sin\left(\frac{\pi}{2} + \theta\right)\right\}$. Then, these two points lie on the line

$$la\cos\theta + mb\sin\theta + n = 0$$

and $\quad -la\sin\theta + mb\cos\theta + n = 0$

$\Rightarrow \quad la\cos\theta + mb\sin\theta = -n$

and $\quad -la\sin\theta + mb\cos\theta = -n$

$\Rightarrow \quad (la\cos\theta + mb\sin\theta)^2 + (-la\sin\theta + mb\cos\theta)^2 = n^2 + n^2$

$\Rightarrow \quad l^2a^2 + m^2b^2 = 2n^2$

Example 4 *The product of the perpendiculars drawn from the foci upon any tangent to an ellipse*

(a) *depends upon foci*
(b) *is constant*
(c) *depends upon the tangent*
(d) *None of the above*

Solution (b) Let equation of an ellipse is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \ldots(i)$$

Its foci are $S(ae, 0)$ and $S'(-ae, 0)$. The equation of tangent at any point $(a \cos\theta, b \sin\theta)$ to ellipse (i) is

$$\frac{x}{a}\cos\theta + \frac{y}{b}\sin\theta = 1 \quad \text{...(ii)}$$

Let the perpendicular from S and S' upon Eq. (ii) be SM and $S'N$, then

$$SM \cdot S'N = \frac{-1}{\frac{\cos^2\theta}{a^2} + \frac{\sin^2\theta}{b^2}}(e^2\cos^2\theta - 1)$$

$$\Rightarrow \quad SM \cdot S'N = b^2 = \text{a constant.}$$

Example 5 *Minimum area of the triangle by any tangent to the ellipse* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ *with the coordinate axes is*

(a) $a^2 + b^2$ (b) $\frac{(a+b)^2}{2}$ (c) ab (d) $\frac{(a-b)^2}{2}$

Solution (c) Equation of tangent at $(a \cos\theta, b \sin\theta)$ is

$$\frac{x}{a}\cos\theta + \frac{y}{b}\sin\theta = 1$$

$\therefore$ Coordinates of P and Q are $\left(\frac{a}{\cos\theta}, 0\right)$ and $\left(0, \frac{b}{\sin\theta}\right)$ respectively.

$$\therefore \quad \text{Area of } \Delta OPQ = \frac{1}{2}\left|\frac{a}{\cos\theta} \times \frac{b}{\sin\theta}\right| = \frac{ab}{|\sin 2\theta|}$$

$$\therefore \quad (\text{Area})_{\text{minimum}} = ab$$

Example 6 *The locus of the points of intersection of the tangents at the extremities of the chords of the ellipse* $x^2 + 2y^2 = 6$ *which touches the ellipse* $x^2 + 4y^2 = 4$, *is*

(a) $x^2 + y^2 = 4$ (b) $x^2 + y^2 = 6$

(c) $x^2 + y^2 = 9$ (d) *None of these*

Solution (c) The given equation of second ellipse can be rewritten as

$$\frac{x^2}{4} + \frac{y^2}{1} = 1$$

Equation of tangent to this ellipse is

$$\frac{x}{2}\cos\theta + y\sin\theta = 1 \quad \text{...(i)}$$

Equation of the first ellipse can be rewritten as

$$\frac{x^2}{6} + \frac{y^2}{3} = 1 \quad \text{...(ii)}$$

Let ellipse (i) meets the first ellipse at P and Q and the tangents at P and Q to the second ellipse intersected at (h, k), then Eq. (i) is the chord of contact of (h, k) with respect to the ellipse (ii) and thus, its equation is

$$\frac{hx}{6} + \frac{ky}{3} = 1 \quad \text{...(iii)}$$

Since, Eqs. (i) and (iii) represent the same line.

$$\therefore \quad \frac{h/6}{\cos\theta/2} = \frac{k/3}{\sin\theta} = 1$$

$$\Rightarrow \quad h = 3\cos\theta \quad \text{and} \quad k = 3\sin\theta$$

Hence, locus is $x^2 + y^2 = 9$.

Example 7 *If a number of ellipses be described having the same major axis, but a variable minor axis, such that each one of the tangents at the ends of their latusrectum passes through the fixed point, then the point of concurrency is*

(a) (1, 1) (b) (0, 1)

(c) (1, 0) (d) *None of these*

Solution (b) Let the equation of the ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.

Since, major axis is fixed,

$\therefore a$ is variable.

Hence, e is variable. Now, the ends of the latusrectum are $\left(\pm ae, \pm\frac{b^2}{a}\right)$.

Hence, the tangents at these points are

$$\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1$$

$$\Rightarrow \quad \frac{\pm x \cdot ae}{a^2} + \frac{\pm y \cdot \frac{b^2}{a}}{b^2} = 1$$

$$\Rightarrow \quad \pm\frac{xe}{a} \pm \frac{y}{a} = 1$$

$$\Rightarrow \quad \pm xe \pm y = a$$

$$\Rightarrow \quad \pm ex \pm y - a = 0$$

Hence, there are 4 tangents.

Since, e is a variable.

$\therefore$ Each of the tangents passes through the point (0, 1) which is fixed.

Example 8 *An arch is the form of a semi ellipse, It is* 8 *m wide and and* 2 *m high of the centre. Find the heigh t of the arch at a point* 1.5 *m from one end.* **[NCERT]**

(a) 1.58 *m approx* (b) 1.56 *m approx*

(c) 1.62 *m approx* (d) *None of these*

Solution (b) Clearly, equation of ellipse takes the form

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \text{...(i)}$$

Here, it is given $2a = 8$ and $b = 2 \Rightarrow a = 4, b = 2$

Put the values of a and b in Eq. (i), we get

$$\frac{x^2}{16}+\frac{y^2}{4}=1$$

Given, $AP = 1.5$ m

$\Rightarrow$ $OP = OA - AP = 4 - 1.5$

$\Rightarrow$ $OP = 2.5$ m

Let $PQ = k$

$\therefore$ Coordinate $Q = (2.5, k)$ will satisfy the equation of ellipse.

i.e., $$\frac{(2.5)^2}{16}+\frac{k^2}{4}=1$$

$$\Rightarrow \quad \frac{6.25}{16}+\frac{k^2}{4}=1$$

$$\Rightarrow \quad \frac{k^2}{4}=\frac{1}{1}-\frac{6.25}{16}=\frac{16-6.25}{16}$$

$$\Rightarrow \quad \frac{k^2}{4}=\frac{9.75}{16}$$

$$\Rightarrow \quad k^2=\frac{9.75}{4}$$

$$\Rightarrow \quad k^2=2.4375$$

$$\Rightarrow \quad k=1.56 \text{ m (approx)}$$

Example 9 *A rod of length 12 cm moves with its ends always touching the coordinate axes. Determine the equation of the locus of a point P on the rod, which is 3 cm from the end in contact with the x-axis.* **[NCERT]**

(a) $\frac{x^2}{81}-\frac{y^2}{9}=1$ (b) $\frac{x^2}{9}+\frac{y^2}{3}=1$

(c) $\frac{x^2}{81}+\frac{y^2}{9}=1$ (d) $\frac{x^2}{9}+\frac{y^2}{81}=1$

Solution (c) Let AB be the rod of length 12 cm.

Let $OA = a$ and $OB = b$

Using by Pythagoras theorem in ΔOAB.

$(\text{Base})^2 + (\text{Perpendicular})^2 = (\text{Hypotenuse})^2$

$$\Rightarrow \quad a^2+b^2=(12)^2 \quad \text{...(i)}$$

$$\Rightarrow \quad a^2+b^2=144$$

Let $AP = 3$ cm $\Rightarrow PB = AB - AP = 12 - 3 = 9$ cm

$\Rightarrow$ $AP : BP = 3 : 9 = 1 : 3$

Let $P = (h, k)$ divides the points A and B internally in the ratio $m : n$, then

$$h=\frac{mx_2+nx_1}{m+n},\ k=\frac{my_2+ny_1}{m+n}$$

$$\therefore \quad h=\frac{1\times 0+3\times a}{1+3}\ h=\frac{3a}{4}$$

$$a=\frac{4h}{3}$$

and $$k=\frac{1\times b+3\times 0}{1+3}$$

$$k=\frac{b}{4}\Rightarrow b=4k$$

Put the values of $a=\frac{4h}{3}$ and $b = 4k$ in Eq. (i), we get

$$\left(\frac{4h}{3}\right)^2+(4k)^2=144$$

$$\Rightarrow \quad \frac{16h^2}{9}+16k^e=144$$

$$\Rightarrow \quad \frac{h^2}{9}+k^2=9\Rightarrow\frac{h^2}{81}+\frac{k^2}{9}=1$$

Hence, locus of a point $P(h, k)$ is

$$\frac{x^2}{81}+\frac{y^2}{9}=1$$

Example 10 *A man running a race course notes that sum of its distances from two flag posts from him is always 10 m and the distance between the flag posts is 8 m. Find the equation of the posts traced by the man.* **[NCERT]**

(a) $\frac{x^2}{9}+\frac{y^2}{25}=1$ (b) $\frac{x^2}{25}+\frac{y^2}{9}=1$

(c) $\frac{x^2}{3}+\frac{y^2}{5}=1$ (d) *None of these*

Solution (b) Clearly, path traced by the man will be ellipse.

Given, $SP + S'P = 10$

i.e., $2a = 10 \Rightarrow a = 5$

Since, the coordinates of S and S' are $(c, 0)$ and $(-c, 0)$. Therefore, distance between S and S' is

$$2c = 8$$

$$\Rightarrow \quad c = 4$$

$$\because \quad c^2 = a^2 - b^2$$

$$\therefore \quad 16 = 25 - b^2$$

$$\Rightarrow \quad b^2 = 25 - 16$$

$$\Rightarrow \quad b^2 = 9$$

$$\Rightarrow \quad b = 3$$

Hence, equation of path (ellipse) is

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

$$\Rightarrow \quad \frac{x^2}{25}+\frac{y^2}{9}=1$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Basic Terms of Ellipse

1. If $ax^2 + by^2 + 2hxy + 2gx + 2fy + c = 0$ $(abc + 2fgh - af^2 - bg^2 - ch^2 \neq 0)$ represents an ellipse, if

(a) $h^2 = ab$ (b) $h^2 > ab$

(c) $h^2 < ab$ (d) None of these

2. The equation of the ellipse whose focus is (1, –1), the directrix of line $x - y - 3 = 0$ and eccentricity $\frac{1}{2}$ is [NCERT Exemplar]

(a) $7x^2 + 2xy + 7y^2 - 10x + 10y + 7 = 0$

(b) $7x^2 + 2xy + 7y^2 + 7 = 0$

(c) $7x^2 + 2xy + 7y^2 + 10x - 10y - 7 = 0$

(d) None of the above

3. The length of the latusrectum of the ellipse $3x^2 + y^2 = 12$ is [NCERT Exemplar]

(a) 4 (b) 3

(c) 8 (d) $\frac{4}{\sqrt{3}}$

4. If e is the eccentricity of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ $(a < b)$, then [NCERT Exemplar]

(a) $b^2 = a^2(1 - e^2)$

(b) $a^2 = b^2(1 - e^2)$

(c) $a^2 = b^2(e^2 - 1)$

(d) $b^2 = a^2(e^2 - 1)$

5. If P is a point on the ellipse $\frac{x^2}{16} + \frac{y^2}{25} = 1$ whose foci are S and S', then $PS + PS'$ is equal to [NCERT Exemplar]

(a) 8 (b) 7

(c) 5 (d) 10

6. If the latusrectum of an ellipse is equal to half of minor axis, then its eccentricity is [NCERT Exemplar]

(a) $\frac{\sqrt{15}}{3}$ (b) $\frac{\sqrt{15}}{2}$

(c) $\frac{\sqrt{15}}{6}$ (d) $\frac{\sqrt{15}}{4}$

7. If the eccentricity of an ellipse is $\frac{5}{8}$ and the distance between its foci is 10, then length of latus rectum of the ellipse is [NCERT Exemplar]

(a) $\frac{39}{7}$ (b) $\frac{39}{4}$

(c) $\frac{39}{5}$ (d) $\frac{39}{8}$

8. The locus of a point which moves such that the sum of its distances from two fixed points is always a constant, is

(a) a straight line (b) a circle

(c) an ellipse (d) a hyperbola

9. Find the distance between the directrices of the ellipse $\frac{x^2}{36} + \frac{y^2}{20} = 1$. [NCERT Exemplar]

(a) –18 (b) 18

(c) 17 (d) 19

10. If equation of ellipse is $\frac{x^2}{4} + \frac{y^2}{25} = 1$, then coordinate of the foci, eccentricity and the length of the latusrectum are respectively [NCERT]

(a) $(0, \pm\sqrt{21}), \frac{\sqrt{21}}{5}, \frac{7}{5}$

(b) $(0, \pm\sqrt{21}), \frac{\sqrt{21}}{5}, \frac{8}{5}$

(c) $(0, \pm\sqrt{21}), \frac{\sqrt{21}}{7}, \frac{8}{5}$

(d) None of the above

Equation of Ellipse and Intersection of Two Curves

11. If vertices and foci of an ellipse are $(0, \pm 13)$ and $(0, \pm 5)$ respectively, then the equation of an ellipse is [NCERT]

(a) $\frac{x^2}{144} + \frac{y^2}{169} = 1$ (b) $\frac{x^2}{169} + \frac{y^2}{144} = 1$
(c) $\frac{x^2}{12} + \frac{y^2}{13} = 1$ (d) None of these

12. Find the equation of an ellipse, if major axis on the x-axis and passes through the points (4, 3) and (6, 2). [NCERT]

(a) $\frac{x^2}{13} + \frac{y^2}{52} = 1$ (b) $\frac{x^2}{40} + \frac{y^2}{10} = 1$
(c) $\frac{x^2}{52} + \frac{y^2}{13} = 1$ (d) None of these

13. The curve with parametric equations $x = \alpha + 5\cos\theta$, $y = \beta + 4\sin\theta$ (where, θ is parameter) is
(a) a parabola (b) an ellipse
(c) a hyperbola (d) None of these

14. The curve represented by the equation $4x^2 + 16y^2 - 24x - 32y - 12 = 0$ is
(a) a parabola
(b) a pair of straight lines
(c) an ellipse with eccentricity $\frac{1}{2}$
(d) an ellipse with eccentricity $\frac{\sqrt{3}}{2}$

15. Let E be the ellipse $\frac{x^2}{9} + \frac{y^2}{4} = 1$ and C be the circle $x^2 + y^2 = 9$. Let P and Q be the points (1, 2) and (2, 1), respectively. Then,
(a) Q lies inside C but outside E
(b) Q lies outside both C and E
(c) P lies inside both C and E
(d) P lies inside C but outside E

16. The length of the axes of the conic $9x^2 + 4y^2 - 6x + 4y + 1 = 0$, are
(a) $\frac{1}{2}, 9$ (b) $3, \frac{2}{5}$ (c) $1, \frac{2}{3}$ (d) 3, 2

17. In an ellipse length of minor axis is 8 and eccentricity is $\frac{\sqrt{5}}{3}$. The length of major axis is
(a) 6 (b) 12 (c) 10 (d) 16

18. The sum of focal distance of any point on the ellipse with major and minor axes as $2a$ and $2b$ respectively, is equal to
(a) $2a$ (b) $2\frac{a}{b}$ (c) $2\frac{b}{a}$ (d) $\frac{b^2}{a}$

19. The eccentric angle of a point on the ellipse $\frac{x^2}{6} + \frac{y^2}{2} = 1$, whose distance from the centre of the ellipse is 2, is
(a) $\frac{\pi}{4}$ (b) $\frac{3\pi}{2}$ (c) $\frac{5\pi}{3}$ (d) $\frac{7\pi}{6}$

20. If e is eccentricity of ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1\,(a > b)$ and e' is eccentricity of $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, (a < b)$, then
(a) $e = e'$ (b) $ee' = 1$
(c) $\frac{1}{e^2} + \frac{1}{(e')^2} = 1$ (d) None of these

21. If the eccentricity of the two ellipse $\frac{x^2}{169} + \frac{y^2}{25} = 1$ and $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ are equal, then the value of $\frac{a}{b}$ is
(a) $\frac{5}{13}$ (b) $\frac{6}{13}$ (c) $\frac{13}{5}$ (d) $\frac{13}{6}$

22. If $(a\cos\alpha, b\sin\alpha)$, $(a\cos\beta, b\sin\beta)$ are the end points of a focal chord of an ellipse $b^2x^2 + a^2y^2 = a^2b^2$, then which of the following is correct?
(a) $e = \frac{\sin\alpha - \sin\beta}{\sin(\alpha - \beta)}$ (b) $e = \frac{\cos\left(\frac{\alpha - \beta}{2}\right)}{\cos\left(\frac{\alpha + \beta}{2}\right)}$
(c) $\frac{e-1}{e+1} = \tan\frac{\alpha}{2}\tan\frac{\beta}{2}$ (d) None of these

23. The line $x = at^2$ meets the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ in the real points, if
(a) $|t| < 2$ (b) $|t| \le 1$
(c) $|t| > 1$ (d) None of these

Tangent and Normal to the Ellipse

24. The equation of tangents to the ellipse $3x^2 + 4y^2 = 5$, which are inclined at 30° to the x-axis, are
(a) $y = \sqrt{3}x \pm \frac{5}{2}$ (b) $y = \frac{1}{\sqrt{3}}x \pm \frac{5}{2}$
(c) $y = \frac{1}{\sqrt{3}}x \pm 1$ (d) None of these

25. The angle between the pair of tangents drawn from the point (1, 2) to the ellipse $3x^2 + 2y^2 = 5$, is
(a) $\tan^{-1}(12/5)$ (b) $\tan^{-1}(6/\sqrt{5})$
(c) $\tan^{-1}(12/\sqrt{5})$ (d) $\tan^{-1}(6/5)$

26. If $x\cos\alpha + y\sin\alpha = p$ is a tangent to the ellipse, then
(a) $a^2\sin^2\alpha + b^2\cos^2\alpha = p^2$
(b) $a^2 + b^2\sin^2\alpha = p^2\operatorname{cosec}^2\alpha$
(c) $a^2\cos^2\alpha + b^2\sin^2\alpha = p^2$
(d) None of the above

27. Number of tangents from (7, 6) to ellipse $\frac{x^2}{16}+\frac{y^2}{25}=1$ is
(a) 0 (b) 1
(c) 2 (d) None of these

28. The distance of the centre of ellipse $x^2+2y^2-2=0$ to those tangents of the ellipse which are equally inclined from both the axes, is
(a) $\frac{3}{\sqrt{2}}$ (b) $\sqrt{\frac{3}{2}}$ (c) $\frac{\sqrt{2}}{3}$ (d) $\frac{\sqrt{3}}{2}$

29. If the two tangents drawn to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ intersect perpendicularly at p, then locus of p is a circle $x^2+y^2=a^2+b^2$. Then, the circle is called
(a) auxiliary circle (b) director circle
(c) great circle (d) None of these

30. Equation of tangents to the ellipse $\frac{x^2}{9}+\frac{y^2}{4}=1$, which are perpendicular to the line $3x+4y=7$, are
(a) $4x-3y=\pm\sqrt{20}$ (b) $4x-3y=\pm\sqrt{12}$
(c) $4x-3y=\pm\sqrt{2}$ (d) $4x-3y=\pm 1$

31. If the normal at point P on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ meets the axes in R and S respectively, then $PR:RS$ is equal to
(a) $a:b$ (b) $a^2:b^2$
(c) $b^2:a^2$ (d) $b:a$

32. On the ellipse $2x^2+3y^2=1$ the points at which the tangent is parallel to $4x=3y+4$, are
(a) $\left(\frac{2}{\sqrt{11}},\frac{1}{\sqrt{11}}\right)$ or $\left(-\frac{2}{\sqrt{11}},-\frac{1}{\sqrt{11}}\right)$
(b) $\left(-\frac{2}{\sqrt{11}},\frac{1}{\sqrt{11}}\right)$ or $\left(\frac{2}{\sqrt{11}},-\frac{1}{\sqrt{11}}\right)$
(c) $\left(-\frac{2}{5},-\frac{1}{5}\right)$
(d) $\left(-\frac{3}{5},-\frac{2}{5}\right)$ or $\left(\frac{3}{5},\frac{2}{5}\right)$

33. The locus of the point of intersection of the perpendicular tangents to the ellipse $\frac{x^2}{9}+\frac{y^2}{4}=1$ is
(a) $x^2+y^2=9$ (b) $x^2+y^2=4$
(c) $x^2+y^2=13$ (d) $x^2+y^2=5$

34. If tangents are drawn to the ellipse $x^2+2y^2=2$, then the locus of the mid-point of the intercept made by the tangents between the coordinate axes is
(a) $\frac{1}{2x^2}+\frac{1}{4y^2}=1$ (b) $\frac{1}{4x^2}+\frac{1}{2y^2}=1$
(c) $\frac{x^2}{2}+\frac{y^2}{4}=1$ (d) $\frac{x^2}{4}+\frac{y^2}{2}=1$

35. Tangent is drawn to the ellipse $\frac{x^2}{27}+y^2=1$ at $(3\sqrt{3}\cos\theta,\sin\theta)\left[\text{where, }\theta\in\left(0,\frac{\pi}{2}\right)\right]$. Then, the value of θ such that sum of intercepts on axes made by this tangent is minimum, is
(a) $\pi/3$ (b) $\pi/6$
(c) $\pi/8$ (d) $\pi/4$

36. If $(\sqrt{3})bx+ay=2ab$ touches the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, then eccentric angle ϕ is
(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$

37. If p is the length of the perpendicular from a focus upon the tangent at any point P of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and r is the distance of P from the focus, then $\frac{2a}{r}-\frac{b^2}{p^2}$ is equal to
(a) -1 (b) 0 (c) 1 (d) 2

38. The tangent drawn from (α,β) to an ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ touches the circle $x^2+y^2=c^2$, then the locus of (α,β) is
(a) an ellipse (b) a circle
(c) a parabola (d) None of these

39. If the tangent at the point $\left(4\cos\phi,\frac{16}{\sqrt{11}}\sin\phi\right)$ to the ellipse $16x^2+11y^2=256$ is also a tangent to the circle $x^2+y^2-2x=15$, then the value of ϕ is
(a) $\pm\pi/2$ (b) $\pm\pi/4$
(c) $\pm\pi/3$ (d) $\pm\pi/6$

40. A tangent at any point to the ellipse $4x^2+9y^2=36$ is cut by the tangent at the extremities of the major axis at T and T'. The circle on TT' as diameter passes through the point
(a) $(0,\sqrt{5})$ (b) $(\sqrt{5},0)$
(c) (2, 1) (d) $(0,-\sqrt{5})$

41. Product of the perpendicular from the foci upon any tangent to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1\,(a<b)$ is equal to
(a) $2a$ (b) a^2 (c) b^2 (d) ab^2

42. If the line $x\cos\alpha+y\sin\alpha=p$ be normal to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, then
(a) $p^2(a^2\cos^2\alpha+b^2\sin^2\alpha)=a^2-b^2$
(b) $p^2(a^2\cos^2\alpha+b^2\sin^2\alpha)=(a^2-b^2)^2$
(c) $p^2(a^2\sec^2\alpha+b^2\operatorname{cosec}^2\alpha)=a^2-b^2$
(d) $p^2(a^2\sec^2\alpha+b^2\operatorname{cosec}^2\alpha)=(a^2-b^2)^2$

43. The equation of the normal at the point (2, 3) on the ellipse $9x^2 + 16y^2 = 180$ is
(a) $3y = 8x - 10$ (b) $3y - 8x + 7 = 0$
(c) $8y + 3x + 7 = 0$ (d) $3x + 2y + 7 = 0$

44. Equation of the normal to the ellipse $4(x-1)^2 + 9(y-2)^2 = 36$, which is parallel to the line $3x - y = 1$, is
(a) $3x - y = \sqrt{5}$ (b) $3x - y = \sqrt{5} - 3$
(c) $3x - y = \sqrt{5} + 2$ (d) $3x - y = \sqrt{5}(\sqrt{5} + 1)$

45. If the normal at the point $P(\theta)$ to the ellipse $\frac{x^2}{14} + \frac{y^2}{5} = 1$ intersect it again at the point $Q(2\theta)$, then $\cos\theta$ is equal to
(a) $\frac{2}{3}$ (b) $-\frac{2}{3}$ (c) $\frac{1}{3}$ (d) $-\frac{1}{3}$

46. In the normal at the end of latusrectum of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ with eccentricity e, passes through one end of the minor axis, then
(a) $e^2(1 + e^2) = 0$ (b) $e^2(1 + e^2) = 1$
(c) $e^2(1 + e^2) = -1$ (d) $e^2(1 + e^2) = 2$

47. If $y = mx - \frac{(a^2 - b^2)m}{\sqrt{a^2 + b^2m^2}}$ is normal to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ for all values of m belonging to
(a) $(0, 1)$ (b) $(0, \infty)$
(c) R (d) None of these

48. If the normal at any point P on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, meets the axes in G and g respectively, then $PG : Pg$ is equal to
(a) $a : b$ (b) $a^2 : b^2$
(c) $b^2 : a^2$ (d) $b : a$

49. If the normal at one end of the latusrectum of an ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ passes through the one end of the minor axis, then
(a) $e^4 - e^2 + 1 = 0$ (b) $e^2 - e + 1 = 0$
(c) $e^2 + e + 1 = 0$ (d) $e^4 + e^2 - 1 = 0$

50. The locus of the point of intersection of the tangents at the end points of the focal chord of an ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, $(b < a)$ is
(a) $x = \pm \frac{a^2}{\sqrt{a^2 - b^2}}$ (b) $y = \pm \frac{b^2}{\sqrt{a^2 - b^2}}$
(c) $x = \pm \frac{ab}{\sqrt{a^2 - b^2}}$ (d) None of these

51. The sum of the squares of the perpendiculars on any tangent to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ from two points on the minor axis each at a distance $\sqrt{a^2 - b^2}$ from the centre is
(a) $2a^2$ (b) $2b^2$ (c) $a^2 + b^2$ (d) $a^2 - b^2$

52. Angle between tangents drawn from the point (5, 4) to the ellipse $\frac{x^2}{25} + \frac{y^2}{16} = 1$, is
(a) 60° (b) 90° (c) 120° (d) 45°

Chord of Contact and Diameter of an Ellipse

53. Locus of the mid-points of the chord of ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, so that chord is always touching the circle $x^2 + y^2 = c^2$, $(c < a, c < b)$ is
(a) $(b^2x^2 + a^2y^2)^2 = c^2(b^4x^2 + a^4y^2)$
(b) $(a^2x^2 + b^2y^2)^2 = c^2(a^4x^2 + b^4y^2)$
(c) $(b^2x^2 + a^2y^2)^2 = c^2(b^2x^4 + a^2y^4)$
(d) None of the above

54. Tangents are drawn from the point on the line $x - y - 5 = 0$ to $x^2 + 4y^2 = 4$, then all the chords of contact pass through a fixed point, whose coordinates are
(a) $\left(\frac{1}{5}, \frac{4}{5}\right)$ (b) $\left(\frac{4}{5}, \frac{1}{5}\right)$ (c) $\left(-\frac{4}{5}, -\frac{1}{5}\right)$ (d) $\left(\frac{4}{5}, -\frac{1}{5}\right)$

55. If the chords of contact of tangents from two points (x_1, y_1) and (x_2, y_2) to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ are at right angles, then $\frac{x_1x_2}{y_1y_2}$ is equal to
(a) $\frac{a^2}{b^2}$ (b) $-\frac{b^2}{a^2}$ (c) $-\frac{a^4}{b^4}$ (d) $-\frac{b^4}{a^4}$

56. If $lx + my + n = 0$ represents a chord of the ellipse $b^2x^2 + a^2y^2 = a^2b^2$ whose eccentric angles differ by 90°, then
(a) $a^2l^2 + b^2m^2 = n^2$ (b) $\frac{a^2}{l^2} + \frac{b^2}{m^2} = \frac{(a^2 - b^2)^2}{n^2}$
(c) $a^2l^2 + b^2m^2 = 2n^2$ (d) None of these

57. The length of the common chord of the ellipse
$$\frac{(x-1)^2}{9} + \frac{(y-2)^2}{4} = 1$$
and the circle $(x-1)^2 + (y-2)^2 = 1$ is
(a) 2 (b) $\sqrt{3}$
(c) 4 (d) None of these

58. Equation of chord of an ellipse $\frac{x^2}{25}+\frac{y^2}{9}=1$, whose mid-point is (1, 1), is
(a) $25x+9y=36$ (b) $9x+25y=34$
(c) $9x-25y=34$ (d) None of these

59. Equation of the chord of contact of pair of tangents drawn to the ellipse $4x^2+9y^2=36$ from the point (m, n), where $mn=m+n$, m and n being non-zero positive integers is
(a) $2x+9y=18$ (b) $2x+2y=1$
(c) $4x+9y=18$ (d) None of these

Miscellaneous

60. The radius of the circle passing through the foci of the ellipse $\frac{x^2}{4}+\frac{4}{7}y^2=1$ and having its centre at $\left(\frac{1}{2}, 2\right)$, is
(a) $\sqrt{5}$ (b) 3 (c) $\sqrt{12}$ (d) $\frac{7}{2}$

61. A common tangent to circle $x^2+y^2=16$ and an ellipse $\frac{x^2}{49}+\frac{y^2}{4}=1$ is
(a) $y=x+4\sqrt{5}$ (b) $y=x+\sqrt{53}$
(c) $y=\frac{2}{\sqrt{11}}x+\frac{4\sqrt{4}}{\sqrt{11}}$ (d) None of these

62. If a variable tangent of the circle $x^2+y^2=1$ intersects the ellipse $x^2+2y^2=4$ at points P and Q, then the locus of the point of intersection of tangent at P and Q is
(a) a circle of radius 2 units
(b) a parabola with focus as (2, 3)
(c) an ellipse with eccentricity $\frac{\sqrt{3}}{2}$
(d) None of the above

63. A man running round a race course notes that the sum of the distances of two flag posts from him is always 10 m and the distance between the flag posts is 8 m. The area of the path he encloses (in square metre) is
(a) 15π (b) 12π (c) 18π (d) 8π

64. The area of the quadrilateral formed by the tangents at the end points of latusrectum to the ellipse $\frac{x^2}{9}+\frac{y^2}{5}=1$ is
(a) 27/4 sq units (b) 9 sq units
(c) 27/2 sq units (d) 27 sq units

65. Equation of the circle passing through the intersection of ellipses $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ and $\frac{x^2}{b^2}+\frac{y^2}{a^2}=1$, is
(a) $x^2+y^2=a^2$ (b) $x^2+y^2=b^2$
(c) $x^2+y^2=\frac{a^2b^2}{a^2+b^2}$ (d) $x^2+y^2=\frac{2a^2b^2}{a^2+b^2}$

66. If a bar of given length moves with its extremities on two fixed straight lines at right angles, then the locus of any point on bar marked on the bar describes a/an
(a) circle (b) parabola (c) ellipse (d) hyperbola

67. Number of points on the ellipse $\frac{x^2}{50}+\frac{y^2}{20}=1$ from which pair of perpendicular tangents are drawn to the ellipse $\frac{x^2}{16}+\frac{y^2}{9}=1$ is
(a) 0 (b) 2 (c) 1 (d) 4

68. If θ and ϕ are eccentric angle of the ends of a pair of conjugate diameters of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, then $\theta-\phi$ is equal to
(a) $\pm\frac{\pi}{2}$ (b) $\pm\pi$
(c) 0 (d) None of these

Round II (Mixed Bag)

Only One Correct Option

1. Let (α, β) be a point from which two perpendicular tangents can be drawn to the ellipse $4x^2+5y^2=20$. If $F=4\alpha+3\beta$, then
(a) $-15 \le F \le 15$ (b) $F \ge 0$
(c) $-5 \le F \le 20$ (d) $F \le -5\sqrt{5}$ or $F \ge 5\sqrt{5}$

2. Three points A, B and C are taken on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ with eccentric angles θ, $\theta+\alpha$ and $\theta+2\alpha$, then
(a) the area of ΔABC is independent of θ
(b) the area of ΔABC is independent of α
(c) the maximum value of area is $\frac{\sqrt{3}}{4}ab$
(d) the maximum value of area is $\frac{3\sqrt{3}}{4}ab$

3. The point, at shortest distance from the line $x+y=7$ and lying on an ellipse $x^2+2y^2=6$, has coordinates
(a) $(\sqrt{2}, \sqrt{2})$ (b) $(0, \sqrt{3})$
(c) (2, 1) (d) $\left(\sqrt{5}, \frac{1}{\sqrt{2}}\right)$

4. A circle has the same centre as an ellipse and passes through the foci F_1 and F_2 of the ellipse, such that the two curves intersect in 4 points. Let P be any one of their points of intersection. If the major axis of the ellipse is 17 and the area of the ΔPF_1F_2 is 30, then the distance between the foci is

(a) 13 (b) 10
(c) 11 (d) None of these

5. Tangents are drawn to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1\,(a>b)$ and the circle $x^2+y^2=a^2$ at the points, where a common ordinate cuts them (on the same side of the x-axis). Then, the greatest acute angle between these tangents is given by

(a) $\tan^{-1}\left(\frac{a-b}{2\sqrt{ab}}\right)$ (b) $\tan^{-1}\left(\frac{a+b}{2\sqrt{ab}}\right)$
(c) $\tan^{-1}\left(\frac{2ab}{\sqrt{a-b}}\right)$ (d) $\tan^{-1}\left(\frac{2ab}{\sqrt{a+b}}\right)$

6. If the ellipse $\frac{x^2}{a^2-7}+\frac{y^2}{13-5a}=1$ is inscribed in a square of side length $\sqrt{2}a$, then a is equal to

(a) 6/5 (b) $(-\infty, -\sqrt{7}) \cup (\sqrt{7}, 13/5)$
(c) $(-\infty, -\sqrt{7}) \cup (13/5, \sqrt{7})$ (d) No such a exists

7. If the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is inscribed in a rectangle whose length to breadth ratio is 2 : 1, then the area of the rectangle is

(a) $4\frac{a^2+b^2}{7}$ (b) $4\frac{a^2+b^2}{3}$
(c) $12\frac{a^2+b^2}{5}$ (d) $8\frac{a^2+b^2}{5}$

8. A parabola is drawn with focus is at one of the foci of the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ (where, $a>b$) and directrix passing through the other focus and perpendicular to the major axes of the ellipse. If latusrectum of the ellipse and the parabola are same, then the eccentricity of the ellipse is

(a) $1-\frac{1}{\sqrt{2}}$ (b) $2\sqrt{2}-2$
(c) $\sqrt{2}-1$ (d) None of these

More Than One Correct Option

9. The points, where the normals to the ellipse $x^2+3y^2=37$ be parallel to the line $6x-5y+7=0$ is/are

(a) (5, 2) (b) (2, 5)
(c) (1, 3) (d) (–5, –2)

10. Let F_1 and F_2 be two foci of the ellipse and PT and PN be the tangent and the normal respectively to the ellipse at point P. Then,

(a) PN bisects $\angle F_1PF_2$
(b) PT bisects $\angle F_1PF_2$
(c) PT bisects angle $(180° - \angle F_1PF_2)$
(d) None of the above

11. If the tangent at the point $P(\theta)$ to the ellipse $16x^2+11y^2=256$ is also a tangent to the circle $x^2+y^2-2x=15$, then θ is equal to

(a) $\frac{2\pi}{3}$ (b) $\frac{4\pi}{3}$ (c) $\frac{5\pi}{3}$ (d) $\frac{\pi}{3}$

Comprehension Based Questions

Passage

Directions (Q. Nos. 12-14) *The ellipse* $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ *is such that it has the least area but contains the circle* $(x-1)^2+y^2=1$.

12. The eccentricity of the ellipse is

(a) $\sqrt{\frac{2}{3}}$ (b) $\frac{1}{\sqrt{3}}$
(c) $\frac{1}{2}$ (d) None of these

13. Equation of auxiliary circle of ellipse is

(a) $x^2+y^4=65$ (b) $x^2+y^4=5$
(c) $x^2+y^4=45$ (d) None of these

14. Length of latusrectum of the ellipse is

(a) 2 units (b) 1 unit
(c) 3 units (d) 2.5 units

Assertion and Reason

Directions (Q. Nos. 15-21) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*) *and* (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

15. **Statement I** The sum of focal distances of a point on the ellipse $9x^2+4y^2-18x-24y+9=0$ is 4.

Statement II The equation $9x^2+4y^2-18x-24y+9=0$ can be expressed as $9(x-1)^2+4(y-3)^2=36$.

16. **Statement I** The major and minor axes of the ellipse $5x^2 + 9y^2 - 54y + 36 = 0$ are 6 and 10, respectively.

Statement II The equation $5x^2 + 9y^2 - 54y + 36 = 0$ can be expressed as $5x^2 + 9(y-3)^2 = 45$.

17. **Statement I** The condition on a and b for which two distinct chords of the ellipse $\frac{x^2}{2a^2} + \frac{y^2}{2b^2} = 1$ passing through $(a, -b)$ are bisected by the line $x + y = b$ is $a^2 + 6ab - 7b^2 \geq 0$.

Statement II Equation of chord of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ whose mid-point (x_1, y_1), is $T = S_1$.

18. **Statement I** Tangents drawn from any point on the circle $x^2 + y^2 = 13$ to the ellipse $\frac{x^2}{9} + \frac{y^2}{4} = 1$ are at right angles.

Statement II Equation of the auxiliary circle of the ellipse $\frac{x^2}{13} + \frac{y^2}{4} = 1$ is $x^2 + y^2 = 13$.

19. **Statement I** The area of the ellipse $2x^2 + 3y^2 = 6$ is more than the area of the circle $x^2 + y^2 - 2x + 4y + 4 = 0$.

Statement II The length of semi-major axes of an ellipse is more than the radius of the circle.

20. **Statement I** If tangent at point P (in first quadrant) to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, (a > b)$, meets corresponding directrix $x = a/e$ at point Q, then circle with minimum radius having PQ as chord passes through the corresponding focus.

Statement II PQ subtends right angle at corresponding focus.

21. **Statement I** An equation of a common tangent to the parabola $y^2 = 16\sqrt{3}x$ and the ellipse $2x^2 + y^2 = 4$ is $y = 2x + 2\sqrt{3}$. [AIEEE 2012]

Statement II If the line $y = mx + \frac{4\sqrt{3}}{m}, (m \neq 0)$ is a common tangent to the parabola $y^2 = 16\sqrt{3}x$ and the ellipse $2x^2 + y^2 = 4$, then m satisfies $m^4 + 2m^2 = 24$.

Previous Years' Questions

22. The equation of the circle passing through the foci of the ellipse $\frac{x^2}{16} + \frac{y^2}{9} = 1$ and having centre at (0, 3) is [JEE Main 2013]

(a) $x^2 + y^2 - 6y - 7 = 0$ (b) $x^2 + y^2 - 6y + 7 = 0$
(c) $x^2 + y^2 - 6y - 5 = 0$ (d) $x^2 + y^2 - 6y + 5 = 0$

23. An ellipse is drawn by taking a diameter of the circle $(x-1)^2 + y^2 = 1$ as its semi-minor axis and a diameter of the circle $x^2 + (y-2)^2 = 4$ is semi-major axis. If the centre of the ellipse is at the origin and its axes are the coordinate axes, then the equation of the ellipse is [AIEEE 2012]

(a) $4x^2 + y^2 = 4$ (b) $x^2 + 4y^2 = 8$
(c) $4x^2 + y^2 = 8$ (d) $x^2 + 4y^2 = 16$

24. Equation of the ellipse whose axes are the axes of coordinates and which passes through the point (–3, 1) and has eccentricity $\sqrt{2/5}$ is [AIEEE 2011]

(a) $5x^2 + 3y^2 - 48 = 0$ (b) $3x^2 + 5y^2 - 15 = 0$
(c) $5x^2 + 3y^2 - 32 = 0$ (d) $3x^2 + 5y^2 - 32 = 0$

25. The ellipse $x^2 + 4y^2 = 4$ is inscribed in a rectangle aligned with the coordinate axes, which is turn in inscribed in another ellipse that passes through the point (5, 0). Then, the equation of the ellipse is [AIEEE 2009]

(a) $x^2 + 12y^2 = 16$ (b) $4x^2 + 48y^2 = 48$
(c) $4x^2 + 64y^2 = 48$ (d) $x^2 + 16y^2 = 16$

26. A focus of an ellipse is at the origin. The directrix is the line $x = 4$ and the eccentricity is 1/2, then length of semi-major axis is [AIEEE 2008]

(a) $\frac{5}{3}$ (b) $\frac{8}{3}$ (c) $\frac{2}{3}$ (d) $\frac{4}{3}$

27. In an ellipse, the distance between its foci is 6 and minor axis is 8. Then, its eccentricity is [AIEEE 2006]

(a) 1/2 (b) 4/5 (c) $1/\sqrt{5}$ (d) 3/5

28. If the angle between the lines joining the end points of minor axis of an ellipse with its foci is $\frac{\pi}{2}$, then the eccentricity of the ellipse is [AIEEE 2005]

(a) 1/2 (b) $1/\sqrt{2}$
(c) $\sqrt{3}/2$ (d) $1/2\sqrt{2}$

29. An ellipse has OB as semi-minor axis, F and F' its foci and the $\angle FBF'$ is a right angle. Then, the eccentricity of the ellipse is [AIEEE 2005]

(a) $1/\sqrt{3}$ (b) 1/4 (c) 1/2 (d) $1/\sqrt{2}$

30. The eccentricity of an ellipse, with centre at the origin, is 1/2 If one directrix is $x = 4$, the equation of the ellipse is [AIEEE 2004]

(a) $3x^2 + 4y^2 = 1$ (b) $3x^2 + 4y^2 = 12$
(c) $4x^2 + 3y^2 = 1$ (d) $4x^2 + 3y^2 = 12$

the Guidance

Round I

1. Equation $ax^2 + by^2 + 2hxy + 2gx + 2fy + c = 0$ represents an ellipse, if

$$\Delta = abc + 2fgh - af^2 - bg^2 - ch^2 \neq 0$$

and $h^2 < ab$

2. By definition of ellipse $SP = ePM$, where P is any point, S is focus and M is point on directrix.

$$\therefore \quad \sqrt{(x-1)^2 + (y+1)^2} = \frac{1}{2}\frac{|x-y-3|}{\sqrt{1^2+1^2}}$$

$$\Rightarrow \quad \sqrt{(x-1)^2 + (y+1)^2} = \frac{1}{2\sqrt{2}}|x-y-3|$$

$$\Rightarrow \quad 8(x^2 + 1 - 2x + y^2 + 1 + 2y) = x^2 + y^2 + 9 - 2xy + 6y - 6x$$

$$\Rightarrow \quad 7x^2 + 7y^2 + 2xy - 10x + 10y + 7 = 0$$

3. Given equation of ellipse can be rewritten as

$$\frac{x^2}{4} + \frac{y^2}{12} = 1$$

On comparing with $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, we get $a^2 = 4, b^2 = 12$

Here, $b > a$

$\therefore$ Length of latusrectum $= \frac{2a^2}{b} = \frac{2 \times 4}{2\sqrt{3}} = \frac{4}{\sqrt{3}}$

4. Given equation of ellipse is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \, (a < b)$$

$\therefore$ Eccentricity, $e = \sqrt{1 - \frac{a^2}{b^2}}$

$$\Rightarrow \quad e^2 = \frac{b^2 - a^2}{b^2}$$

$$\Rightarrow \quad a^2 = b^2(1 - e^2)$$

5. Given equation of ellipse is

$$\frac{x^2}{16} + \frac{y^2}{25} = 1$$

Here, $a^2 = 16, b^2 = 25$ *i.e.*, $b > a$

$\therefore$ $PS + PS' = 2b$ ($\because$ sum of focal radii $= 2b$)

$= 2 \times 5 = 10$

6. Let equation of ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, a > b$.

According to the given condition,

Latusrectum of ellipse $= \frac{1}{2}$ (minor axis)

$$\Rightarrow \quad \frac{2b^2}{a} = \frac{1}{2}(b)$$

$\Rightarrow \quad 4b = a$

$\because \quad e = \sqrt{1-\frac{b^2}{a^2}} = \sqrt{1-\frac{b^2}{(4b)^2}}$

$= \sqrt{1-\frac{1}{16}} = \frac{\sqrt{15}}{4}$

7. Given, $e = \frac{5}{8}$ and $2ae = 10$

$\therefore \quad 2a \times \frac{5}{8} = 10$

$\Rightarrow \quad a = 8$

$\because \quad b^2 = a^2(1-e^2) = 64\left(1-\frac{25}{64}\right) = 39$

$\therefore$ Length of latusrectum $= \frac{2b^2}{a} = \frac{2\times 39}{8} = \frac{39}{4}$

8. The locus of a point which moves such that the sum of its distances from two fixed points is always a constant is an ellipse.

9. Given equation of ellipse is $\frac{x^2}{36}+\frac{y^2}{20}=1$

Here, $a^2 = 36, b^2 = 20$

$\therefore$ Distance between directrices $= \frac{2a}{e}$

Now, $e = \sqrt{1-\frac{b^2}{a^2}} = \sqrt{1-\frac{20}{36}} = \sqrt{\frac{16}{36}} = \frac{4}{6} = \frac{2}{3}$

$\therefore$ Distance between directrices $= \frac{2\times 6}{2/3} = 18$

10. Given equation of ellipse is

$$\frac{x^2}{4}+\frac{y^2}{25}=1$$

Here, $a^2 = 4, b^2 = 25$

i.e., $a < b$

$\therefore$ The major axis is along y-axis.

$\therefore \quad e = \sqrt{1-\frac{a^2}{b^2}} = \sqrt{1-\frac{4}{25}} = \frac{\sqrt{21}}{5}$

Here, major axis is along y-axis. So,

Foci $= (0, \pm e) + (0, \pm\sqrt{21})$

Length of latusrectum $= \frac{2a^2}{b} = \frac{2\times 4}{5} = \frac{8}{5}$

11. Given vertices $= (0, \pm 13)$ and foci $= (0, \pm 5)$

Here, we see that x-coordinate is 0, it means major axis is lies along y-axis.

Let $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1, b > a$

Here, $b = 13$ and $be = 5$

$\Rightarrow \quad 13e = 5 \Rightarrow e = \frac{5}{13}$

$\because \quad a^2 = b^2(1-e^2) = 169\left(1-\frac{25}{169}\right) = 144$

$\Rightarrow \quad a^2 = 144$

$\therefore$ Equation of ellipse is $\frac{x^2}{144}+\frac{y^2}{169}=1$

12. Since, major axis is along x-axis. Hence, equation of ellipse will be of the form

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \quad \text{...(i)}$$

Given that Eq.(i) passes through the points (4, 3) and (6, 2), *i.e.*, they will satisfy it

$\therefore \quad \frac{(4)^2}{a^2}+\frac{(3)^2}{b^2}=1 \Rightarrow \frac{16}{a^2}+\frac{9}{b^2}=1 \quad$ ...(ii)

and $\frac{(6)^2}{a^2}+\frac{(2)^2}{b^2}=1 \Rightarrow \frac{36}{a^2}+\frac{4}{b^2}=1 \quad$ ...(iii)

On multiplying Eq. (ii) by 4 and Eq. (iii) by 9, then subtracting, we get

$$\frac{64}{a^2}-\frac{324}{a^2} = 4-9 \Rightarrow -\frac{260}{a^2} = -5$$

$\Rightarrow \quad a^2 = \frac{260}{5} \Rightarrow a^2 = 52$

From Eq.(ii),

$$\frac{9}{b^2} = 1-\frac{16}{52} \Rightarrow \frac{9}{b^2} = \frac{52-16}{52}$$

$\Rightarrow \quad \frac{9}{b^2} = \frac{36}{52} \Rightarrow b^2 = \frac{9\times 52}{36} = 13$

Put the values of $a^2 = 52$ and $b^2 = 13$ in Eq. (i), we get

$$\frac{x^2}{52}+\frac{y^2}{13}=1$$

13. Given equation of curve is $x = \alpha + 5\cos\theta, y = \beta + 4\sin\theta$

or $\cos\theta = \frac{x-\alpha}{5}, \quad \sin\theta = \frac{y-\beta}{4}$

$\because \quad \cos^2\theta + \sin^2\theta = 1$

$\Rightarrow \quad \left(\frac{x-\alpha}{5}\right)^2 + \left(\frac{y-\beta}{4}\right)^2 = 1$

This represents the equation of an ellipse.

14. The given equation can be rewritten as

$4x^2 - 24x + 36 + 16y^2 - 32y + 16 - 36 - 16 - 12 = 0$

$\Rightarrow \quad (2x-6)^2 + (4y-4)^2 = 64$

$\Rightarrow \quad \frac{(x-3)^2}{16} + \frac{(y-1)^2}{4} = 1$

This represents an ellipse.

Here, $a^2 = 16, b^2 = 4 \therefore e = \sqrt{1-\frac{4}{16}} = \frac{\sqrt{3}}{2}$

15. The position of the points (1, 2) and (2, 1) with respect to the circle $x^2 + y^2 = 9$ is given by $1^2 + 2^2 = 5 < 9$ and $2^2 + 1^2 = 5 < 9$. Thus, both P and Q lie inside C.

The position of the points (1, 2) and (2, 1) with respect to the ellipse $\frac{x^2}{9}+\frac{y^2}{4}=1$ is given by $\frac{1^2}{9}+\frac{2^2}{4} = \frac{1}{9}+1 > 1$

and $\frac{2^2}{9}+\frac{1}{4}=\frac{16+9}{36}=\frac{25}{36}<1,$

P lies outside E and Q lies inside E. Thus, P lies inside C but outside E.

16. Given equation is $9x^2+4y^2-6x+4y+1=0$

$$\Rightarrow\ 9\left(x^2-\frac{2}{3}x+\frac{1}{3^2}\right)+4\left(y^2+y+\frac{1}{4}\right)+1-1-1=0$$

$$\Rightarrow\ \frac{\left(x-\frac{1}{3}\right)^2}{\left(\frac{1}{3}\right)^2}+\frac{\left(y+\frac{1}{2}\right)^2}{\left(\frac{1}{2}\right)^2}=1 \qquad \text{(here, } a<b\text{)}$$

Length of major axis $=2b=2\left(\frac{1}{2}\right)=1$

Length of minor axis $=2a=2\left(\frac{1}{3}\right)=\frac{2}{3}$

17. Let the standard equation of ellipse is $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1(a>b)$.

Minor axis $=2b=8 \Rightarrow b=4$

and eccentricity $=e=\frac{\sqrt{5}}{3}$

Now, $b^2=a^2(1-e^2)$

$$\Rightarrow\ (4)^2=a^2\left(1-\frac{5}{9}\right)\Rightarrow 16=a^2\left(\frac{4}{9}\right)$$

$$\Rightarrow\ a^2=36 \Rightarrow a=6$$

Length of major axis $=2a=12$

18. We know that sum of focal distance of any point on the ellipse always equal to the length of major axis, *i.e.*, it is equal to $2a$.

19. Let point is $(\sqrt{6}\cos\theta, \sqrt{2}\sin\theta)$ and let it's distance d from origin.

$$\therefore\ d=\sqrt{6\cos^2\theta+2\sin^2\theta}$$

$$\Rightarrow\ 2=\sqrt{2+4\cos^2\theta}$$

$$\Rightarrow\ 2+4\cos^2\theta=4$$

$$\Rightarrow\ \cos^2\theta=\frac{1}{2}$$

$$\Rightarrow\ \cos\theta=\pm\frac{1}{\sqrt{2}}$$

$$\Rightarrow\ \theta=\frac{\pi}{4}$$

20. $e^2=\frac{a^2-b^2}{a^2}$ and $e'^2=\frac{b^2-a^2}{b^2}$

$$\Rightarrow\ \frac{1}{e^2}+\frac{1}{e'^2}=1$$

21. Equations of the ellipse are $\frac{x^2}{13^2}+\frac{y^2}{5^2}=1$ and $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$

and their eccentricity are

$$e=\sqrt{1-\frac{25}{169}}$$

and $e'=\sqrt{1-\frac{b^2}{a^2}}$

According to given condition, $e'=e$

$$\Rightarrow\ \sqrt{1-\left(\frac{b^2}{a^2}\right)}=\sqrt{1-\left(\frac{25}{169}\right)}$$

$$\Rightarrow\ \frac{b}{a}=\frac{5}{13} \qquad (\because a>0, b>0)$$

$$\Rightarrow\ \frac{a}{b}=\frac{13}{5}$$

22. If $(a\cos\alpha, b\sin\alpha)$ and $(a\cos\beta, b\sin\beta)$ are the end points of chord, then equation of chord is

$$\frac{x}{a}\cos\left(\frac{\alpha+\beta}{2}\right)+\frac{y}{b}\sin\left(\frac{\alpha+\beta}{2}\right)=\cos\left(\frac{\alpha-\beta}{2}\right)$$

If it is a focal chord, it passes through $(ae, 0)$, so

$$e\cos\left(\frac{\alpha+\beta}{2}\right)=\cos\left(\frac{\alpha-\beta}{2}\right)$$

$$\Rightarrow\ e=\frac{\cos\left(\frac{\alpha-\beta}{2}\right)}{\cos\left(\frac{\alpha+\beta}{2}\right)}$$

23. Putting $x=at^2$ in $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1,$

we get $t^4+\frac{y^2}{b^2}=1$

i.e., $y^2=b^2(1-t^4)=b^2(1+t^2)(1-t^2)$

y is real, if $1-t^2\geq 0$

i.e., $|t|\leq 1$

24. Given equation of ellipse is

$$\frac{x^2}{\frac{5}{3}}+\frac{y^2}{\frac{5}{4}}=1$$

The equation of tangents in slope form is

$$y=mx\pm\sqrt{\frac{5}{3}m^2+\frac{5}{4}}$$

Slope of tangents are $\frac{1}{\sqrt{3}}$ or $-\frac{1}{\sqrt{3}}$

$$\therefore\ y=\pm\frac{1}{\sqrt{3}}x\pm\sqrt{\frac{5}{9}+\frac{5}{4}}$$

$$\Rightarrow\ y=\pm\frac{1}{\sqrt{3}}x\pm\frac{\sqrt{65}}{6}$$

25. The combined equation of the pair of tangents drawn from (1, 2) to the ellipse $3x^2+2y^2=5$ is $SS'=T^2$

$$\Rightarrow\ (3x^2+2y^2-5)[3(1)^2+2(2)^2-5]=[3x(1)+2y(2)-5]^2$$

$$\Rightarrow\ (3x^2+2y^2-5)(3+8-5)=(3x+4y-5)^2$$

$$\Rightarrow\ 9x^2-24xy-4y^2+40y+30x-55=0$$

This is the equation of pair of straight lines,

where, $a = 9,\ h = -12,\ b = -4$

The angle between these lines is given by

$$\tan\theta = \frac{2\sqrt{h^2 - ab}}{a + b}$$

$$\Rightarrow \quad \tan\theta = \frac{2\sqrt{144 + 36}}{9 - 4} = \frac{2\sqrt{180}}{5} = \frac{12}{\sqrt{5}}$$

$$\Rightarrow \quad \theta = \tan^{-1}\left(\frac{12}{\sqrt{5}}\right)$$

26. We have, $x\cos\alpha + y\sin\alpha = p$

$$\Rightarrow \quad y = -x\cot\alpha + p\,\text{cosec}\,\alpha$$

Since, above line is tangent to the ellipse.

$$\therefore \quad c^2 = a^2m^2 + b^2$$

$$\Rightarrow \quad p^2\,\text{cosec}^2\alpha = a^2\cot^2\alpha + b^2$$

$$\Rightarrow \quad a^2\cos^2\alpha + b^2\sin^2\alpha = p^2$$

27. Let $S \equiv \frac{x^2}{16} + \frac{y^2}{25} - 1 = 0$

At point (7, 6), $S_1 > 0$. So, two tangents can be drawn from this point.

28. Equation of ellipse is $\frac{x^2}{2} + \frac{y^2}{1} = 1$. General equation of tangent to the ellipse of slope m is

$$y = mx \pm \sqrt{2m^2 + 1}$$

Since, this is equally inclined to axes, so $m = \pm 1$. Thus, tangents are

$$y = \pm x \pm \sqrt{2 + 1} = \pm x \pm \sqrt{3}$$

Distance of any tangent from origin

$$= \frac{|0 + 0 \pm \sqrt{3}|}{\sqrt{1^2 + 1^2}} = \frac{\sqrt{3}}{2}$$

29. The director circle is the locus of points from which perpendicular tangents are drawn to the ellipse.

Now, equation of director circle to an ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \text{ is } x^2 + y^2 = a^2 + b^2.$$

30. Let the equation of tangent, which is perpendicular to the line $3x + 4y = 7$ is $4x - 3y = \lambda$.

Since, it is a tangent to the ellipse.

$$\therefore \quad \lambda^2 = a^2m^2 + b^2$$

Here, $a^2 = 9, b^2 = 4$ and $m = \frac{4}{3}$

$$\therefore \quad \lambda^2 = 9 \times \left(\frac{4}{3}\right)^2 + 4 = 16 + 4$$

$$\Rightarrow \quad \lambda^2 = 20 \Rightarrow \lambda = \pm\sqrt{20}$$

$\therefore$ Equation of tangents are $4x - 3y = \pm\sqrt{20}$.

31. The equation of normal at point $P(a\cos\theta, b\sin\theta)$ is

$$ax\sec\theta - by\,\text{cosec}\,\theta = a^2 - b^2$$

The point of intersection with coordinate axes are $R\left(\frac{a^2 - b^2}{a}\cos\theta, 0\right)$ and $S\left(0, -\frac{a^2 - b^2}{a}\sin\theta\right)$.

$$\text{Now,} \quad RP^2 = \left[a\cos\theta - \left(\frac{a^2 - b^2}{a}\right)\cos\theta\right]^2 + b^2\sin^2\theta$$

$$= \frac{b^2}{a^2}(b^2\cos^2\theta + a^2\sin^2\theta)$$

$$\text{and} \quad RS^2 = \frac{a^2}{b^2}(b^2\cos^2\theta + a^2\sin^2\theta)$$

$$\therefore \quad RP^2 : RS^2 = b^4 : a^4$$

$$\Rightarrow \quad RP : PS = b^2 : a^2$$

32. We have, $a^2 = \frac{1}{2},\ b^2 = \frac{1}{3},\ m = \frac{4}{3}$

The required points are

$$\left(\pm\frac{a^2m}{\sqrt{a^2m^2 + b^2}}, \mp\frac{b^2}{\sqrt{a^2m^2 + b^2}}\right)$$

$$= \left(\pm\frac{\frac{1}{2}\times\frac{4}{3}}{\sqrt{\frac{1}{2}\times\frac{16}{9} + \frac{1}{3}}}, \mp\frac{\frac{1}{3}}{\sqrt{\frac{1}{2}\times\frac{16}{9} + \frac{1}{3}}}\right) = \left(\pm\frac{2}{\sqrt{11}}, \mp\frac{1}{\sqrt{11}}\right)$$

33. We know that, the locus of point of intersection of two perpendicular tangents drawn on the ellipse is $x^2 + y^2 = a^2 + b^2$, which is called director circle.

Given equation of ellipse is $\frac{x^2}{9} + \frac{y^2}{4} = 1$.

Here, $a^2 = 9,\ b^2 = 4$

$\therefore$ Locus is $x^2 + y^2 = a^2 + b^2$

$$\Rightarrow \quad x^2 + y^2 = 9 + 4 \Rightarrow x^2 + y^2 = 13$$

34. Let the point be $P(\sqrt{2}\cos\theta, \sin\theta)$ on $\frac{x^2}{2} + \frac{y^2}{1} = 1$.

$\therefore$ Equation of tangent at P is $\frac{x\sqrt{2}}{2}\cos\theta + y\sin\theta = 1$

whose intercept on coordinate axes are $A(\sqrt{2}\sec\theta, 0)$ and $B(0, \text{cosec}\,\theta)$.

$\therefore$ Mid-point of its intercept between axes is

$$\left(\frac{\sqrt{2}}{2}\sec\theta, \frac{1}{2}\,\text{cosec}\,\theta\right) = (h, k)$$

$$\Rightarrow \quad \cos\theta = \frac{1}{\sqrt{2}\,h} \quad \text{and} \quad \sin\theta = \frac{1}{2k}$$

$$\text{Now,} \quad \cos^2\theta + \sin^2\theta = 1 \Rightarrow \frac{1}{2h^2} + \frac{1}{4k^2} = 1$$

The locus of mid-point M is $\frac{1}{2x^2} + \frac{1}{4y^2} = 1$.

35. Equation of tangent at $(3\sqrt{3}\cos\theta, \sin\theta)$ to the ellipse $\frac{x^2}{27}+y^2=1$ is $\frac{x\cos\theta}{3\sqrt{3}}+y\sin\theta=1$.

It cuts intercepts on the coordinate axes.

$\therefore$ Sum of intercepts on axes is

$$3\sqrt{3}\sec\theta+\operatorname{cosec}\theta=f(\theta) \qquad \text{(say)}$$

On differentiating w.r.t. θ, we get

$$f'(\theta)=\frac{3\sqrt{3}\sin^3\theta-\cos^3\theta}{\sin^2\theta\cos^2\theta}$$

For maxima and minima, put $f'(\theta)=0$

$$\Rightarrow \quad 3\sqrt{3}\sin^3\theta-\cos^3\theta=0$$

$$\Rightarrow \quad \tan^3\theta=\frac{1}{3\sqrt{3}}$$

$$\Rightarrow \quad \tan\theta=\frac{1}{\sqrt{3}} \Rightarrow \theta=\frac{\pi}{6}$$

At $\theta=\frac{\pi}{3}$, $f''(\theta)>0$

$\therefore f(\theta)$ is minimum at $\theta=\frac{\pi}{6}$.

36. Given equation of tangent is $\frac{x}{a}\frac{\sqrt{3}}{2}+\frac{y}{b}\frac{1}{2}=1$ and equation of tangent at the point $(a\cos\phi, b\sin\phi)$ on the ellipse is $\frac{x}{a}\cos\phi+\frac{y}{b}\sin\phi=1$.

Both are same.

$$\therefore \quad \cos\phi=\frac{\sqrt{3}}{2}, \quad \sin\phi=\frac{1}{2} \Rightarrow \phi=\frac{\pi}{6}$$

37. The equation of the tangent at $P(a\cos\theta, b\sin\theta)$ to the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$ is $\frac{x}{a}\cos\theta+\frac{y}{b}\sin\theta=1$.

Length of perpendicular from the focus $(ae, 0)$ on the ellipse

$$=\left|\frac{e\cos\theta-1}{\sqrt{\frac{\cos^2\theta}{a^2}+\frac{\sin^2\theta}{b^2}}}\right|$$

$$=\left|\frac{ab(e\cos\theta-1)}{\sqrt{b^2\cos^2\theta+a^2(1-\cos^2\theta)}}\right|=\left|\frac{ab(e\cos\theta-1)}{\sqrt{a^2-a^2e^2\cos^2\theta}}\right|$$

$$\therefore \quad p=b\sqrt{\frac{1-e\cos\theta}{1+e\cos\theta}}$$

$$\Rightarrow \quad \frac{b^2}{p^2}=\frac{1+e\cos\theta}{1-e\cos\theta}$$

Now, $r^2=(ae-a\cos\theta)^2+b^2\sin^2\theta$

$$=a^2[(e-\cos\theta)^2+(1-e^2)\sin^2\theta]$$

$$=a^2[e^2\cos^2\theta-2e\cos\theta+1]=a^2(1-e\cos\theta)^2$$

$$\Rightarrow \quad r=a(1-e\cos\theta)$$

$$\therefore \quad \frac{2a}{r}-\frac{b^2}{p^2}=\frac{2}{1-e\cos\theta}-\frac{1+e\cos\theta}{1-e\cos\theta}=1$$

38. The chord of contact of (α,β) is $\frac{x\alpha}{a^2}+\frac{y\beta}{b^2}=1$. It touches the circle $x^2+y^2=c^2$.

$$\therefore \quad \frac{1}{\sqrt{\frac{\alpha^2}{a^4}+\frac{\beta^2}{b^4}}}=c \Rightarrow \frac{\alpha^2}{\alpha^4}+\frac{\beta^2}{\beta^4}=\frac{1}{\chi^2}$$

Thus, the locus of (α,β) is

$$\frac{x^2}{a^4}+\frac{y^2}{b^4}=\frac{1}{c^2}$$

39. The equation of the tangent at $\left(4\cos\phi, \frac{16}{\sqrt{11}}\sin\phi\right)$ to the ellipse $16x^2+11y^2=256$ is

$$16(4\cos\phi)x+11\left(\frac{16}{\sqrt{11}}\sin\phi\right)y=256$$

$$\Rightarrow \quad 4x\cos\phi+\sqrt{11}y\sin\phi=16$$

This, touches the circle $(x-1)^2+y^2=4^2$.

$$\therefore \quad \left|\frac{4\cos\phi-16}{\sqrt{16\cos^2\phi+11\sin^2\phi}}\right|=4$$

$$\Rightarrow \quad (\cos\phi-4)^2=16\cos^2\phi+11\sin^2\phi$$

$$\Rightarrow \quad 4\cos^2\phi+8\cos\phi-5=0$$

$$\Rightarrow \quad (2\cos\phi-1)(2\cos\phi+5)=0$$

$$\Rightarrow \quad \cos\phi=\frac{1}{2} \Rightarrow \phi=\pm\frac{\pi}{3} \qquad \left(\because \cos\phi\neq\frac{5}{2}\right)$$

40. Any point on the ellipse is $P(3\cos\theta, 2\sin\theta)$.

Equation of the tangent at P is

$$\frac{x}{3}\cos\theta+\frac{y}{2}\sin\theta=1$$

which meets the tangents $x=3$ and $x=-3$ at the extremities of the major axis at $T\left\{3, \frac{2(1-\cos\theta)}{\sin\theta}\right\}$ and $T'\left\{-3, \frac{2(1+\cos\theta)}{\sin\theta}\right\}$.

Equation of circle on TT' as diameter is

$$(x-3)(x+3)+\left\{y-\frac{2(1-\cos\theta)}{\sin\theta}\right\}\left\{y-\frac{2(1+\cos\theta)}{\sin\theta}\right\}=0$$

$$\Rightarrow \quad x^2+y^2-\frac{4}{\sin\theta}y-5=0$$

which passes through $(\sqrt{5}, 0)$.

41. Given equation of ellipse is

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 (a<b)$$

It is a vertical ellipse with foci $(0, \pm be)$.

Equation of any tangent line to the above ellipse is

$$y=mx+\sqrt{a^2m^2+b^2}$$

$\therefore$ Required product

$$= \left|\frac{-be + \sqrt{a^2m^2 + b^2}}{\sqrt{m^2+1}}\right| \left|\frac{be + \sqrt{a^2m^2 + b^2}}{\sqrt{m^2+1}}\right|$$

$$= \left|\frac{a^2m^2 + b^2 - b^2e^2}{m^2+1}\right|$$

$$= \left|\frac{a^2m^2 + b^2(1-e^2)}{m^2+1}\right|$$

$$= \left|\frac{a^2m^2 + a^2}{m^2+1}\right| = a^2 \qquad [\because a^2 = b^2(1-e^2)]$$

42. The equation of any normal to $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is

$$ax \sec\phi - by \operatorname{cosec}\phi = a^2 - b^2 \qquad \ldots(i)$$

The straight line $x\cos\alpha + y\sin\alpha = p$ will be a normal to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, then Eq. (i) and $x\cos\alpha + y\sin\alpha = p$ will represent the same line.

$$\therefore \quad \frac{a\sec\phi}{\cos\alpha} = \frac{-b\operatorname{cosec}\phi}{\sin\alpha} = \frac{a^2-b^2}{p}$$

$$\Rightarrow \quad \cos\phi = \frac{ap}{(a^2-b^2)\cos\alpha}$$

and $$\sin\phi = \frac{-bp}{(a^2-b^2)\sin\alpha}$$

$$\because \quad \sin^2\phi + \cos^2\phi = 1$$

$$\Rightarrow \quad \frac{b^2p^2}{(a^2-b^2)^2\sin^2\alpha} + \frac{a^2p^2}{(a^2-b^2)^2\cos^2\alpha} = 1$$

$$\Rightarrow \quad p^2(b^2\operatorname{cosec}^2\alpha + a^2\sec^2\alpha) = (a^2-b^2)^2$$

43. The given equation can be rewritten as $\frac{x^2}{20} + \frac{y^2}{\frac{45}{4}} = 1$

On comparing the given equation with the standard equation, we get

$$a^2 = 20, \quad b^2 = \frac{45}{4}$$

$\therefore$ The equation of normal at the point (2, 3) is

$$\frac{x-2}{\frac{2}{20}} = \frac{y-3}{\left(\frac{12}{45}\right)}$$

$$\Rightarrow \quad 40(x-2) = 15(y-3)$$

$$\Rightarrow \quad 8x - 3y = 7 \quad \Rightarrow \quad 3y - 8x + 7 = 0$$

44. Equation of given ellipse is $\frac{(x-1)^2}{9} + \frac{(y-2)^2}{4} = 1$.

Equation of normal to ellipse $\frac{X^2}{9} + \frac{Y^2}{4} = 1$ is

$$3X\sec\theta - 2Y\operatorname{cosec}\theta = 5.$$

Slope of normal is $\frac{3}{2}\tan\theta$,

which is parallel to $3x - y = 1$, then $\frac{3}{2}\tan\theta = 3$

$$\Rightarrow \quad \tan\theta = 2$$

$$\therefore \quad \sin\theta = \frac{2}{\sqrt{5}}, \quad \cos\theta = \frac{1}{\sqrt{5}}$$

So, equation of normal is $3\sqrt{5}X - \sqrt{5}Y = 5$.

$$\because \quad X = x-1, \quad Y = y-2$$

$$\therefore \quad 3\sqrt{5}(x-1) - \sqrt{5}(y-2) = 5$$

$$\Rightarrow \quad \sqrt{5}(3x-y) = 5(\sqrt{5}+1)$$

$$\Rightarrow \quad 3x - y = \sqrt{5}(\sqrt{5}+1)$$

45. Equation of ellipse is $\frac{x^2}{14} + \frac{y^2}{5} = 1$.

Any point on the ellipse is $(\sqrt{14}\cos\theta, \sqrt{5}\sin\theta)$.

$\therefore$ Equation of normal at $(\sqrt{14}\cos\theta, \sqrt{5}\sin\theta)$ is

$$\sqrt{14}x\sec\theta - \sqrt{5}y\operatorname{cosec}\theta = 9.$$

It passes through $(a\cos 2\theta, b\sin 2\theta)$.

$$\therefore \quad \sqrt{14}\sqrt{14}\cos 2\theta\sec\theta - \sqrt{5}\sqrt{5}\sin 2\theta\operatorname{cosec}\theta = 9$$

$$\Rightarrow \quad 14\frac{\cos 2\theta}{\cos\theta} - 5\frac{\sin 2\theta}{\sin\theta} = 9$$

$$\Rightarrow \quad 14(2\cos^2\theta - 1) - 10\cos^2\theta = 9\cos\theta$$

$$\Rightarrow \quad 18\cos^2\theta - 9\cos\theta - 14 = 0$$

$$\Rightarrow \quad 18\cos^2\theta - 21\cos\theta + 12\cos\theta - 14 = 0$$

$$\Rightarrow \quad (3\cos\theta + 2)(6\cos\theta - 7) = 0$$

$$\Rightarrow \quad \cos\theta = -\frac{2}{3}, \quad \cos\theta \neq -\frac{7}{6}$$

46. Normal at $\left(ae, \frac{b^2}{a}\right)$ of ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is

$$\frac{x - ae}{\frac{ae}{a^2}} = \frac{y - \frac{b^2}{a}}{\left(\frac{b^2}{a}/b^2\right)}$$

Since, it passes through $(0, -b)$, then

$$\frac{0 - ae}{\frac{ae}{a^2}} = \frac{-b - \frac{b^2}{a}}{\frac{1}{a}}$$

$$\Rightarrow \quad -a^2 = -a\left(b + \frac{b^2}{a}\right)$$

$$\Rightarrow \quad a^2 = ab + b^2$$

$$\Rightarrow \quad a^2 = ab + a^2 - a^2e^2 \quad (\because b^2 = a^2 - a^2e^2)$$

$$\Rightarrow \quad b = ae^2$$

$$\Rightarrow \quad b^2 = a^2e^4$$

$$\Rightarrow \quad a^2(1-e^2) = a^2e^4$$

$$\Rightarrow \quad 1 - e^2 = e^4 \Rightarrow e^2(e^2+1) = 1$$

47. The equation of normal to the given ellipse at $P(a\cos\theta, b\sin\theta)$ is

$$a\,x\sec\theta - by\,\text{cosec}\,\theta - a^2 = b^2$$

$$\Rightarrow \quad y = \left(\frac{a}{b}\tan\theta\right)x - \frac{a^2-b^2}{b}\sin\theta \quad \ldots\text{(i)}$$

Let $\frac{a}{b}\tan\theta = m$, then $\sin\theta = \frac{bm}{\sqrt{a^2+b^2m^2}}$

$\therefore$ From Eq. (i), we get

$$y = mx - \frac{(a^2-b^2)m}{\sqrt{a^2+b^2m^2}}$$

$$\because \quad \frac{a}{b}\tan\theta \in R \;\Rightarrow\; m \in R$$

48. Let $P(a\cos\theta, b\sin\theta)$ be any point on the ellipse $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$.

Then, the equation of the normal at P is

$$ax\sec\theta - by\,\text{cosec}\,\theta = a^2 - b^2$$

It meets the axes at $G\left(\frac{a^2-b^2}{a}\cos\theta, 0\right)$

and $\quad g\left(0, -\frac{a^2-b^2}{b}\sin\theta\right)$

$$\therefore \quad PG^2 = \left(a\cos\theta - \frac{a^2-b^2}{a}\cos\theta\right)^2 + b^2\sin^2\theta$$

$$PG^2 = \frac{b^2}{a^2}(b^2\cos^2\theta + a^2\sin^2\theta) \quad \ldots\text{(i)}$$

and $\quad Pg^2 = \frac{a^2}{b^2}(b^2\cos^2\theta + a^2\sin^2\theta) \quad \ldots\text{(ii)}$

$$\therefore \quad PG : Pg = b^2 : a^2$$

49. The coordinates of the extremity of the latusrectum which lies in the first quadrant are $\left(ae, \frac{b^2}{a}\right)$. The equation of the normal at (x_1, y_1) is

$$\frac{a^2x}{x_1} - \frac{b^2y}{y_1} = (a^2-b^2)$$

$\therefore$ The equation of the normal at $\left(ae, \frac{b^2}{a}\right)$ is

$$\frac{a^2x}{ae} - \frac{b^2y}{b^2/a} = a^2 - b^2$$

$$\Rightarrow \quad ax - aey = e(a^2-b^2)$$

$$\Rightarrow \quad ax - aey = ea^2e^2$$

$$\Rightarrow \quad x - ey = ae^3$$

This passes through the extremity of the minor axis *i.e.*, $(0, -b)$

$$\therefore \quad 0 + eb - ae^3 = 0$$

$$\Rightarrow \quad b = ae^2$$

$$\Rightarrow \quad b^2 = a^2e^4$$

$$\Rightarrow \quad a^2(1-e^2) = a^2e^4$$

$$\therefore \quad e^4 + e^2 - 1 = 0$$

50. Since, locus of the point of intersection of the tangents at the end points of a focal chord is directrix.

$\therefore$ Required locus is $x = \pm\frac{a}{e} = \pm\frac{a^2}{\sqrt{a^2-b^2}}$

51. $\because \quad e^2 = 1 - \frac{b^2}{a^2}$

$$\therefore \quad a^2 - b^2 = a^2e^2$$

So, the points on the minor axis at a distance $\sqrt{a^2-b^2}$ from the centre (0, 0) of the ellipse are $(0, \pm ae)$.

The equation of tangent at any point $(a\cos\theta, b\sin\theta)$ on the ellipse is

$$\frac{x}{a}\cos\theta + \frac{y}{b}\sin\theta = 1$$

$\therefore$ Required sum

$$= \left[\frac{\frac{ae\sin\theta}{b} - 1}{\sqrt{\frac{\cos^2\theta}{a^2} + \frac{\sin^2\theta}{b^2}}}\right]^2 + \left[\frac{\frac{-ae\sin\theta}{b} - 1}{\sqrt{\frac{\cos^2\theta}{a^2} + \frac{\sin^2\theta}{b^2}}}\right]^2$$

$$= \frac{(ae\sin\theta - b)^2 + (ae\sin\theta + b)^2}{(b^2\cos^2\theta + a^2\sin^2\theta)} \times a^2$$

$$= \frac{2a^2[(a^2-b^2)\sin^2\theta + b^2]}{b^2\cos^2\theta + a^2\sin^2\theta} = 2a^2$$

52. Equation of director circle of the ellipse $\frac{x^2}{25}+\frac{y^2}{16}=1$ is

$$x^2 + y^2 = 25 + 16$$

$$\Rightarrow \quad x^2 + y^2 = 41$$

$\because$ The given point (5, 4) lies on the director circle, therefore the tangents are drawn from this point to the ellipse makes an angle 90°.

53. Let mid-point of the chord be (h, k), then equation of the chords be

$$\frac{hx^2}{a^2} + \frac{ky^2}{b^2} - 1 = \frac{h^2}{a^2} + \frac{k^2}{b^2} - 1$$

$$\Rightarrow \quad y = -\frac{b^2}{a^2}\cdot\frac{h}{k}x + \left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)\frac{b^2}{k} \quad \ldots\text{(i)}$$

Since, line (i) is touching the circle $x^2 + y^2 = c^2$.

$$\therefore \quad \left(\frac{h^2}{a^2} + \frac{k^2}{b^2}\right)\frac{b^4}{k^2} = c^2\left(1 + \frac{b^4h^2}{a^4k^2}\right)$$

Hence, locus is $(b^2x^2 + a^2y^2)^2 = c^2(b^4x^2 + a^4y^2)$.

54. Any point on the line $x - y - 5 = 0$ will be of the form $(t, t-5)$. Chord of contact of this point with respect to curve $x^2 + 4y^2 = 4$ is

$$tx + 4(t-5)y - 4 = 0$$

$$\Rightarrow \quad (-20y - 4) + t(x + 4y) = 0$$

which is a family of straight lines, each member of this family pass through point of intersection of straight lines $-20y - 4 = 0$ and $x + 4y = 0$ which is $\left(\frac{4}{5}, -\frac{1}{5}\right)$.

55. Chords of contact are

$$\frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1$$

and

$$\frac{xx_2}{a^2} + \frac{yy_2}{b^2} = 1$$

Product of slopes $= -1$

$$\Rightarrow \quad \left(-\frac{x_1}{a^2}\cdot\frac{b^2}{y_1}\right)\left(-\frac{x_2}{a^2}\cdot\frac{b^2}{y_2}\right) = -1$$

$$\Rightarrow \quad \frac{x_1x_2}{y_1y_2} = -\frac{a^4}{b^4}$$

56. Equation of chord joining points $P(a\cos\alpha, b\sin\alpha)$ and $Q(a\cos\beta, b\sin\beta)$ is

$$\frac{x}{a}\cos\left(\frac{\alpha+\beta}{2}\right) + \frac{y}{b}\sin\left(\frac{\alpha+\beta}{2}\right) = \cos\left(\frac{\alpha-\beta}{2}\right)$$

Now, $\quad \beta = \alpha + 90°$

$$\therefore \quad \frac{x}{a}\cos\left(\frac{2\alpha+90°}{2}\right) + \frac{y}{b}\sin\left(\frac{2\alpha+90°}{2}\right) = \frac{1}{\sqrt{2}}$$

Now, compare it with $lx + my = -n$, we get

$$\frac{\cos\left(\frac{2\alpha+90°}{2}\right)}{al} = \frac{\sin\left(\frac{2\alpha+90°}{2}\right)}{bm} = -\frac{1}{\sqrt{2}\,n}$$

$$\because \quad \cos^2\theta + \sin^2\theta = 1$$

$$\Rightarrow \quad a^2l^2 + b^2m^2 = 2n^2$$

57. It is clear from the figure that the two curves do not intersect each other.

58. We know that, if (x_1, y_1) is the mid-point of the chord, then equation of chord is

$$T = S_1$$

$$\Rightarrow \quad \frac{xx_1}{25} + \frac{yy_1}{9} = \frac{x_1^2}{25} + \frac{y_1^2}{9}$$

$\because$ Point is (1, 1), then

$$\frac{x}{25} + \frac{y}{9} = \frac{1}{25} + \frac{1}{9}$$

$$\Rightarrow \quad 9x + 25y = 34$$

59. Given, $\quad m(n-1) = n$

n is divisible by $n - 1$.

$$\Rightarrow \quad n = 2 \Rightarrow m = 2$$

Hence, chord of contact of tangents drawn from (2, 2) to

$$\frac{x^2}{9} + \frac{y^2}{4} = 1 \text{ is}$$

$$\frac{2x}{9} + \frac{2y}{4} = 1$$

$$\Rightarrow \quad 4x + 9y = 18$$

60. Given equation of ellipse is $\frac{x^2}{4} + \frac{y^2}{\frac{7}{4}} = 1$.

Here, $\quad a^2 = 4$ and $b^2 = \frac{7}{4}$

$$\therefore \quad b^2 = a^2(1 - e^2)$$

$$\Rightarrow \quad \frac{7}{4} = 4(1 - e^2)$$

$$\Rightarrow \quad e^2 = 1 - \frac{7}{16} = \frac{9}{16}$$

$$\Rightarrow \quad e = \frac{3}{4}$$

Thus, the foci are $\left(\pm\frac{3}{2}, 0\right)$.

The radius of required circle $= \sqrt{\left(\frac{3}{2} - \frac{1}{2}\right)^2 + (2-0)^2}$

$$= \sqrt{1+4} = \sqrt{5}$$

61. Let the equation of tangent to the circle $x^2 + y^2 = 16$ is

$$y = mx + 4\sqrt{1+m^2} \qquad (\because y = mx + a\sqrt{1+m^2})$$

and let the equation of tangent to the ellipse $\frac{x^2}{49} + \frac{y^2}{4} = 1$ is

$$y = mx + \sqrt{49m^2 + 4} \qquad (\because y = mx + \sqrt{a^2m^2 + b^2})$$

For common tangent,

$$4\sqrt{1+m^2} = \sqrt{49m^2 + 4}$$

$$\Rightarrow \quad 16 + 16m^2 = 49m^2 + 4$$

$$\Rightarrow \quad 12 = 33m^2$$

$$\Rightarrow \quad m^2 = \frac{12}{33}$$

$$\Rightarrow \quad m = \frac{2}{\sqrt{11}}$$

$$\therefore \quad y = \frac{2}{\sqrt{11}}x + 4\sqrt{1 + \frac{4}{11}}$$

$$= \frac{2}{\sqrt{11}}x + 4\sqrt{\frac{15}{11}}$$

62. Let point of intersection be (h, k). Then, equation of the line passing through P and Q is $hx + 2ky = 4$ (chord of contact).

Since, $hx + 2ky = 4$ touches $x^2 + y^2 = 1$, $\frac{16}{4k^2} = 1 + \frac{h^2}{4k^2}$

i.e., $4k^2 + h^2 = 16$. So, required locus is $4y^2 + x^2 = 16$, which is an ellipse of eccentricity $\frac{\sqrt{3}}{2}$ and length of latusrectum is 2 units.

63. Let P is the position of man and S, S' are position of flags, then

$$SP + S'P = 10 = 2a \Rightarrow a = 5$$

$$\therefore \quad SS' = 2ae = 8 \Rightarrow e = \frac{4}{5}$$

Now, $\quad e^2 = 1 - \frac{b^2}{a^2} \Rightarrow \frac{16}{25} = 1 - \frac{b^2}{25}$

$\Rightarrow \quad b^2 = 9 \Rightarrow b = 3$

Area of ellipse $= \pi ab = 15\pi$ sq m

64. The quadrilateral formed by the tangents at the end points of latusrectum is a rhombus. It is symmetrical about the axes.

So, total area is four times the area of the right angled triangle formed by the tangent and axes in the Ist quadrant.

Now, $\quad ae = \sqrt{a^2 - b^2}$

$\Rightarrow \quad ae = 2$

$\therefore$ Coordinates of one end point of latusrectum are $\left(2, \frac{5}{3}\right)$.

The equation of tangent at that point is $\frac{x}{\frac{9}{2}} + \frac{y}{3} = 1$. This equation meets the coordinate axes at a point $A\left(0, \frac{9}{2}\right)$ and $B(3, 0)$.

In ΔAOB, $\quad$ Area $= \frac{1}{2} \times \frac{9}{2} \times 3 = \frac{27}{4}$

Total area of rhombus $ABCD = 4 \times$ Area of ΔAOB

$$= 4 \times \frac{27}{4} = 27 \text{ sq units}$$

65. Given equations of ellipse are

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \text{ and } \frac{x^2}{b^2} + \frac{y^2}{a^2} = 1$$

The point of the intersection of these ellipse are

$$\left(\pm \frac{ab}{\sqrt{a^2 + b^2}}, \pm \frac{ab}{\sqrt{a^2 + b^2}}\right) \text{ i.e., } P\left(\frac{ab}{\sqrt{a^2 + b^2}}, \frac{ab}{\sqrt{a^2 + b^2}}\right).$$

$\therefore$ The distance between $OP = r$

$$= \sqrt{\left(\frac{ab}{\sqrt{a^2 + b^2}} - 0\right)^2 + \left(\frac{ab}{\sqrt{a^2 + b^2}} - 0\right)^2}$$

$$= \frac{ab}{\sqrt{a^2 + b^2}} \sqrt{2}$$

$\therefore$ Equation of circle is

$$x^2 + y^2 = r^2$$

$$\Rightarrow \quad x^2 + y^2 = \frac{2a^2b^2}{a^2 + b^2}$$

66. Obviously, it is an ellipse, because the normal and tangent at point P of an ellipse bisect the internal and external angles between the focal distance of the point.

67. For the ellipse $\frac{x^2}{16} + \frac{y^2}{9} = 1$, equation of director circle is $x^2 + y^2 = 25$. The director circle will cut the ellipse $\frac{x^2}{50} + \frac{y^2}{20} = 1$ at four points. Hence, number of points is 4.

68. Let $y = m_1x$ and $y = m_2x$ be a pair of conjugate diameters of an ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ and let $P(a \cos\theta, b \sin\theta)$ and $Q(a \cos\phi, b \sin\phi)$ be ends of these two diameters. Then,

$$m_1m_2 = -\frac{b^2}{a^2}$$

$$\Rightarrow \quad \frac{b \sin\theta - 0}{a \cos\theta - 0} \times \frac{b \sin\phi - 0}{a \cos\phi - 0} = -\frac{b^2}{a^2}$$

$$\Rightarrow \quad \sin\theta \sin\phi = -\cos\theta \cos\phi$$

$$\Rightarrow \quad \cos(\theta - \phi) = 0 \Rightarrow \theta - \phi = \pm \frac{\pi}{2}$$

Round II

1. (α, β) lies on the director circle of the ellipse *i.e.*, on $x^2 + y^2 = 9$.

So, we can assume

$$\alpha = 3\cos\theta, \quad \beta = 3\sin\theta$$

$\therefore \quad F = 12\cos\theta + 9\sin\theta = 3(4\cos\theta + 3\sin\theta)$

$\Rightarrow \quad -15 \le F \le 15$

2. $A \equiv (a\cos\theta, b\sin\theta)$

$B \equiv \{a\cos(\theta+\alpha), b\sin(\theta+\alpha)\}$

$C \equiv \{a\cos(\theta+2\alpha), b\sin(\theta+2\alpha)\}$

$\Delta \equiv$ Area of ΔABC

$$= \frac{1}{2}\begin{vmatrix} 1 & a\cos\theta & b\sin\theta \\ 1 & a\cos(a+\alpha) & b\sin(\theta+\alpha) \\ 1 & a\cos(\theta+2\alpha) & b\sin(\theta+2\alpha) \end{vmatrix}$$

$$= 2ab\sin^2\left(\frac{\alpha}{2}\right)\sin\alpha$$

$$\Delta(\alpha) = ab\sin\alpha(1-\cos\alpha)$$

$$= \frac{ab}{2}(2\sin\alpha - \sin 2\alpha)$$

$$\Delta'(\alpha) = 0$$

$\Rightarrow \quad \cos\alpha = 1$ or $\cos\alpha = -\frac{1}{2}$

$\cos\alpha = 1$ gives triangle $= 0$

$\cos\alpha = -\frac{1}{2}$ gives maximum value of triangle $= \frac{3\sqrt{3}}{4}ab$

3. The tangent at the point of shortest distance from the line $x + y = 7$ parallel to the given line.

Any point on the given ellipse is $(\sqrt{6}\cos\theta, \sqrt{3}\sin\theta)$.

Equation of the tangent is

$$\frac{x\cos\theta}{\sqrt{6}} + \frac{y\sin\theta}{\sqrt{3}} = 1. \text{ It is parallel to } x + y = 7.$$

$\Rightarrow \quad \frac{\cos\theta}{\sqrt{6}} = \frac{\sin\theta}{\sqrt{3}}$

$\Rightarrow \quad \frac{\cos\theta}{\sqrt{2}} = \frac{\sin\theta}{1}$

$$= \frac{1}{\sqrt{3}}$$

The required point is (2, 1).

4. Let ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ and circle $x^2 + y^2 = a^2e^2$

Radius of circle $= ae$

Point of intersection of circle and ellipse is

$$\left[\frac{a}{e}\sqrt{2e^2-1}, \frac{a}{e}(1-e^2)\right].$$

Now, area of ΔPF_1F_2

$$= \frac{1}{2}\begin{vmatrix} \frac{a}{e}\sqrt{2e^2-1} & \frac{a}{e}(1-e^2) & 1 \\ ae & 0 & 1 \\ -ae & 0 & 1 \end{vmatrix} = \frac{1}{2}\left|\frac{a}{e}(1-e^2)(2ae)\right| = 30$$

$\Rightarrow \quad a^2(1-e^2) = 30$ (given)

$\Rightarrow \quad a^2e^2 = a^2 - 30 = \left(\frac{17}{2}\right)^2 - 30 = \frac{169}{4}$

$\Rightarrow \quad 2ae = 13$

5.

Tangent to the ellipse at $P(a\cos\alpha, b\sin\alpha)$ is

$$\frac{x}{a}\cos\alpha + \frac{y}{b}\sin\alpha = 1 \quad \text{...(i)}$$

Tangent to the circle at $Q(a\cos\alpha, a\sin\alpha)$ is

$$\cos\alpha x + \sin\alpha y = a \quad \text{...(ii)}$$

Now, angle between tangents is θ,

then $\quad \tan\theta = \left|\dfrac{-\frac{b}{a}\cot\alpha - (-\cot\alpha)}{1 + \left(-\frac{b}{a}\cot\alpha\right)(-\cot\alpha)}\right|$

$$= \left|\frac{\cot\alpha\left(1 - \frac{b}{a}\right)}{1 + \frac{b}{a}\cot^2\alpha}\right| = \left|\frac{a-b}{a\tan\alpha + b\cot\alpha}\right|$$

$$= \left|\frac{a-b}{(\sqrt{a\tan\alpha} - \sqrt{b\cot\alpha})^2 + 2\sqrt{ab}}\right|$$

Now, the greatest value of the above expression is $\left|\frac{a-b}{2\sqrt{ab}}\right|$

when $\sqrt{a\tan\alpha} = \sqrt{b\cot\alpha}$

$\Rightarrow \quad \theta_{max} = \tan^{-1}\left(\frac{a-b}{2\sqrt{ab}}\right)$

6.

Since, sides of the square are tangent and perpendicular to each other, so two vertices lie on director circle.

$\Rightarrow \quad x^2 + y^2 = (a^2 - 7) + (13 - 5a)$

$= a^2$ ($\sqrt{2}a$ is side of the square)

$\Rightarrow \quad (a^2 - 7) + (13 - 5a) = a^2$

$\Rightarrow \quad a = \frac{6}{5}$

But for an ellipse to exist $a^2 - 7 > 0$ and $13 - 5a > 0$

$\Rightarrow \quad a \in (-\infty, -\sqrt{7})$

Hence, $\quad a \neq \frac{6}{5}$

Hence, no such a exists.

7. Since, mutually perpendicular tangents can be drawn from vertices of rectangle. So, all the vertices of rectangle should lie on director circle $x^2 + y^2 = a^2 + b^2$.

Let breadth $= 2l$ and length $= 4l$, then

area of rectangle $= 2l \times 4l = 8l^2$

$= \frac{8}{5}(a^2 + b^2)$

($\therefore$ In ΔOAB, $a^2 + b^2 = l^2 + 4l^2 \Rightarrow 5l^2 = a^2 + b^2$)

8. Equation of the ellipse is $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.

Equation of the parabola with focus $S(ae, 0)$ and directrix $x + ae = 0$ is $y^2 = 4aex$.

Now, length of latusrectum of the ellipse is $\frac{2b^2}{a}$ and that of the parabola is $4ae$.

For the two latusrectum to be equal, we get

$$\frac{2b^2}{a} = 4ae$$

$\Rightarrow \quad \frac{2a^2(1 - e^2)}{a} = 4ae$

$\Rightarrow \quad 1 - e^2 = 2e$

$\Rightarrow \quad e^2 + 2e - 1 = 0$

Therefore, $\quad e = -\frac{2 \pm \sqrt{8}}{2} = -1 \pm \sqrt{2}$

Hence, $\quad e = \sqrt{2} - 1$

9. Let (x_1, y_1) be a point, then $x_1^2 + 3y_1^2 = 37$ ...(i)

Equation of tangent at (x_1, y_1) is

$$xx_1 + 3yy_1 = 37$$

Slope of tangent $= -\frac{x_1}{3y_1}$

Then, $\quad$ slope of normal $= \frac{3y_1}{x_1} = \frac{6}{5}$ (given)

$\Rightarrow \quad x_1 = \frac{5y_1}{2}$ ...(ii)

From Eqs. (i) and (ii), we get

$$\frac{25y_1^2}{4} + 3y_1^2 = 37$$

$\Rightarrow \quad y_1^2 = 4$

$\therefore \quad y_1 = \pm 2$

From Eq. (ii), $\quad x_1 = \pm 5$

$\therefore$ Required points are $(5, 2)$ and $(-5, -2)$.

10. $\because \frac{PF_1}{PF_2} = \frac{NF_1}{NF_2}$

$\therefore$ PN bisects the $\angle F_1PF_2$.

$\because$ Bisectors are perpendicular to each other.

$\therefore$ PT bisects the angle $(180° - \angle F_1PF_2)$.

11. Given equation of ellipse is $16x^2 + 11y^2 = 256$.

Equation of tangent at $\left(4\cos\theta, \frac{16}{\sqrt{11}}\sin\theta\right)$ is

$$16x(4\cos\theta) + 11y\left(\frac{16}{\sqrt{11}}\sin\theta\right) = 256$$

It touches $(x - 1)^2 + y^2 = 4^2$, if

$$\left|\frac{4\cos\theta - 16}{\sqrt{16\cos^2\theta + 11\sin^2\theta}}\right| = 4$$

$\Rightarrow \quad (\cos\theta - 4)^2 = 16\cos^2\theta + 11\sin^2\theta$

$\Rightarrow \quad 4\cos^2\theta + 8\cos\theta - 5 = 0$

$\Rightarrow \quad \cos\theta = \frac{1}{2}$

$\therefore \quad \theta = \frac{\pi}{3}, \frac{5\pi}{3}$

12. Solving both equations, we have

$$\frac{x^2}{a^2}+\frac{1-(x-1)^2}{b^2}=1$$

$\Rightarrow \quad b^2x^2+a^2[1-(x-1)^2]=a^2b^2$

$\Rightarrow (b^2-a^2)x^2+2a^2x-a^2b^2=0$ ...(i)

For least area circle must touch the ellipse.

$\therefore$ Discriminant of Eq. (i) is zero

$\Rightarrow \quad 4a^4+4a^2b^2(b^2-a^2)=0$

$\Rightarrow \quad a^2+b^2(b^2-a^2)=0$

$\Rightarrow \quad a^2+b^2(-a^2e^2)=0$

$\Rightarrow \quad 1-b^2e^2=0$

$\Rightarrow \quad b=\frac{1}{e}$

Also, $\quad a^2=\frac{b^2}{1-e^2}=\frac{1}{e^2(1-e^2)} \qquad \left(\because b=\frac{1}{e}\right)$

$\Rightarrow \quad a=\frac{1}{e\sqrt{1-e^2}}$

Let S be the area of the ellipse. Then,

$$S=\pi ab=\frac{\pi}{e^2\sqrt{1-e^2}}=\frac{\pi}{\sqrt{e^4-e^6}}$$

Area is minimum, if $f(e)=e^4-e^6$ is maximum,

when $f'(e)=4e^3-6e^5=0$,

or $\quad e=\sqrt{2/3} \quad$ {which is point of maxima for $f(e)$}

S is least when $e=\sqrt{\frac{2}{3}}$

$\therefore \quad b=\frac{1}{\sqrt{2/3}}=\sqrt{\frac{3}{2}}$

and $\quad a=\frac{1}{\sqrt{\frac{2}{3}}\sqrt{1-\frac{2}{3}}}=\frac{3}{\sqrt{2}}$

$\therefore$ Equation of ellipse is $2x^2+6y^2=9$.

13. Equation of auxiliary circle of ellipse is $x^2+y^2=45$.

14. Length of latusrectum of ellipse is

$$\frac{2b^2}{a}=\frac{2\frac{9}{4}}{\frac{9}{2}}=1$$

15. $9x^2+4y^2-18x-24y+9=0$

$\Rightarrow \quad 9(x-1)^2+4(y-3)^2=36$

$\Rightarrow \quad \frac{(x-1)^2}{2^2}+\frac{(y-3)^2}{3^2}=1$

Here, $\quad b>a$

$\therefore$ Sum of focal distances of a point is $2b=6$.

16. $\because \quad 5x^2+9y^2-54y+36=0$

$\Rightarrow \quad 5x^2+9(y-3)^2=45$

$\Rightarrow \quad \frac{x^2}{3^2}+\frac{(y-3)^2}{(\sqrt{5})^2}=1$

$\therefore \quad$ Length of major axis $=2\times 3=6$

and length of minor axis $=2\times\sqrt{5}=2\sqrt{5}$

17. Let $(t, b-t)$ be a point on the line $x+y=b$, then equation of chord whose mid-point $(t, b-t)$ is

$$\frac{tx}{2a^2}+\frac{(b-t)y}{2b^2}-1=\frac{t^2}{2a^2}+\frac{(b-t)^2}{2b^2}-1 \qquad \text{...(i)}$$

$(a, -b)$ lies on Eq. (i), then

$$\frac{ta}{2a^2}-\frac{b(b-t)}{2b^2}=\frac{t^2}{2a^2}+\frac{(b-t)^2}{2b^2}$$

$\Rightarrow \quad t^2(a^2+b^2)-ab(3a+b)t+2a^2b^2=0$

$\because t$ is real.

$\therefore \quad B^2-4AC\geq 0$

$\Rightarrow \quad a^2b^2(3a+b)^2-4(a^2+b^2)2a^2b^2\geq 0$

$\Rightarrow \quad 9a^2+6ab+b^2-8a^2-8b^2\geq 0$

$\therefore \quad a^2+6ab-7b^2\geq 0$

18. The equation of the director circle of the ellipse $\frac{x^2}{9}+\frac{y^2}{4}=1$ is $x^2+y^2=13$.

Statement II is also true but it is not a correct explanation for statement I.

19. Given ellipse is $\frac{x^2}{3}+\frac{y^2}{2}=1$, whose area is $\pi\sqrt{3}\sqrt{2}=\pi\sqrt{6}$.

Circle is $x^2+y^2-2x+4y+4=0$ or $(x-1)^2+(y-2)^2=1$.

Its area is π. Hence, statement I is true.

Also, statement II is true but it is not the correct explanation of statement I.

Consider the ellipse $\frac{x^2}{25}+\frac{y^2}{1}=1$, whose area is 5π and circle $x^2+y^2=16$ whose area is 16π.

Also, here semi-major axis of ellipse $(=5)$ is more than the radius of the circle $(=4)$.

20. Statement II is true as it is one of the properties of the ellipse

Circle with minimum radius having PQ as chord when PQ is diameter of the circle, hence as shown in the figure it passes through the focus.

21. Standard equation of tangent with slope m to the parabola $y^2 = 16\sqrt{3}x$ is

$$y = mx + \frac{4\sqrt{3}}{m} \quad \ldots(i)$$

Standard equation of tangent with slope m to the ellipse $\frac{x^2}{2} + \frac{y^2}{4} = 1$ is

$$y = mx \pm \sqrt{2m^2 + 4} \quad \ldots(ii)$$

If a line L is a common tangent to both parabola and ellipse, then

L should be tangent to parabola, *i.e.*, its equation should be like Eq. (i)

L should be tangent to ellipse *i. e.*, its equation should be like Eq. (ii).

i.e., L must be like both of the Eqs. (i) and (ii).

Hence, comparing Eqs. (i) and (ii), we get

$$\frac{4\sqrt{3}}{m} = \pm\sqrt{2m^2 + 4}$$

On squaring, we get

$$m^2(2m^2 + 4) = 48$$

$$\Rightarrow \quad m^4 + 2m^2 - 24 = 0$$

$$\Rightarrow \quad (m^2 + 6)(m^2 - 4) = 0$$

$$\Rightarrow \quad m^2 = 4 \quad (\because m^2 \neq -6)$$

$$\Rightarrow \quad m = \pm 2$$

On substituting $m = \pm 2$ in the Eq. (i), we get the required equation of the common tangents as

$$y = 2x + 2\sqrt{3}$$

and $$y = -2x - 2\sqrt{3}$$

Hence, statement I is correct.

Statement II In statement II, we have already seen that, if the line $y = mx + \frac{4\sqrt{3}}{m}$ is a common tangent to the parabola $y^2 = 16\sqrt{3}x$ and the ellipse $\frac{x^2}{2} + \frac{y^2}{4} = 1$, then it satisfies the equation $m^4 + 2m^2 - 24 = 0$.

Hence, statement II is also correct but it is not able to explain the statement I.

22. Given equation of ellipse is

$$\frac{x^2}{16} + \frac{y^2}{9} = 1.$$

Here, $a = 4$, $b = 3$, $e = \sqrt{1 - \frac{9}{16}} = \frac{\sqrt{7}}{4}$

$\therefore$ Foci is $(\pm ae, 0)$

$$= \left(\pm 4 \times \frac{\sqrt{7}}{4}, 0\right) = (\pm\sqrt{7}, 0)$$

$\therefore$ Radius of the circle,

$$r = \sqrt{(ae)^2 + b^2} = \sqrt{7 + 9} = \sqrt{16} = 4$$

Now, equation of circle is

$$(x - 0)^2 + (y - 3)^2 = 16$$

$$\therefore \quad x^2 + y^2 - 6y - 7 = 0$$

23. Diameter of circle $(x - 1)^2 + y^2 = 1$ is 2 units and that of circle $x^2 + (y - 2)^2 = 4$ is 4 units.

Semi-minor axis of ellipse, $b = 2$ units and semi-major axis of ellipse, $a = 4$ units.

Hence, the equation of the ellipse is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

$$\Rightarrow \quad \frac{x^2}{16} = \frac{y^2}{4} = 1$$

$$\Rightarrow \quad x^2 + 4y^2 = 16$$

24. Given, $$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Passes through $P(-3, 1)$ and $e = \sqrt{\frac{2}{5}}$

$$\therefore \quad \frac{9}{a^2} + \frac{1}{b^2} = 1$$

and $$e^2 = 1 - \frac{b^2}{a^2}$$

$$\Rightarrow \quad \frac{9}{a^2} + \frac{5}{3a^2} = 1$$

and $$\frac{2}{5} = 1 - \frac{b^2}{a^2}$$

$$\Rightarrow \quad \frac{27 + 5}{3a^2} = 1 \text{ and } \frac{b^2}{a^2} = \frac{3}{5}$$

$$\Rightarrow \quad a^2 = \frac{32}{3} \text{ and } b^2 = \frac{32}{5}$$

$\therefore$ Equation of ellipse is

$$\frac{3x^2}{32} + \frac{5y^2}{32} = 1 \Rightarrow 3x^2 + 5y^2 = 32$$

25. Let the equation of the required ellipse be $\frac{x^2}{16} + \frac{y^2}{b^2} = 1$. But the ellipse passes through the point (2, 1).

$$\Rightarrow \quad \frac{1}{4} + \frac{1}{b^2} = 1$$

$\Rightarrow \quad \frac{1}{b^2} = \frac{3}{4} \Rightarrow b^2 = \frac{4}{3}$

Hence, equation is

$$\frac{x^2}{16} + \frac{3y^2}{4} = 1 \Rightarrow x^2 + 12y^2 = 16$$

26. Since, $\frac{a}{e} - ae = 4$ and $e = \frac{1}{2}$

$\therefore \quad 2a - \frac{a}{2} = 4$

$\Rightarrow \quad \frac{3a}{2} = 4$

$\Rightarrow \quad a = \frac{8}{3}$

27. Since, $ae = 3, b = 4$

Now, $\quad \frac{16}{9} = \frac{b^2}{a^2e^2} = \frac{a^2(1-e^2)}{a^2e^2} = \frac{1-e^2}{e^2}$

$\Rightarrow \quad e^2 = \frac{9}{25} \Rightarrow e = \frac{3}{5}$

28. Let the equation of ellipse be $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 (a > b)$

$\because \quad \angle FBF' = \frac{\pi}{2}$

$\therefore \quad \angle FBC = \frac{\pi}{4}$

$\therefore \angle CFB$ is also an angle of $\frac{\pi}{4}$.

$\Rightarrow \quad BC = CF \Rightarrow b = ae$

$\Rightarrow \quad b^2 = a^2e^2 \quad \ldots(i)$

We know, $\quad b^2 = a^2(1 - e^2)$

$\therefore \quad a^2e^2 = a^2(1 - e^2)$ [from Eq. (i)]

$\Rightarrow \quad e^2 = 1 - e^2$

$\Rightarrow \quad 2e^2 = 1 \Rightarrow e = \frac{1}{\sqrt{2}}$

29. $\angle FBF' = 90° \Rightarrow \angle OBF' = 45°$

$\Rightarrow \quad ae = b$

and $\quad e^2 = 1 - \frac{b^2}{a^2}$

$\Rightarrow \quad e^2 = 1 - \frac{a^2e^2}{a^2}$

$\Rightarrow \quad e^2 = 1 - e^2$

$\Rightarrow \quad 2e^2 = 1 \Rightarrow e = \frac{1}{\sqrt{2}}$

30. Since, $\frac{a}{e} = 4 \Rightarrow 2a = 4 \Rightarrow a = 2$

Now, $\quad b^2 = a^2(1 - e^2) = 4\left(1 - \frac{1}{4}\right) = 3$

There fore, equation is $\frac{x^2}{4} + \frac{y^2}{3} = 1$ or $3x^2 + 4y^2 = 12$

16.1 Hyperbola

A hyperbola is the set of points in a plane whose distances from two fixed points in the plane have a constant difference. The two fixed points are the foci of the hyperbola.

OR

A hyperbola is the locus of a point in a plane which moves in a plane in such a way that the ratio of its distance from a fixed point (*i.e.*, focus) to the distance from a fixed line (*i.e.*, directrix) is greater than unity .

Mathematically, $\frac{SP}{PM} = e$, where $e > 1$.

*In Mathematics a **hyperbola** is a type of smooth curve, lying in a plane, defined by its geometric properties or by equations for which it is the solution set . A hyperbola has two pieces, called connected components or branches, that are mirror images of each other and resemble two infinite bows. The hyperbola is one of the four kinds of conic section formed by the intersection of a plane and a cone.*

Standard Equation of Hyperbola

If the centre of the hyperbola is at the origin and foci are on the x-axis or y-axis, then that types of equation are called standard equation of an ellipse. The two such possible orientations are shown below.

(i) $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

(ii) $\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1$

Terms Related to Hyperbola

Vertices

The point A and A', where the curve meets the line joining the foci S and S', are called the vertices of the hyperbola.

Transverse and Conjugate Axes

Transverse axis is the one which lie along the line passing through the foci and perpendicular to the directrices and conjugate axis is the one which is perpendicular to the transverse axis and passes through the mid-point of the foci (*i.e.*, centre).

Centre

The mid-point C of AA' bisects every chord of the hyperbola passing through it and is called the centre of the hyperbola.

Focal Chord

A chord of a hyperbola which is passing through the focus is called a focal chord of the hyperbola.

Directrix

A line which is perpendicular to the axis and it lies between centre and vertex. The equation of directrix is $x = \pm \frac{a}{e}$.

Double Ordinates

If Q be a point on the hyperbola draw QN perpendicular to the axis of the hyperbola and produced to meet the curve again at Q'. Then, QQ' is called a double ordinate of Q.

Latusrectum

The double ordinate passing through focus is called latusrectum.

Note

- The vertex divides the join of focus and the point of intersection of directrix with axis internally and externally in the ratio $e : 1$.
- Domain and range of a hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ are $x \le -a$ or $x \ge a$ and $y \in R$ respectively.

***Sample* Problem 1** *The equation of the hyperbola whose directrix is $2x + y = 1$, focus is $(1, 2)$ and eccentricity is $\sqrt{3}$, is $7x^2 - 2y^2 + 12xy - 2x + 14y + k = 0$, then k is equal to*

(a) 0
(b) 22
(c) –22
(d) *None of the above*

Interpret (c) We know that, $SP^2 = e^2PM^2$

$$\Rightarrow \quad 5[(x-1)^2 + (y-2)^2] = 3(2x+y-1)^2$$

$$\Rightarrow \quad 5x^2 + 5y^2 - 10x - 20y + 25 = 3(4x^2 + y^2 + 1 + 4xy - 4x - 2y)$$

$$\Rightarrow \quad 7x^2 - 2y^2 + 12xy - 2x + 14y - 22 = 0$$

Thus, $k = -22$

16.2 Conjugate Hyperbola

The hyperbola whose transverse and conjugate axes are respectively the conjugate and transverse axes of a given hyperbola is called the conjugate hyperbola of the given hyperbola.

The conjugate hyperbola of the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

is

$$-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Detailed Description of Hyperbola

	Fundamental Terms	Hyperbola	Conjugate Hyperbola
(a)	Equation	$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$	$-\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$
(b)	Graph		
(c)	Centre	$C(0, 0)$	$C(0, 0)$
(d)	Vertices	$(\pm a, 0)$	$(0, \pm b)$
(e)	Length of transverse axis	$2a$	$2b$
(f)	Length of conjugate axis	$2b$	$2a$
(g)	Foci	$(\pm ae, 0)$	$(0, \pm be)$
(h)	Equation of directrices	$x=\pm\left(\frac{a}{e}\right)$	$y=\pm\left(\frac{b}{e}\right)$
(i)	Eccentricity	$e=\sqrt{1+\frac{b^2}{a^2}}$	$e=\sqrt{1+\frac{a^2}{b^2}}$
(j)	Length of latusrectum	$\frac{2b^2}{a}$	$\frac{2a^2}{b}$
(k)	Ends of latusrectum	$\left(\pm ae, \pm\frac{b^2}{a}\right)$	$\left(\pm\frac{a^2}{b}, \pm be\right)$
(l)	Parametric equations	$\begin{cases} x = a\sec\alpha \\ y = b\tan\alpha \end{cases}$ or $x=a\left(\frac{e^\theta+e^{-\theta}}{2}\right)$ and $y=\frac{e^\theta-e^{-\theta}}{2}$	$\begin{cases} x = a\tan\alpha \\ y = b\sec\alpha \end{cases}$
(m)	Parametric coordinates	$(a\sec\alpha, b\tan\alpha)$	$(a\tan\alpha, b\sec\alpha)$
(n)	Focal radi	$\lvert SP\rvert=(ex_1-a)$ and $\lvert S'P\rvert=(ex_1+a)$	$\lvert SP\rvert=(ey_1-b)$ and $\lvert S'P\rvert=(ey_1+b)$
(o)	Difference of focal radi = $\lvert SP\rvert-\lvert S'P\rvert$	$2a$	$2b$
(p)	Distance between foci	$2ae$	$2be$
(q)	Tangents at vertices	$x=a$ and $x=-a$	$x=b$ and $y=-b$

Sample **Problem 2** *If equation of ellipse is $16x^2-9y^2=576$, then foci, eccentricity and length of latusrectum is* [**NCERT**]

(a) $(\pm 10, 0), \frac{5}{3}, \frac{64}{5}$ (b) $(\pm 10, 0), \frac{5}{3}, \frac{64}{3}$

(c) $(\pm 20, 0), \frac{5}{3}, \frac{64}{3}$ (d) $(-10, 0), \frac{5}{3}, \frac{64}{3}$

Interpret (b) Given equation is $16x^2-9y^2=576$, divide it by 576, we get

$$\frac{16x^2}{576}-\frac{9y^2}{576}=\frac{576}{576}\Rightarrow\frac{x^2}{36}-\frac{y^2}{64}=1$$

Now, comparing $\frac{x^2}{36}-\frac{y^2}{64}=1$ with $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, we get

$$a^2=36 \text{ and } b^2=64$$

$$\Rightarrow \quad a=6 \text{ and } b=8$$

$$\therefore \quad e=\sqrt{1+\frac{b^2}{a^2}}=\sqrt{1+\frac{64}{36}}=\sqrt{\frac{100}{36}}$$

$$\Rightarrow \quad e=\frac{10}{6}=\frac{5}{3}$$

Foci $=(\pm ae, 0)$

$$=(\pm 6\times\frac{5}{3}, 0)=(\pm 10, 0)$$

Length of latusrectum $= \dfrac{2b^2}{a}$

$$= \frac{2 \times 64}{6} = \frac{64}{3}$$

***Sample* Problem 3** *If vertices and foci of a hyperbola are* $(0, \pm 5)$ *and* $(0, \pm 8)$ *respectively, then equation of hyperbola is* [NCERT]

(a) $\dfrac{x^2}{39} - \dfrac{y^2}{25} = 1$ (b) $\dfrac{y^2}{25} - \dfrac{x^2}{39} = 1$

(c) $\dfrac{x^2}{39} + \dfrac{y^2}{25} = 1$ (d) *None of these*

Interpret (b) Since, vertices $(0, \pm 5)$ and foci $(0, \pm 8)$ lies on y-axis, as coefficient of X-axis is zero.

Hence, equation of hyperbola will be of the form

$$-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \ldots(i)$$

where it is given that $(0, \pm b) = (0, \pm 5)$ and foci $(0, \pm be) = (0, \pm 8)$

$$b = 5 \text{ and } be = \pm 8$$

$\because$ $$a^2 = b^2(e^2 - 1) = (be)^2 - b^2 = 64 - 25 = 39$$

On putting the values of a^2 and b^2 in Eq. (i), we get

$$-\frac{x^2}{39} + \frac{y^2}{25} = 1$$

***Sample* Problem 4** *If foci is* $(\pm 3\sqrt{5}, 0)$ *and the length of latusrectum is* 8, *then equation of hyperbola is* [NCERT]

(a) $\dfrac{x^2}{25} + \dfrac{y^2}{20} = 1$ (b) $\dfrac{x^2}{20} - \dfrac{y^2}{25} = 1$

(c) $\dfrac{x^2}{25} - \dfrac{y^2}{20} = 1$ (d) *None of these*

Interpret (c) Since, foci $(\pm 3\sqrt{5}, 0)$ lies on x-axis, as y-coordinate is zero. Hence, equation of hyperbola will be of the form

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \ldots(i)$$

where it is given that foci $(\pm 3\sqrt{5}, 0) = (\pm ae, 0)$

$$ae = 3\sqrt{5}$$

$\Rightarrow$ $$a^2e^2 = 45 \Rightarrow a^2\left(1 + \frac{b^2}{a^2}\right) = 45 \quad \ldots(ii)$$

and length of latusrectum $= \dfrac{2b^2}{a} = 8$

$$b^2 = 4a$$

$\therefore$ From Eq.(ii), $$a^2\left(1 + \frac{4a}{a^2}\right) = 45$$

$\Rightarrow$ $$a^2 + 4a - 45 = 0$$

$\Rightarrow$ $$(a - 5)(a + 9) = 0$$

$\Rightarrow$ $$a = 5, -9$$

$\because$ a cannot be negative.

So, we take $a = 5$,

then $$b^2 = 4 \times 5 = 20$$

From Eq.(i),

$$\frac{x^2}{25} - \frac{y^2}{20} = 1$$

16.3 Auxiliary Circle

Let $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$ be the hyperbola, then equation of the auxiliary circle is $x^2 + y^2 = a^2$

Let $\angle QCN = \phi$. Here, P and Q are the corresponding points on the hyperbola and the auxiliary circle $(0 \le \phi < 2\pi)$

Parametric Equations

The equation $x = a \sec\phi$ and $y = b \tan\phi$ are known as the parametric equations of the hyperbola $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$. This $(a \sec\phi, b \tan\phi)$ lies on the hyperbola for all values of ϕ.

***Sample* Problem 5** *If the equation of hyperbola is* $\dfrac{x^2}{9} - \dfrac{y^2}{16} = 1$, *then equation of auxiliary circle is*

(a) $x^2 + y^2 = 16$ (b) $x^2 + y^2 = 9$

(c) $x^2 + y^2 = 25$ (d) *None of these*

Interpret (b) Given equation of hyperbola is $\dfrac{x^2}{9} - \dfrac{y^2}{16} = 1$

$\therefore$ Equation of auxiliary circle is $x^2 + y^2 = 9$

16.4 Position of a Point with Respect to a Hyperbola

Let the equation of a hyperbola is $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$ and coordinates of a point P are (h, k). Then,

Point P lies outside, if

$$\frac{h^2}{a^2} - \frac{k^2}{b^2} - 1 < 0$$

Point P lies on the hyperbola, if $\frac{h^2}{a^2} - \frac{k^2}{b^2} = 1$

and point P lies inside, if $\frac{h^2}{a^2} - \frac{k^2}{b^2} - 1 > 0$

***Sample* Problem 6** *The position of the point* (5, – 4) *relative to the hyperbola* $9x^2 - y^2 = 1$, *is*

(a) *outside* (b) *on the hyperbola*
(c) *inside* (d) *None of these*

Interpret (c) The equation of hyperbola is $9x^2 - y^2 = 1$.

At point (5, – 4),

$$9(5)^2 - (-4)^2 - 1 = 225 - 16 - 1 = 208 > 0$$

So, the point (5, – 4) lies inside the hyperbola $9x^2 - y^2 = 1$.

Check Point **1**

1. The locus of the point $\left(\frac{e^t + e^{-t}}{2}, \frac{e^t - e^{-t}}{2}\right)$ is a hyperbola of eccentricity
(a) $\sqrt{3}$ (b) 3
(c) $\sqrt{2}$ (d) 2

2. The equation of the hyperbola whose directrix is x + 2y = 1, focus is (2, 1) and eccentricity 2, is
(a) $x^2 + 16xy - 11y^2 - 12x + 6y + 21 = 0$
(b) $x^2 - 16xy - 11y^2 - 12x + 6y + 21 = 0$
(c) $x^2 - 4xy - y^2 - 12x + 6y + 21 = 0$
(d) None of the above

3. The difference between the length 2a of transverse axis of a hyperbola of eccentricity e and the length of its latusrectum is
(a) $2a[3 - e^2]$ (b) $2a[2 - e^2]$
(c) $2a[e^2 - 1]$ (d) $a(2e^2 - 1)$

4. Which of the following does not represent hyperbola ?
(a) xy = 1 (b) $x^2 - y^2 = 5$
(c) (x – 1)(y – 3) = 3 (d) $x^2 - y^2 = 0$

5. The vertices of the hyperbola $9x^2 - 16y^2 - 36x + 96y - 252 = 0$ are
(a) (6, 3), (–2, 3)
(b) (6, 3), (–6, 3)
(c) (–6, 3), (–6, –3)
(d) None of the above

6. Which of the following is independent of α in the hyperbola $\left(0 < \alpha < \frac{\pi}{2}\right) \frac{x^2}{\cos^2\alpha} - \frac{y^2}{\sin^2\alpha} = 1$?
(a) eccentricity (b) abscissa of foci
(c) directrix (d) vertex

7. The equation $16x^2 - 3y^2 - 32x + 12y - 44 = 0$ represents hyperbola whose
(a) transverse axis is $4\sqrt{3}$ (b) conjugate axis is 4
(c) eccentricity is $\frac{\sqrt{19}}{\sqrt{3}}$ (d) centre is (–1, 2)

8. If the latusrectum of a hyperbola through one focus subtends 60° angle at the other focus, then its eccentricity is
(a) $\sqrt{2}$ (b) $\sqrt{3}$ (c) $\sqrt{8}$ (d) $\sqrt{6}$

9. The equation of hyperbola, if vertices (0, ± 3) and foci (0, ± 5), is
(a) $\frac{y^2}{16} - \frac{x^2}{9} = 1$ (b) $\frac{y^2}{9} - \frac{x^2}{16} = 1$
(c) $\frac{y^2}{16} + \frac{x^2}{9} = 1$ (d) None of these

10. If equation of hyperbola is $\frac{x^2}{25} - \frac{y^2}{16} = 1$, then equation of auxiliary circle is
(a) $x^2 + y^2 = 41$ (b) $x^2 + y^2 = 16$
(c) $x^2 + y^2 = 50$ (d) $x^2 + y^2 = 25$

16.5 Intersection of a Line and a Hyperbola

Let the hyperbola be $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ ...(i)

and the given line be $y = mx + c$ ...(ii)

On eliminating y from Eqs. (i) and (ii), we get

$$\frac{x^2}{a^2} - \frac{(mx + c)^2}{b^2} = 1$$

$$\Rightarrow \quad b^2x^2 - a^2(mx + c)^2 = a^2b^2$$

$$\Rightarrow \quad (a^2m^2 - b^2)x^2 + 2mca^2x + a^2(b^2 + c^2) = 0 \quad \text{...(iii)}$$

It is a quadratic equation in x which gives two values of x.

$\therefore D = 4m^2c^2a^4 - 4(a^2m^2 - b^2)a^2(b^2 + c^2) = -a^2m^2 + b^2 + c^2$

(i) If $D > 0$ *i.e.*, $c^2 > a^2m^2 - b^2$, then line intersect the hyperbola at two points.

(ii) If $D = 0$ *i.e.*, $c^2 = a^2m^2 - b^2$, then line touches the hyperbola.

(iii) If $D < 0$ *i.e.*, $c^2 < a^2m^2 - b^2$, then line neither touches nor intersect the hyperbola.

Condition of Tangency

The line $y = mx + c$ will touch a hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, if

$$c^2 = a^2m^2 - b^2$$

and coordinates of point of contact are

$$\left(\pm \frac{a^2m}{\sqrt{a^2m^2 - b^2}}, \pm \frac{b^2}{\sqrt{a^2m^2 - b^2}}\right)$$

***Sample* Problem 7** *The line $x \cos\alpha + y \sin\alpha = p$ touches the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, if $a^2 \cos^2\alpha - b^2 \sin^2\alpha$ is equal to*

(a) p (b) p^2 (c) $-p^2$ (d) $2p^2$

Interpret (b) The given line is $x \cos\alpha + y \sin\alpha = p$

or $y = -x \cot\alpha + p \operatorname{cosec}\alpha$

On comparing with $y = mx + c$, we get

$$m = -\cot\alpha, x = p \operatorname{cosec}\alpha$$

Since, the given line touches the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1, \text{ then } c^2 = a^2m^2 - b^2$$

$$\therefore \quad p^2 \operatorname{cosec}^2\alpha = a^2 \cot^2\alpha - b^2$$

$$\Rightarrow \quad a^2 \cos^2\alpha - b^2 \sin^2\alpha = p^2$$

16.6 Tangent to the Hyperbola

A line which intersect the hyperbola at only one point is called the tangent to the hyperbola.

Equation of Tangent in Different Forms

(i) Point Form

The equation of tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at the point (x_1, y_1) is $\frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1$.

(ii) Slope Form

The equation of tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ in the slope form is $y = mx \pm \sqrt{a^2m^2 - b^2}$.

(iii) Parametric Form

The equation of tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at a point $(a \sec\theta, b \tan\theta)$ is $\frac{x}{a} \sec\theta - \frac{y}{b} \tan\theta = 1$

Note

- The tangents at the points $P(a \sec\theta_1, b \tan\theta_1)$ and $Q(a \sec\theta_2, b \tan\theta_2)$ intersect at the point

$$R\left\{\frac{a \cos\left(\frac{\theta_1 - \theta_2}{2}\right)}{\cos\left(\frac{\theta_1 + \theta_2}{2}\right)}, \frac{b \sin\left(\frac{\theta_1 - \theta_2}{2}\right)}{\cos\left(\frac{\theta_1 + \theta_2}{2}\right)}\right\}.$$

- To a hyperbola, two tangents can be drawn from a point outside of the hyperbola.

***Sample* Problem 8** *If the line $y = mx + \sqrt{a^2m^2 - b^2}$ touches the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at the point $(a \sec\theta, b \tan\theta)$, then θ is equal to*

(a) $\sin^{-1}\left(\frac{b}{m}\right)$ (b) $\sin^{-1}\left(\frac{b}{a}\right)$

(c) $\sin^{-1}\left(\frac{b}{ma}\right)$ (d) *None of these*

Interpret (c) Since, the point $(a \sec\theta, b \tan\theta)$ lies on the line

$$y = mx + \sqrt{a^2m^2 - b^2}$$

$$\therefore \quad b \tan\theta = am \sec\theta + \sqrt{a^2m^2 - b^2}$$

$$\Rightarrow \quad (b \tan\theta - am \sec\theta)^2 = a^2m^2 - b^2$$

$$\Rightarrow \quad b^2 \tan^2\theta + a^2m^2 \sec^2\theta - 2abm \tan\theta \sec\theta = a^2m^2 - b^2$$

$$\Rightarrow \quad a^2m^2 \tan^2\theta - 2abm \tan\theta \sec\theta + b^2 \sec^2\theta = 0$$

$$\Rightarrow \quad a^2m^2 \sin^2\theta - 2abm \sin\theta + b^2 = 0 \quad (\because \cos\theta \neq 0)$$

$$\therefore \quad \sin\theta = \frac{2abm \pm \sqrt{4a^2b^2m^2 - 4a^2b^2m^2}}{2a^2m^2} = \left(\frac{b}{am}\right)$$

$$\therefore \quad \theta = \sin^{-1}\left(\frac{b}{am}\right)$$

***Sample* Problem 9** *The equation of the tangent to the hyperbola $x^2 - 4y^2 = 36$, which is perpendicular to the line $x - y + 4 = 0$ is*

(a) $x + y \pm 3\sqrt{3} = 0$ (b) $x + y \pm 3\sqrt{3} = 0$

(c) $x + y \pm 2\sqrt{3} = 0$ (d) $x - y \pm 3\sqrt{3} = 0$

Interpret (*b*) Let m be the solpe of the tangent. Since, the tangent is perpendicular to the line $x - y + 4 = 0$

$$\therefore \quad m \times 1 = -1$$

$$\Rightarrow \quad m = -1$$

Given equation of hyperbola is $x^2 - 4y^2 = 36$.

or $$\frac{x^2}{36} - \frac{y^2}{9} = 1$$

Here, $$a^2 = 36, b^2 = 9$$

$\therefore$ The equation of tangents are

$$y = (-1)x \pm \sqrt{36 \times (-1)^2 - 9} \qquad (\because y = mx \pm \sqrt{a^2m^2 - b^2})$$

$$= -x \pm \sqrt{27}$$

$$= -x \pm 3\sqrt{3}$$

$$\therefore \quad x + y \pm 3\sqrt{3} = 0$$

16.7 Normal to the Hyperbola

A line which is perpendicular to the tangent of the hyperbola is called the normal to the hyperbola.

Equation of Normal in Different Forms

(i) Point Form

The equation of normal at the point (x_1, y_1) to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is $\frac{a^2x}{x_1} + \frac{b^2y}{y_1} = a^2 + b^2$

(ii) Slope Form

The equation of normal of slope m to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is $y = mx \mp \frac{m(a^2 + b^2)}{\sqrt{a^2 - b^2m^2}}$ at the points

$$\left(\pm \frac{a^2}{\sqrt{a^2 - b^2m^2}}, \mp \frac{b^2m}{\sqrt{a^2 - b^2m^2}}\right)$$

Note

The line $y = mx + c$ will be a normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, if $c^2 = \frac{m^2(a^2 + b^2)^2}{a^2 - b^2m^2}$

(iii) Parametric Form

The equation of normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at $(a \sec\theta, b \tan\theta)$ is $ax \cos\theta + by \cot\theta = a^2 + b^2$

Note Four normals can be drawn to the hyperbola from any point outside to the hyperbola.

***Sample* Problem 10** *If the line $lx + my - n = 0$ will be a normal to the hyperbola, then $\frac{a^2}{l^2} - \frac{b^2}{m^2} = \frac{(a^2 + b^2)^2}{k}$, where k is equal to*

(a) n (b) n^2
(c) n^3 (d) *None of these*

Interpret (*b*) The equation of any normal to $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

$$ax \cos\phi + by \cot\phi = a^2 + b^2$$

$$\Rightarrow \quad ax \cos\phi + by \cot\phi - (a^2 + b^2) = 0 \qquad \text{...(i)}$$

The straight line $lx + my - n = 0$ will be a normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, then Eq. (i) and $lx + my - n = 0$ represent the same line.

$$\therefore \quad \frac{a \cos\phi}{l} = \frac{b \cot\phi}{m} = \frac{(a^2 + b^2)}{n}$$

$$\Rightarrow \quad \sec\phi = \frac{na}{l(a^2 + b^2)}$$

and $$\tan\phi = \frac{nb}{m(a^2 + b^2)}$$

$$\therefore \quad \sec^2\phi - \tan^2\phi = 1$$

$$\Rightarrow \quad \frac{n^2a^2}{l^2(a^2 + b^2)^2} - \frac{n^2b^2}{m^2(a^2 + b^2)^2} = 1$$

$$\Rightarrow \quad \frac{a^2}{l^2} - \frac{b^2}{m^2} = \frac{(a^2 + b^2)^2}{n^2}$$

Thus, $$k = n^2$$

***Sample* Problem 11** *Find the locus of the foot of perpendicular from the centre upon any normal to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$*

(a) $(x^2 + y^2)^2(a^2y^2 - b^2x^2) = (a^2 + b^2)^2x^2y^2$
(b) $(x^2 + y^2)^2(a^2y^2 + b^2x^2) = (a^2 + b^2)^2x^2y^2$
(c) $(x^2 - y^2)^2(a^2y^2 - b^2x^2) = (a^2 + b^2)^2x^2y^2$
(d) *None of the above*

Interpret (*a*) Equation of normal at $P(a \sec\phi, b \tan\phi)$ is

$$ax \cos\phi + by \cot\phi = a^2 + b^2 \qquad \text{...(i)}$$

And equation of line perpendicular to Eq. (i) and passing through origin is

$$bx \cot \phi - ay \cos \phi = 0$$

$$\Rightarrow \quad bx - ay \sin \phi = 0 \quad \text{...(ii)}$$

$$\Rightarrow \quad \sin \phi = \frac{bx}{ay}$$

$$\therefore \quad \cos \phi = \sqrt{1 - \sin^2 \phi}$$

$$= \sqrt{1 - \frac{b^2x^2}{a^2y^2}} = \frac{\sqrt{a^2y^2 - b^2x^2}}{ay}$$

and $\cot \phi = \dfrac{\sqrt{a^2y^2 - b^2x^2}}{bx}$

From Eq. (i),

$$\frac{ax \times \sqrt{a^2y^2 - b^2x^2}}{ay} + \frac{by \times \sqrt{a^2y^2 - b^2x^2}}{bx} = a^2 + b^2$$

$$\Rightarrow \quad (x^2 + y^2)\sqrt{a^2y^2 - b^2x^2} = (a^2 + b^2)xy$$

$$\Rightarrow \quad (x^2 + y^2)^2(a^2y^2 - b^2x^2) = (a^2 + b^2)^2x^2y^2$$

16.8 Number of Normals and Conormal Points

There are exactly four lines passing through a given point such that they are normals to the hyperbola at the points where they intersect the hyperbola. Such points on the hyperbola are known as the **conormal points**.

Properties of Eccentric Angles of Conormal Points

(i) The sum of the eccentric angles of conormal points is an odd multiple of π.

(ii) If θ_1, θ_2, θ_3 and θ_4 are eccentric angles of four points on the hyperbola $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$, the normals at which are concurrent, then

(a) $\Sigma \cos(\theta_1 + \theta_2) = 0$

(b) $\Sigma \sin(\theta_1 + \theta_2) = 0$

(iii) If θ_1, θ_2 and θ_3 are the eccentric angle of three points on the hyperbola $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$ such that $\sin(\theta_1 + \theta_2) + \sin(\theta_2 + \theta_3) + \sin(\theta_3 + \theta_1) = 0$, then the normals at these points are concurrent.

(iv) If the normals at four points $P(x_1, y_1)$, $Q(x_2, y_2)$, $R(x_3, y_3)$ and $S(x_4, y_4)$ on the hyperbola $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$ are concurrent, then

$$(x_1 + x_2 + x_3 + x_4)\left(\frac{1}{x_1} + \frac{1}{x_2} + \frac{1}{x_3} + \frac{1}{x_4}\right) = 4$$

16.9 Equation of Pair of Tangents

Let $P(x_1, y_1)$ be a point which lies outside the hyperbola $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$, then the equation of pair of tangents drawn from external point P to the hyperbola is given by

$$SS_1 = T^2$$

where, $S = \dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} - 1$

$$S_1 = \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1$$

and $T = \dfrac{xx_1}{a^2} - \dfrac{yy_1}{b^2} - 1$

16.10 Chord of Contact

Let PA and PB be any two tangents to the hyperbola from a point $P(x_1, y_1)$, then AB is known as chord of contact and its equation is given by

$$T = 0$$

$$\Rightarrow \quad \frac{xx_1}{a^2} - \frac{yy_1}{b^2} - 1 = 0$$

Equation of the Chord Bisected at a Given Point

The equation of the chord of the hyperbola $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$, bisected at the point (x_1, y_1) is

$$\frac{xx_1}{a^2} - \frac{yy_1}{b^2} - 1 = \frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} - 1$$

or $T = S_1$

***Sample* Problem 12** *From the points on the circle $x^2 + y^2 = a^2$ tangents are drawn to the hyperbola $x^2 - y^2 = a^2$, then the locus of the middle points of the chords of contact is the curve $(x^2 - y^2)^2 = k(x^2 + y^2)$, where k is equal to*

(a) a (b) a^3

(c) a^2 (d) *None of these*

Interpret (c) Since, any point of the circle $x^2+y^2=a^2$ is $(a\cos\theta, a\sin\theta)$, chord of contact of this point w.r.t. hyperbola $x^2-y^2=a^2$ is

$$x(a\cos\theta)-y(a\sin\theta)=a^2$$

or $$x\cos\theta-y\sin\theta=a \quad \text{...(i)}$$

If its mid-point be (h,k), then it is same as

$$T=S_1$$

$$\Rightarrow \quad hx-ky-a^2=h^2-k^2-a^2$$

$$\Rightarrow \quad hx-ky=h^2-k^2 \quad \text{...(ii)}$$

On comparing Eqs. (i) and (ii), we get

$$\frac{\cos\theta}{h}=\frac{\sin\theta}{k}=\frac{a}{(h^2-k^2)}$$

$$\therefore \quad (h^2-k^2)\cos\theta=ah \quad \text{...(iii)}$$

and $$(h^2-k^2)\sin\theta=ak \quad \text{...(iv)}$$

On squaring and adding Eqs. (iii) and (iv), we get

$$(h^2-k^2)^2=a^2h^2+a^2k^2$$

$$\Rightarrow \quad (h^2-k^2)^2=a^2(h^2+k^2)$$

Hence, the required locus is

$$(x^2-y^2)^2=a^2(x^2+y^2)$$

16.11 Director Circle

The locus of the point of intersection of the tangents to the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, which are perpendicular to each other is called director circle. The equation of the director circle of the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is $x^2+y^2=a^2-b^2$.

Note For director circle of $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, a must be greater than b. If $a<b$, then director circle $x^2+y^2=a^2-b^2$ does not exist.

***Sample* Problem 13** *The equation of the director circle of the hyperbola* $9x^2-16y^2=144$ *is*

(a) $x^2+y^2=7$ (b) $x^2+y^2=9$
(c) $x^2+y^2=16$ (d) $x^2+y^2=25$

Interpret (b) Given equation can be rewritten as $\frac{x^2}{16}-\frac{y^2}{9}=1$

$\therefore$ Required equation of director circle is

$$x^2+y^2=16-9$$

$$\therefore \quad x^2+y^2=9$$

16.12 Diameter

The locus of the middle points of a system of parallel chords of a hyperbola is called a diameter and the point where the diameter intersects the hyperbola is called the vertex of the diameter.

Let $y=mx+c$ a system of parallel chords to $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ for different chords, then the equation of diameter of the hyperbola is $y=\frac{b^2x}{a^2m}$, which is passing through (0, 0).

Conjugate Diameter

Two diameters are said to be conjugate when each bisects all chords parallel to the others.

If $y=m_1x$ and $y=m_2x$ be conjugate diameters, then $m_1m_2=\frac{b^2}{a^2}$

***Sample* Problem 14** *If the lines* $lx+my+n=0$ *passes through the extremities of a pair of conjugate diameters of the hyperbola* $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, *then* $a^2l^2-b^2m^2$ *is equal to*

(a) 0 (b) – 1
(c) 1 (d) 2

Interpret (a) The extremities of a pair of conjugate diameters of $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ are $(a\sec\phi, b\tan\phi)$ and $(a\tan\phi, b\sec\phi)$ respectively.

According to the question, since extremities of a pair of conjugate diameters lie on $lx+my+n=0$

$$\therefore \quad l(a\sec\phi)+m(b\tan\phi)+n=0 \quad \text{...(i)}$$

$$\Rightarrow \quad l(a\tan\phi)+m(b\sec\phi)+n=0 \quad \text{...(ii)}$$

Then, from Eq. (i), $al\sec\phi+bm\tan\phi=-n$

or $$a^2l^2\sec^2\phi+b^2m^2\tan^2\phi+2ablm\sec\phi\tan\phi=n^2 \quad \text{...(iii)}$$

and from Eq. (ii), $al\tan\phi+bm\sec\phi=-n$

or $$a^2l^2\tan^2\phi+b^2m^2\sec^2\phi+2ablm\sec\phi\tan\phi=n^2 \quad \text{...(iv)}$$

Then, subtracting Eq. (iv) from Eq. (iii), we get

$$a^2l^2(\sec^2\phi-\tan^2\phi)+b^2m^2(\tan^2\phi-\sec^2\phi)=0$$

$$\Rightarrow \quad a^2l^2-b^2m^2=0$$

Check Point 2

1. The locus of the middle points of chords of hyperbola $3x^2 - 2y^2 + 4x - 6y = 0$ parallel to the line $y = 2x$, is
(a) $3x - 4y = 4$ (b) $3y - 4x + 4 = 0$
(c) $4x - 4y = 3$ (d) $3x - 4y = 2$

2. If the tangent to the hyperbola $\frac{x^2}{4} - \frac{y^2}{9} = 1$ at $(2\sec\phi, 3\tan\phi)$ is parallel to the line $3x - y + 4 = 0$, then the value of ϕ is
(a) 45° (b) 60°
(c) 30° (d) 75°

3. A tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ cuts the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at P and Q. The locus of the mid-point of PQ is
(a) $\left(\frac{x^2}{a^2} + \frac{y^2}{b^2}\right)^2 = \frac{x^2}{a^2} - \frac{y^2}{b^2}$ (b) $\left(\frac{x^2}{a^2} - \frac{y^2}{b^2}\right)^2 = \frac{x^2}{a^2} + \frac{y^2}{b^2}$
(c) $\left(\frac{x^2}{a^2} - \frac{y^2}{b^2}\right)^2 = \frac{2x^2y^2}{a^2b^2}$ (d) None of these

4. The equation of normal to the hyperbola $\frac{x^2}{16} - \frac{y^2}{9} = 1$ at $(8, 3\sqrt{3})$ is
(a) $\sqrt{3}x + 2y = 25$ (b) $x + y = 25$
(c) $y + 2x = 25$ (d) $2x + \sqrt{3}y = 25$

5. The line $y = x + 2$ touches hyperbola $5x^2 - 9y^2 = 45$, the point of contact is
(a) (0, 2) (b) (3, 1) (c) $\left(-\frac{9}{2}, -\frac{5}{2}\right)$ (d) $\left(-\frac{9}{2}, \frac{5}{2}\right)$

6. The equation of director circle of the hyperbola $4x^2 - 9y^2 = 36$ is
(a) $x^2 + y^2 = 4$ (b) $x^2 + y^2 = 5$
(c) $x^2 + y^2 = 9$ (d) $x^2 + y^2 = 13$

7. Find the condition for the lines $Ax^2 + 2Hxy + By^2 = 0$ to be conjugate diameters of $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$.
(a) $aA = bB$ (b) $a^2B = b^2A$
(c) $a^2A = b^2B$ (d) None of these

16.13 Asymptotes

An asymptote of any hyperbola is a straight line which touches in it two points at infinity. In other words asymptotes are the lines which are tangents to the curve at infinity.

The equations of two asymptotes of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ are $y = \pm \frac{b}{a}x$.

Method to Determine the Asymptotes

Step I Determine the degree of the equation of the curve. Let it is n.

Step II If x^n is present in the equation of the curve, then there is no asymptote parallel to x-axis.

Step III If the term of x^n is missing, then equate to zero the coefficient of x^{n-1}, this will give the asymptote parallel to x-axis.

Similarly, we can find the asymptote parallel to y-axis.

Note

- A hyperbola and its conjugate hyperbola have the same asymptotes.
- The angle between the asymptotes of $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is $2\tan^{-1}\left(\frac{b}{a}\right)$.
- The asymptotes pass through the centre of the hyperbola.
- The bisectors of the angle between the asymptotes are the coordinate axes.
- The product of the perpendiculars from any point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ to its asymptotes is equal to $\frac{a^2b^2}{a^2 + b^2}$.

***Sample* Problem 15** *The asymptotes of a hyperbola having centre at the point (1, 2) are parallel to the lines $2x + 3y = 0$ and $3x + 2y = 0$. If the hyperbola passes through the point (5, 3), its equation is $(2x + 3y - 8)(3x + 2y - 7) = k$, where k is equal to*
(a) 15 (b) 154
(c) 0 (d) *None of these*

Interpret (b) Let the asymptotes be $2x + 3y + \lambda = 0$ and $3x + 2y + \mu = 0$. Since, asymptotes passes through (1, 2), then

$$\lambda = -8 \quad \text{and} \quad \mu = -7$$

Thus, the equations of asymptotes are

$$2x + 3y - 8 = 0 \quad \text{and} \quad 3x + 2y - 7 = 0$$

Let the equation of hyperbola be

$$(2x + 3y - 8)(3x + 2y - 7) + v = 0 \qquad \ldots(i)$$

It passes through (5, 3), then

$$(10 + 9 - 8)(15 + 6 - 7) + v = 0 \Rightarrow 11 \times 14 + v = 0$$

$$\therefore \quad v = -154$$

On putting the value of v in Eq. (i), we get

$$(2x + 3y - 8)(3x + 2y - 7) - 154 = 0$$

This is the equation of required hyperbola.

16.14 Rectangular Hyperbola

A hyperbola whose asymptotes are at right angles to each other, is said to be rectangular hyperbola.

or

If the length of transverse and conjugate axes of any hyperbola are equal, then hyperbola is known as rectangular hyperbola.

The equation of rectangular hyperbola to the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is $x^2-y^2=a^2$ and equation of the asymptotes are $y=\pm x$ *i.e.*, $y=x$ and $y=-x$. Clearly, each of these two asymptotes is inclined at 45° to the transverse axis.

When the centre of any rectangular hyperbola be at the origin and its asymptotes coincide with the coordinate axes, then the equation of rectangular hyperbola is $xy=c^2$. Its eccentricity is $\sqrt{2}$.

(i) Rectangular Hyperbola of the Form $x^2-y^2=a^2$

(a) Asymptotes are perpendicular lines *i.e.*, $x \pm y = 0$

(b) Eccentricity, $e=\sqrt{2}$.

(c) Centre, (0, 0)

(d) Foci $(\pm\sqrt{2}\,a, 0)$

(e) Directrices, $x=\pm\frac{a}{\sqrt{2}}$

(f) Latusrectum $=2a$

(g) Point form, $x=x_1$, $y=y_1$

Equation of tangent, $xx_1-yy_1=a^2$

Equation of normal, $\frac{x_1}{x}+\frac{y_1}{y}=2$.

(h) Parametric form, $x=a\sec\theta$, $y=a\tan\theta$

Equation of tangent, $x\sec\theta-y\tan\theta=a$

Equation of normal, $\frac{x}{\sec\theta}+\frac{y}{\tan\theta}=2a$

(ii) Rectangular Hyperbola of the Form $xy=c^2$

(a) Asymptotes are perpendicular lines *i.e.*, $x=0$ and $y=0$

(b) Eccentricity, $e=\sqrt{2}$

(c) Centre,(0, 0)

(d) Foci are $S(\sqrt{2}c, \sqrt{2}c)$, $S_1(-\sqrt{2}c, -\sqrt{2}c)$

(e) Vertices, $V_1(c, c)$, $V_2(-c, -c)$

(f) Directrices, $x+y=\pm\sqrt{2}c$

(g) Latusrectum $=2\sqrt{2}c$

(h) Point form, $x=x_1$, $y=y_1$

Equation of tangent, $xy_1+yx_1=2c^2$

$\Rightarrow \qquad \frac{x}{x_1}+\frac{y}{y_1}=2$

Equation of normal, $xx_1-yy_1=x_1^2-y_1^2$

(i) Parametric form : $x=ct$, $y=\frac{c}{t}$

Equation of tangent, $x+yt^2=2ct$

Equation of normal, $t^2x-y=c\left(t^3-\frac{1}{t}\right)$

(iii) Properties of Rectangular Hyperbola $xy=c^2$

(a) Equation of the chord joining t_l and t_2 is $x+yt_1t_2-c(t_1+t_2)=0$.

(b) Equation of tangent at (x_1,y_1) is $xy_1+x_1y=2c^2$.

(c) Equation of tangent at $\left(ct, \frac{c}{t}\right)$ is $\frac{x}{t}+yt=2c$.

(d) Point of intersection of tangents at t_1 and t_2 is $\left(\frac{2ct_1t_2}{t_1+t_2}, \frac{2c}{t_1+t_2}\right)$.

(e) Equation of normal at $\left(ct, \frac{c}{t}\right)$ is $xt^3-yt-ct^4+c=0$.

(f) Equation of normal to rectangular hyperbola at (x_1,y_1) is

$$x\,x_1-yy_1=x_1^2-y_1^2.$$

WORKED OUT Examples

Example 1 *The equation of hyperbola, having foci* $(\pm 5, 0)$ *and length of transverse axis is* 8, *is* [**NCERT**]

(*a*) $\frac{x^2}{16} - \frac{y^2}{9} = 1$ (*b*) $\frac{x^2}{16} + \frac{y^2}{9} = 1$

(*c*) $\frac{y^2}{9} - \frac{x^2}{16} = 1$ (*d*) *None of these*

Solution (*a*) Since, foci $(\pm 5, 0)$ lies on X-axis, as coordinate of Y is zero. Hence, equation of hyperbola will be of the form

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \ldots(i)$$

where it is given that foci $(\pm 5, 0) = (\pm ae, 0)$ and length of transverse axis is $2a = 8$

$\therefore$ $ae = 5$ and $2a = 8$

$\Rightarrow$ $a = 4$

$\Rightarrow$ $e = \frac{5}{4}$

$\therefore$ $b = a\sqrt{e^2 - 1} = 4\sqrt{\frac{25}{16} - 1}$

$b = 3$

Put $a^2 = 16$ and $b^2 = 9$ in Eq. (i), we get

$$\frac{x^2}{16} - \frac{y^2}{9} = 1$$

Example 2 *The equation* $16x^2 - 3y^2 - 32x + 12y - 44 = 0$ *represents a hyperbola*

(*a*) *the length of whose transverse axis is* $4\sqrt{3}$

(*b*) *the length of whose conjugate axis is* 4

(*c*) *whose centre is* $(-1, 2)$

(*d*) *whose eccentricity is* $\sqrt{\frac{19}{3}}$

Solution (*d*) We have

$$16(x^2 - 2x) - 3(y^2 - 4y) = 44$$

$\Rightarrow$ $16(x-1)^2 - 3(y-2)^2 = 48$

$\Rightarrow$ $\frac{(x-1)^2}{3} - \frac{(y-2)^2}{16} = 1$

This equation represents a hyperbola with eccentricity

$$e = \sqrt{1 + \frac{16}{3}} = \sqrt{\frac{19}{3}}$$

Example 3 *The equation of the transverse axis of the hyperbola* $(x-3)^2 + (y+1)^2 = (4x+3y)^2$ *is*

(*a*) $x + 3y = 0$ (*b*) $4x + 3y = 9$

(*c*) $3x - 4y = 13$ (*d*) $4x + 3y = 0$

Solution (*c*) $(x-3)^2 + (y+1)^2 = (4x+3y)^2$

$\Rightarrow$ $(x-3)^2 + (y+1)^2 = 25\left(\frac{4x+3y}{5}\right)^2$

$\Rightarrow$ $PS = 5PM$

$\Rightarrow$ Directrix is $4x + 3y = 0$ and focus $(3, -1)$.

So, equation of transverse axis is $y + 1 = \frac{3}{4}(x - 3)$

$\Rightarrow$ $3x - 4y = 13$

Example 4 *The locus of the point of intersection of the lines* $\sqrt{3}x - y - 4\sqrt{3}t = 0$ *and* $\sqrt{3}tx + ty - 4\sqrt{3} = 0$ (*where, t is a parameter*) *is a hyperbola whose eccentricity is*

(*a*) $\sqrt{3}$ (*b*) 2 (*c*) $\frac{2}{\sqrt{3}}$ (*d*) $\frac{4}{3}$

Solution (*b*) Eliminating t from the given two equations, we have

$$\frac{x^2}{16} - \frac{y^2}{48} = 1,$$

where eccentricity is $e = \sqrt{1 + \frac{48}{16}} = 2$

Example 5 *The equation of the hyperbola whose eccentricity is* $\sqrt{2}$ *and the distance between the foci is* 16, *taking transverse and conjugate axes of the hyperbola as x and y axes respectively, is*

(*a*) $x^2 - y^2 = 0$ (*b*) $x^2 - y^2 = 32$

(*c*) $x^2 - y^2 = 2$ (*d*) *None of these*

Solution (*b*) Let the equation of the hyperbola be $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

The coordinates of the foci are $(ae, 0)$ and $(-ae, 0)$.

$\therefore$ $2ae = 16 \Rightarrow 2a\sqrt{2} = 16 \Rightarrow a = 4\sqrt{2}$

Also, $b^2 = a^2(e^2 - 1) = 32(2 - 1) = 32$

Thus, $a^2 = 32$ and $b^2 = 32$

Hence, the required equation is

$$\frac{x^2}{32} - \frac{y^2}{32} = 1 \Rightarrow x^2 - y^2 = 32$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Basic Terms of Hyperbola

1. If equation $(10x-5)^2+(10y-4)^2=\lambda^2(3x+4y-1)^2$ represents a hyperbola, then
(a) $-2<\lambda<2$ (b) $\lambda>2$
(c) $\lambda<-2$ or $\lambda>2$ (d) $0<\lambda<2$

2. The eccentricity of the hyperbola whose latusrectum is 8 and conjugate axis is equal to half of the distance between the foci is [NCERT Exemplar]
(a) $\frac{4}{3}$ (b) $\frac{4}{\sqrt{3}}$
(c) $\frac{2}{\sqrt{3}}$ (d) None of these

3. If the equation of hyperbola is $9y^2-4x^2=36$, then vertices and length of latusrectum is [NCERT]
(a) $(0,+2), 9$ (b) $(0,\pm 2), 9$
(c) $(0,-2), 9$ (d) None of these

4. A general point on the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is
(a) $(a\sin\theta, b\cos\theta)$ (where, θ is parameter)
(b) $(a\tan\theta, b\sec\theta)$ (where, θ is parameter)
(c) $\left(a\frac{e^t+e^{-t}}{2}, b\frac{e^t-e^{-t}}{2}\right)$ (where, t is parameter)
(d) None of the above

5. If a point $(x,y)=(\tan\theta+\sin\theta, \tan\theta-\sin\theta)$, then locus of (x,y) is
(a) $(x^2y)^{2/3}+(xy^2)^{2/3}=1$ (b) $x^2-y^2=4xy$
(c) $(x^2-y^2)^2=16xy$ (d) $x^2-y^2=6xy$

6. Eccentricity of hyperbola $\frac{x^2}{k}+\frac{y^2}{k^2}=1 (k<0)$ is
(a) $\sqrt{1+k}$ (b) $\sqrt{1-k}$
(c) $\sqrt{1+\frac{1}{k}}$ (d) $\sqrt{1-\frac{1}{k}}$

7. The length of transverse axis of the hyperbola $3x^2-4y^2=32$ is
(a) $\frac{8\sqrt{2}}{\sqrt{3}}$ (b) $\frac{16\sqrt{2}}{\sqrt{3}}$ (c) $\frac{3}{32}$ (d) $\frac{64}{3}$

8. The difference between the length $2a$ of the transverse axis of a hyperbola of eccentricity e and the length of its latusrectum is
(a) $2a(3-e^2)$ (b) $2a\,|2-e^2|$
(c) $2a(e^2-1)$ (d) $a(2e^2-1)$

9. If eccentricity of hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is e and e' is the eccentricity of its conjugate hyperbola, then
(a) $e=e'$ (b) $ee'=1$
(c) $\frac{1}{e^2}+\frac{1}{(e')^2}$ (d) None of these

10. Any point on the hyperbola $\frac{(x+1)^2}{16}-\frac{(y-2)^2}{4}=1$ is of the form
(a) $(4\sec\theta, 2\tan\theta)$ (b) $(4\sec\theta-1, 2\tan\theta+2)$
(c) $(4\sec\theta-1, 2\tan\theta-2)$ (d) $(4\sec\theta-4, 2\tan\theta-2)$

11. The product of the perpendicular from two foci on any tangent to the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, is
(a) a^2 (b) b^2 (c) $-a^2$ (d) $-b^2$

Equation of Hyperbola and Intersection of Two Curves

12. The equation of the hyperbola whose foci are (6,4) and (−4,4) and eccentricity 2, is
(a) $\frac{4(x-1)^2}{25}+\frac{4(y-4)^2}{25}=1$ (b) $\frac{4(x+1)^2}{25}+\frac{4(y+4)^2}{75}=1$
(c) $\frac{4(x-1)^2}{75}-\frac{4(y-4)^2}{25}=1$ (d) $\frac{4(x-1)^2}{25}-\frac{4(y-4)^2}{75}=1$

13. The distance between the foci of a hyperbola is 16 and its eccentricity is $\sqrt{2}$. Its equation is [NCERT Exemplar]

(a) $x^2 - y^2 = 32$ (b) $\frac{x^2}{4} - \frac{y^2}{9} = 1$

(c) $2x - 3y^2 = 7$ (d) None of these

14. Equation of the hyperbola with eccentricity $\frac{3}{2}$ and foci at $(\pm 2, 0)$ is [NCERT Exemplar]

(a) $\frac{x^2}{4} - \frac{y^2}{5} = \frac{4}{9}$ (b) $\frac{x^2}{9} - \frac{y^2}{9} = \frac{4}{9}$

(c) $\frac{x^2}{4} - \frac{y^2}{9} = 1$ (d) None of these

15. The equation of hyperbola having vertices $(\pm 2, 0)$ and foci $(\pm 3, 0)$ is [NCERT]

(a) $\frac{x^2}{4} - \frac{y^2}{5} = 1$ (b) $\frac{x^2}{5} - \frac{y^2}{4} = 1$

(c) $\frac{x^2}{4} + \frac{y^2}{5} = 1$ (d) None of these

16. The equation of hyperbola having foci $(0, \pm\sqrt{10})$ and passing through the point (2, 3) is [NCERT]

(a) $x^2 + y^2 = 5$ (b) $y^2 - x^2 = 5$

(c) $x^2 - y^2 = 5$ (d) None of these

17. Equation $\frac{1}{r} = \frac{1}{8} + \frac{3}{8}\cos\theta$ represents

(a) a rectangular hyperbola (b) a hyperbola

(c) an ellipse (d) a parabola

18. The angle between lines joining the origin to the point of intersection of the line $\sqrt{3}x + y = 2$ and the curve $y^2 - x^2 = 4$ is

(a) $\tan^{-1}\left(\frac{2}{\sqrt{3}}\right)$ (b) $\frac{\pi}{6}$

(c) $\tan^{-1}\left(\frac{\sqrt{3}}{2}\right)$ (d) $\frac{\pi}{2}$

Tangent and Normal to the Hyperbola

19. The straight line $x + y = \sqrt{2}p$ will touch the hyperbola $4x^2 - 9y^2 = 36$, if

(a) $p^2 = 2$ (b) $p^2 = 5$ (c) $5p^2 = 2$ (d) $2p^2 = 5$

20. What is the slope of the tangent drawn to the hyperbola $xy = a, (a \neq 0)$ at the point $(a, 1)$?

(a) $\frac{1}{a}$ (b) $-\frac{1}{a}$ (c) a (d) $-a$

21. The locus of the point of intersection of perpendicular tangents to the hyperbola $\frac{x^2}{3} - \frac{y^2}{1} = 1$ is

(a) $x^2 + y^2 = 2$ (b) $x^2 + y^2 = 3$

(c) $x^2 - y^2 = 3$ (d) $x^2 + y^2 = 4$

22. Number of points from where perpendicular tangents to the curve $\frac{x^2}{16} - \frac{y^2}{25} = 1$ can be drawn, is

(a) 1 (b) 2

(c) 0 (d) None of these

23. The point of intersection of two tangents to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, the product of whose slope is c^2, lies on the curve

(a) $y^2 - b^2 = c^2(x^2 + a^2)$ (b) $y^2 + a^2 = c^2(x^2 - b^2)$

(c) $y^2 + b^2 = c^2(x^2 - a^2)$ (d) $y^2 - a^2 = c^2(x^2 + b^2)$

24. Equation of the normal to the hyperbola $\frac{x^2}{25} - \frac{y^2}{16} = 1$ perpendicular to the line $2x + y = 1$ is

(a) $\sqrt{21}(x - 2y) = 41$ (b) $x - 2y = 1$

(c) $\sqrt{41}(x - 2y) = 41$ (d) $\sqrt{21}(x - 2y) = 21$

25. The number of normals to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ from an external point is

(a) 6 (b) 5 (c) 4 (d) 2

26. The equation of normal at $\left(at, \frac{a}{t}\right)$ to the hyperbola $xy = a^2$ is

(a) $xt^3 - yt + at^4 - a = 0$ (b) $xt^3 - yt - at^4 + a = 0$

(c) $xt^3 + yt + at^4 - a = 0$ (d) None of these

27. Let $P(a\sec\theta, b\tan\theta)$ and $Q(a\sec\phi, b\tan\phi)$, where $\theta + \phi = \frac{\pi}{2}$ be two points on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. If (h, k) is the point of intersection of normals at P and Q, then k is equal to

(a) $\frac{a^2 + b^2}{a}$ (b) $-\left[\frac{a^2 + b^2}{a}\right]$ (c) $\frac{a^2 + b^2}{b}$ (d) $-\left[\frac{a^2 + b^2}{b}\right]$

28. The value of m, for which the line $y = mx + \frac{25\sqrt{3}}{3}$ is a normal to the conic $\frac{x^2}{16} - \frac{y^2}{9} = 1$, is

(a) $-\frac{2}{\sqrt{3}}$ (b) $\sqrt{3}$

(c) $-\frac{\sqrt{3}}{2}$ (d) None of these

Chord of Contact and Diameter of a Hyperbola

29. If the chords of contact of tangents from two points (x_1, y_1) and (x_2, y_2) to the hyperbola $4x^2 - 9y^2 - 36 = 0$ are at right angles, then $\frac{x_1 x_2}{y_1 y_2}$ is equal to

(a) $\frac{9}{4}$ (b) $-\frac{9}{4}$ (c) $\frac{81}{16}$ (d) $-\frac{81}{16}$

30. If $x = 9$ is the chord of contact of the hyperbola $x^2 - y^2 = 9$, then the equation of the corresponding pair of tangents is
(a) $9x^2 - 8y^2 + 18x - 9 = 0$ (b) $9x^2 - 8y^2 - 18x + 9 = 0$
(c) $9x^2 - 8y^2 - 18x - 9 = 0$ (d) $9x^2 - 8y^2 + 18x + 9 = 0$

31. If chords of the hyperbola $x^2 - y^2 = a^2$ touch the parabola $y^2 = 4ax$. Then, the locus of the middle points of these chords is
(a) $y^2 = (x - a)x^3$ (b) $y^2(x - a) = x^3$
(c) $x^2(x - a) = x^3$ (d) None of these

32. The locus of middle points of chords of hyperbola $3x^2 - 2y^2 + 4x - 6y = 0$ parallel to $y = 2x$ is
(a) $3x - 4y = 4$ (b) $3y - 4x + 4 = 0$
(c) $4x - 3y = 3$ (d) $3x - 4y = 2$

33. Equation of the chord of the hyperbola $25x^2 - 16y^2 = 400$, which is bisected at the point (6, 2), is
(a) $16x - 75y = 418$ (b) $75x - 16y = 418$
(c) $25x - 4y = 400$ (d) None of these

Rectangular Hyperbola

34. If $5x^2 + \lambda y^2 = 20$ represents a rectangular hyperbola, then λ is equal to
(a) 5 (b) –5
(c) 4 (d) –4

35. The equation of a line passing through the centre of a rectangular hyperbola is $x - y - 1 = 0$. If one of the asymptotes is $3x - 4y - 6 = 0$, the equation of other asymptote is
(a) $4x - 3y + 17 = 0$ (b) $-4x - 3y + 17 = 0$
(c) $-4x + 3y + 1 = 0$ (d) $4x + 3y + 17 = 0$

36. The asymptotes of the hyperbola $xy = hx + ky$ are
(a) $x = k, y = h$ (b) $x = h, y = k$
(c) $x = h, y = h$ (d) $x = k, y = k$

37. Eccentricity of hyperbola whose asymptotes are $3x - 4y = 7$ and $4x + 3y = 8$, is
(a) $\sqrt{2}$
(b) 2
(c) not sufficient information
(d) None of the above

38. The product of the lengths of perpendiculars drawn from any point on the hyperbola $x^2 - 2y^2 - 2 = 0$ to its asymptotes, is
(a) 1/2 (b) 2/3 (c) 3/2 (d) 2

39. The equation of the asymptotes of the hyperbola $3x^2 + 4y^2 + 8xy - 8x - 4y - 6 = 0$ is
(a) $3x^2 + 4y^2 + 8xy - 8x - 4y - 3 = 0$
(b) $3x^2 + 4y^2 + 8xy - 8x - 4y + 3 = 0$
(c) $3x^2 + 4y^2 + 8xy - 8x - 4y + 6 = 0$
(d) $4x^2 + 3y^2 + 2xy - x + y + 3 = 0$

40. If asymptotes of a hyperbola are at 90°, then
(a) eccentricity is $\sqrt{2}$
(b) eccentricity is 2
(c) eccentricity depends on equation of asymptotes
(d) None of the above

41. A hyperbola has the asymptotes $x + 2y = 3$ and $x - y = 0$ and passes through (2, 1). Its centre is
(a) (1, 2) (b) (2, 2)
(c) (1, 1) (d) (2, 1)

42. The angle between the asymptotes of the hyperbola $x^2 + 2xy - 3y^2 + x + 7y + 9 = 0$ is
(a) $\tan^{-1}(\pm 2)$ (b) $\tan^{-1}(\pm\sqrt{3})$
(c) $\tan^{-1}\left(\frac{1}{\sqrt{3}}\right)$ (d) $\tan^{-1}\left(\frac{1}{2}\right)$

43. The angle between the two asymptotes of the hyperbola $\frac{x^2}{16} - \frac{y^2}{9} = 1$ is
(a) $\pi - 2\tan^{-1}\left(\frac{3}{4}\right)$ (b) $\pi - 2\tan^{-1}\left(\frac{3}{2}\right)$
(c) $2\tan^{-1}\left(\frac{3}{4}\right)$ (d) $\pi - 2\tan^{-1}\left(\frac{4}{3}\right)$

44. If tangent and normal to a rectangular hyperbola $xy = c^2$ cut off intercepts a_1 and a_2 on one axis and b_1, b_2 on the other, then
(a) $a_1 = b_1$ (b) $a_2 = b_2$
(c) $\frac{a_1}{a_2} = \frac{b_1}{b_2}$ (d) $a_1a_2 + b_1b_2 = 0$

45. The length of the transverse axis of the rectangular hyperbola $xy = 18$ is
(a) 6 (b) 12
(c) 18 (d) 9

Miscellaneous

46. Tangents at any point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ cut the axes at A and B respectively. If the rectangle $OAPB$, where O is the origin is completed, then locus of point P is given by
(a) $\frac{a^2}{x^2} - \frac{b^2}{y^2} = 1$ (b) $\frac{a^2}{x^2} + \frac{b^2}{y^2} = 1$
(c) $\frac{a^2}{y^2} - \frac{b^2}{x^2} = 1$ (d) None of these

47. The equation of the common tangent to the curves $y^2 = 8x$ and $xy = -1$ is
(a) $3y = 9x + 2$ (b) $y = 2x + 1$
(c) $2y = y + 8$ (d) $y = x + 2$

Round II (Mixed Bag)

Only One Correct Option

1. If PQ is a double ordinate of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ such that OPQ is an equilateral triangle, O being the centre of the hyperbola. Then, the eccentricity e of the hyperbola satisfies

(a) $1 < e < \frac{2}{\sqrt{3}}$ (b) $e = \frac{2}{\sqrt{3}}$

(c) $e = \frac{\sqrt{3}}{2}$ (d) $e > \frac{2}{\sqrt{3}}$

2. The normal at P to a hyperbola of eccentricity e, intersects its transverse and conjugate axes at L and M respectively. If locus of the mid-point of LM is hyperbola, then eccentricity of the hyperbola is

(a) $\left(\frac{e+1}{e-1}\right)$ (b) $\frac{e}{\sqrt{(e^2-1)}}$

(c) e (d) None of these

3. Consider the set of hyperbola $xy = k, k \in R$. Let e_1 be the eccentricity when $k = 4$ and e_2 be the eccentricity when $k = 9$, then $e_1 - e_2$ is equal to

(a) -1 (b) 0 (c) 2 (d) -3

4. With one focus of the hyperbola $\frac{x^2}{9} - \frac{y^2}{16} = 1$ as the centre, a circle is drawn which is tangent to the hyperbola with no part of the circle being outside the hyperbola. The radius of the circle is

(a) less than 2 (b) 2

(c) 1/3 (d) None of these

5. Locus of a point whose chord of contact with respect to the circle $x^2 + y^2 = 4$ is a tangent to the hyperbola $xy = 1$ is a/an

(a) ellipse (b) circle (c) hyperbola (d) parabola

6. The coordinates of a point on the hyperbola, $\frac{x^2}{24} - \frac{y^2}{18} = 1$, which is nearest to the line $3x + 2y + 1 = 0$ are

(a) (6, 3) (b) (–6, –3) (c) (6, –3) (d) (–6, 3)

7. P is a point on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, N is the foot of the perpendicular from P on the transverse axis. The tangent to the hyperbola at P meets the transverse axis at T. If O is the centre of the hyperbola, then $OT \times ON$ is equal to

(a) e^2 (b) a^2

(c) b^2 (d) $\frac{b^2}{a^2}$

8. If tangents PQ and PR are drawn from variable point P to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1\ (a > b)$ so that the fourth vertex S of parallelogram $PQSR$ lies on circumcircle of ΔPQR, then locus of P is

(a) $x^2 + y^2 = b^2$ (b) $x^2 + y^2 = a^2$

(c) $x^2 + y^2 = (a^2 - b^2)$ (d) None of these

9. Number of points on the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 3$ from which mutually perpendicular tangents can be drawn to the circle $x^2 + y^2 = a^2$, is/are

(a) 0 (b) 2 (c) 3 (d) 4

More Than One Correct Option

10. The locus of the point of intersection of two perpendicular tangents to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is

(a) director circle (b) $x^2 + y^2 = a^2$

(c) $x^2 + y^2 = a^2 - b^2$ (d) $x^2 + y^2 = a^2 + b^2$

11. A straight line touches the rectangular hyperbola $9x^2 - 9y^2 = 8$ and the parabola $y^2 = 32x$. The equation of the line is

(a) $9x + 3y - 8 = 0$ (b) $9x - 3y + 8 = 0$

(c) $9x + 3y + 8 = 0$ (d) $9x - 3y - 8 = 0$

12. If foci of $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ coincide with the foci of $\frac{x^2}{25} + \frac{y^2}{9} = 1$ and eccentricity of the hyperbola is 2, then

(a) $a^2 + b^2 = 16$

(b) there is no director circle of the hyperbola

(c) centre of the director circle is (0, 0)

(d) length of latusrectum of the hyperbola $= 12$

Comprehension Based Questions

Passage

Directions (Q. Nos. 13 and 14) *Let the curves be*

$$x^2 - y^2 = 9, \quad P: y^2 = 4(x-5), \quad L: x = 9$$

On the basis of above information, answer the following questions.

13. If L is the chord of contact of the hyperbola H, then the equation of the corresponding pair of tangents is

(a) $9x^2 - 8y^2 + 18x - 9 = 0$ (b) $9x^2 - 8y^2 - 18x + 9 = 0$

(c) $9x^2 - 8y^2 - 18x - 9 = 0$ (d) $9x^2 - 8y^2 + 18x + 9 = 0$

14. If R is the point of intersection of the tangents of H at the extremities of the chord L, then equation of the chord of contact of R with respect to the parabola P is

(a) $x = 7$ (b) $x = 9$
(c) $y = 7$ (d) $y = 9$

Assertion and Reason

Directions (Q. Nos. 15-20) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*) *and* (*d*) *given below*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I is true; Statement II is false.
(d) Statement I is false; Statement II is true.

15. **Statement I** $\frac{5}{3}$ and $\frac{5}{4}$ are the eccentricities of two conjugate hyperbolas.

Statement II If e and e_1 are the eccentricities of two conjugate hyperbolas, then $ee_1 > 1$.

16. **Statement I** A hyperbola whose asymptotes include a right angle is said to be equilateral hyperbola.

Statement II Eccentricity of an equilateral hyperbola is $\sqrt{2}$..

17. **Statement I** The line $bx - ay = 0$ will not meet the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1\,(a > b > 0)$

Statement II The line $y = mx + c$ does not meet the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, if $c^2 = a^2m^2 - b^2$

18. **Statement I** The equation of the director circle to the hyperbola $4x^2 - 3y^2 = 12$ is $x^2 + y^2 = 1$.

Statement II Director circle is the locus of the point of intersection of perpendicular tangents to a hyperbola.

19. **Statement I** Let $(2, \sqrt{2})$ be any point on hyperbola $x^2 - y^2 = 2$, then the product of distances of foci from P is equal to 6.

Statement II If S and S' be the foci, C the centre and P be any point on a hyperbola $x^2 - y^2 = a^2$, then $SP \cdot S'P = CP^2$

20. **Statement I** Asymptotes of hyperbola $3x + 4y = 2$ and $4x - 3y = 5$ are bisectors of transverse and conjugate axes of hyperbola.

Statement II Transverse and conjugate axes of hyperbola are bisectors of the asymptotes.

Previous Years' Questions

21. The equation of the hyperbola whose foci are (–2, 0) and (2, 0) and eccentricity is 2 is given by **[AIEEE 2011]**

(a) $-3x^2 + y^2 = 3$ (b) $x^2 - 3y^2 = 3$
(c) $3x^2 - y^2 = 3$ (d) $-x^2 + 3y^2 = 3$

22. For the hyperbola $\frac{x^2}{\cos^2\alpha} - \frac{y^2}{\sin^2\alpha} = 1$. Which of the following remains constant when α varies? **[AIEEE 2007]**

(a) Directrix (b) Abscissae of vertices
(c) Abscissae of foci (d) Eccentricities

23. The locus of a point $P(\alpha, \beta)$ moving under the condition that the line $y = \alpha x + \beta$ is a tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is **[AIEEE 2005]**

(a) circle (b) ellipse
(c) parabola (d) hyperbola

the Guidance

Round I

1. Given equation of hyperbola is

$$(10x-5)^2+(10y-4)^2=\lambda^2(3x+4y-1)^2$$

can be rewritten as

$$\frac{\sqrt{\left(x-\frac{1}{2}\right)^2+\left(y-\frac{2}{5}\right)^2}}{\left|\frac{3x+4y-1}{5}\right|}=\left|\frac{\lambda}{2}\right|$$

This is of the form of $\frac{PS}{PM}=e$

where, P is any point on the hyperbola and S is a focus and M is the point of directrix.

Here, $\left|\frac{\lambda}{2}\right|>1 \Rightarrow |\lambda|>2$ $(\because e>1)$

$\Rightarrow$ $\lambda<-2$ or $\lambda>2$

2. Let equation of hyperbola be

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$$

Given, $\frac{2b^2}{a}=8$

$\Rightarrow$ $\frac{b^2}{a}=4$

and $2b=\frac{1}{2}(2ae)$

$\Rightarrow$ $2b=ae$

$\Rightarrow$ $4b^2=a^2e^2$

$\Rightarrow$ $4\left(\frac{b^2}{a^2}\right)=e^2$

$\Rightarrow$ $4(e^2-1)=e^2$ $[\because b^2=a^2(e^2-1)]$

$\Rightarrow$ $3e^2=4$

$\Rightarrow$ $e^2=\frac{4}{3}$

$\Rightarrow$ $e=\frac{2}{\sqrt{3}}$

3. Given equation is $9y^2-4x^2=36$, divide it by 36, we get

$$\frac{9y^2}{36}-\frac{4x^2}{36}=\frac{36}{36}$$

$\Rightarrow$ $\frac{y^2}{4}-\frac{x^2}{9}=1$

Now, comparing $\frac{y^2}{4}-\frac{x^2}{9}=1$ with $\frac{y^2}{b^2}-\frac{x^2}{a^2}=1$, we get

$$b^2=4 \text{ and } a^2=9$$

$\Rightarrow$ $b=2$ and $a=3$

Here, in hyperbolic equation coefficient of y^2 is positive, so transverse axis is along Y-axis.

$$\text{Vertices}=(0,\pm b)=(0,\pm 2)$$

and latusrectum $=\frac{2a^2}{b}=\frac{2\times 9}{2}=9$

4. Now, taking option (c).

Let $x = a\dfrac{e^t + e^{-t}}{2} \Rightarrow \dfrac{2x}{a} = e^t + e^{-t}$ ...(i)

and $\dfrac{2y}{a} = e^t - e^{-t}$ ...(ii)

On squaring and subtracting Eq. (ii) from Eq. (i), we get

$$\frac{4x^2}{a^2} - \frac{4y^2}{b^2} = 4 \Rightarrow \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

5. Put the value of $(x, y) \equiv (\tan\theta + \sin\theta, \tan\theta - \sin\theta)$ in the given option, we get the required result.

On putting the value of x and y in option (c), we get

$$[(\tan\theta + \sin\theta)^2 - (\tan\theta - \sin\theta)^2]^2$$
$$= 16(\tan\theta + \sin\theta) \times (\tan\theta - \sin\theta)$$
$$\Rightarrow \quad [\tan^2\theta + \sin^2\theta - \tan^2\theta - \sin^2\theta + 4\tan\theta\sin\theta]^2$$
$$= 16(\tan^2\theta - \sin^2\theta)$$
$$\Rightarrow \quad (4\tan\theta \cdot \sin\theta)^2 = 16(\tan^2\theta - \sin^2\theta)$$
$$\Rightarrow \quad 16\tan^2\theta\sin^2\theta = 16\tan^2\theta(1 - \cos^2\theta)$$
$$\Rightarrow \quad 16\tan^2\theta\sin^2\theta = 16\tan^2\theta\sin^2\theta$$

Hence, the option (c) satisfies.

6. Given equation can be rewritten as $\dfrac{y^2}{k^2} - \dfrac{x^2}{(-k)} = 1 (-k > 0)$

$$e^2 = 1 + \frac{(-k)}{k^2} = 1 - \frac{k}{k^2}$$
$$\Rightarrow \quad e = \sqrt{1 - \frac{1}{k}}$$

7. The given equation may be written as

$$\frac{x^2}{\frac{32}{3}} - \frac{y^2}{8} = 1$$
$$\Rightarrow \quad \frac{x^2}{\left(\frac{4\sqrt{2}}{\sqrt{3}}\right)^2} - \frac{y^2}{(2\sqrt{2})^2} = 1$$

On comparing the given equation with the standard equation $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$, we get

$$a^2 = \left(\frac{4\sqrt{2}}{\sqrt{3}}\right)^2 \quad \text{and} \quad b^2 = (2\sqrt{2})^2$$

$\therefore$ Length of transverse axis of a hyperbola

$$= 2a = 2 \times \frac{4\sqrt{2}}{\sqrt{3}} = \frac{8\sqrt{2}}{\sqrt{3}}$$

8. Let equation of hyperbola be $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$

Length of transverse axis is $2a$ and

Length of latusrectum is $\dfrac{2b^2}{a}$.

Now, difference $E = \left|2a - \dfrac{2b^2}{a}\right| = \dfrac{2}{a}\left|2a^2 - a^2e^2\right|$

$\therefore$ Difference $= 2a\,|2 - e^2|$

9. Given equation of hyperbola is $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$ and equation of conjugate hyperbola is $\dfrac{x^2}{b^2} - \dfrac{y^2}{a^2} = 1$

Since, e and e' are the eccentricities of the respective hyperbola, then

$$e^2 = 1 + \frac{b^2}{a^2}, (e')^2 = 1 + \frac{a^2}{b^2}$$
$$\therefore \quad \frac{1}{e^2} + \frac{1}{e'^2} = \frac{a^2}{a^2 + b^2} + \frac{b^2}{a^2 + b^2}$$

10. Any point on hyperbola $\dfrac{(x+1)^2}{16} - \dfrac{(y-2)^2}{4} = 1$ is of the form $(4\sec\theta - 1, 2\tan\theta + 2)$

11. Let equation of tangent to hyperbola $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$ is

$$y = mx + \sqrt{a^2m^2 - b^2}$$

i.e., $mx - y + \sqrt{a^2m^2 - b^2} = 0$

$\therefore$ Required product

$$= \left|\frac{mae + \sqrt{a^2m^2 - b^2}}{\sqrt{m^2 + 1}}\right| \left|\frac{-mae + \sqrt{a^2m^2 - b^2}}{\sqrt{m^2 + 1}}\right|$$
$$= \left|\frac{a^2m^2 - b^2 - m^2a^2e^2}{m^2 + 1}\right|$$
$$= \left|\frac{m^2a^2(1 - e^2) - b^2}{m^2 + 1}\right| = \left|\frac{-m^2b^2 - b^2}{m^2 + 1}\right| \quad [\because b^2 = a^2(e^2 - 1)]$$
$$= b^2$$

12. Given, S (6,4) and $S'(-4,4)$ and eccentricity, $e = 2$

$$\therefore \quad SS' = \sqrt{(6+4)^2 + (4-4)^2} = 10$$

But $SS' = 2ae$

$$\therefore \quad 2a \times 2 = 10 \Rightarrow a = \frac{5}{2}$$

and we know that,

$$b^2 = a^2(e^2 - 1)$$
$$\Rightarrow \quad b^2 = \frac{25}{4}(4 - 1) = \frac{75}{4}$$

Centre of hyperbola is $\left[\dfrac{6 + (-4)}{2}, \dfrac{4 + 4}{2}\right] = (1,4)$

$\therefore$ Equation of hyperbola is $\dfrac{(x-1)^2}{\frac{25}{4}} - \dfrac{(y-4)^2}{\frac{75}{4}} = 1$

$$\Rightarrow \quad \frac{4(x-1)^2}{25} - \frac{4(y-4)^2}{75} = 1$$

13. Let equation of hyperbola be $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ ...(i)

According to the given condition,

$$2ae=16$$

and $e=\sqrt{2}$

$\Rightarrow$ $2a(\sqrt{2})=16$

$\Rightarrow$ $a=\frac{8}{\sqrt{2}}$

$\Rightarrow$ $a^2=32$

$\because$ $b^2=a^2(e^2-1)$

$=32(2-1)=32$

On putting the values of a^2 and b^2 in Eq. (i), we get

$$\frac{x^2}{32}-\frac{y^2}{32}=1$$

$\Rightarrow$ $x^2-y^2=32$

14. Let the equation of hyperbola be

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1 \quad ...(i)$$

Given, $e=\frac{3}{2}$ and foci $=(\pm ae,0)=(\pm 2,0)$

$\therefore$ $e=\frac{3}{2}$ and $ae=2$

$\Rightarrow$ $a\times\frac{3}{2}=2\Rightarrow a^2=\frac{16}{9}$

$\because$ $b^2=a^2(e^2-1)$

$\therefore$ $b^2=\frac{16}{9}\left(\frac{9}{4}-1\right)$

$=\frac{16}{9}\times\frac{5}{4}=\frac{20}{9}$

On putting the values of a^2 and b^2 in Eq. (i), we get

$$\frac{x^2}{16/9}-\frac{y^2}{20/9}=1$$

$\Rightarrow$ $\frac{x^2}{4}-\frac{y^2}{5}=\frac{4}{9}$

15. Since, vertices $(\pm 2,0)$ and foci $(\pm 3,0)$ lies on X-axis, as coefficient of Y-axis is zero.

Hence, equation of hyperbola will be of the form

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1 \quad ...(i)$$

where, it is given that

$a=2$ and $ae=3$

$\Rightarrow$ $e=\frac{3}{2}$

$$b=a\sqrt{e^2-1}=2\sqrt{\frac{9}{4}-1}=\sqrt{5}$$

Put the values of $a^2=4$ and $b^2=5$ in Eq. (i), we get

$$\frac{x^2}{4}-\frac{y^2}{5}=1$$

16. Since, foci $(0,\pm\sqrt{10})$ lies on Y-axis, as x-coordinate is zero. Hence, equation of hyperbola will be of the form

$$\frac{y^2}{a^2}-\frac{x^2}{b^2}=1 \quad ...(i)$$

where, it is given that foci $(0,\pm\sqrt{10})=(0,\pm be)\Rightarrow be=\sqrt{10}$

Also, hyperbola passes through the point (2, 3), *i.e.*, point will satisfy Eq. (i).

$\therefore$ $\frac{(3)^2}{a^2}-\frac{(2)^2}{b^2}=1$

$\Rightarrow$ $\frac{9}{a^2}-\frac{4}{b^2}=1$ ...(ii)

$\because$ $a^2=b^2e^2-b^2$

$\therefore$ $a^2+b^2=10$

$\Rightarrow$ $b^2=10-a^2$ ...(iii)

From Eq. (ii),

$$\frac{9}{a^2}-\frac{4}{10-a^2}=1\Rightarrow\frac{90-9a^2-4a^2}{a^2(10-a^2)}=1$$

$\Rightarrow$ $90-13a^2=10a^2-a^4$

$\Rightarrow$ $a^4-23a^2+90=0$

$\Rightarrow$ $a^4-18a^2-5a^2+90=0$

$\Rightarrow$ $a^2(a^2-18)-5(a^2-18)=0$

$\Rightarrow$ $(a^2-5)(a^2-18)=0$

$\Rightarrow$ $a^2=5$ or $a^2=18$

From Eq. (iii), if $a^2=5$

$\Rightarrow$ $b^2=10-5=5$

If $a^2=18$

$\Rightarrow$ $b^2=10-18=-8$ which is not possible.

So, $a^2=b^2=5$

Put $a^2=b^2=5$ in Eq. (i), we get

$$\frac{y^2}{5}-\frac{x^2}{5}=1\Rightarrow y^2-x^2=5$$

17. Given equation is $\frac{1}{r}=\frac{1}{8}+\frac{3}{8}\cos\theta$, it can be rewritten as $\frac{8}{r}=1+3\cos\theta$, which is the form of $\frac{1}{r}=1+e\cos\theta$

On comparing, we get

$$e=3>1$$

$\therefore$ Given equation represents a hyperbola

18. On homogenising $y^2-x^2=4$ with the help of the line $\sqrt{3}x+y=2$, we get

$$y^2-x^2=4\frac{(\sqrt{3}x+y)^2}{4}$$

$\Rightarrow$ $y^2-x^2=3x^2+y^2+2\sqrt{3}xy$

$\Rightarrow \quad 4x^2 + 2\sqrt{3}\,xy = 0$

$\therefore \quad \tan\theta = 2\dfrac{\sqrt{h^2 - ab}}{a+b}$

$\Rightarrow \quad \tan\theta = \dfrac{2\sqrt{3-0}}{4}$

$\Rightarrow \quad \theta = \tan^{-1}\left(\dfrac{\sqrt{3}}{2}\right)$

19. Given equation of hyperbola is $\dfrac{x^2}{9} - \dfrac{y^2}{4} = 1$.

Here, $a^2 = 9,\ b^2 = 4$

and equation of line is $y = -x + \sqrt{2}\,p$ ...(i)

If the line $y = mx + c$ touches the hyperbola

$\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$, then $c^2 = a^2m^2 - b^2$ ...(ii)

From Eq. (i), we get

$m = -1, c = \sqrt{2}p$

On putting these values in Eq. (ii), we get

$(\sqrt{2}p)^2 = 9(1) - 4 \Rightarrow 2p^2 = 5$

20. Given equation is $xy = a$

On differentiating, we get

$x\dfrac{dy}{dx} + y = 0$

$\Rightarrow \quad \dfrac{dy}{dx} = -\dfrac{y}{x}$

$\Rightarrow \quad \left(\dfrac{dy}{dx}\right)_{(a,1)} = -\dfrac{1}{a}$

21. We know that the locus of the point of intersection of perpendicular tangents to the hyperbola $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$ is a circle $x^2 + y^2 = a^2 - b^2$

Thus, locus of the point of intersection of perpendicular tangents to the hyperbola $\dfrac{x^2}{3} - \dfrac{y^2}{1} = 1$ is a circle

$x^2 + y^2 = 3 - 1$

$\Rightarrow \quad x^2 + y^2 = 2$

22. Director circle is set of points form where drawn tangents are perpendicular, in this case $x^2 + y^2 = a^2 - b^2$ (equation of director circle) *i.e.*, $x^2 + y^2 = -9$ is not a real circle, so there is no point from where tangents are perpendicular.

23. Let the slopes of the two tangents to the hyperbola

$\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$ be cm and $\dfrac{c}{m}$

The equations of tangents are

$y = cmx + \sqrt{a^2c^2m^2 - b^2}$ ...(i)

and $my - cx = \sqrt{a^2c^2 - b^2m^2}$ ...(ii)

On squaring and subtracting Eq. (ii) from Eq. (i), we get

$(y - cmx)^2 - (my - cx)^2 = a^2c^2m^2 - b^2 - a^2c^2 + b^2m^2$

$\Rightarrow \quad (1 - m^2)(y^2 - c^2x^2) = -(1 - m^2)(a^2c^2 + b^2)$

$\Rightarrow \quad y^2 + b^2 = c^2(x^2 - a^2)$

24. Equation of normal to the hyperbola at the point $(5\sec\theta, 4\tan\theta)$ is

$5x\cos\theta + 4y\cot\theta = 25 + 16$ ...(i)

This line is perpendicular to the line $2x + y = 1$

$\therefore \quad m_1m_2 = -1$

$\Rightarrow \quad \left(\dfrac{-5\cos\theta}{4\cot\theta}\right)(-2) = -1$

$\Rightarrow \quad \sin\theta = -\dfrac{2}{5}$

$\therefore \quad \cos\theta = \sqrt{1 - \dfrac{4}{25}} = \mp\dfrac{\sqrt{21}}{5}$

and $\cot\theta = \mp\dfrac{\sqrt{21}}{2}$

From Eq. (i),

$5x\dfrac{\sqrt{21}}{5} - \dfrac{4y\sqrt{21}}{2} = 41$

$\Rightarrow \quad \sqrt{21}(x - 2y) = 41$

25. The maximum four normals can be drawn from an external point.

26. The equation of normal at point $\left(at, \dfrac{a}{t}\right)$ is $t^2x - y = a\left(t^3 - \dfrac{1}{t}\right)$

$\Rightarrow \quad xt^3 - yt - at^4 + a = 0$

27. Equation of the tangents at $P(a\sec\theta, b\tan\theta)$ is

$\dfrac{x}{a}\sec\theta - \dfrac{y}{b}\tan\theta = 1$

$\therefore$ Equation of the normal at P is

$ax + b\,\mathrm{cosec}\,\theta\, y = (a^2 + b^2)\sec\theta$ ...(i)

Similarly, the equation of normal at $Q(a\sec\phi, b\tan\phi)$ is

$ax + b\,\mathrm{cosec}\,\phi\, y = (a^2 + b^2)\sec\phi$ ...(ii)

On subtracting Eq. (ii) from Eq. (i), we get

$y = \dfrac{a^2 + b^2}{b}\cdot\dfrac{\sec\theta - \sec\phi}{\mathrm{cosec}\,\theta - \mathrm{cosec}\,\phi}$

So, $k = y = \dfrac{a^2 + b^2}{b}\cdot\dfrac{\sec\theta - \sec\left(\dfrac{\pi}{2} - \theta\right)}{\mathrm{cosec}\,\theta - \mathrm{cosec}\left(\dfrac{\pi}{2} - \theta\right)}$

$= \dfrac{a^2 + b^2}{b}\cdot\dfrac{\sec\theta - \mathrm{cosec}\,\theta}{\mathrm{cosec}\,\theta - \sec\theta}$

$= -\left[\dfrac{a^2 + b^2}{b}\right]$

28. Given that, $y = mx + \frac{25\sqrt{3}}{3}$ ...(i)

and $\frac{x^2}{16} - \frac{y^2}{9} = 1$ ...(ii)

Here, Eq. (i) is normal to Eq. (ii), then

$$\frac{(a^2+b^2)^2}{c^2} = \frac{a^2}{m^2} - \frac{b^2}{1}$$

$$\Rightarrow \quad \frac{(16+9)^2 \times 9}{625 \times 3} = \frac{16}{m^2} - \frac{9}{1}$$

$$\Rightarrow \quad \frac{16}{m^2} = 12 \Rightarrow m = \pm \frac{2}{\sqrt{3}}$$

29. The equation of hyperbola is

$$4x^2 - 9y^2 = 36$$

$$\Rightarrow \quad \frac{x^2}{9} - \frac{y^2}{4} = 1 \quad \text{...(i)}$$

The equation of the chords of contact of tangents from (x_1, y_1) and (x_2, y_2) to the given hyperbola are

$$\frac{xx_1}{9} - \frac{yy_1}{4} = 1 \quad \text{...(ii)}$$

and $\frac{xx_2}{9} - \frac{yy_2}{4} = 1$ ...(iii)

Lines (ii) and (iii) are at right angles.

$$\frac{9}{4} \cdot \frac{x_1}{y_1} \times \frac{4}{9} \cdot \frac{x_2}{y_2} = -1$$

$$\Rightarrow \quad \frac{x_1x_2}{y_1y_2} = -\left(\frac{9}{4}\right)^2 = -\frac{81}{16}$$

30. Let (h, k) be the point whose chord of contact w.r.t. hyperbola $x^2 - y^2 = 9$ is $x = 9$. We know that chord of (h, k) w.r.t. hyperbola $x^2 - y^2 = 9$ is $T = 0$

$$\Rightarrow \quad hx - ky - 9 = 0$$

But it is the equation of line $x = 9$. This is possible only when $h = 1, k = 0$.

Again, equation of pair of tangents is

$$T^2 = SS_1$$

$$\Rightarrow \quad (x-9)^2 = (x^2 - y^2 - 9)(1-9)$$

$$\Rightarrow \quad x^2 - 18x + 81 = (x^2 - y^2 - 9)(-8)$$

$$\Rightarrow \quad 9x^2 - 8y^2 - 18x + 9 = 0$$

31. Equation of chord of hyperbola $x^2 - y^2 = a^2$ with mid-point as (h, k) is given by

$$xh - yk = h^2 - k^2$$

$$\Rightarrow \quad y = \frac{h}{k}x - \frac{(h^2 - k^2)}{k}$$

This will touch the parabola $y^2 = 4ax$, if

$$-\left(\frac{h^2 - k^2}{k}\right) = \frac{a}{h/k}$$

$$\Rightarrow \quad ak^2 = -h^3 + k^2h$$

$\therefore$ Locus of the mid-point is $x^3 = y^2(x - a)$

32. Let (h, k) is mid-point of chord.

Then, its equation is

$$3hx - 2ky + 2(x+h) - 3(y+k) = 3h^2 - 2k^2 + 4h - 6k$$

$$\Rightarrow \quad x(3h+2) + y(-2k-3) = 3h^2 - 2k^2 + 2h - 3k$$

Since, this line is parallel to $y = 2x$.

$$\therefore \quad \frac{3h+2}{2k+3} = 2$$

$$\Rightarrow \quad 3h + 2 = 4k + 6$$

$$\Rightarrow \quad 3h - 4k = 4$$

Thus, locus of mid-point is $3x - 4y = 4$

33. Given equation of hyperbola is $25x^2 - 16y^2 = 400$. If $(6, 2)$ is the mid-point of the chord, then equation of chord is $T = S_1$.

$$\Rightarrow \quad 25(6x) - 16(2y) = (25)(36) - 16(4)$$

$$\Rightarrow \quad 75x - 16y = 418$$

34. Since, for a rectangular hyperbola, we have

(Coefficient of x^2) + (Coefficient of y^2) = 0

$$\lambda = -5$$

35. We know that asymptotes of rectangular hyperbola are mutually perpendicular, thus other asymptote should be $4x + 3y + \lambda = 0$

Also, intersection point of asymptotes is also the centre of the hyperbola.

Hence, intersection point of $4x + 3y + \lambda = 0$ and $3x - 4y - 6 = 0$ is $\left(\frac{18 - 4\lambda}{25}, \frac{-12\lambda - 96}{100}\right)$ and it should lie on the line $x - y - 1 = 0$

$$\therefore \quad \frac{18 - 4\lambda}{25} - \frac{-12\lambda - 96}{100} - 1 = 0$$

$$\Rightarrow \quad \lambda = 17$$

Hence, equation of other asymptote is $4x + 3y + 17 = 0$

36. Given that, $xy = hx + ky \Rightarrow (x-k)(y-h) = hk$

On shifting origin to (k, h) the above equation reduces to

$$XY = hk = c^2 \quad \text{(say)}$$

where, $x = X + k$ and $y = Y + h$

Then, the equation of the asymptotes are $X = 0$ and $Y = 0$

i.e.,

$$x = k, \quad y = h$$

37. Since, asymptotes $3x - 4y = 7$ and $4x + 3y = 8$ are perpendicular, therefore it is a rectangular hyperbola, so eccentricity is $\sqrt{2}$.

38. Given equation is $x^2 - 2y^2 - 2 = 0$, it can be rewritten as

$$\frac{x^2}{2} - \frac{y^2}{1} = 1$$

Here, $a^2 = 2, \; b^2 = 1$

We know that equation of hyperbola is $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, then the product of length of perpendicular drawn from any point on the hyperbola to the asymptotes is

$$\frac{a^2b^2}{a^2+b^2}=\frac{2(1)}{2+1}=\frac{2}{3}$$

39. The equation of the asymptotes of the hyperbola

$$3x^2+4y^2+8xy-8x-4y-6=0$$

is $\quad 3x^2+4y^2+8xy-8x-4y+\lambda=0$

It should represent a pair of straight lines.

$\therefore \quad abc+2fgh-af^2-bg^2-ch^2=0$

$3\cdot4\cdot\lambda+2\cdot(-2)(-4)\ 4-3(-2)^2-4(-4)^2-\lambda(4)^2=0$

$\Rightarrow \quad 12\lambda+56-12-56-16\lambda=0$

$\Rightarrow \quad -4\lambda-12=0$

$\Rightarrow \quad \lambda=-3$

$\therefore$ Required equation is

$$3x^2+4y^2+8xy-8x-4y-3=0$$

40. Since, asymptotes are at 90°, it means that it is a rectangular hyperbola.

$\therefore$ Eccentricity is $\sqrt{2}$.

41. Equation of asymptotes are

$$x+2y=3 \quad \text{...(i)}$$

and $\quad x-y=0 \quad$ ...(ii)

On solving Eqs. (i) and (ii), we get

$$x=1, y=1$$

$\therefore$ Centre of hyperbola is (1, 1) because asymptotes passes through the centre of the hyperbola.

42. Equation of asymptotes of the hyperbola are

$$x^2+2xy-3y^2=0$$

The angle between asymptotes is

$$\theta=\tan^{-1}\left[\frac{1-1(-3)}{1-3}\right]$$

$$=\tan^{-1}\left(\frac{1+3}{-2}\right)=\tan^{-1}(\pm2)$$

43. We know that angle between two asymptotes of the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$ is $2\tan^{-1}\left(\frac{b}{a}\right)$.

Equation of given hyperbola is $\frac{x^2}{16}-\frac{y^2}{9}=1$.

Here, $\quad a=4$

and $\quad b=3$

$\therefore \quad$ Required angle $=2\tan^{-1}\left(\frac{3}{4}\right)$

44. $\because$ Tangent and normal are at 90°.

$\therefore$ Product of slopes is -1.

$\Rightarrow \quad \left(-\frac{b_1}{a_1}\right)\left(-\frac{b_2}{a_2}\right)=-1 \Rightarrow a_1a_2+b_1b_2=0$

45. The given equation of rectangular hyperbola is

$$xy=18 \quad \text{...(i)}$$

On comparing Eq. (i), with general equation of rectangular hyperbola $xy=\frac{a^2}{2}$, we get

$$\frac{a^2}{2}=18 \Rightarrow a^2=36 \Rightarrow a=6$$

$\therefore$ Length of the transverse axis of rectangular hyperbola is $2a=2\times6=12$

46. The equation of tangent is $\frac{x}{a}\sec\theta-\frac{y}{b}\tan\theta=1$

$\therefore$ Coordinates of A and B are $(a\cos\theta, 0)$ and $(0, -b\cot\theta)$ respectively.

Let coordinates of P are (h, k).

$\therefore \quad h=a\cos\theta, \quad k=-b\cot\theta$

$\Rightarrow \quad \frac{k}{h}=-\frac{b}{a\sin\theta} \Rightarrow \sin\theta=-\frac{bh}{ak}$

$\Rightarrow \quad \frac{b^2h^2}{a^2k^2}=\sin^2\theta \Rightarrow \frac{b^2h^2}{a^2k^2}+\frac{h^2}{a^2}=1$

$\Rightarrow \quad \frac{b^2}{k^2}+1=\frac{a^2}{h^2} \Rightarrow \frac{a^2}{h^2}-\frac{b^2}{k^2}=1$

Hence, the locus of P is $\frac{a^2}{x^2}-\frac{b^2}{y^2}=1$

47. Any point on parabola $y^2=8x$ is $(2t^2, 4t)$. The equation of tangent at that point is

$$yt=x+2t^2 \quad \text{...(i)}$$

Given that, $\quad xy=-1 \quad$ ...(ii)

On solving Eqs. (i) and (ii), we get

$$y(yt-2t^2)=-1 \Rightarrow ty^2-2t^2y+1=0$$

$\because$ It is common tangent. It means they are intersect only at one point and the value of discriminant is equal to zero.

i.e., $\quad 4t^4-4t=0 \Rightarrow t=0, 1$

$\therefore$ The common tangent is $y=x+2$, (when $t=0$, it is $x=0$ which can touch $xy=-1$ at infinity only)

Round II

1. $\because$ PQ is the double ordinate. Let $MP = MQ = l$.

Given that ΔOPQ is an equilateral, then $OP = OQ = PQ$

$\Rightarrow \quad (OP)^2 = (OQ)^2 = (PQ)^2$

$\Rightarrow \quad \frac{a^2}{b^2}(b^2 + l^2) + l^2 = \frac{a^2}{b^2}(b^2 + l^2) + l^2 = 4l^2$

$\Rightarrow \quad \frac{a^2}{b^2}(b^2 + l^2) = 3l^2$

$\Rightarrow \quad a^2 = l^2\left(3 - \frac{a^2}{b^2}\right)$

$\Rightarrow \quad l^2 = \frac{a^2b^2}{(3b^2 - a^2)} > 0$

$\therefore \quad 3b^2 - a^2 > 0 \Rightarrow 3b^2 > a^2$

$\Rightarrow \quad 3a^2(e^2 - 1) > a^2$

$\Rightarrow \quad e^2 > 4/3 \;\therefore\; e > \frac{2}{\sqrt{3}}$

2. Equation of normal at $P(a\sec\phi, b\tan\phi)$ is

$ax\cos\phi + by\cot\phi = a^2 + b^2$.

Then, coordinates of L and M are

$$\left(\frac{a^2+b^2}{a}\cdot\sec\phi, 0\right) \text{ and } \left(0, \frac{a^2+b^2}{b}\tan\phi\right)$$

respectively.

Let mid-point of ML is $Q(h, k)$,

then $\quad h = \frac{(a^2+b^2)}{2a}\sec\phi$

$\therefore \quad \sec\phi = \frac{2ah}{(a^2+b^2)} \quad$ ...(i)

and $\quad k = \frac{(a^2+b^2)}{2b}\tan\phi$

$\therefore \quad \tan\phi = \frac{2bk}{(a^2+b^2)} \quad$ ...(ii)

From Eqs. (i) and (ii), we get

$$\sec^2\phi - \tan^2\phi = \frac{4a^2h^2}{(a^2+b^2)^2} - \frac{4b^2k^2}{(a^2+b^2)^2}$$

Hence, required locus is

$$\frac{x^2}{\left(\frac{a^2+b^2}{2a}\right)^2} - \frac{y^2}{\left(\frac{a^2+b^2}{2b}\right)^2} = 1$$

Let eccentricity of this curve is e_1.

$\Rightarrow \quad \left(\frac{a^2+b^2}{2b}\right)^2 = \left(\frac{a^2+b^2}{2a}\right)^2(e_1^2 - 1)$

$\Rightarrow \quad a^2 = b^2(e_1^2 - 1)$

$\Rightarrow \quad a^2 = a^2(e^2 - 1)(e_1^2 - 1) \quad [\because b^2 = a^2(e^2 - 1)]$

$\Rightarrow \quad e^2e_1^2 - e^2 - e_1^2 + 1 = 1$

$\Rightarrow \quad e_1^2(e^2 - 1) = e^2$

$\Rightarrow \quad e_1 = \frac{e}{\sqrt{(e^2 - 1)}}$

3. $\because \quad xy = 4 \quad$ ...(i)

and $\quad xy = 9 \quad$ ...(ii)

Eqs. (i) and (ii) are the equations of rectangular hyperbolas.

$\therefore \quad e_1 = \sqrt{2}$ and $e_2 = \sqrt{2}$, then $e_1 - e_2 = 0$

4. Given hyperbola is

$\frac{x^2}{9} - \frac{y^2}{16} = 1 \quad$ ...(i)

$\therefore \quad e^2 = 1 + \frac{16}{9} = \frac{25}{9} \Rightarrow e = \frac{5}{3}$

Hence, its foci are $(\pm 5, 0)$.

The equation of the circle with (5, 0) as centre is

$(x - 5)^2 + y^2 = r^2 \quad$ ...(ii)

On solving Eqs. (i) and (ii), we have

$16x^2 - 9[r^2 - (x - 5)^2] = 144$

$\Rightarrow \quad 25x^2 - 90x - 9r^2 + 81 = 0$

Since, the circle touches the hyperbola, above equation must have equal roots. Hence,

$90^2 - 4(25)(81 - 9r^2) = 0$

$\Rightarrow \quad 9 - (9 - r^2) = 0$

$\Rightarrow r = 0$, which is not possible.

Hence, the circle cannot touch at two points.

It can only be tangent at the vertex. Hence,

$r = 5 - 3 = 2$

5. Let the point be (h, k).

Then, equation of the chord of contact is $hx + ky = 4$

Since, $hx + ky = 4$ is tangent to $xy = 1$,

$\therefore \quad x\left(\dfrac{4-hx}{k}\right)=1$ has two equal roots,

$\Rightarrow \quad hx^2-4x+k=0 \Rightarrow hk=4$

$\therefore$ Locus of (h, k) is $xy = 4$

6.

Point P is nearest to the given line, if tangent at P is parallel to the given line.

Now, slope of tangent at $P(x_1, y_1)$ is

$\left(\dfrac{dy}{dx}\right)_{(x_1,\, y_1)}=\dfrac{18y_1}{24x_1}=\dfrac{3}{4}\dfrac{y_1}{x_1}$, which must be equal to $-\dfrac{3}{2}$

$\therefore \quad \dfrac{3}{4}\dfrac{y_1}{x_1}=-\dfrac{3}{2}$

$\Rightarrow \quad y_1=-2x_1 \quad$ ...(i)

Also, (x_1, y_1) lies on the curve. Hence,

$$\frac{x_1^2}{24}-\frac{y_1^2}{18}=1 \quad \text{...(ii)}$$

On solving Eqs. (i) and (ii), we get two points (6, –3) and (–6, 3) of which (6, –3) is nearest.

7. Tangent at point P is

$$\frac{x}{a}\sec\theta-\frac{y}{b}\tan\theta=1.$$

It meets the x-axis at point $T(a\cos\theta, 0)$ and foot of perpendicular from P to x-axis is $N(a\sec\theta, 0)$.

From the diagram, we have

$$OT = a\cos\theta$$

and $\quad ON = a\sec\theta$

$\Rightarrow \quad OT \times ON = a^2$

8. Fourth vertex of parallelogram lies on circumcircle

$\Rightarrow$ Parallelogram is cyclic.

$\Rightarrow$ Parallelogram is a rectangle

$\Rightarrow$ Tangents are perpendicular

$\Rightarrow$ Locus of P is the director circle

i.e., $\quad x^2+y^2=a^2-b^2$

9. Director circle of circle $x^2+y^2=a^2$ is $x^2+y^2=2a^2$

The semi-transverse axis is $\sqrt{3}a$.

Radius of the circle is $\sqrt{2}a$.

Hence, director circle and hyperbola do not intersect.

10. Equation of any tangent in terms of slope m is

$$y=mx+\sqrt{(a^2m^2-b^2)}$$

It passes through (h, k), then

$$(k-mh)^2=a^2m^2-b^2$$

$\Rightarrow \quad m^2(h^2-a^2)-2mhk+k^2+b^2=0$

which is quadratic in m.

Let slopes of tangents are m_1 and m_2, then $m_1m_2=-1$

$\Rightarrow \quad \dfrac{k^2+b^2}{h^2-a^2}=-1$

$\Rightarrow \quad h^2+k^2=a^2-b^2$

Hence, required locus is $x^2+y^2=a^2-b^2$

which is director circle of $\dfrac{x^2}{a^2}-\dfrac{y^2}{b^2}=1$

11. The equation of tangent in terms of slope of $y^2=32x$ is

$$y=mx+\frac{8}{m} \quad \text{...(i)}$$

which is also tangent of the hyperbola $9x^2-9y^2=8$

i.e., $\quad x^2-y^2=\dfrac{8}{9}$

Then, $\quad \left(\dfrac{8}{m}\right)^2=\dfrac{8}{9}m^2-\dfrac{8}{9}$

$\Rightarrow \quad \dfrac{8}{m^2}=\dfrac{m^2}{9}-\dfrac{1}{9}$

$\Rightarrow \quad 72=m^4-m^2$

$\Rightarrow \quad m^4-m^2-72=0$

$\Rightarrow \quad (m^2-9)(m^2+8)=0$

$\Rightarrow \quad m^2=9, \quad (\because m^2+8\neq 0)$

$\Rightarrow \quad m=\pm 3$

From Eq. (i), we get

$$y=\pm 3x\pm\frac{8}{3}$$

$\Rightarrow \quad 3y=\pm 9x\pm 8$

$\Rightarrow \quad \pm 9x-3y\pm 8=0$

$\Rightarrow \quad 9x-3y+8=0,\ 9x-3y-8=0$

$-9x-3y+8=0,\ -9x-3y-8=0$

or $\quad 9x-3y+8=0,\ 9x-3y-8=0$

$\Rightarrow \quad 9x+3y-8=0$

and $\quad 9x+3y+8=0$

12. For the ellipse,

$$a=5 \text{ and } e=\sqrt{\frac{25-9}{25}}=\frac{4}{5}$$

$\therefore \quad ae=4$

Hence, the foci are (–4, 0) and (4, 0).

For the hyperbola, $ae = 4$, $e = 2$

$\therefore \quad a = 2$

$b^2 = 4(4-1) = 12$

$\Rightarrow \quad b = \sqrt{12}$

Length of latusrectum $= \dfrac{2b^2}{a} = 2 \times \dfrac{12}{2} = 12$

13. Let $R(h, k)$ be the point of intersection of the tangents to the extremities of the chord $L : x = 9$ to the hyperbola, then equation of L is $hx - ky = 9 \Rightarrow h = 1, k = 0$.

$\therefore$ Coordinates of R are (1, 0).

Equation of the pair of tangents from R to the hyperbola is

$$(x^2 - y^2 - 9)(1 - 9) = (x - 9)^2 \qquad (\because S_1 = T^2)$$

$$\Rightarrow \quad 9x^2 - 8y^2 - 18x + 9 = 0$$

14. The equation of chord of contact of (1, 0) to the parabola is

$$y \times 0 = 2(x + 1) - 20 \Rightarrow x = 9$$

15. The equation of two conjugate hyperbolas are

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

and $$\frac{y^2}{b^2} - \frac{x^2}{a^2} = 1$$

$$\therefore \quad e^2 = 1 + \frac{b^2}{a^2} = \frac{a^2 + b^2}{a^2}$$

and $$e_1^2 = 1 + \frac{a^2}{b^2} = \frac{a^2 + b^2}{b^2}$$

$$\therefore \quad \frac{1}{e^2} + \frac{1}{e_1^2} = \frac{a^2}{a^2 + b^2} + \frac{b^2}{a^2 + b^2} = 1$$

$$\Rightarrow \quad \frac{1}{(5/3)^2} + \frac{1}{(5/4)^2} = \frac{9}{25} + \frac{16}{25} = 1$$

and $$ee_1 = \frac{5}{3} \times \frac{5}{4} = \frac{25}{12} > 1$$

16. $\because \quad 2\tan^{-1}\left(\dfrac{b}{a}\right) = \dfrac{\pi}{2}$

$$\Rightarrow \quad \tan^{-1}\left(\frac{b}{a}\right) = \frac{\pi}{4} \Rightarrow \frac{b}{a} = 1 \text{ or } a = b$$

Then, hyperbola convert in $x^2 - y^2 = a^2$

and $$e = \sqrt{\left(1 + \frac{a^2}{a^2}\right)} = \sqrt{2}$$

17. The intersection of line $bx - ay = 0$ and the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \text{ is } \frac{x^2}{a^2} - \left(\frac{b}{a}\right)^2 \frac{x^2}{b^2} = 1$$

$$\Rightarrow \quad 0 = 1$$

Hence, no solution exist.

But statement II is false.

18. Now, $\quad 4x^2 - 3y^2 = 12$

$$\Rightarrow \quad \frac{x^2}{3} - \frac{y^2}{4} = 1$$

Then, director circle is $x^2 + y^2 = 3 - 4 = -1$ which does not exist for existence $a > b$

19. First of all we will verify statement II.

Let $P(a \sec\theta, a \tan\theta)$ be any point on $x^2 - y^2 = a^2$, then

$$SP \cdot S'P = (ea \sec\theta - a)(ea \sec\theta + a)$$

$$= e^2a^2 \sec^2\theta - a^2$$

$$= 2a^2 \sec^2\theta - a^2 \qquad (\because e = \sqrt{2})$$

and $$CP^2 = a^2 \sec^2\theta + a^2 \tan^2\theta$$

$$= a^2 \sec^2\theta + a^2 \sec^2\theta - a^2$$

$$= 2a^2 \sec^2\theta - a^2$$

$$\Rightarrow \quad SP \cdot S'P = CP^2$$

$\therefore$ Statement II is true.

If we put $a = \sqrt{2}, \theta = \dfrac{\pi}{4}$, then statement I is verified.

20. Statement I is correct.

Also, statement II is true as asymptotes are perpendicular, they are bisectors of transverse and conjugate axes of hyperbola.

But statement II does not explain Statement I, as in hyperbolas other than rectangular hyperbolas asymptotes are not bisectors of transverse and conjugate axes.

21. Let equation of hyperbola be

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

where, $2ae = 4$ and $e = 2$

$\Rightarrow \quad a = 1$

$a^2e^2 = a^2 + b^2$

$\Rightarrow \quad 4 = 1 + b^2$

$\therefore \quad b^2 = 3$

Thus, equation of hyperbola is

$$\frac{x^2}{1} - \frac{y^2}{3} = 1$$

$$\Rightarrow \quad 3x^2 - y^2 = 3$$

22. For $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$, the foci are $(\pm\sqrt{a^2 + b^2}, 0)$, here the foci are $(\pm 1, 0)$.

23. Since, $y = \alpha x + \beta$ is a tangent, then $\beta^2 = a^2\alpha^2 - b^2$. Hence, locus of P is a hyperbola $a^2x^2 - y^2 = b^2$.

17 Introduction to Three Dimensional Geometry

JEE Main MILESTONE

- Coordinate Axes and Coordinate Planes in Three Dimensional Space
- Distance between Two Points
- Section Formulae
- Area of a Triangle

17.1 Coordinate Axes and Coordinate Planes in Three Dimensional Space

Let $X'OX, Y'OY$ and $Z'OZ$ be three mutually perpendicular lines intersecting at O. O is the origin and the lines $X'OX, Y'OY$ and ZOZ' are called x-axis, y-axis and z-axis, respectively. These three lines are also called the rectangular axes of coordinates. The planes containing these three lines in pairs, determine three mutually perpendicular planes XOY, YOZ and ZOX.

In Mathematics, analytic geometry (Cartesian geometry) describes every point in three dimensional space by means of three coordinates, the position of any point in three dimensional space is given by an ordered triplet of real numbers, each number giving the distance of that point from the origin measured along the given axis, which is equal to the distance of that point from the plane determined by the other two axes.

The three planes divide space into eight cells called octants.

The following table show the signs of coordinates of points in various octants.

Octant Coordinate	Octant	x	y	z
$OXYZ$	I	+	+	+
$OX'YZ$	II	−	+	+
$OX'Y'Z$	III	−	−	+
$OXY'Z$	IV	+	−	+
$OXYZ'$	V	+	+	−
$OX'YZ'$	VI	−	+	−
$OX'Y'Z'$	VII	−	−	−
$OXY'Z'$	VIII	+	−	−

Coordinates of a Point in Space

The cartesian coordinates (x, y, z) of a point P in a space are the numbers at which the planes through P perpendicular to the axes out the axes. The coordinates of a point on x-axis are $(x, 0, 0)$, on y-axis are $(0, y, 0)$ and on z-axis are $(0, 0, z)$.

The standard equations of xy-plane, yz-plane and zx-plane are $z = 0, x = 0$ and $y = 0$, respectively.

Consider a point P in space whose position is given by triad (x,y,z) where, x, y,z are perpendicular distance from YZ-plane, ZX-plane and XY-plane respectively.

If we assume, $\hat{\mathbf{i}}, \hat{\mathbf{j}}, \hat{\mathbf{k}}$ unit vectors along OX, OY, OZ respectively, then position vector of point P is $x\hat{\mathbf{i}} + y\,\hat{\mathbf{j}} + z\hat{\mathbf{k}}$ or simply (x, y, z).

***Sample* Problem 1** *A plane is parallel to yz-plane so it is perpendicular to* [NCERT]

(a) *x-axis* (b) *y-axis*
(c) *z-axis* (d) *None of these*

Interpret (a) If any plane is parallel to yz-plane, then it is perpendicular to x-axis.

***Sample* Problem 2** *In which of the following point lies in a fourth octant?*

(1, 2, 3), (4, –2,3), (4,–2,–5) and (4, 2, – 5) [NCERT]

(a) (1, 2,3) (b) (4,–2,3) (c) (4,–2,–5) (d) (4,2,–5)

Interpret (b)

Point	Octant
(1, 2, 3)	I (all the coordinates are positive)
(4,–2,3)	IV (y-coordinate is negative)
(4,–2,–5)	VIII (y and z-coordinates are negative)
(4,2,– 5)	V (z-coordinate is negative)

17.2 Distance between Two Points

The distance between two points $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ is given by

$$PQ = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

Note

- The distance of a point $P(x, y, z)$ from the origin is $\sqrt{x^2 + y^2 + z^2}$.
- The distance of a point $P(x, y, z)$ from x-axis is $\sqrt{y^2 + z^2}$.
- The distance of a point $P(x, y, z)$ from y-axis is $\sqrt{x^2 + z^2}$.
- The distance of a point $P(x, y, z)$ from z-axis is $\sqrt{x^2 + y^2}$.
- If $P(x, y, z)$ be a point in a space, then distance from yz, zx and xy-planes are respectively x, y and z

***Sample* Problem 3** *Find the coordinates of a point on Y-axis which are at a distance of $5\sqrt{2}$ from the point P(3, – 2, 5).* [NCERT]

(a) (0,–6,0) or (0,2,0) (b) (0,6,0) or (0,–2,0)
(c) (0,–6,0) or (1,2,0) (d) *None of these*

Interpret (a) Let any point on the Y-axis is $A(0, y, 0)$.

Given, distance between P and A, $PA = 5\sqrt{2}$

$$\Rightarrow \quad \sqrt{(3-0)^2 + (-2-y)^2 + (5-0)^2} = 5\sqrt{2}$$

On squaring both sides, we get

$$(3-0)^2 + (-2-y)^2 + (5-0)^2 = 50$$

$$\Rightarrow \quad 9 + 4 + y^2 + 4y + 25 = 50$$

$$\Rightarrow \quad y^2 + 4y + 38 - 50 = 0$$

$$\Rightarrow \quad y^2 + 4y - 12 = 0$$

$$\Rightarrow \quad (y + 6)(y - 2) = 0$$

$$\Rightarrow \quad y = -6, 2$$

Hence, the points on Y-axis are $(0, -6, 0)$ or $(0, 2, 0)$.

***Sample* Problem 4** *Which of the following pairs of points have a distance $\sqrt{43}$?* [NCERT]

(a) (2,3,5) and (4,3,1) (b) (–3,7,2) and (2, 4, –1)
(c) (–1,3,–4) and (1,–3,4) (d) (2,–1,3) and (–2,1,3)

Interpret (b) (a) Let the given points are $A(2, 3, 5)$ and $B(4, 3, 1)$.

$$\therefore \quad x_1 = 2,\ y_1 = 3,\ z_1 = 5$$
$$x_2 = 4,\ y_2 = 3,\ z_2 = 1$$

$\therefore$ Required distance

$$AB = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

$$\Rightarrow \quad AB = \sqrt{(4-2)^2 + (3-3)^2 + (1-5)^2}$$

$$= \sqrt{4 + 0 + 16} = \sqrt{20} = 2\sqrt{5}$$

(b) Let the given points are $A(-3, 7, 2)$ and $B(2, 4, -1)$.

Here, $x_1 = -3,\ y_1 = 7,\ z_1 = 2$

$x_2 = 2,\ y_2 = 4,\ z_2 = -1$

$\therefore$ Required distance $AB = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$

$$= \sqrt{[2-(-3)]^2 + (4-7)^2 + (-1-2)^2}$$
$$= \sqrt{(2+3)^2 + (4-7)^2 + (-1-2)^2}$$
$$= \sqrt{25+9+9} = \sqrt{43}$$

(c) Let the given points are $A(-1, 3, -4)$ and $B(1, -3, 4)$.

$\therefore$ $x_1 = -1, y_1 = 3, z_1 = -4$
$x_2 = 1, y_2 = -3, z_2 = 4$

$\therefore$ Required distance, $AB = \sqrt{(1+1)^2 + (-3-3)^2 + (4+4)^2}$

$$= \sqrt{4+36+64} = \sqrt{104} = 2\sqrt{26}$$

(d) Let the given points are $A(2, -1, 3)$ and $B(-2, 1, 3)$.

$\therefore$ $x_1 = 2, y_1 = -1, z_1 = 3$
$x_2 = -2, y_2 = 1, z_2 = 3$

$\therefore$ Required distance

$$AB = \sqrt{(-2-2)^2 + (1+1)^2 + (3-3)^2} = \sqrt{4^2 + 2^2 + 0}$$
$$= \sqrt{16+4} = \sqrt{20} = 2\sqrt{5}$$

***Sample* Problem 5** *The equation of the set of points which are equidistant from the points* (1, 2, 3) *and* (3, 2, – 1) *is*

(a) $x - 3z = 0$ (b) $x - 2z = 0$
(c) $x - 4z = 0$ (d) $x + 2z = 0$

Interpret (b) Let the given points are A and B. Let $P(x, y, z)$ be any point equidistant from A and B.

$\therefore$ $PA = PB$,

i.e., distance between P and A = distance between P and B

$$\Rightarrow \sqrt{(x-1)^2 + (y-2)^2 + (z-3)^2} = \sqrt{(x-3)^2 + (y-2)^2 + (z+1)^2}$$
$$\Rightarrow (x-1)^2 + (y-2)^2 + (z-3)^2 = (x-3)^2 + (y-2)^2 + (z+1)^2$$
$$\Rightarrow x^2 + 1 - 2x + y^2 + 4 - 4y + z^2 + 9 - 6z$$
$$= x^2 + 9 - 6x + y^2 + 4 - 4y + z^2 + 1 + 2z$$
$$\Rightarrow 4x - 8z = 0 \Rightarrow x - 2z = 0$$

which is the required equation.

17.3 Section Formulae

(i) Section Formulae for Internal Division

Let $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ be two points. Let R be a point on the line segment joining P and Q internally in the ratio $m : n$. Then, the coordinates of R are

$$\left(\frac{mx_2 + nx_1}{m+n}, \frac{my_2 + ny_1}{m+n}, \frac{mz_2 + nz_1}{m+n}\right)$$

Note If R is the mid-point of PQ, then coordinates of R are $\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}, \frac{z_1 + z_2}{2}\right)$.

(ii) Section Formulae for External Division

If P and Q are such that R divides the join of P and Q externally in the ratio $m : n$. Then, the coordinates of R are

$$\left(\frac{mx_2 - nx_1}{m-n}, \frac{my_2 - ny_1}{m-n}, \frac{mz_2 - nz_1}{m-n}\right)$$

Note If $A(x_1, y_1, z_1)$ and $B(x_2, y_2, z_2)$ are two points, then the mid-point of AB is $\left(\frac{x_1 + y_1}{2}, \frac{x_2 + y_2}{2}, \frac{x_3 + y_3}{2}\right)$.

***Sample* Problem 6** *A point R with x-coordinate 4 lies on the line segment joining the points P*(2, – 3, 4) *and Q*(8, 0, 10). *Find the coordinates of the point R.* **[NCERT]**

(a) (4, –2, –6) (b) (4, 2, 6)
(c) (4, –2, 6) (d) *None of these*

Interpret (b) Let the point $R(x, y, z)$ divides PQ in the ratio $k : 1$.

$$\Rightarrow \frac{k \times 8 + 1 \times 2}{k+1} = 4 \quad \text{(given)}$$
$$\Rightarrow \frac{8k+2}{k+1} = 4$$
$$\Rightarrow 8k + 2 = 4k + 4$$
$$\Rightarrow 8k - 4k = 4 - 2$$
$$\Rightarrow 4k = 2 \Rightarrow k = \frac{1}{2} \Rightarrow k : 1 = 1 : 2$$

Hence, the point R divides PQ internally in the ratio 1 : 2. Therefore, y-coordinate of $R = \left(\frac{1 \times 0 + 2 \times (-3)}{1+2}\right) = \frac{-6}{3} = -2$ and z-coordinate of $R = \left(\frac{1 \times 10 + 2 \times 4}{1+2}\right) = \frac{10+8}{3} = \frac{18}{3} = 6$.

Hence, coordinate of R are (4, –2, 6).

17.4 Area of a Triangle

Let the vertices of a ΔABC be $A(x_1, y_1, z_1)$, $B(x_2, y_2, z_2)$ and $C(x_3, y_3, z_3)$.

If A_{yz}, A_{zx}, A_{xy} be the projection of an area A on the coordinate planes yz, zx and xy respectively, then

Area, $$\Delta = \sqrt{A_{yz}^2 + A_{zx}^2 + A_{xy}^2}$$

where $$A_{yz} = \frac{1}{2}\left\| \begin{matrix} y_1 & z_1 & 1 \\ y_2 & z_2 & 1 \\ y_3 & z_3 & 1 \end{matrix} \right\|,$$

$$A_{zx} = \frac{1}{2}\begin{Vmatrix} z_1 & x_1 & 1 \\ z_2 & x_2 & 1 \\ z_3 & x_3 & 1 \end{Vmatrix} \text{ and } A_{xy} = \frac{1}{2}\begin{Vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{Vmatrix}$$

Note Area of $\Delta ABC = \frac{1}{2}\begin{Vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \end{Vmatrix}$

Conditions for Collinearity

If A, B and C are collinear, then area of triangle should be zero

i.e., $\Delta = 0$

***Sample* Problem 7** *If there are three points $A(2, 3, 4)$, $B(-1, 2, -3)$ and $C(-4, 1, -10)$ in a space, then they are* **[NCERT Exemplar]**

(*a*) *collinear* (*b*) *non-collinear*
(*c*) *Do not say anything* (*d*) *None of these*

Interpret (*b*) Given, points are $A(2, 3, 4)$, $B(-1, 2, -3)$ and $C(-4, 1, -10)$.

Now, determine area of triangle.

$\therefore$ Area of triangle, $\Delta = \sqrt{\Delta_{xy}^2 + \Delta_{yz}^2 + \Delta_{zx}^2}$

where $\Delta_{xy} = \frac{1}{2}\begin{Vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{Vmatrix}$, $\Delta_{yz} = \frac{1}{2}\begin{Vmatrix} y_1 & z_1 & 1 \\ y_2 & z_2 & 1 \\ y_3 & z_3 & 1 \end{Vmatrix}$

and $\Delta_{zx} = \frac{1}{2}\begin{Vmatrix} z_1 & x_1 & 1 \\ z_2 & x_2 & 1 \\ z_3 & x_3 & 1 \end{Vmatrix}$

Now, $\Delta_{xy} = \frac{1}{2}\begin{Vmatrix} 2 & 3 & 1 \\ -1 & 2 & 1 \\ -4 & 1 & 1 \end{Vmatrix} = \frac{1}{2}|[2(2-1) - 3(-1+4)] + 1(-1+8)]|$

$= \frac{1}{2}|[2 - 9 + 7]| = 0$

$\Delta_{yz} = \frac{1}{2}\begin{Vmatrix} 3 & 4 & 1 \\ 2 & -3 & 1 \\ 1 & -10 & 1 \end{Vmatrix} = \frac{1}{2}|[3(-3+10) - 4(2-1) + 1(-20+3)]|$

$= \frac{1}{2}|21 - 4 - 17| = 0$

$\Delta_{zx} = \frac{1}{2}\begin{Vmatrix} 4 & 2 & 1 \\ -3 & -1 & 1 \\ -10 & -4 & 1 \end{Vmatrix}$

$= \frac{1}{2}|[4(-1+4) - 2(-3+10) + 1(12-10)]|$

$= \frac{1}{2}|[12 - 14 + 2]| = 0$

$\therefore \quad \Delta = \sqrt{0^2 + 0^2 + 0^2} = 0$

Hence, given points are collinear.

Circles associated with a Triangle

(i) Centroid of a triangle

The centroid of a triangle is the point of intersection of its medians. The centroid divides the median in the ratio 2 : 1. If $A(x_1, y_1, z_1)$, $B(x_2, y_2, z_2)$ and $C(x_3, y_3, z_3)$ are the vertices of a triangle, then the centroid of a triangle is

$$G = \left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3}, \frac{z_1 + z_2 + z_3}{3}\right)$$

(ii) Circumcentre of a Triangle

The circumcentre of a triangle is the point of intersection of the perpendicular bisectors of the sides of a triangle. It is the centre of circle which passes through the vertices of the triangle and so its distance from the vertices of the triangle is the same and this distance is known as the circumradius of the triangle.

If $A(x_1, y_1, z_1)$, $B(x_2, y_2, z_2)$ and $C(x_3, y_3, z_3)$ are the vertices of a triangle, then the circumcentre of ΔABC is

$$\left(\frac{x_1 \sin 2A + x_2 \sin 2B + x_3 \sin 2C}{\sin 2A + \sin 2B + \sin 2C}, \frac{y_1 \sin 2A + y_2 \sin 2B + y_3 \sin 2C}{\sin 2A + \sin 2B + \sin 2C}, \frac{z_1 \sin 2A + z_2 \sin 2B + z_3 \sin 2C}{\sin 2A + \sin 2B + \sin 2C}\right)$$

(iii) Incentre of a Triangle

The incentre of a triangle is the point of intersection of internal bisector of the angles. Also, it is a centre of a circle touching all the sides of a triangle.

$\therefore$ Coordinates of incentre

$$\left(\frac{ax_1 + bx_2 + cx_3}{a+b+c}, \frac{ay_1 + by_2 + cy_3}{a+b+c}, \frac{az_1 + bz_2 + cz_3}{a+b+c}\right)$$

where a, b and c are the sides of a ΔABC.

(iv) Orthocentre of a triangle

It is the point of intersection of perpendiculars drawn from vertices on opposite sides (called altitudes) of a triangle and can be obtained by solving the equation of any two altitudes.

Here, O is the orthocentre, since $AE \perp BC, BF \perp AC, CD \perp AB$, then $OE \perp BC, OF \perp AC$ and $OD \perp AB$.

Solving any two we can get coordinate of O.

The orthocentre of ΔABC is

$$\left(\frac{x_1 \tan A + x_2 \tan B + x_3 \tan C}{\tan A + \tan B + \tan C}, \frac{y_1 \tan A + y_2 \tan B + y_3 \tan C}{\tan A + \tan B + \tan C}, \frac{z_1 \tan A + z_2 \tan B + z_3 \tan C}{\tan A + \tan B + \tan C}\right)$$

If a triangle is right angled triangle, then orthocentre is the point where right angle is formed.

(v) Excircle of a triangle

A circle touches one side outside the triangle and other two extended sides, then circle is known as excircle. Let ABC be a triangle, then there are three excircles with three excentres. Let I_1, I_2, I_3 be the centres of excircles opposite to vertices A, B and C, respectively. If vertices of triangle are $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$, then

$$I_1 \equiv \left(\frac{-ax_1 + bx_2 + cx_3}{-a+b+c}, \frac{-ay_1 + by_2 + cy_3}{-a+b+c}, \frac{-az_1 + bz_2 + cz_3}{-a+b+c}\right)$$

$$I_2 \equiv \left(\frac{ax_1 - bx_2 + cx_3}{a-b+c}, \frac{ay_1 - by_2 + cy_3}{a-b+c}, \frac{az_1 - bz_2 + cz_3}{a-b+c}\right)$$

$$I_3 \equiv \left(\frac{ax_1 + bx_2 - cx_3}{a+b-c}, \frac{ay_1 + by_2 - cy_3}{a+b-c}, \frac{az_1 + bz_2 - cz_3}{a+b-c}\right)$$

Note Centroid G, Incentre I, Excentres I_1, I_2 and I_3, Orthocentre O, Circumcentre S are given by $\left(\frac{m_1x_1 + m_2x_2 + m_3x_3}{m_1 + m_2 + m_3}, \frac{m_1y_1 + m_2y_2 + m_3y_3}{m_1 + m_2 + m_3}, \frac{m_1z_1 + m_2z_2 + m_3z_3}{m_1 + m_2 + m_3}\right)$.

where $A(x_1, y_1, z_1)$, $B(x_2, y_2, z_2)$ and $C(x_3, y_3, z_3)$ are the vertices of ΔABC.

	m_1	m_2	m_3
G	1	1	1
I	$\sin A$	$\sin B$	$\sin C$
I_1	$-\sin A$	$\sin B$	$\sin C$
I_2	$\sin A$	$-\sin B$	$\sin C$
I_3	$\sin A$	$\sin B$	$-\sin C$
O	$\tan A$	$\tan B$	$\tan C$
S	$\sin 2A$	$\sin 2B$	$\sin 2C$

***Sample* Problem 8** *Find the orthocentre of the triangle formed by the points $A(0, 7, 10)$, $B(-1, 6, 6)$ and $C(-4, 9, 6)$.*

(a) $(1, -6, -6)$ (b) $(-1, 6, 6)$ (c) $(1, -6, 6)$ (d) $(1, 6, 6)$

Interpret (b) Now,

$$AB = \sqrt{(-1-0)^2 + (6-7)^2 + (6-10)^2} = \sqrt{18} = 3\sqrt{2}$$

$$BC = \sqrt{(-4+1)^2 + (9-6)^2 + (6-6)^2} = \sqrt{18} = 3\sqrt{2}$$

$$AC = \sqrt{(-4-0)^2 + (9-7)^2 + (6-10)^2} = \sqrt{36} = 6$$

$$\therefore \quad AB^2 + BC^2 = 18 + 18 = 36 = AC^2$$

Hence, ΔABC is a right-angled triangle. So, orthocentre of a ΔABC is $(-1, 6, 6)$.

***Sample* Problem 9** *If the vertices of a triangle are $A(1, -1, -5)$, $B(3, 1, 3)$ and $C(9, 1, -3)$, then the circumcentre of a ΔABC is*

(a) $\left(\frac{13}{3}, \frac{1}{3}, \frac{5}{3}\right)$ (b) $\left(\frac{13}{3}, \frac{1}{3}, -\frac{5}{3}\right)$

(c) $\left(-\frac{13}{3}, \frac{1}{3}, -\frac{5}{3}\right)$ (d) *None of these*

Interpret (b) Now, $AB = \sqrt{(3-1)^2 + (1+1)^2 + (3+5)^2}$

$$= \sqrt{4 + 4 + 64} = \sqrt{72}$$

$$BC = \sqrt{(9-3)^2 - (1-1)^2 + (-3-3)^2} = \sqrt{36 + 0 + 36} = \sqrt{72}$$

and $CA = \sqrt{(9-1)^2 + (1+1)^2 + (-3+5)^2} = \sqrt{64 + 4 + 4} = \sqrt{72}$

$\therefore \quad AB = BC = CA = \sqrt{72}$

Hence, ΔABC is an equilateral triangle. Since, in an equilateral triangle, circumcentre and centroid coincide it.

$\therefore$ Circumcentre of ΔABC = Centroid of ΔABC

$$= \left(\frac{1+3+9}{3}, \frac{-1+1+1}{3}, \frac{-5+3-3}{3}\right) = \left(\frac{13}{3}, \frac{1}{3}, -\frac{5}{3}\right)$$

WORKED OUT
Examples

Example 1 *If the origin is the centroid of ΔPQR with vertices $P(2a, 2, 6)$, $Q(-4, 3b, -10)$ and $R(8, 14, 2c)$, then find the values of a, b* and *c are respectively.* [**NCERT**]

(a) $-2, -\frac{16}{3}, 3$ (b) $2, \frac{16}{3}, -2$

(c) $-2, -\frac{16}{3}, 2$ (d) *None of these*

Solution (c) Centroid of the ΔPQR is

$$\left(\frac{x_1+x_2+x_3}{3}, \frac{y_1+y_2+y_3}{3}, \frac{z_1+z_2+z_3}{3}\right)$$

i.e., $$\left(\frac{2a-4+8}{3}, \frac{2+3b+14}{3}, \frac{6-10+2c}{3}\right)$$

Origin is the centroid *i.e.*, the coordinates of the centroid are (0, 0, 0), then

$$\frac{2a-4+8}{3}=0$$

$\Rightarrow$ $2a+4=0 \Rightarrow a=-2$

Also, $\frac{2+3b+14}{3}=0$

$\Rightarrow$ $3b+16=0$

$\Rightarrow$ $b=-\frac{16}{3}$

and $\frac{6-10+2c}{3}=0$

$\Rightarrow$ $2c-4=0 \Rightarrow c=2$

$\therefore$ $a=-2, b=\frac{-16}{3}, c=2$

Example 2 *Three vertices of a parallelogram ABCD are $A(3, -1, 2)$, $B(1, 2, -4)$ and $C(-1, 1, 2)$. Find the coordinates of the fourth vertex.* [**NCERT**]

(a) $(-1, -2, 8)$ (b) $(1, -2, 8)$ (c) $(1, -2, -8)$ (d) $(1, 2, 8)$

Solution (b) Let *ABCD* be a parallelogram and coordinates of point $D(\alpha, \beta, \gamma)$ and the diagonals *AC* and *BD* intersect at *P*.

In a parallelogram diagonals bisect each other.

$\therefore$ Coordinates of mid-point of *BD*

= Coordinates of mid-point of *AC*

$$\Rightarrow \left(\frac{\alpha+1}{2}, \frac{\beta+2}{2}, \frac{\gamma-4}{2}\right)=\left(\frac{3-1}{2}, \frac{-1+1}{2}, \frac{2+2}{2}\right)$$

$$\Rightarrow \left(\frac{\alpha+1}{2}, \frac{\beta+2}{2}, \frac{\gamma-4}{2}\right)=\left(\frac{2}{2}, 0, \frac{4}{2}\right)$$

$$\Rightarrow \left(\frac{\alpha+1}{2}, \frac{\beta+2}{2}, \frac{\gamma-4}{2}\right)=(1, 0, 2)$$

On comparing the corresponding coordinates, we get

$\frac{\alpha+1}{2}=1, \frac{\beta+2}{2}=0, \frac{\gamma-4}{2}=2$

$\Rightarrow$ $\alpha+1=2, \beta+2=0, \gamma-4=4$

$\Rightarrow$ $\alpha=1, \beta=-2, \gamma=8$

$\therefore$ Coordinates of point *D* are (1, –2, 8).

Example 3 *The area of triangle whose vertices are* (1, 2, 3), (2, 5, –1) *and* (–1, 1, 2) *is*

(a) 150 *sq units* (b) 145 *sq units*

(c) $\frac{\sqrt{155}}{2}$ *sq units* (d) $\frac{155}{2}$ *sq units*

Solution (c) Let $(1, 2, 3)=(x_1, y_1, z_1)$, $(2, , 5 -1)=(x_2, y_2, z_2)$ and $(-1, 1, 2)=(x_3, y_3, z_3)$

Now, $$\Delta_{xy}=\frac{1}{2}\left\|\begin{matrix}1 & 2 & 1\\ 2 & 5 & 1\\ -1 & 1 & 1\end{matrix}\right\|=\frac{1}{2}|[1(5-1)-2(2+1)+1(2+5)]|$$

$$=\frac{1}{2}|[4-6+7]|=\frac{5}{2}$$

$$\Delta_{yz}=\frac{1}{2}\left\|\begin{matrix}2 & 3 & 1\\ 5 & -1 & 1\\ 1 & 2 & 1\end{matrix}\right\|=\frac{1}{2}|[2(-1-2)-3(5-1)+1(10+1)]|$$

$$=\frac{1}{2}|[-6-12+11]|=\frac{7}{2}$$

$$\Delta_{zx}=\frac{1}{2}\left\|\begin{matrix}3 & 1 & 1\\ -1 & 2 & 1\\ 2 & -1 & 1\end{matrix}\right\|=\frac{1}{2}|[3(2+1)-1(-1-2)+1(1-4)]|$$

$$=\frac{1}{2}|[9+3-3]|=\frac{9}{2}$$

$$\therefore \text{Area of } \Delta=\sqrt{\Delta_{xy}^2+\Delta_{yz}^2+\Delta_{zx}^2}=\sqrt{\left(\frac{5}{2}\right)^2+\left(\frac{7}{2}\right)^2+\left(\frac{9}{2}\right)^2}$$

$$=\sqrt{\frac{25}{4}+\frac{49}{4}+\frac{81}{4}}=\frac{\sqrt{155}}{2} \text{ sq units}$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Cartesian Coordinates in Three Dimensions

1. A plane is parallel xy-plane, so it is perpendicular to
(a) z-axis (b) y-axis
(c) x-axis (d) None of these

2. The locus of a point for which $y = 0$, $z = 0$ is
(a) equation of x-axis (b) equation of y-axis
(c) equation of z-axis (d) None of these

3. The point $(-2, -3, -4)$ lies in the [NCERT]
(a) first octant (b) seventh octant
(c) second octant (d) eight octant

4. L is the foot of the perpendicular drawn from a point $P(3, 4, 5)$ on the xy-plane. The coordinates of point L are [NCERT Exemplar]
(a) (3, 0, 0) (b) (0, 4, 5)
(c) (3, 0, 5) (d) None of these

Distance between Two Points and Section Formulae

5. The distance of point $P(3, 4, 5)$ from the yz-plane is [NCERT Exemplar]
(a) 3 units (b) 4 units (c) 5 units (d) 550 units

6. What is the length of foot of perpendicular drawn from the point $P(3, 4, 5)$ on y-axis? [NCERT Exemplar]
(a) $\sqrt{41}$ (b) $\sqrt{34}$
(c) 5 (d) None of these

7. If the distance between the points $(a, 0, 1)$ and $(0, 1, 2)$ is $\sqrt{27}$, then the value of a is [NCERT Exemplar]
(a) 5 (b) ± 5
(c) -5 (d) None of these

8. If x-coordinate of a point P of line joining the points $Q(2, 2, 1)$ and $R(5, 2, -2)$ is 4, then the z-coordinate of P is
(a) -2 (b) -1 (c) 1 (d) 2

9. If A and B be the points $(3, 4, 5)$ and $(-1, 3, -7)$ respectively, find the equation of the set of points P such that $(PA)^2 + (PB)^2 = K^2$, where K is a constant. [NCERT]
(a) $2(x^2 + y^2 + z^2) + 4x + 14y + 4z + 109 - k^2 = 0$
(b) $2(x^2 + y^2 + z^2) - 4x - 14y + 4z + 109 - k^2 = 0$
(c) $x^2 + y^2 + z^2 + 4x + 14y + 4z + 109 - k^2 = 0$
(d) None of the above

10. Distance of the point (1, 2, 3) from the coordinate axes are
(a) 13, 10, 5 (b) $\sqrt{13}, \sqrt{10}, \sqrt{5}$
(c) $\sqrt{5}, \sqrt{13}, \sqrt{10}$ (d) $\frac{1}{\sqrt{13}}, \frac{1}{\sqrt{10}}, \frac{1}{\sqrt{5}}$

11. If the sum of the squares of the distance of a point from the three coordinate axes be 36, then its distance from the origin is
(a) 6 (b) $3\sqrt{2}$
(c) $2\sqrt{3}$ (d) None of these

12. The coordinates of a point which is equidistant from the points $(0, 0, 0)$, $(a, 0, 0)$, $(0, b, 0)$, $(0, 0, c)$ are given by
(a) $\left(\frac{a}{2}, \frac{b}{2}, \frac{c}{2}\right)$ (b) $\left(-\frac{a}{2}, -\frac{b}{2}, \frac{c}{2}\right)$
(c) $\left(\frac{a}{2}, -\frac{b}{2}, -\frac{c}{2}\right)$ (d) $\left(-\frac{a}{2}, \frac{b}{2}, -\frac{c}{2}\right)$

13. If $x^2 + y^2 = 1$, then the distance from the point $(x, y, \sqrt{1 - x^2 - y^2})$ to the origin is [NCERT Exemplar]
(a) 1 (b) -1 (c) 0 (d) 2

14. Three vertices of a parallelogram $ABCD$ are $A(1, 2, 3)$, $B(-1, -2, -1)$ and $C(2, 3, 2)$. Find the fourth vertex D. [NCERT Exemplar]
(a) $(-4, -7, -6)$ (b) (4, 7, 6)
(c) $(4, 7, -6)$ (d) None of these

15. If a parallelopiped is formed by planes drawn through the points (5, 8, 10) and (3, 6, 8) parallel to the coordinate planes, then the length of diagonal of the parallelopiped is [NCERT Exemplar]
(a) $2\sqrt{3}$ (b) $3\sqrt{2}$ (c) $\sqrt{2}$ (d) $\sqrt{3}$

16. Find the coordinates of the point which divides the line segment joining the points (– 2, 3, 5) and (1, – 4, 6) in the ratio 2 : 3 externally. [NCERT]
(a) (– 8, – 17, 3) (b) (– 8, 17, 3)
(c) (8, – 17, 3) (d) None of these

17. Find the ratio in which the YZ-plane divides the line segment formed by joining the points (– 2, 4, 7) and (3, – 5, 8). [NCERT]
(a) externally 2 : 3 (b) internally 2 : 3
(c) internally 3 : 2 (d) externally 3 : 2

18. Find the length of the medians of the triangle with vertices $A(0, 0, 6)$, $B(0, 4, 0)$ and $C(6, 0, 0)$. [NCERT]
(a) $7, 7, \sqrt{34}$ (b) $7, 8, \sqrt{34}$
(c) $7, 9, \sqrt{34}$ (d) None of these

19. Find the coordinates of the points which trisect the line segment joining the points $P(4, 2, -6)$ and $Q(10, -16, 6)$. [NCERT]
(a) (6, – 4, – 2), (8, – 10, 2) (b) (6, 4, – 2), (8, – 10, 2)
(c) (6, – 4, – 2), (8, 10, 2) (d) None of these

20. Find the centroid of a triangle, the mid-point of whose sides are $D(1, 2, -3)$, $E(3, 0, 1)$ and $F(-1, 1, -4)$. [NCERT Exemplar]
(a) (1, 1, 2) (b) (1, 1, – 2)
(c) (– 1, –1, –2) (d) (1, –1, –2)

21 The points $A(5, -1, 1)$, $B(7, -4, 7)$, $C(1, -6, 10)$ and $D(-1, -3, 4)$ are vertices of a
(a) square (b) rhombus
(c) rectangle (d) None of these

22. The points (5, – 4, 2),(4,– 3, 1), (7, – 6, 4) and (8, – 7, 5) are the vertices of
(a) a rectangle (b) a square
(c) a parallelogram (d) None of these

23. If the coordinates of the vertices of a ΔABC are $A(-1, 3, 2)$, $B(2, 3, 5)$ and $C(3, 5, -2)$, then $\angle A$ is equal to
(a) 45° (b) 60°
(c) 90° (d) 30°

24. The mid-points of the sides of a triangle are (5, 7, 11), (0, 8, 5) and (2, 3, – 1). Then, the vertices are [NCERT Exemplar]
(a) (7, 2, 5), (3, 12, 17), (– 3, 4, – 7)
(b) (7, 2, 5), (3, 12, 17), (3, 4, 7)
(c) (7, 2, 5), (– 3, 12, 17), (– 3, – 4, – 7)
(d) None of the above

Area of Triangle and Volume of Tetrahedran

25. The area of the triangle, whose vertices are at the points (2, 1, 1), (3, 1, 2) and (– 4, 0, 1) is
(a) $\sqrt{19}$ (b) $\frac{1}{2}\sqrt{19}$
(c) $\frac{1}{2}\sqrt{38}$ (d) $\frac{1}{2}\sqrt{57}$

26. If vertices of a triangle are $A(1, -1, 2)$, $B(2, 0, -1)$ and $C(0, 2, 1)$, then the area of a triangle is
(a) $\sqrt{6}$ (b) $2\sqrt{6}$
(c) $3\sqrt{6}$ (d) $4\sqrt{6}$

27. The triangle formed by the points
(0, 7, 10), (– 1, 6, 6), (– 4, 9, 6) is
(a) equilateral (b) isosceles
(c) right angled (d) right angled isosceles

28. The points (5, 2, 4), (6, – 1, 2) and (8, – 7, k) are collinear, if k is equal to
(a) – 2 (b) 2
(c) 3 (d) – 1

29. The point $A(1, -1, 3)$, $B(2, -4, 5)$ and $C(5, -13, 11)$ are [NCERT Exemplar]
(a) collinear (b) non-collinear
(c) Do not say anything (d) None of these

Circles associated with a Triangle

30. If orthocentre and circumcentre of a triangle are respectively (1, 1, 1) and (3, 2, 2), then the coordinates of its centroid is
(a) $\left(-\frac{7}{3}, \frac{5}{3}, \frac{5}{3}\right)$ (b) $\left(\frac{7}{3}, \frac{5}{3}, \frac{5}{3}\right)$
(c) $\left(\frac{5}{3}, \frac{7}{3}, \frac{5}{3}\right)$ (d) None of these

31. The incentre of triangle with vertices $A(1, 1, 2)$, $B(2, 1, 3)$ and $C(1, -1, 3)$ is
(a) $\left(\frac{3\sqrt{5}+\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}, \frac{3\sqrt{5}-\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}, \frac{5\sqrt{5}+3\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}\right)$
(b) $\left(\frac{1-2\sqrt{5}+\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}, \frac{1+\sqrt{5}+\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}, \frac{2+3\sqrt{5}+3\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}\right)$
(c) $\left(\frac{1+2\sqrt{5}+\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}, \frac{1-\sqrt{5}-\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}, \frac{2+3\sqrt{5}+3\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}\right)$
(d) None of the above

32. If the vertices of a triangle are $A(0, 4, 1)$, $B(2, 3, -1)$ and $C(4, 5, 0)$, then orthocentre of a ΔABC is
(a) (4, 5, 0) (b) (2, 3, – 1)
(c) (– 2, 3, – 1) (d) None of the above

the **Guidance**

1. If a plane is parallel to xy-plane, then it is perpendicular to z- axis.

2. Since, in a x-axis, the coordinates of y and z are zero.

3. In a given point $(-2, -3, -4)$ all coordinates are negative. Hence, it lies in seventh octant.

4. Since, in a xy-plane, the z-coordinate will be zero. Hence, the coordinate of the foot of the point $L(3, 4, 0)$.

5. When we draw a perpendicular line from $P(3, 4, 5)$ on the yz-plane, the x-coordinate will be zero and the other coordinate y and z will be 4 and 5, *i.e.*, coordinate on yz-plane be $Q(0, 4, 5)$.

$\therefore$ Distance between P and $Q = PQ$

$$= \sqrt{(3-0)^2 + (4-4)^2 + (5-5)^2}$$

$$= \sqrt{3^2 + 0^2 + 0^2} = 3 \text{ units}$$

6. When we drawn perpendicular from the point $P(3, 4, 5)$ on y-axis, the x and z-coordinates will be zero and y-coordinate will be 4. *i.e.*, coordinate on y-axis $Q(0, 4, 0)$.

$\therefore$ Distance between P and $Q = PQ$

$$= \sqrt{(3-0)^2 + (4-4)^2 + (5-0)^2}$$

$$= \sqrt{3^2 + 0^2 + 5^2} = \sqrt{9+25} = \sqrt{34} \text{ units}$$

7. Given, distance between points $(a, 0, 1)$ and $(0, 1, 2)$ is $\sqrt{27}$.

$\therefore \sqrt{(a-0)^2 + (0-1)^2 + (1-2)^2} = \sqrt{27}$

$\Rightarrow \quad \sqrt{a^2 + 1^2 + 1^2} = \sqrt{27}$

$\Rightarrow \quad a^2 + 2 = 27$ ($\because$ squaring both sides)

$\Rightarrow \quad a^2 = 25 \Rightarrow a = \pm 5$

8. Suppose P divides QR in the ratio $\lambda : 1$. Then, coordinate of P are $\left(\frac{5\lambda+2}{\lambda+1}, \frac{2\lambda+2}{\lambda+1}, \frac{-2\lambda+1}{\lambda+1}\right)$.

Since, the x-coordinate of P is 4.

i.e., $\quad \frac{5\lambda+2}{\lambda+1} = 4$

$\Rightarrow \quad \lambda = 2$

So, z-coordinate of P is $\frac{-2\lambda+1}{\lambda+1} = \frac{-4+1}{2+1} = -1$

9. Let the point P is (x, y, z).

Given, $\quad (PA)^2 + (PB)^2 = K^2$

$\Rightarrow \quad (x-3)^2 + (y-4)^2 + (z-5)^2 + (x+1)^2 + (y-3)^2 + (z+7)^2 = K^2$

$\Rightarrow \quad x^2 + 9 - 6x + y^2 + 16 - 8y + z^2 + 25 - 10z + x^2 + 1 + 2x + y^2 + 9 - 6y + z^2 + 49 + 14z = K^2$

$\Rightarrow \quad 2x^2 + 2y^2 + 2z^2 - 4x - 14y + 4z + 109 - K^2 = 0$

$\Rightarrow \quad 2(x^2 + y^2 + z^2) - 4x - 14y + 4z + 109 - K^2 = 0$

which is the required equation.

10. Let point be $P(x, y, z) = (1, 2, 3)$

$\therefore$ The distance from x-axis $= \sqrt{y^2 + z^2}$

$$= \sqrt{4+9} = \sqrt{13}$$

The distance from y-axis $= \sqrt{x^2 + z^2} = \sqrt{1^2 + 3^2}$

$$= \sqrt{1+9} = \sqrt{10}$$

The distance from z-axis $= \sqrt{x^2 + y^2} = \sqrt{1^2 + 2^2}$

$$= \sqrt{1+4} = \sqrt{5}$$

11. Let $P(x, y, z)$ be any point in the plane.

According to the given condition,

(distance from P to x-axis)^2 + (distance from P to y-axis)^2 + (distance from P to z-axis)$^2 = 36$

$\Rightarrow \quad (\sqrt{y^2 + z^2})^2 + (\sqrt{x^2 + z^2})^2 + (\sqrt{x^2 + y^2})^2 = 36$

$\Rightarrow \quad (y^2 + z^2) + (x^2 + z^2) + (x^2 + y^2) = 36$

$\Rightarrow \quad 2(x^2 + y^2 + z^2) = 36$

$\Rightarrow \quad x^2 + y^2 + z^2 = 18 \qquad \ldots(i)$

$\therefore$ The distance from origin to the point (x, y, z) is

$$= \sqrt{x^2 + y^2 + z^2} = \sqrt{18} \qquad [\because \text{from Eq. (i)}]$$

$$= 3\sqrt{2}$$

12. Let P be any point in a space.

According to the given condition,

$$\sqrt{(x-0)^2+(y-0)^2+(z-0)^2}=\sqrt{(x-a)^2+y^2+z^2}$$
$$=\sqrt{x^2+(y-b)^2+z^2}=\sqrt{x^2+y^2+(z-c)^2}$$

On squaring both sides, we get

$$x^2+y^2+z^2=(x-a)^2+y^2+z^2=x^2+(y-b)^2+z^2$$
$$=x^2+y^2+(z-c)^2$$
$$\Rightarrow \quad x^2+y^2+z^2=x^2+a^2-2ax+y^2+z^2$$
$$\Rightarrow \quad a^2-2ax=0 \Rightarrow x=\frac{a}{2}$$

Similarly, we can solve the other values, we get

$$y=\frac{b}{2}, z=\frac{c}{2}$$

13. $\therefore$ Distance from point $(x, y, \sqrt{1-x^2-y^2})$ to the origin.

$$=\sqrt{(x-0)^2+(y-0)^2+\sqrt{(1-x^2-y^2-0)^2}}$$
$$=\sqrt{x^2+y^2+1-x^2-y^2}$$
$$=\sqrt{1+1-(1)} \qquad (\because x^2+y^2=1 \text{ given})$$
$$=\sqrt{1}=1$$

14. Let the fourth vertex be (x, y, z).

We know that diagonals of a parallelogram are bisecting to each other.

i.e., mid-point of a diagonals are coinciding.

$\therefore$ Mid-point of diagonal AC = Mid-point of diagonal BD

$$\therefore \left(\frac{1+2}{2}, \frac{2+3}{2}, \frac{3+2}{2}\right)=\left(\frac{-1+x}{2}, \frac{-2+y}{2}, \frac{-1+z}{2}\right)$$
$$\Rightarrow \quad \left(\frac{3}{2}, \frac{5}{2}, \frac{5}{2}\right)=\left(\frac{-1+x}{2}, \frac{-2+y}{2}, \frac{-1+z}{2}\right)$$
$$\Rightarrow \quad \frac{3}{2}=\frac{-1+x}{2}, \frac{5}{2}=\frac{-2+y}{2}, \frac{5}{2}=\frac{-1+z}{2}$$
$$\Rightarrow \quad x=4, y=7, z=6$$

Hence, required point is (4, 7, 6).

15. The edge of a parallelopiped $=(3-5, 6-8, 8-10)$

$$=(-2, -2, -2)$$

$\therefore$ Length of diagonal $=\sqrt{(-2)^2+(-2)^2+(-2)^2}$

$$=\sqrt{4+4+4}=2\sqrt{3}$$

16. Let the point C divides the line externally in the ratio $2:3$.

Here, the ratio is $2:3$.

$\therefore \quad m=2, n=3$

The coordinates of point C

$$=\left[\left(\frac{mx_2-nx_1}{m-n}\right), \left(\frac{my_2-ny_1}{m-n}\right), \left(\frac{mz_2-nz_1}{m-n}\right)\right]$$
$$\Rightarrow \quad C=\left[\frac{2\times(1)-3\times(-2)}{(2-3)}, \frac{2\times(-4)-3\times 3}{(2-3)}, \frac{2\times 6-3\times 5}{(2-3)}\right]$$
$$=\left[\frac{2+6}{(-1)}, \frac{-8-9}{(-1)}, \frac{12-15}{(-1)}\right]$$
$$=(-8, 17, 3)$$

17. The given points are $A(-2, 4, 7)$ and $B(3, -5, 8)$.

Let the point $P(0, y, z)$ in YZ-plane divides AB in the ratio $k:1$, then

$$X\text{-coordinate of point } P=\frac{mx_2+nx_1}{m+n}$$
$$\frac{k\times 3+1\times(-2)}{k+1}=0 \ (\because x\text{-coordinate of } P \text{ is zero})$$
$$\Rightarrow \quad 3k-2=0$$
$$\Rightarrow \quad k=\frac{2}{3}$$
$$\Rightarrow \quad k:1=2:3$$

$\therefore YZ$-plane divides the segment internally in the ratio 2 : 3.

18. ABC is a triangle with vertices $A(0, 0, 6)$, $B(0, 4, 0)$ and $C(6, 0, 0)$.

Let points D, E and F are the mid-points of BC, AC and AB, respectively. So, AD, BE and CF will be the medians of the triangle.

$\Rightarrow$ Coordinates of point D

$$=\left(\frac{0+6}{2}, \frac{4+0}{2}, \frac{0+0}{2}\right)=(3, 2, 0)$$

Coordinates of point $E=\left(\frac{0+6}{2}, \frac{0+0}{2}, \frac{6+0}{2}\right)=(3, 0, 3)$

and

coordinates of point $F=\left(\frac{0+0}{2}, \frac{0+4}{2}, \frac{6+0}{2}\right)=(0, 2, 3)$

Now, length of median AD = Distance between A and D

$$AD=\sqrt{(0-3)^2+(0-2)^2+(6-0)^2}$$
$$=\sqrt{9+4+36}=\sqrt{49}=7$$

Similarly, $BE=\sqrt{(0-3)^2+(4-0)^2+(0-3)^2}$

$$=\sqrt{9+16+9}=\sqrt{34}$$

and $\quad CF=\sqrt{(6-0)^2+(0-2)^2+(0-3)^2}$

$$=\sqrt{36+4+9}=\sqrt{49}=7$$

19. Let the point R_1 trisects the line PQ *i.e.,* it divides the line in the ratio 1 : 2.

$$\Rightarrow R_1 = \left[\frac{1\times 10 + 2\times 4}{1+2}, \frac{1\times(-16)+2\times 2}{1+2}, \frac{1\times 6 + 2\times(-6)}{1+2}\right]$$

$$= \left(\frac{10+8}{3}, \frac{-16+4}{3}, \frac{6-12}{3}\right) = \left(\frac{18}{3}, \frac{-12}{3}, \frac{-6}{3}\right)$$

$$= (6, -4, -2)$$

Again, let the point R_2 divides PQ internally in the ratio 2 : 1. Then,

$$\Rightarrow R_2 = \left[\frac{2\times 10 + 1\times 4}{2+1}, \frac{2\times(-16)+1\times 2}{2+1}, \frac{2\times 6 + 1\times(-6)}{1+2}\right]$$

$$= \left(\frac{20+4}{3}, \frac{-32+2}{3}, \frac{12-6}{3}\right) = \left(\frac{24}{3}, \frac{-30}{3}, \frac{6}{3}\right)$$

$$= (8, -10, 2)$$

Hence, required points are $(6, -4, -2)$ and $(8, -10, 2)$.

20. Given, mid-point of sides of a triangle are $D(1, 2, -3)$, $E(3, 0, 1)$ and $F(-1, 1, -4)$.

$$\therefore \text{Centroid of triangle} = \left(\frac{1+3-1}{3}, \frac{2+0+1}{3}, \frac{-3+1-4}{3}\right)$$

$$= \left(\frac{3}{3}, \frac{3}{3}, \frac{-6}{3}\right) = (1, 1, -2)$$

21. Given that, $A(5, -1, 1)$, $B(7, -4, 7)$, $C(1, -6, 10)$ and $D(-1, -3, 4)$.

Now, $AB = \sqrt{(7-5)^2 + (-4+1)^2 + (7-1)^2}$

$= \sqrt{4+9+36} = 7$

$BC = \sqrt{(1-7)^2 + (-6+4)^2 + (10-7)^2}$

$= \sqrt{36+4+9} = 7$

$CD = \sqrt{(-1-1)^2 + (-3+6)^2 + (4-10)^2}$

$= \sqrt{4+9+36} = 7$

$DA = \sqrt{(5+1)^2 + (-1+3)^2 + (1-4)^2}$

$= \sqrt{36+4+9} = 7$

$\therefore \quad AB = BC = CD = DA = 7,$

Also, $AC = \sqrt{(1-5)^2 + (-6+1)^2 + (10-1)^2}$

$= \sqrt{16+25+81} = \sqrt{122}$

$BD = \sqrt{(-1-7)^2 + (-4+3)^2 + (7-4)^2}$

$= \sqrt{64+1+9} = \sqrt{74}$

$\therefore$ Diagonal $AC \neq BD$

Hence, $ABCD$ is not a square, so it is a rhombus.

22. Let $A(5, -4, 2)$, $B(4, -3, 1)$, $C(7, -6, 4)$ and $D(8, -7, 5)$.

Then, $AB = \sqrt{(4-5)^2 + (-3+4)^2 + (1-2)^2}$

$= \sqrt{1+1+1} = \sqrt{3}$

$BC = \sqrt{(7-4)^2 + (-6+3)^2 + (4-1)^2}$

$= \sqrt{9+9+9} = 3\sqrt{3}$

$CD = \sqrt{(8-7)^2 + (-7+6)^2 + (5-4)^2}$

$= \sqrt{1+1+1} = \sqrt{3}$

$AD = \sqrt{(8-5)^2 + (-7+4)^2 + (5-2)^2}$

$= \sqrt{9+9+9} = 3\sqrt{3}$

$AC = \sqrt{(7-5)^2 + (-6+4)^2 + (4-2)^2}$

$= \sqrt{4+4+4} = 2\sqrt{3}$

$BD = \sqrt{(8-4)^2 + (-7+3)^2 + (5-1)^2}$

$= \sqrt{16+16+16} = 4\sqrt{3}$

Here, we see that opposite sides $AB = CD$, $BC = AD$ are equal and diagonals $AC \neq BD$.

Hence, given points are the vertices of a parallelogram.

23. $\because$ Vertices of ΔABC are $A(-1, 3, 2)$, $B(2, 3, 5)$ and $C(3, 5, -2)$.

$\Rightarrow \quad AB = \sqrt{9+0+9} = \sqrt{18}$

$CA = \sqrt{16+4+16} = 6$

and $\quad BC = \sqrt{1+4+49} = \sqrt{54}$

$\because \quad AB^2 + CA^2 = BC^2$

ΔABC is right angled triangle at A.

$\therefore \quad \angle A = 90°$

24. Let the vertices of a triangle are $A(x_1, y_1, z_1)$, $B(x_2, y_2, z_2)$ and $C(x_3, y_3, z_3)$.

Since, D, E and F are the mid-points of AC, BC and AB.

$$\therefore \quad \left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}, \frac{z_1+z_2}{2}\right) = (0, 8, 5)$$

$$\Rightarrow \quad x_1 + x_2 = 0, y_1 + y_2 = 16, z_1 + z_2 = 10 \quad \text{...(i)}$$

$$\left(\frac{x_2+x_3}{2}, \frac{y_2+y_3}{2}, \frac{z_2+z_3}{2}\right) = (2, 3, -1)$$

$$\Rightarrow \quad x_2 + x_3 = 4, y_2 + y_3 = 6, z_2 + z_3 = -2 \quad \text{...(ii)}$$

and $$\left(\frac{x_1+x_3}{2}, \frac{y_1+y_3}{2}, \frac{z_1+z_3}{2}\right) = (5, 7, 11)$$

$$\Rightarrow \quad x_1 + x_3 = 10, y_1 + y_3 = 14, z_1 + z_3 = 22 \quad \text{...(iii)}$$

On adding Eqs. (i), (ii) and (iii), we get

$2(x_1 + x_2 + x_3) = 14, 2(y_1 + y_2 + y_3) = 36, 2(z_1 + z_2 + z_3) = 30$

$\Rightarrow x_1 + x_2 + x_3 = 7, y_1 + y_2 + y_3 = 18, z_1 + z_2 + z_3 = 15$ ...(iv)

On solving Eqs. (i), (ii), (iii) and (iv), we get

$$x_3 = 7, x_1 = 3, x_2 = -3;$$
$$y_3 = 2, y_1 = 12, y_2 = 4$$
and $$z_3 = 5, z_1 = 17, z_2 = -7$$

Hence, vertices of a triangle are

(7, 2, 5), (3, 12, 17), (–3, 4, –7).

25. $\because \quad \Delta_{yz} = \frac{1}{2}\begin{Vmatrix} y_1 & z_1 & 1 \\ y_2 & z_2 & 1 \\ y_3 & z_3 & 1 \end{Vmatrix}, \Delta_{zx} = \frac{1}{2}\begin{Vmatrix} z_1 & x_1 & 1 \\ z_2 & x_2 & 1 \\ z_3 & x_3 & 1 \end{Vmatrix}$

$$\Delta_{xy} = \frac{1}{2}\begin{Vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{Vmatrix}$$

$$\therefore \quad \Delta_{yz} = \frac{1}{2}\begin{Vmatrix} 1 & 1 & 1 \\ 1 & 2 & 1 \\ 0 & 1 & 1 \end{Vmatrix} = \frac{1}{2}|[1(2-1) - 1(1-0) + 1(1-0)]|$$

$$= \frac{1}{2}|[1 - 1 + 1]| = \frac{1}{2}$$

$$\Delta_{zx} = \frac{1}{2}\begin{Vmatrix} 1 & 2 & 1 \\ 2 & 3 & 1 \\ 1 & -4 & 1 \end{Vmatrix} = \frac{1}{2}|[1(3+4) - 2(2-1) + 1(-8-3)]|$$

$$= \frac{1}{2}|[7 - 2 - 11]| = 3$$

$$\Delta_{xy} = \frac{1}{2}\begin{Vmatrix} 2 & 1 & 1 \\ 3 & 1 & 1 \\ -4 & 0 & 1 \end{Vmatrix}$$

$$= \frac{1}{2}|[2(1-0) - 1(3+4) + 1(0+4)]| = \frac{1}{2}$$

$\therefore$ Area of triangle, $\Delta = \sqrt{\Delta_{yz}^2 + \Delta_{zx}^2 + \Delta_{xy}^2}$

$$= \sqrt{\left(\frac{1}{2}\right)^2 + (3)^2 + \left(\frac{1}{2}\right)^2}$$

$$= \sqrt{\frac{1}{4} + 9 + \frac{1}{4}}$$

$$= \frac{\sqrt{38}}{2} \text{ sq unit}$$

26. Now, $\Delta_{xy} = \frac{1}{2}\begin{Vmatrix} 1 & -1 & 1 \\ 2 & 0 & 1 \\ 0 & 2 & 1 \end{Vmatrix} = \frac{1}{2}|1(0-2) + 1(2-0) + 1(4-0)|$

$$= \frac{1}{2}|-2 + 2 + 4| = 2$$

$$\Delta_{yz} = \frac{1}{2}\begin{Vmatrix} -1 & 2 & 1 \\ 0 & -1 & 1 \\ 2 & 1 & 1 \end{Vmatrix} = \frac{1}{2}|[-1(-1-1) - 2(0-2) + 1(0+2)]|$$

$$= \frac{1}{2}|[2 + 4 + 2]| = 4$$

$$\Delta_{zx} = \frac{1}{2}\begin{Vmatrix} 2 & 1 & 1 \\ -1 & 2 & 1 \\ 1 & 0 & 1 \end{Vmatrix} = \frac{1}{2}|[2(2-0) - 1(-1-1) + 1(0-2)]|$$

$$= \frac{1}{2}|[4 + 2 - 2]| = 2$$

$\therefore$ Area of triangle, $\Delta = \sqrt{\Delta_{xy}^2 + \Delta_{yz}^2 + \Delta_{zx}^2}$

$$= \sqrt{2^2 + 4^2 + 2^2} = \sqrt{24} = 2\sqrt{6}$$

27. Let $A(0, 7, 10)$, $B(-1, 6, 6)$ and $C(-4, 9, 6)$.

Then, $$AB = \sqrt{(-1-0)^2 + (6-7)^2 + (6-10)^2}$$
$$= \sqrt{1 + 1 + 16} = \sqrt{18} = 3\sqrt{2}$$
$$BC = \sqrt{(-4+1)^2 + (9-6)^2 + (6-6)^2}$$
$$= \sqrt{9 + 9 + 0} = \sqrt{18} = 3\sqrt{2}$$
$$AC = \sqrt{(-4-0)^2 + (9-7)^2 + (6-10)^2}$$
$$= \sqrt{16 + 4 + 16} = \sqrt{36} = 6$$

Clearly, $AC^2 = AB^2 + BC^2$

Hence, triangle is right angled. Also, $AB = BC$

$\therefore$ Triangle is right angled isosceles.

28. Now, $\Delta_{xy} = \frac{1}{2}\begin{Vmatrix} 5 & 2 & 1 \\ 6 & -1 & 1 \\ 8 & -7 & 1 \end{Vmatrix}$

$$= \frac{1}{2}|[5(-1+7) - 2(6-8) + 1(-42+8)]|$$

$$= \frac{1}{2}|[30 + 4 - 34]| = 0$$

$$\Delta_{yz} = \frac{1}{2}\begin{Vmatrix} 2 & 4 & 1 \\ -1 & 2 & 1 \\ -7 & k & 1 \end{Vmatrix} = \frac{1}{2}|[2(2-k) - 4(-1+7) + 1(-k+14)]|$$

$$= \frac{1}{2}|[4 - 2k - 24 - k + 14]| = \frac{1}{2}|[-3k - 6]| = \frac{3k+6}{2}$$

$$\Delta_{zx} = \frac{1}{2}\begin{Vmatrix} 4 & 5 & 1 \\ 2 & 6 & 1 \\ k & 8 & 1 \end{Vmatrix} = \frac{1}{2}|[4(6-8) - 5(2-k) + 1(16-6k)]|$$

$$= \frac{1}{2}|[-8 - 10 + 5k + 16 - 6k]| = \frac{1}{2}|[-2 - k]|$$

$$= \frac{k+2}{2}$$

$\therefore$ For collinear, $\Delta = 0$

$$\therefore \quad \sqrt{0^2 + \left(\frac{3k+6}{2}\right)^2 + \left(\frac{k+2}{2}\right)^2} = 0$$

$$\Rightarrow \quad \frac{1}{4}[(3k+6)^2 + (k+2)^2] = 0$$

$$\Rightarrow \quad 9k^2 + 36 + 36k + k^2 + 4 + 4k = 0$$

$$\Rightarrow \quad 10k^2 + 40k + 40 = 0 \Rightarrow k^2 + 4k + 4 = 0$$

$$\Rightarrow \quad (k+2)^2 = 0 \Rightarrow k = -2$$

29. Now, $\Delta_{xy} = \frac{1}{2}\left\|\begin{matrix} 1 & -1 & 1 \\ 2 & -4 & 1 \\ 5 & -13 & 1 \end{matrix}\right\|$

$$= \frac{1}{2}|[1(-4+13)+1(2-5)+1(-26+20)]|$$

$$= \frac{1}{2}|[9-3-6]| = 0$$

$$\Delta_{yz} = \frac{1}{2}\left\|\begin{matrix} -1 & 3 & 1 \\ -4 & 5 & 1 \\ -13 & 11 & 1 \end{matrix}\right\|$$

$$= \frac{1}{2}|[-1(5-11)-3(-4+13)+1(-44+65)]|$$

$$= \frac{1}{2}|[6-27+21]| = 0$$

$$\Delta_{zx} = \frac{1}{2}\left\|\begin{matrix} 3 & 1 & 1 \\ 5 & 2 & 1 \\ 11 & 5 & 1 \end{matrix}\right\|$$

$$= \frac{1}{2}|[3(2-5)-1(5-11)+1(25-22)]|$$

$$= \frac{1}{2}|[-9+6+3]| = 0$$

$\therefore$ Area of triangle $= \sqrt{\Delta_{xy}^2 + \Delta_{yz}^2 + \Delta_{zx}^2}$

$$= \sqrt{0+0+0} = 0$$

Hence, given points are collinear.

30. We know that centroid divides the line segment joining orthocentre and circumcentre in the ratio 2 : 1. Since, the coordinates of orthocentre and circumcentre are (1, 1, 1) and (3, 2, 2), respectively.

$\therefore$ The coordinates of centroid are

$$\left(\frac{2\times3+1\times1}{2+1}, \frac{2\times2+1\times1}{2+1}, \frac{2\times2+1\times1}{2+1}\right)$$

$$= \left(\frac{7}{3}, \frac{5}{3}, \frac{5}{3}\right)$$

31. Current vertices of a triangle are $A(1, 1, 2)$, $B(2, 1, 3)$ and $C(1, -1, 3)$.

$\therefore AB = c = \sqrt{(2-1)^2 + (1-1)^2 + (3-2)^2} = \sqrt{1+0+1} = \sqrt{2}$

$BC = a = \sqrt{(1-2)^2 + (-1-1)^2 + (3-3)^2} = \sqrt{1+4+0} = \sqrt{5}$

$CA = b = \sqrt{(1-1)^2 + (-1-1)^2 + (3-2)^2} = \sqrt{0+4+1} = \sqrt{5}$

$\because$ Incentre of triangle

$$= \left(\frac{ax_1+bx_2+cx_3}{a+b+c}, \frac{ay_1+by_2+cy_3}{a+b+c}, \frac{az_1+bz_2+cz_3}{a+b+c}\right)$$

$$= \left(\frac{\sqrt{5}\times1+\sqrt{5}\times2+\sqrt{2}\times1}{1+\sqrt{2}+\sqrt{5}}, \frac{\sqrt{5}\times1+\sqrt{5}\times1+\sqrt{2}\times-1}{1+\sqrt{2}+\sqrt{5}}, \frac{\sqrt{5}\times2+\sqrt{5}\times3+\sqrt{2}\times3}{1+\sqrt{2}+\sqrt{5}}\right)$$

$$= \left(\frac{3\sqrt{5}+\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}, \frac{2\sqrt{5}-\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}, \frac{5\sqrt{5}+3\sqrt{2}}{1+\sqrt{2}+\sqrt{5}}\right)$$

32. Given vertices of a ΔABC are $A(0, 4, 1)$, $B(2, 3, -1)$ and $C(4, 5, 0)$.

Now, $AB = \sqrt{(2-0)^2 + (3-4)^2 + (-1-1)^2}$

$$= \sqrt{4+1+4} = 3$$

$BC = \sqrt{(4-2)^2 + (5-3)^2 + (0+1)^2}$

$$= \sqrt{4+4+1} = 3$$

and $CA = \sqrt{(4-0)^2 + (5-4)^2 + (0-1)^2}$

$$= \sqrt{16+1+1} = 3\sqrt{2}$$

Here, we see that $(AB)^2 + (BC)^2 = (3)^2 + (3)^2$

$$= 18 = CA^2$$

$\therefore \Delta ABC$ is a right angled triangle at B.

We know that in a right angled triangle, the orthocentre is on right angled triangle.

Hence, required orthocentre is (2, 3, –1).

18 Limits and Derivatives

18.1 Concept of Limit

Consider the function $f(x) = \dfrac{x^2 - 4}{x - 2}$. Clearly, this function is defined for all x except $x = 2$ as it assumes the form $\dfrac{0}{0}$ (known as an indeterminate form) at $x = 2$. However, if $x \neq 2$, then

$$f(x) = \frac{(x-2)(x+2)}{x-2} = x + 2$$

In The derivative is a measure of how a function changes as its input changes. Loosely speaking a derivative can be thought of as how much one quantity is changing in response to changes in some other quantity.

The following table exhibits the values of $f(x)$ at points which are close to 2 on its two sides, *viz*. left and right on the real line.

x	1.4	1.5	1.6	1.7	1.8	1.9	1.99	2
$f(x)$	3.4	3.5	3.6	3.7	3.8	3.9	3.99	$\frac{0}{0}$

x	2.01	2.1	2.2	2.3	2.4	2.5	2.6
$f(x)$	4.01	4.1	4.2	4.3	4.4	4.5	4.6

The graph of this function is shown in the figure,

It is evident from the above table and the graph of $f(x)$ that as x increases and comes closer to 2 from lefth and side of 2, the values of $f(x)$ increases and come closer to 4. This is interpreted as

When x approaches to 2 from its left hand side, the function $f(x)$ tends to the limit 4.

If we use notation '$x \to 2^-$' to denote 2 from left hand side, the above statement can be restated as

$x \to 2^-$, $f(x) \to 4$ or $\lim_{x \to 2} f(x) = 4$ or left hand limit of $f(x)$ at $x = 2$ is 4.

Thus, $\lim_{x \to 2} f(x) = 4$ means that as x tends to 2 from left hand side, $f(x)$ is tending to 4.

From the above table as well as the graph of $f(x)$ shown in the figure we observe that as x decreases and comes closer to 2 from right hand side 2, the values of $f(x)$ decreases and come closer to 4. This is interpreted as

When x approaches to 2 from its right hand side, the function $f(x)$ tends to the limit 4.

Using the notation '$x \to 2^+$', to denote 'x tends to from right hand side' the above statement can be restated as $x \to 2^+$, $f(x) \to 4$ or $\lim_{x \to 2^+} f(x) = 4$ or right hand limit of $f(x)$ at $x = 2$ is 4.

Thus, $\lim_{x \to 2^+} f(x) = 4$ means that as x tends to 2 from right hand side, $f(x)$ is tending to 4.

If follows from the above discussion that for the function $f(x)$ is given by

$$f(x) = \frac{x^2 - 4}{x - 2}, \text{ we have}$$

(i) $\lim_{x \to 2^-} f(x) = 4$

(ii) $\lim_{x \to 2^+} f(x) = 4$

(iii) $\lim_{x \to 2^-} f(x) = \lim_{x \to 2^+} f(x)$

(iv) $f(2)$ does not exist *i.e.*, $f(x)$ is not defined at $x = 2$.

Note The following indeterminant forms are

$$\frac{0}{0}, \infty - \infty, \frac{\infty}{\infty}, 0 \times \infty, 1^\infty, \infty, 0^0, \infty^0$$

18.2 Limit

If $f(x)$ is a function of x such that, if x approaches to a constant value a, then the value of $f(x)$ also approaches to another constant k, then constant k is known as limit of $f(x)$ at $x = a$. Limit is defined as

$$\lim_{x \to a} f(x) = k$$

OR

A real number l is called the limit of the function f, if for every $\varepsilon > 0$, however small, there exists $\delta > 0$ such that

$|f(x) - l| < \varepsilon$, whenever $0 < |x - a| < \delta$

or we write

$$\lim_{x \to a} f(x) = l$$

18.3 Left Hand Limit

A function f is said to approach l as x approaches a from the left, if corresponding to an arbitrary positive number ε, there exists a positive number δ such that

$|f(x) - l| < \varepsilon$ whenever $a - \delta < x < a$.

It is written as $\lim_{x \to a^-} f(x) = l$ or $f(a - 0) = l$.

The working rule for finding the left hand limit is put $a - h$ for x in $f(x)$, where h is positive and very small and make h approach zero.

i.e., $$f(a - 0) = \lim_{h \to 0} f(a - h)$$

18.4 Right Hand Limit

A function f is said to approach l as x approaches a from right, if corresponding to an arbitrary positive number ε, there exists a positive number δ such that $|f(x) - l| < \varepsilon$ whenever $a < x < a + \delta$.

It is written as $\lim_{x \to a^+} f(x) = l$ or $f(a + 0) = l$.

The working rule for finding the right hand limit is 'put $a + h$ for x in $f(x)$, where h is positive and very small and make h approach zero.

i.e., $$f(a + 0) = \lim_{h \to 0} f(a + h)$$

***Sample* Problem 1** *Find the left hand limit of* $\dfrac{\frac{1}{x} + \frac{1}{2}}{x + 2}$ *at* $x = -2$.

(*a*) $\frac{1}{3}$ (*b*) $-\frac{1}{4}$ (*c*) $-\frac{1}{3}$ (*d*) $\frac{1}{4}$

Interpret (*b*) Let $L = \lim_{x \to -2^-} \dfrac{\frac{1}{x} + \frac{1}{2}}{x + 2}$

Put $x = -2 - h$

As $x \to -2$, then $h \to 0$

$$\therefore \quad L = \lim_{h \to 0} \frac{\frac{1}{-2-h} + \frac{1}{2}}{-h}$$

$$= \lim_{h \to 0} \frac{2 - 2 - h}{-2h(-2-h)} = \lim_{h \to 0} \frac{-h}{-2h(-2-h)} = \lim_{h \to 0} \frac{-1}{2(2+h)} = \frac{-1}{4}$$

18.5 Existence of Limit

If both right hand limit and left hand limit exist and are equal, then their common value, evidently will be the limit of f as $x \to a$ *i.e.*,

If $\lim_{x \to a^+} f(x) = \lim_{x \to a^-} f(x) = l$, then $\lim_{x \to a} f(x) = l$,

If however, either both of these limits do not exist or both these limits exist but are not equal in value, then $\lim_{x \to a} f(x)$ does not exist.

***Sample* Problem 2** *Find the limit of the function,*

$$f(x) = \begin{cases} \dfrac{|x-3|}{x-3}, & x \neq 3 \\ 0, & x = 3 \end{cases} \text{ at } x = 3$$

(*a*) –1 (*b*) 1
(*c*) –3 (*d*) does not exist

Interpret (*d*) Given, $f(x) = \begin{cases} \dfrac{|x-3|}{x-3}, & x \neq 3 \\ 0, & x = 3 \end{cases}$ at $x = 3$.

Now, $\text{LHL } \lim_{x \to 3^-} \dfrac{|x-3|}{x-3} = \lim_{x \to 3} \dfrac{-(x-3)}{x-3}$

$= \lim_{x \to 3} (-1) = -1$

$\text{RHL } \lim_{x \to 3^+} \dfrac{|x-3|}{x-3} = \lim_{x \to 3} \dfrac{(x-3)}{x-3}$

$\lim_{x \to 3} 1 = 1$

$\therefore$ LHL $\neq$ RHL

$= 1$ So, limit does not exist.

18.6 Algebra of Limits

Let f and g be two functions such that both $\lim_{x \to a} f(x)$ and $\lim_{x \to a} g(x)$ exist. Then,

(i) Limit of sum of two functions is sum of limits of the functions,
i.e., $\lim_{x \to a} [f(x) + g(x)] = \lim_{x \to a} f(x) + \lim_{x \to a} g(x)$

(ii) Limit of difference of two functions is difference of the limits of the functions
i.e., $\lim_{x \to a} [f(x) - g(x)] = \lim_{x \to a} f(x) - \lim_{x \to a} g(x)$

(iii) Limit of product of two functions is product of the limits of the functions
i.e., $\lim_{x \to a} [f(x) \cdot g(x)] = \lim_{x \to a} f(x) \cdot \lim_{x \to a} g(x)$

(iv) Limit of a quotient of two functions is quotient of the limits of the functions (wherenever denominator is non-zero)
i.e., $\lim_{x \to a} \dfrac{f(x)}{g(x)} = \dfrac{\lim_{x \to a} f(x)}{\lim_{x \to a} g(x)}$

***Sample* Problem 3** *The value of* $\lim_{x \to 3} (x^4 + x^3 - 3x)$ *is*

(*a*) 99 (*b*) – 99
(*c*) – 85 (*d*) 85

Interpret (*a*) $\lim_{x \to 3} (x^4 + x^3 - 3x)$

$= \lim_{x \to 3} x^4 + \lim_{x \to 3} x^3 - 3 \lim_{x \to 3} x$

$= (3)^4 + (3)^3 - (3)(3)$

$= 81 + 27 - 9 = 99$

18.7 Evaluation of Algebraic Limit

Let $f(x)$ be an algebraic function (polynomial or rational) and a be any real number, then $\lim_{x \to a} f(x)$ is known as an algebraic limit.

e.g., $\lim_{x \to 1} \dfrac{x^3 - 1}{x - 1}$, $\lim_{x \to 0} \dfrac{\sqrt{1+x} - \sqrt{1-x}}{x}$ etc.

The limit of algebraic functions can be find by the following methods.

(i) Method of Direct Substitution

$\lim_{x \to a} f(x)$ can be evaluated by method of direct substitution, if $f(x)$ exists finitely for $x = a$

e.g., $\lim_{x \to 1} \dfrac{x^2 + 2x + 3}{x^2 + x + 1} = \dfrac{(1)^2 + 2(1) + 3}{(1)^2 + 1 + 1} = \dfrac{6}{3} = 2$

***Sample* Problem 4** *The value of* $\lim_{x \to 4} \dfrac{4x + 3}{x - 2}$ *is* **[NCERT]**

(*a*) 19 (*b*) $\dfrac{19}{2}$
(*c*) $\dfrac{19}{3}$ (*d*) $-\dfrac{19}{2}$

Interpret (*b*) $\lim_{x \to 4} \dfrac{4x + 3}{x - 2} = \dfrac{4 \times 4 + 3}{4 - 2} = \dfrac{19}{2}$

(ii) Method of Factorisation

Consider $\lim_{x \to a} \dfrac{f(x)}{g(x)}$. If by putting $x = a$ the rational function $\dfrac{f(x)}{g(x)}$ takes the form $\dfrac{0}{0}, \dfrac{\infty}{\infty}$ etc., then $(x - a)$ is a factor of both $f(x)$ and $g(x)$. In such a case we factorise the numerator and denominator and then, cancel out the common factor $(x - a)$. After cancelling out the common factor $(x - a)$, we again put $x = a$ in the given expression and see whether, we get a meaningful number or not. This process is repeated till we get a meaningful number.

***Sample* Problem 5** $\lim_{x\to 2} \frac{3x^2 - x - 10}{x^2 - 4}$ *is equal to* [NCERT]

(a) $\frac{11}{4}$ (b) $-\frac{11}{4}$

(c) $\frac{11}{5}$ (d) *None of these*

Interpret (a) $\lim_{x\to 2} \frac{3x^2 - x - 10}{x^2 - 4}$ $\left(\frac{0}{0} \text{ form}\right)$

$$\lim_{x\to 2} \frac{3x^2 - (6-5)x - 10}{(x-2)(x+2)} = \lim_{x\to 2} \frac{3x^2 - 6x + 5x - 10}{(x-2)(x+2)}$$

$$= \lim_{x\to 2} \frac{3x(x-2) + 5(x-2)}{(x-2)(x+2)}$$

$$= \lim_{x\to 2} \frac{(x-2)(3x+5)}{(x-2)(x+2)} = \lim_{x\to 2} \frac{3x+5}{x+2}$$

$$= \frac{3\times 2 + 5}{2+2} = \frac{6+5}{4} = \frac{11}{4}$$

(iii) Method of Rationalisation

Rationalisation method is used when, we have radical signs in an expression (like $\frac{1}{2}, \frac{1}{3}$ etc.,) and there exists a negative sign between two terms of an algebraic expression.

After rationalisation, the terms are factorised which on cancellation gives the required result.

***Sample* Problem 6** *The value of* $\lim_{x\to a} \frac{\sqrt{3x-a} - \sqrt{x+a}}{x-a}$ *is*

(a) $-\frac{1}{\sqrt{2}a}$ (b) $\frac{1}{\sqrt{2}a}$

(c) $\frac{1}{\sqrt{3}a}$ (d) $\frac{1}{\sqrt{2}}$

Interpret (b) $\lim_{x\to a} \frac{\sqrt{3x-a} - \sqrt{x+a}}{x-a}$

$$= \lim_{x\to a} \frac{\sqrt{3x-a} - \sqrt{x+a}}{x-a} \times \frac{\sqrt{3x-a} + \sqrt{x+a}}{\sqrt{3x-a} + \sqrt{x+a}}$$

$$= \lim_{x\to a} \frac{(3x-a) - (x+a)}{(x-a)(\sqrt{3x-a} + \sqrt{x+a})}$$

$$= \lim_{x\to a} \frac{2(x-a)}{(x-a)(\sqrt{3x-a} + \sqrt{x+a})}$$

$$= \frac{2}{\sqrt{3a-a} + \sqrt{a+a}} = \frac{2}{2\sqrt{2}a} = \frac{1}{\sqrt{2}a}$$

(iv) Evaluation of Limits Using Standard Results

$$\lim_{x\to a} \frac{x^n - a^n}{x-a} = \lim_{x\to a} (x^{n-1} + x^{n-2}a + x^{n-3}a + \ldots + a^{n-1})$$

(using expansion)

$$\Rightarrow \quad \lim_{x\to a} \frac{x^n - a^n}{x-a} = a^{n-1} + a^{n-1} + a^{n-1} + \ldots + a^{n-1}$$

$$\therefore \quad \lim_{x\to a} \frac{x^n - a^n}{x-a} = na^{n-1}$$

Discuss 2 example of $\lim_{x\to\infty}$

Note When $x \to \infty$, then if k is the highest power of x in numerator and denominator both, then divide each term in numerator and denominator by x^k and use the result $\lim_{x\to\infty} \frac{1}{x^n} = 0$, where $x > 0$.

***Sample* Problem 7** $\lim_{x\to 0} \frac{(x+1)^5 - 1}{x}$ *is equal to* [NCERT]

(a) 5 (b) 4

(c) 3 (d) – 5

Interpret (a) $\lim_{x\to 0} \frac{(x+1)^5 - 1}{x}$ $\left(\frac{0}{0} \text{ form}\right)$

Let $x + 1 = h$

When $x \to 0$, then $h \to 1$

$$\therefore \quad \lim_{h\to 1} \frac{h^5 - 1}{h-1} = \lim_{h\to 1} \frac{h^5 - 1^5}{h-1} = \lim_{h\to 1} 5(h)^{5-1} = 5 \times 1^4 = 5$$

***Sample* Problem 8** *Find the value of* $\lim_{x\to\infty} \frac{ax^2 + bx + c}{dx^2 + ex + f}$

(a) $-\frac{a}{d}$ (b) $\frac{a}{d}$

(c) $\frac{d}{a}$ (d) *None of these*

Interpret (b) When we put $x = \infty$ in the given expression, then the expression becomes $\frac{\infty}{\infty}$. So, here we divide numerator and denominator by x^2, we get

$$\lim_{x\to\infty} \frac{a + \frac{b}{x} + \frac{c}{x^2}}{d + \frac{e}{x} + \frac{f}{x^2}} = \frac{a+0+0}{d+0+0} = \frac{a}{d}$$

18.8 Evaluation of Trigonometric Limits

In order to evaluate the said type of limits, we use the following standard results

(i) $\lim_{\theta\to 0} \frac{\sin\theta}{\theta} = 1$ (ii) $\lim_{\theta\to 0} \frac{\tan\theta}{\theta} = 1$

(iii) $\lim_{\theta\to a} \frac{\sin(\theta - a)}{\theta - a} = 1$ (iv) $\lim_{\theta\to a} \frac{\tan(\theta - a)}{\theta - a} = 1$

(v) $\lim_{x\to 0} \frac{\sin^{-1} x}{x} = 1$ (vi) $\lim_{x\to 0} \frac{\tan^{-1} x}{x} = 1$

***Sample* Problem 9** *The value of* $\lim_{x \to \frac{\pi}{2}} \frac{\tan 2x}{x - \frac{\pi}{2}}$ *is* [NCERT]

(a) – 2 (b) 2 (c) 3 (d) – 3

Interpret (b) Given, $\lim_{x \to \frac{\pi}{2}} \frac{\tan 2x}{x - \frac{\pi}{2}}$

Let $x - \frac{\pi}{2} = h$

when $x \to \frac{\pi}{2}$, then $h \to 0$

$$\text{Therefore, given limit} = \lim_{h \to 0} \frac{\tan 2\left(\frac{\pi}{2} + h\right)}{h} = \lim_{h \to 0} \frac{\tan(\pi + 2h)}{h}$$

$$= \lim_{h \to 0} \frac{\tan 2h}{h} \qquad (\because \tan(\pi + \theta) = \tan\theta)$$

$$= \lim_{h \to 0} \frac{2 \tan 2h}{2h}$$

$$= 2 \times 1 = 2 \qquad \left(\because \lim_{x \to 0} \frac{\tan x}{x} = 1\right)$$

18.9 Some Useful Expansions

(i) $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \ldots$

(ii) $a^x = 1 + x \log a + \frac{x^2}{2!}(\log a)^2 + \frac{x^3}{3!}(\log a)^3 + \ldots$

(iii) $\log(1 + x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \ldots, |x| < 1$

(iv) $(1 + x)^n = 1 + nx + \frac{n(n-1)}{2!} x^2 + \ldots$

(v) $\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \ldots$

(vi) $\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \ldots$

(vii) $\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \ldots$

***Sample* Problem 10** *Find the value of* $\lim_{x \to 0} \frac{\cos x - 1}{x^2}$.

(a) $\frac{1}{2}$ (b) $-\frac{1}{2}$ (c) $\frac{1}{4}$ (d) $-\frac{1}{4}$

Interpret (b) $\lim_{x \to 0} \frac{\cos x - 1}{x^2}$

$$= \lim_{x \to 0} \frac{1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \ldots - 1}{x^2}$$

$$= \lim_{x \to 0} \frac{x^2\left(-\frac{1}{2!} + \frac{x^2}{4!} - \ldots\right)}{x^2} = -\frac{1}{2!} = -\frac{1}{2}$$

18.10 Derivative

Suppose, f is a real valued function, the function defined by $\lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$, wherever the limit exists is defined to be the derivative of f at x and is denoted by $f'(x)$. This definition of derivative is also called the first principle of derivative.

Hence, $$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$

Sometimes $f'(x)$ is denoted by $\frac{d}{dx}[f(x)]$ or if $y = f(x)$, it is denoted by $\frac{dy}{dx}$. This is referred to as derivative of $f(x)$ or y w.r.t. x. It is also denoted by $D[f(x)]$. Further the derivative of f at $x = a$ is also denoted by

$$\left(\frac{df}{dx}\right)_a \text{ or } \left(\frac{df}{dx}\right)_{x=a}$$

Geometrical Meaning of a Derivative

Let $P\{x_0, f(x_0)\}$ and $Q\{x_0 + h, f(x_0 + h)\}$ be two points very near to each other on the curve $y = f(x)$. Draw PM and QN perpendiculars from P and Q on x-axis PL perpendicular from P on QN. Let the chord QP produced meet the x-axis at R and $\angle QPL = \angle QRN = \phi$. Now, in right angled ΔQPL.

$$\tan\phi = \frac{QL}{PL} = \frac{NQ - NL}{MN} = \frac{NQ - MP}{ON - OM}$$

$$= \frac{f(x_0 + h) - f(x_0)}{(x_0 + h) - x_0} = \frac{f(x_0 + h) - f(x_0)}{h} \qquad \ldots(i)$$

When $h \to 0$, the point Q moving along the curve tends to P *i.e.*, $Q \to P$, then the chord PQ approaches the tangent line PT at the point P and then $\phi \to \psi$. Now, applying $\lim_{h \to 0}$ in Eq. (i) , then

$$\lim_{h \to 0} \tan\phi = \lim_{h \to 0} \frac{f(x_0 + h) - f(x_0)}{h}$$

$$\tan\psi = \lim_{h \to 0} \frac{f(x_0 + h) - f(x_0)}{h}$$

$$\Rightarrow \qquad f'(x_0) = \lim_{h \to 0} \frac{f(x_0 + h) - f(x_0)}{h}$$

18.11 Derivative from First Principle

Let $f(x)$ is a function finitely differentiable at every point on the real number line. Then, its derivative is given by the first principle is

$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}.$$

***Sample* Problem 11** *Find the derivative of a function* $f(x) = \frac{x+1}{x-1}$ *by the first principle.*

(a) $\frac{2}{(x-1)^2}$ (b) $\frac{-2}{(x-1)^2}$ (c) $\frac{-2}{x-1}$ (d)

Interpret (b) Let $f(x) = \frac{x+1}{x-1}$

We have, $f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$

$$\Rightarrow f'(x) = \lim_{h \to 0} \frac{\frac{x+h+1}{x+h-1} - \frac{x+1}{x-1}}{h} \qquad \left[\because f(x) = \frac{x+1}{x-1}\right]$$

$$= \lim_{h \to 0} \frac{(x+h+1)(x-1) - (x+1)(x+h-1)}{(x+h-1)(x-1)h}$$

$$= \lim_{h \to 0} \frac{(x^2 - x + hx - h + x - 1) - (x^2 + hx - x + x + h - 1)}{(x+h-1)(x-1)h}$$

$$= \lim_{h \to 0} \frac{x^2 + hx - h - 1 - x^2 - hx - h + 1}{(x+h-1)(x-1)h}$$

$$= \lim_{h \to 0} \frac{-2h}{(x+h-1)(x-1)h} = \frac{-2}{(x+0-1)(x-1)} = \frac{-2}{(x-1)^2}$$

18.12 Differentiation of Some Important Functions

(i) $\frac{d}{dx}(c) = 0$, c is independent of x

(ii) $\frac{d}{dx}(x^n) = nx^{n-1}$

(iii) $\frac{d}{dx}(\sin x) = \cos x$

(iv) $\frac{d}{dx}(\cos x) = -\sin x$

(v) $\frac{d}{dx}(\tan x) = \sec^2 x, \left\{x \neq n\pi + \frac{\pi}{2}\right\}$

(vi) $\frac{d}{dx}(\cot x) = -\operatorname{cosec}^2 x, \{x \neq n\pi\}$

(vii) $\frac{d}{dx}(\sec x) = \sec x \tan x, \left\{x \neq n\pi + \frac{\pi}{2}\right\}$

(viii) $\frac{d}{dx}(\operatorname{cosec} x) = -\operatorname{cosec} x \cot x, \{x \neq n\pi\}$

(ix) $\frac{d}{dx}(a^x) = a^x \log_e a$ (x) $\frac{d}{dx}(e^x) = e^x$

(xi) $\frac{d}{dx}(\log x) = \frac{1}{x}, (x > 0)$ (xii) $\frac{d}{dx}(\log_a x) = \frac{1}{x \log_e a}$

***Sample* Problem 12** *Find the derivative of* $(ax^2 + b)^2$. **[NCERT]**

(a) $-4a^2x^3 + 4axb$ (b) $4a^2x^3 + 4axb$

(c) $4a^2x^3 - 4axb$ (d) *None of these*

Interpret (b) Let $f(x) = (ax^2 + b)^2 = a^2x^4 + b^2 + 2ax^2b$

On differentiating w.r.t. x, we get $\frac{d}{dx}\{f(x)\} = \frac{d}{dx}(a^2x^4 + b^2 + 2ax^2b)$

$$= 4a^2x^3 + 0 + 4axb = 4a^2x^3 + 4axb$$

18.13 Algebra of Derivative of Functions

Let f and g be two functions such that their derivatives are defined in a common domain. Then,

(i) Derivative of sum of two functions is sum of the derivatives of the functions.

i.e., $\frac{d}{dx}[f(x) + g(x)] = \frac{d}{dx}f(x) + \frac{d}{dx}g(x)$

(ii) Derivative of difference of two functions is the difference of the derivatives of two functions.

i.e., $\frac{d}{dx}[f(x) - g(x)] = \frac{d}{dx}f(x) - \frac{d}{dx}g(x)$

(iii) Derivative of product of two functions is given by the following product rule.

$$\frac{d}{dx}[f(x) \cdot g(x)] = g(x)\frac{d}{dx}f(x) + f(x) \cdot \frac{d}{dx}g(x)$$

(iv) Derivative of quotient of two functions is given by the following quotient rule (whenever the denominator is non-zero)

$$\therefore \quad \frac{d}{dx}\left[\frac{f(x)}{g(x)}\right] = \frac{g(x) \cdot \frac{d}{dx}f(x) - f(x) \cdot \frac{d}{dx}g(x)}{[g(x)]^2}$$

***Sample* Problem 13** *Find the derivative of* $(3 \cot x + 4 \operatorname{cosec} x)$. **[NCERT]**

(a) $-3 \operatorname{cosec}^2 x - 4 \operatorname{cosec} x \cot x$

(b) $3 \operatorname{cosec}^2 x - 5 \operatorname{cosec} x \cot x$

(c) $-3 \operatorname{cosec}^2 x + 5 \operatorname{cosec} x \cot x$

(d) *None of the above*

Interpret (a) Let $y = 3 \cot x + 4 \operatorname{cosec} x$

On differentiating w.r.t x, we get $\frac{d}{dx}(y) = \frac{d}{dx}(3 \cot x + 4 \operatorname{cosec}(x)$

$$= \frac{3d}{dx}(\cot x) + 4\frac{d}{dx}(\operatorname{cosec} x) = -3 \operatorname{cosec}^2 x - 4 \operatorname{cosec} x \cot x$$

WORKED OUT Examples

Example 1 $\lim_{x \to 4} \frac{|x-4|}{x-4}$ *is equal to* [NCERT Exemplar]

(a) 3 (b) –2
(c) 1 (d) *does not exist*

Solution (d) Let $f(x) = \frac{|x-4|}{x-4}$

At $x = 4$,

$$\text{RHL} = \lim_{x \to 4^+} f(x) = \lim_{h \to 0} f(4+h) = \lim_{h \to 0} \frac{|4+h-4|}{(4+h-4)}$$

$$= \lim_{h \to 0} \frac{(4+h-4)}{(4+h-4)} = 1$$

At $x = 4$, $\text{LHL} = \lim_{x \to 4^-} f(x) = \lim_{h \to 0} f(4-h)$

$$= \lim_{h \to 0} \frac{|4-h-4|}{(4-h-4)}$$

$$= \lim_{h \to 0} \frac{-(4-h-4)}{(4-h-4)} = -1$$

$\because$ RHL $\neq$ LHL

$\therefore$ At $x = 4$, limit does not exist.

Note In an absolute function, sometimes it may be possible that LHL $\neq$ RHL, Please be careful about it.

Example 2 *Find the value of* $\lim_{x \to 0} \frac{\sin x - 2\sin 3x + \sin 5x}{x}$. [NCERT Exemplar]

(a) –1 (b) 0
(c) 1 (d) 3

Solution (b) Given, $\lim_{x \to 0} \frac{\sin x - 2\sin 3x + \sin 5x}{x}$

$$= \lim_{x \to 0} \frac{(\sin 5x + \sin x) - 2\sin 3x}{x}$$

$$= \lim_{x \to 0} \frac{2\sin\frac{5x+x}{2}\cos\frac{5x-x}{2} - 2\sin 3x}{x}$$

$$\left(\because \sin C + \sin D = 2\sin\frac{C+D}{2}\cos\frac{C-D}{2}\right)$$

$$= \lim_{x \to 0} \frac{2\sin 3x\cos 2x - 2\sin 3x}{x}$$

$$= \lim_{x \to 0} \frac{2\sin 3x(\cos 2x - 1)}{x}$$

$$= \lim_{x \to 0} 2\left(\frac{\sin 3x}{3x}\right) \times 3\left[\frac{-(1-\cos 2x)}{1}\right]$$

$$= -2 \times 1 \times 3(1 - \cos 0) = -6(1-1) = -6 \times 0 = 0$$

Example 3 *If* $\lim_{x \to 1} \frac{x^4 - 1}{x - 1} = \lim_{x \to k} \frac{x^3 - k^3}{x^2 - k^2}$, *then find the value of k.* [NCERT Exemplar]

(a) $\frac{5}{3}$ (b) $-\frac{8}{3}$
(c) $\frac{8}{3}$ (d) *None of these*

Solution (c) Given, $\lim_{x \to 1} \frac{x^4 - 1^4}{x - 1} = \lim_{x \to k} \frac{x^3 - k^3}{x^2 - k^2}$

$$\Rightarrow \quad 4(1)^{4-1} = \frac{3}{2}(k)^{3-2} \qquad \left(\because \lim_{x \to a} \frac{x^n - a^n}{x - a} = na^{n-1}\right)$$

$$\Rightarrow \quad 4 = \frac{3}{2}k$$

$$\Rightarrow \quad k = \frac{8}{3}$$

Example 4 *Let* $f(x) = x - [x]$; $x \in R$, *then* $f'\left(\frac{1}{2}\right)$ *is* [NCERT Exemplar]

(a) $\frac{3}{2}$ (b) 1
(c) 0 (d) –1

Solution (b) Given, $f(x) = x - [x]$

On differentiating $f(x)$ w.r.t. x, we get

$$f'(x) = 1 - 0 \quad \Rightarrow \quad f'(x) = 1$$

($\because [\cdot]$ greatest integer function is constant function)

At $x = \frac{1}{2}$, $f'\left(\frac{1}{2}\right) = 1$

Example 5 *Let* $f(x) = \begin{cases} x^2 - 1, & 0 < x < 2 \\ 2x + 3, & 2 \le x < 3 \end{cases}$, *the quadratic equation whose roots are* $\lim_{x \to 2^-} f(x)$ *and* $\lim_{x \to 2^+} f(x)$ *is* [NCERT Exemplar]

(a) $x^2 - 6x + 9 = 0$ (b) $x^2 - 7x + 8 = 0$
(c) $x^2 - 14x + 49 = 0$ (d) $x^2 - 10x + 21 = 0$

Solution (*d*) Given, $f(x) = \begin{cases} x^2 - 1, & 0 < x < 2 \\ 2x + 3, & 2 \le x < 3 \end{cases}$

At $x = 2$, RHL $= \lim_{x \to 2^+} f(x) = \lim_{h \to 0} f(2 + h)$

$= \lim_{h \to 0} 2(2 + h) + 3$

$= 2(2 + 0) + 3 = 4 + 3 = 7 = \alpha$ (say) $[\because f(x) = 2x + 3]$

LHL $= \lim_{x \to 2^-} f(x) = \lim_{h \to 0} f(2 - h)$

$= \lim_{h \to 0} (2 - h)^2 - 1 = (2 - 0)^2 - 1$

$= 4 - 1 = 3 = \beta$ (say) $[\because f(x) = x^2 - 1]$

If a quadratic equation has roots α and β, then the equation is

$x^2 -$ (Sum of roots) $x +$ Product of roots $= 0$

i.e., $x^2 - (\alpha + \beta)x + \alpha\beta = 0$

i.e., $x^2 - (7 + 3)x + 7 \times 3 = 0 \Rightarrow x^2 - 10x + 21 = 0$

Example 6 *Find* $\lim_{x \to 0} f(x)$ *and* $\lim_{x \to 1} f(x)$, *where*

$$f(x) = \begin{cases} 2x + 3, & x \le 0 \\ 3(x + 1), & x > 0 \end{cases}$$

[**NCERT Exemplar**]

(*a*) 3, 5 (*b*) 3, 6
(*c*) 4, 7 (*d*) 3, –6

Solution (*b*) We have, $f(x) = \begin{cases} 2x + 3, & x \le 0 \\ 3(x + 1), & x > 0 \end{cases}$

At $x = 0$,

RHL $= \lim_{x \to 0^+} f(x) = \lim_{h \to 0} f(0 + h)$

$= \lim_{h \to 0} 3(0 + h + 1)$

$= 3(0 + 0 + 1) = 3 \times 1 = 3$

LHL $= \lim_{h \to 0^-} f(x) = \lim_{h \to 0} f(0 - h)$

$= \lim_{h \to 0} 2(0 - h) + 3 = 2(0 - 0) + 3 = 3$

$\Rightarrow$ RHL = LHL = 3

At $x = 1$, RHL $= \lim_{x \to 1^+} f(x) = \lim_{h \to 0} f(1 + h)$

$= \lim_{h \to 0} 3(1 + h + 1)$ (putting $x = 1 + h$)

$= 3(1 + 0 + 1) = 6$

LHL $= \lim_{x \to 1^-} f(x) = \lim_{h \to 0} f(1 - h)$ (putting $x = 1 - h$)

$= \lim_{h \to 0} 3(1 - h + 1) = 6$

$\therefore$ LHL = RHL = 6

Start Practice for JEE Main

Round I (Topically Divided Problems)

Limits

1. The value of $\lim_{x \to 1} \frac{(1+x)^6 - 1}{(1+x)^2 - 1}$ is [NCERT Exemplar]

(a) 20 (b) 21
(c) 15 (d) 17

2. The value of $\lim_{x \to \sqrt{2}} \frac{x^4 - 4}{x^2 + 3\sqrt{2}x - 8}$ is [NCERT Exemplar]

(a) $-\frac{8}{5}$ (b) $\frac{7}{5}$
(c) $\frac{8}{5}$ (d) None of these

3. The value of $\lim_{x \to 1} \frac{x^7 - 2x^5 + 1}{x^3 - 3x^2 + 2}$ is [NCERT Exemplar]

(a) 0 (b) 1
(c) –1 (d) 3

4. The value of $\lim_{x \to 2} \frac{x^2 - 4}{\sqrt{3x-2} - \sqrt{x+2}}$ is

(a) 8 (b) –8
(c) 7 (d) 5

5. The value of $\lim_{x \to \frac{1}{2}} \left(\frac{8x-3}{2x-1} - \frac{4x^2+1}{4x^2-1} \right)$ is [NCERT Exemplar]

(a) $\frac{7}{3}$ (b) $-\frac{7}{2}$
(c) $-\frac{7}{3}$ (d) $\frac{7}{2}$

6. Find n, if $\lim_{x \to 2} \frac{x^n - 2^n}{x - 2} = 80$, $n \in N$. [NCERT Exemplar]

(a) 5
(b) 6
(c) 4
(d) 7

7. The value of $\lim_{x \to 0} \frac{\sin^2 2x}{\sin^2 4x}$ is [NCERT Exemplar]

(a) $\frac{1}{2}$ (b) $-\frac{1}{4}$
(c) $\frac{1}{4}$ (d) $-\frac{1}{2}$

8. $\lim_{x \to 0} \frac{1 - \cos 2x}{x^2}$ is equal to [NCERT Exemplar]

(a) 2 (b) –2
(c) 3 (d) –3

9. $\lim_{x \to 0} \frac{2\sin x - \sin 2x}{x^3}$ is equal to [NCERT Exemplar]

(a) –1 (b) 1
(c) 2 (d) –2

10. $\lim_{x \to \frac{\pi}{6}} \frac{\sqrt{3}\sin x - \cos x}{x - \frac{\pi}{6}}$ is equal to [NCERT Exemplar]

(a) 3 (b) –2
(c) 2 (d) 4

11. $\lim_{x \to a} \frac{\sin x - \sin a}{\sqrt{x} - \sqrt{a}}$ is equal to [NCERT Exemplar]

(a) $-\sqrt{a}\cos a$ (b) $\sqrt{a}\cos a$
(c) $-2\sqrt{a}\cos a$ (d) $2\sqrt{a}\cos a$

12. $\lim_{x \to \frac{\pi}{6}} \frac{\cot^2 x - 3}{\operatorname{cosec} x - 2}$ is equal to [NCERT Exemplar]

(a) 3 (b) 4
(c) 2 (d) 1

13. The value of $\lim_{x \to 0} \frac{\sqrt{2} - \sqrt{1 + \cos x}}{\sin^2 x}$ is [NCERT Exemplar]

(a) $\frac{1}{2\sqrt{3}}$ (b) $-\frac{1}{2\sqrt{2}}$
(c) $\frac{1}{2\sqrt{2}}$ (d) None of these

14. $\lim_{x \to \pi} \frac{\sin x}{x - \pi}$ is equal to [NCERT Exemplar]

(a) 1 (b) 2
(c) –1 (d) –2

15. $\lim_{x \to 0} \frac{x^2 \cos x}{1 - \cos x}$ is equal to [NCERT Exemplar]

(a) 2 (b) $\frac{3}{2}$
(c) $\frac{-3}{2}$ (d) 1

16. $\lim_{x \to 0} \frac{(1+x)^n - 1}{x}$ is equal to [NCERT Exemplar]

(a) n (b) 1
(c) $-n$ (d) 0

17. $\lim_{x \to 1} \frac{x^m - 1}{x^n - 1}$ is equal to [NCERT Exemplar]

(a) 1 (b) $\frac{m}{n}$
(c) $-\frac{m}{n}$ (d) $\frac{m^2}{n^2}$

18. $\lim_{\theta \to 0} \frac{1 - \cos 4\theta}{1 - \cos 6\theta}$ is equal to [NCERT Exemplar]

(a) $\frac{4}{9}$ (b) $\frac{1}{2}$
(c) $\frac{-1}{2}$ (d) –1

19. $\lim_{x \to 0} \frac{\operatorname{cosec} x - \cot x}{x}$ is equal to [NCERT Exemplar]

(a) $\frac{-1}{2}$ (b) 1
(c) $\frac{1}{2}$ (d) 1

20. $\lim_{x \to 0} \frac{\sin x}{\sqrt{x+1} - \sqrt{1-x}}$ is [NCERT Exemplar]

(a) 2 (b) 0 (c) 1 (d) –1

21. $\lim_{x \to 1} \frac{(\sqrt{x} - 1)(2x - 3)}{2x^2 + x - 3}$ is [NCERT Exemplar]

(a) $\frac{1}{10}$ (b) $\frac{-1}{10}$
(c) 1 (d) None of these

22. $\lim_{x \to 4} \frac{|x - 4|}{x - 4}$ is equal to

(a) 1 (b) –1
(c) does not exist (d) None of these

23. $\lim_{x \to 0} \frac{|\sin x|}{x}$ is [NCERT Exemplar]

(a) 1 (b) –1
(c) does not exist (d) None of these

24. $\lim_{x \to 0} \frac{\tan 2x - x}{3x - \sin x}$ is [NCERT Exemplar]

(a) 2 (b) $\frac{1}{2}$
(c) $\frac{-1}{2}$ (d) $\frac{1}{4}$

25. Let $f(x) = \begin{cases} x + 2, & x \le -1 \\ cx^2, & x > -1 \end{cases}$, find c, if $\lim_{x \to -1} f(x)$ exists. [NCERT Exemplar]

(a) –1 (b) 1 (c) 0 (d) 2

Derivatives

26. The derivative of $\left(x + \frac{1}{x}\right)^3$ is [NCERT Exemplar]

(a) $3x^2 + \frac{3}{x^4} + 3 + \frac{3}{x^2}$ (b) $3x^2 - \frac{3}{x^4} + 3 - \frac{3}{x^2}$
(c) $3x^2 + \frac{3}{x^4} + 3 - \frac{3}{x^2}$ (d) None of these

27. The derivative of $(3x + 5)(1 + \tan x)$ is [NCERT Exemplar]

(a) $3x \sec^2 x - 6 \sec^2 x - 3 + 3 \tan x$
(b) $3x \sec^2 x - 5 \sec^2 x - 3 - 3 \tan x$
(c) $3x \sec^2 x + 5 \sec^2 x + 3 + 3 \tan x$
(d) None of the above

28. The derivative of $\frac{x^5 - \cos x}{\sin x}$ is [NCERT Exemplar]

(a) $\frac{5x^4 \sin x - 1 - x^5 \cos x}{\sin^2 x}$ (b) $\frac{5x^4 \sin x + 1 - x^5 \cos x}{\sin^2 x}$
(c) $\frac{5x^4 \sin x - 1 - x^3 \cos x}{\sin^2 x}$ (d) None of these

29. The derivative of $(ax^2 + \cot x)(p + q \cos x)$ is [NCERT Exemplar]

(a) $ax^2 \cot x(-q \sin x) + (p + q \cos x)(2ax - \operatorname{cosec}^2 x)$
(b) $ax^2 \cot x(q \sin x) + (p + q \cos x)(2ax - \operatorname{cosec}^2 x)$
(c) $ax^2 \cot x(-q \sin x) + (p - q \cos x)(2ax + \operatorname{cosec}^2 x)$
(d) None of the above

30. The derivative of $(x^2 \sin x + \cos 2x)$ is [NCERT Exemplar]

(a) $x^2 \cos x + 2x \sin x - \sin 2x$
(b) $x^2 \cos x + 2x \sin x - 2 \sin 2x$
(c) $x^2 \cos x + x \sin x - 2 \sin 2x$
(d) $x^2 \cos x + 2x \sin x + 2 \sin 2x$

31. The derivative of $\sin^3 x \cos^3 x$ is [NCERT Exemplar]

(a) $\frac{3}{5} \sin^2 2x \cos 2x$ (b) $\frac{3}{4} \sin^2 2x \cos 2x$
(c) $\frac{3}{4} \sin 2x \cos^2 2x$ (d) $\frac{3}{2} \sin^2 2x \cos 2x$

32. Find the differentiation of $x^{2/3}$ by using first principle. [NCERT Exemplar]

(a) $\frac{2}{3}x^{-1/3}$ (b) $\frac{-2}{3}x^{-1/3}$

(c) $\frac{2}{3}x^{1/3}$ (d) None of these

33. Find the differentiation of $\cos(x^2+1)$ by using first principle. [NCERT Exemplar]

(a) $2x\sin(x^2+1)$ (b) $-2x\sin(x^2+1)$

(c) $-2x\sin(x^2-1)$ (d) None of these

34. Find the differentiation of $x\cos x$ by using first principle. [NCERT Exemplar]

(a) $-x\sin x+\cos x$ (b) $x\sin x+\cos x$

(c) $-x\cos x-\cos x$ (d) None of these

35. If $y=\sqrt{x}+\frac{1}{\sqrt{x}}$, then $\frac{dy}{dx}$ at $x=1$ is [NCERT Exemplar]

(a) 1 (b) $\frac{1}{2}$ (c) $\frac{1}{\sqrt{2}}$ (d) 0

36. If $f(x)=\frac{x-4}{2\sqrt{x}}$, then $f'(1)$ is [NCERT Exemplar]

(a) $\frac{5}{4}$ (b) $\frac{4}{5}$ (c) 1 (d) 0

37. If $y=\dfrac{1+\frac{1}{x^2}}{1-\frac{1}{x^2}}$, then $\frac{dy}{dx}$ is [NCERT Exemplar]

(a) $\frac{-4x}{(x^2-1)^2}$ (b) $\frac{-4x}{x^2-1}$

(c) $\frac{1-x^2}{4x}$ (d) $\frac{4x}{x^2-1}$

38. If $y=\frac{\sin x+\cos x}{\sin x-\cos x}$, then $\frac{dy}{dx}$ at $x=0$ is [NCERT Exemplar]

(a) -2 (b) 0

(c) $\frac{1}{2}$ (d) does not exist

39. If $y=\frac{\sin(x+9)}{\cos x}$, then $\frac{dy}{dx}$ at $x=0$ is [NCERT Exemplar]

(a) cos 9 (b) sin 9 (c) 0 (d) 1

40. If $f(x)=1+x+\frac{x^2}{2}+\ldots+\frac{x^{100}}{100}$, then $f'(1)$ is equal to [NCERT Exemplar]

(a) $\frac{1}{100}$ (b) 100

(c) does not exist (d) 0

the **Guidance**

1. $\lim_{x\to 1}\frac{(1+x)^6-1}{(1+x)^2-1}=\frac{(1+1)^6-1}{(1+1)^2-1}$

$$=\frac{2^6-1}{2^2-1}=\frac{64-1}{4-1}=\frac{63}{3}=21$$

2. $\lim_{x\to\sqrt{2}}\frac{x^4-4}{x^2+3\sqrt{2}x-8}=\lim_{x\to\sqrt{2}}\frac{(x+\sqrt{2})(x-\sqrt{2})(x^2+2)}{(x-\sqrt{2})(x+4\sqrt{2})}$

$$=\lim_{x\to\sqrt{2}}\frac{(x+\sqrt{2})(x^2+2)}{(x+4\sqrt{2})}$$

$$=\frac{(\sqrt{2}+\sqrt{2})(2+2)}{(\sqrt{2}+4\sqrt{2})}$$

$$=\frac{8\sqrt{2}}{5\sqrt{2}}=\frac{8}{5}$$

3. $\lim_{x\to 1}\frac{x^7-2x^5+1}{x^3-3x^2+2}=\lim_{x\to 1}\frac{(x-1)(x^6+x^5-x^4-x^3-x^2-x-1)}{(x-1)(x^2-2x-2)}$

$$=\lim_{x\to 1}\frac{x^6+x^5-x^4-x^3-x^2-x-1}{x^2-2x-2}$$

$$=\frac{1^6+1^5-1^4-1^3-1^2-1-1}{1^2-2(1)-2}$$

$$=\frac{-3}{-3}=1$$

4. $\lim_{x\to 2}\frac{x^2-4}{\sqrt{3x-2}-\sqrt{x+2}}=\lim_{x\to 2}\frac{x^2-4}{(\sqrt{3x-2}-\sqrt{x+2})}$

$$\times\frac{\sqrt{3x-2}+\sqrt{x+2}}{\sqrt{3x-2}+\sqrt{x+2}}$$

$$= \lim_{x \to 2} \frac{(x^2 - 4)(\sqrt{3x-2} + \sqrt{x+2})}{(\sqrt{3x-2})^2 - (\sqrt{x+2})^2}$$

$$= \lim_{x \to 2} \frac{(x^2 - 4)(\sqrt{3x-2} + \sqrt{x+2})}{(3x-2) - (x+2)}$$

$$= \lim_{x \to 2} \frac{(x^2 - 4)(\sqrt{3x-2} + \sqrt{x+2})}{2x-4}$$

$$= \lim_{x \to 2} \frac{(x-2)(x+2)(\sqrt{3x-2} + \sqrt{x+2})}{2(x-2)}$$

$$= \lim_{x \to 2} \frac{(x+2)(\sqrt{3x-2} + \sqrt{x+2})}{2}$$

$$= \frac{(2+2)(\sqrt{6-2} + \sqrt{2+2})}{2} = \frac{4(2+2)}{2} = 8$$

5. $\lim_{x \to 1/2} \left(\frac{8x-3}{2x-1} - \frac{4x^2+1}{4x^2-1} \right)$

$$= \lim_{x \to 1/2} \left(\frac{(8x-3)(2x+1) - (4x^2+1)}{(2x-1)(2x+1)} \right)$$

$$= \lim_{x \to 1/2} \left(\frac{16x^2 + 2x - 3 - 4x^2 - 1}{(2x-1)(2x+1)} \right)$$

$$= \lim_{x \to 1/2} \left(\frac{12x^2 + 2x - 4}{(2x-1)(2x+1)} \right)$$

$$= \lim_{x \to 1/2} \left(\frac{2(6x^2 + x - 2)}{(2x-1)(2x+1)} \right)$$

$$= 2 \lim_{x \to 1/2} \frac{6x^2 + 4x - 3x - 2}{(2x-1)(2x+1)}$$

$$= 2 \lim_{x \to 1/2} \frac{(3x+2)(2x-1)}{(2x-1)(2x+1)} = 2 \lim_{x \to 1/2} \frac{3x+2}{2x+1}$$

$$= 2 \left(\frac{3 \times \frac{1}{2} + 2}{2 \times \frac{1}{2} + 1} \right) = 2 \left(\frac{7/2}{1+1} \right) = \frac{7}{2}$$

6. Given, $\lim_{x \to 2} \frac{x^n - 2^n}{x-2} = 80$

$$\Rightarrow \quad n(2)^{n-1} = 80 \quad \Rightarrow \quad n \times 2^{n-1} = 5 \times 2^4$$

$$\left[\because \lim_{x \to a} \left[\frac{x^n - a^n}{x-a} \right] = na^{n-1} \right]$$

$$\Rightarrow \quad n \times 2^{n-1} = 5 \times 2^{5-1}$$

On comparing, we get

$$n = 5$$

7. $\lim_{x \to 0} \frac{\sin^2 2x}{\sin^2 4x} = \lim_{x \to 0} \frac{\sin^2 2x}{(2x)^2} \times \frac{(4x)^2}{\sin^2 4x} \times \frac{1}{4}$

$$= \frac{1}{4} \lim_{x \to 0} \left(\frac{\sin 2x}{2x} \right)^2 \times \lim_{x \to 0} \left(\frac{4x}{\sin 4x} \right)^2$$

$$= \frac{1}{4} \times 1 \times 1 = \frac{1}{4} \qquad \left(\because \lim_{x \to a} \frac{\sin ax}{ax} = 1 \right)$$

8. $\lim_{x \to 0} \frac{1 - \cos 2x}{x^2} = \lim_{x \to 0} \frac{2 \sin^2 x}{x^2} = \lim_{x \to 0} 2 \left(\frac{\sin x}{x} \right)^2 = 2 \times 1 = 2$

9. $\lim_{x \to 0} \frac{2 \sin x - \sin 2x}{x^3}$

$$= \lim_{x \to 0} \frac{2\left(x - \frac{x^3}{3!} + \frac{x^5}{5!} - \ldots \right) - \left\{ 2x - \frac{(2x)^3}{3!} + \frac{(2x)^5}{5!} - \ldots \right\}}{x^3}$$

$$= \lim_{x \to 0} \frac{-\frac{2x^3}{3!} + \frac{2x^5}{5!} - \ldots \left(+ \frac{8x^3}{3!} - \frac{32x^5}{5!} + \ldots \right)}{x^3}$$

$$= \lim_{x \to 0} -\frac{2}{3!} + \frac{2}{5!} x^2 - \ldots \left(+ \frac{8}{3!} - \frac{32}{5!} x^3 - \ldots \right)$$

$$= -\frac{2}{3!} + 0 - \ldots \left(+ \frac{8}{3!} - 0 + \ldots \right) = -\frac{2}{6} + \frac{8}{6} = \frac{6}{6} = 1$$

10. Given, $\lim_{x \to \frac{\pi}{6}} \frac{\sqrt{3} \sin x - \cos x}{x - \frac{\pi}{6}}$

Let $x - \frac{\pi}{6} = h$, when $x \to \frac{\pi}{6} \Rightarrow h \to 0$

$$\therefore \quad \lim_{h \to 0} \frac{\sqrt{3} \sin\left(\frac{\pi}{6} + h \right) - \cos\left(\frac{\pi}{6} + h \right)}{h}$$

$$= \lim_{h \to 0} \frac{\sqrt{3}\left(\sin \frac{\pi}{6} \cos h + \cos \frac{\pi}{6} \sin h \right) - \left(\cos \frac{\pi}{6} \cos h - \sin \frac{\pi}{6} \sin h \right)}{h}$$

$$= \lim_{h \to 0} \frac{\sqrt{3}\left(\frac{1}{2} \cos h + \frac{\sqrt{3}}{2} \sin h \right) - \left(\frac{\sqrt{3}}{2} \cos h - \frac{1}{2} \sin h \right)}{h}$$

$$= \lim_{h \to 0} \frac{\frac{\sqrt{3}}{2} \cos h + \frac{3}{2} \sin h - \frac{\sqrt{3}}{2} \cos h + \frac{1}{2} \sin h}{h}$$

$$= \lim_{h \to 0} \frac{2 \sin h}{h} = 2 \times 1 = 2$$

11. Given, $\lim_{x \to a} \frac{\sin x - \sin a}{\sqrt{x} - \sqrt{a}}$

On multiplying and dividing by $\sqrt{x} + \sqrt{a}$, we get

$$\lim_{x \to a} \frac{\sin x - \sin a}{\sqrt{x} - \sqrt{a}} \times \frac{\sqrt{x} + \sqrt{a}}{\sqrt{x} + \sqrt{a}} = \lim_{x \to a} \frac{(\sin x - \sin a)(\sqrt{x} + \sqrt{a})}{x - a}$$

Let $x - a = h$, when $x \to a \Rightarrow h \to 0$,

$$\therefore \lim_{h \to 0} \frac{[\sin(a+h) - \sin a][\sqrt{a+h} + \sqrt{a}]}{h}$$

$$= \lim_{h \to 0} \frac{2 \cos \frac{a+h+a}{2} \sin\left(\frac{a+h-a}{2} \right) (\sqrt{a+h} + \sqrt{a})}{h}$$

$$\left(\because \sin C - \sin D = 2 \cos \frac{C+D}{2} \sin \frac{C-D}{2} \right)$$

$$= \lim_{h \to 0} \frac{2\cos\frac{2a+h}{2}\left(\sin\frac{h}{2}\right)(\sqrt{a+h}+\sqrt{a})}{2\left(\frac{h}{2}\right)}$$

$$= \frac{2\cos\left(\frac{2a+0}{2}\right)(\sqrt{a+0}+\sqrt{a})}{2} \qquad \left(\because \lim_{h \to 0} \frac{\sin h/2}{h/2} = 1\right)$$

$$= 2\sqrt{a}\cos a$$

12. Given, $\lim_{x \to \frac{\pi}{6}} \frac{\cot^2 x - 3}{\operatorname{cosec} x - 2}$

$$= \lim_{x \to \frac{\pi}{6}} \frac{\operatorname{cosec}^2 x - 1 - 3}{\operatorname{cosec} x - 2} \qquad (\because \operatorname{cosec}^2 x - \cot^2 x = 1)$$

$$= \lim_{x \to \frac{\pi}{6}} \frac{\operatorname{cosec}^2 x - 4}{\operatorname{cosec} x - 2} = \lim_{x \to \frac{\pi}{6}} \frac{(\operatorname{cosec} x - 2)(\operatorname{cosec} x + 2)}{(\operatorname{cosec} x - 2)}$$

(by factorization)

$$= \lim_{x \to \frac{\pi}{6}} (\operatorname{cosec} x + 2) = \operatorname{cosec}\frac{\pi}{6} + 2 = 2 + 2 = 4$$

13. $\lim_{x \to 0} \frac{\sqrt{2} - \sqrt{1+\cos x}}{\sin^2 x} = \lim_{x \to 0} \frac{\sqrt{2} - \sqrt{2}\cos^2\frac{x}{2}}{\sin^2 x}$

$$= \lim_{x \to 0} \frac{\sqrt{2}\left(1 - \cos^2\frac{x}{2}\right)}{\sin^2 x} = \lim_{x \to 0} \frac{\sqrt{2} \times \sin^2\frac{x}{2}}{\sin^2 x}$$

$$= \lim_{x \to 0} \sqrt{2} \times \frac{\sin^2\frac{x}{2}}{\left(\frac{x}{2}\right)^2} \times \frac{x^2}{\sin^2 x} \times \frac{1}{4}$$

$$= \frac{\sqrt{2}}{4} \lim_{x \to 0} \left(\frac{\sin\frac{x}{2}}{\frac{x}{2}}\right)^2 \times \lim_{x \to 0} \left(\frac{x}{\sin x}\right)^2$$

$$= \frac{1}{2\sqrt{2}} \times 1 \times 1 = \frac{1}{2\sqrt{2}}$$

14. $\lim_{x \to \pi} \frac{\sin x}{x - \pi}$

Put $x = \pi + h$ as $x \to \pi, h \to 0$

$$\therefore \lim_{h \to 0} \frac{\sin(\pi + h)}{h}$$

$$= \lim_{h \to 0} \frac{-\sin h}{h} = -(1) = -1$$

15. $\lim_{x \to 0} \frac{x^2 \cos x}{1 - \cos x}$

$$= \lim_{x \to 0} \frac{x^2 \cos x}{2\sin^2\frac{x}{2}} = \frac{1}{2} \lim_{x \to 0} \frac{\left(\frac{x}{2}\right)^2}{\sin^2\frac{x}{2}} \times 4 \lim_{x \to 0} \cos x$$

$$= 2 \times 1 \times 1 = 2$$

16. $\lim_{x \to 0} \frac{(1+x)^n - 1}{x}$

$$= \lim_{x \to 0} \frac{1 + nx + \frac{n(n-1)}{2}x^2 + \ldots - 1}{x}$$

$$= \lim_{x \to 0} \frac{nx\left(1 + \frac{n-1}{2}x + \ldots\right)}{x} = n(1 + 0 + \ldots) = n$$

17. $\lim_{x \to 1} \frac{x^m - 1}{x^n - 1}$

$$= \lim_{x \to 1} \frac{x^m - 1}{m} \times \frac{n}{(x^n - 1)} \times \frac{m}{n}$$

$$= 1 \times 1 \times \frac{m}{n} = \frac{m}{n} \qquad \left(\because \lim_{x \to 1} \frac{x^m - 1}{m} = 1\right)$$

18. $\lim_{\theta \to 0} \frac{1 - \cos 4\theta}{1 - \cos 6\theta} = \lim_{\theta \to 0} \frac{2\sin^2 2\theta}{2\sin^2 3\theta}$

$$= \lim_{\theta \to 0} \frac{\sin^2 2\theta}{(2\theta)^2} \times \frac{(3\theta)^2}{\sin 3\theta} \times \frac{4}{9} = 1 \times 1 \times \frac{4}{9} = \frac{4}{9}$$

19. We have, $\lim_{x \to 0} \frac{\operatorname{cosec} x - \cot x}{x}$

$$= \lim_{x \to 0} \frac{\frac{1}{\sin x} - \frac{\cos x}{\sin x}}{x} = \lim_{x \to 0} \frac{1 - \cos x}{x \sin x}$$

$$= \lim_{x \to 0} \frac{2\sin^2\frac{x}{2}}{x\left(2\sin\frac{x}{2}\cos\frac{x}{2}\right)} = \lim_{x \to 0} \frac{\sin\frac{x}{2}}{x\cos\frac{x}{2}} = \lim_{x \to 0} \frac{\tan\frac{x}{2}}{2 \cdot \frac{x}{2}}$$

$$= \frac{1}{2} \times 1 = \frac{1}{2} \qquad \left\{\because \lim_{x \to 0}\left(\frac{\tan\frac{x}{2}}{\frac{x}{2}}\right) = 1\right\}$$

20. $\lim_{x \to 0} \frac{\sin x}{\sqrt{x+1} - \sqrt{1-x}} \times \frac{\sqrt{x+1} \times \sqrt{1-x}}{\sqrt{x+1} + \sqrt{1-x}}$

$$= \lim_{x \to 0} \frac{\sin x(\sqrt{x+1} + \sqrt{1-x})}{(\sqrt{x+1})^2 - (\sqrt{1-x})^2}$$

$$= \lim_{x \to 0} \frac{\sin x(\sqrt{x+1} + \sqrt{1-x})}{x + 1 - (1-x)}$$

$$= \lim_{x \to 0} \frac{\sin x}{2x} \times \lim_{x \to 0} (\sqrt{x+1} + \sqrt{1-x})$$

$$= \frac{1}{2} \times 1 \times (\sqrt{0+1} + \sqrt{1-0}) = \frac{1}{2} \times (2) = 1$$

21. $\lim_{x \to 1} \frac{(\sqrt{x} - 1)(2x - 3)}{2x^2 + x - 3} = \lim_{x \to 1} \frac{(\sqrt{x} - 1)(2x - 3)}{(x - 1)(2x + 3)}$

$$= \lim_{x \to 1} \frac{(\sqrt{x} - 1)(2x - 3)}{(\sqrt{x} - 1)(\sqrt{x} + 1)(2x + 3)}$$

$$= \lim_{x \to 1} \frac{2x - 3}{(\sqrt{x} + 1)(2x + 3)} = \frac{2 - 3}{(1 + 1)(2 + 3)} = -\frac{1}{10}$$

22. We know that, $|x-4| = \begin{cases} x-4, & x \geq 4 \\ -(x-4), & x < 4 \end{cases}$

$$\text{LHL} = \lim_{x \to 4^-} \frac{|x-4|}{x-4}$$

$$= \lim_{x \to 4} \frac{-(x-4)}{x-4} = -1$$

$$\text{RHL} = \lim_{x \to 4^+} \frac{|x-4|}{x-4} = \lim_{x \to 4} \frac{x-4}{x-4} = 1$$

$\therefore$ LHL $\neq$ RHL

Hence, limit does not exist.

23. $\lim_{x \to 0} \frac{|\sin x|}{x}$

Since, $|\sin x| = \begin{cases} -\sin x, & x < 0 \\ \sin x, & x \geq 0 \end{cases}$

$\therefore$ $\text{LHL} = \lim_{x \to 0^-} \frac{-\sin x}{x} = -1$

$$\text{RHL} = \lim_{x \to 0^+} \frac{\sin x}{x} = 1$$

$\therefore$ LHL $\neq$ RHL

Hence, limit does not exist.

24. $$\lim_{x \to 0} \frac{\tan 2x - x}{3x - \sin x} = \lim_{x \to 0} \frac{2x + \frac{(2x)^3}{3} + \frac{(2x)^5}{15} + \ldots - x}{3x - \left(x - \frac{x^3}{3!} + \frac{x^5}{5!} - \ldots\right)}$$

$$= \lim_{x \to 0} \frac{x + \frac{(2x)^3}{3} + \frac{(2x)^5}{15} + \ldots}{2x + \frac{x^3}{3!} - \frac{x^5}{5!} + \ldots}$$

$$= \lim_{x \to 0} \frac{1 + \frac{2^3 x^2}{3} + \frac{2^5 x^4}{15} + \ldots}{2 + \frac{x^2}{3!} - \frac{x^4}{5!} + \ldots} = \frac{1}{2}$$

25. Given, $f(x) = \begin{cases} x+2, & x \leq -1 \\ cx^2, & x > -1 \end{cases}$

Since, at $x = -1$, limit exists

$\therefore$ RHL = LHL

$\Rightarrow$ $\lim_{x \to -1^+} f(x) = \lim_{x \to -1^-} f(x)$

$\Rightarrow$ $\lim_{h \to 0} f(-1+h) = \lim_{h \to 0} f(-1-h)$

$\Rightarrow$ $\lim_{h \to 0} c(-1+h)^2 = \lim_{h \to 0} -1-h+2$

$\Rightarrow$ $c(-1+0)^2 = +1-0$

$\Rightarrow$ $c = 1$

26. Let $y = \left(x + \frac{1}{x}\right)^3$

On differentiating w.r.t. x, we get

$$\frac{dy}{dx} = \frac{d}{dx}\left(x + \frac{1}{x}\right)^3$$

$$= \frac{d}{dx}\left\{x^3 + \frac{1}{x^3} + 3\left(x + \frac{1}{x}\right)\right\}$$

$$= \frac{d}{dx}\left(x^3 + \frac{1}{x^3} + 3x + \frac{3}{x}\right) = 3x^2 - \frac{3}{x^4} + 3 - \frac{3}{x^2}$$

27. Let $y = (3x+5)(1+\tan x)$

On differentiating w.r.t. x, we get

$$\frac{dy}{dx} = (3x+5)\frac{d}{dx}(1+\tan x) + (1+\tan x)\frac{d}{dx}(3x+5)$$

$$= (3x+5)(0+\sec^2 x) + (1+\tan x)(3)$$

$$= 3x\sec^2 x + 5\sec^2 x + 3 + 3\tan x$$

28. Let $y = \frac{x^5 - \cos x}{\sin x}$

On differentiating w.r.t. x, we get

$$\frac{dy}{dx} = \frac{\sin x \frac{d}{dx}(x^5 - \cos x) - (x^5 - \cos x)\frac{d}{dx}(\sin x)}{\sin^2 x}$$

$$= \frac{\sin x(5x^4 + \sin x) - (x^5 - \cos x)(\cos x)}{\sin^2 x}$$

$$= \frac{5x^4 \sin x + \sin^2 x - x^5 \cos x + \cos^2 x}{\sin^2 x}$$

$$= \frac{5x^4 \sin x + 1 - x^5 \cos x}{\sin^2 x}$$

29. Let $y = (ax^2 + \cot x)(p + q\cos x)$

$$\frac{dy}{dx} = (ax^2 + \cot x)\frac{d}{dx}(p + q\cos x) + (p + q\cos x)\frac{d}{dx}(ax^2 + \cot x)$$

$$= (ax^2 + \cot x)(0 - q\sin x) + (p + q\cos x)(2ax - \operatorname{cosec}^2 x)$$

$$= (ax^2 \cot x)(-q\sin x) + (p + q\cos x)(2ax - \operatorname{cosec}^2 x)$$

30. Let $y = x^2 \sin x + \cos 2x$

$$\frac{dy}{dx} = \frac{d}{dx}(x^2 \sin x) + \frac{d}{dx}(\cos 2x)$$

$$= x^2 \frac{d}{dx}(\sin x) + \sin x \frac{d}{dx}(x^2) + (-2\sin 2x)$$

$$= x^2 \cos x + 2x \sin x - 2\sin 2x$$

31. Let $y = \sin^3 x \cos^3 x \times \frac{8}{8} = \frac{(\sin 2x)^3}{8}$

$$\frac{dy}{dx} = \frac{1}{8} 3(\sin^2 2x)\frac{d}{dx}(\sin 2x)$$

$$= \frac{3}{8}(\sin^2 2x) \times \cos 2x(2) = \frac{3}{4}\sin^2 2x \cos 2x$$

32. Let $f(x) = x^{2/3}$

We know by first principle, $f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$

$\therefore$ $f'(x) = \lim_{h \to 0} \frac{(x+h)^{2/3} - x^{2/3}}{h}$

$\therefore$ $$\lim_{h \to 0} \frac{\left(x^{2/3} + \frac{2}{3}x^{-1/3}h + \ldots\right) - x^{2/3}}{h} = \frac{2}{3x^{1/3}}$$

33. Let $f(x) = \cos(x^2 + 1)$

We know by first principle,

$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$

$$\therefore \quad f'(x) = \lim_{h \to 0} \frac{\cos[(x+h)^2 + 1] - \cos(x^2 + 1)}{h}$$

$$[\because f(x) = \cos(x^2 + 1)]$$

$$= \lim_{h \to 0} \frac{-2 \sin \frac{(x+h)^2 + 1 + x^2 + 1}{2} \sin \frac{(x+h)^2 + 1 - (x^2 + 1)}{2}}{h}$$

$$\left(\because \cos C - \cos D = -2 \sin \frac{C+D}{2} \sin \frac{C-D}{2}\right)$$

$$= \lim_{h \to 0} \frac{-2 \sin \frac{(x+h)^2 + x^2 + 2}{2} \sin \frac{(x+h)^2 - x^2}{2}}{h}$$

$$= \lim_{h \to 0} \frac{-2 \sin \frac{(x+h)^2 + x^2 + 2}{2} \left[\sin \frac{(x+h)^2 - x^2}{2}\right]}{h \times \frac{(x+h)^2 - x^2}{2}} \times \left[\frac{(x+h)^2 - x^2}{2}\right]$$

$$= \lim_{h \to 0} \frac{-2 \sin \frac{(x+h)^2 + x^2 + 2}{2} \times \frac{(x+h+x)(x+h-x)}{2}}{h}$$

$$= \lim_{h \to 0} \frac{-2 \sin \left[\frac{(x+h)^2 + x^2 + 2}{2}\right] (2x+h) \frac{h}{2}}{h}$$

$$= -2 \sin\left(\frac{2x^2 + 2}{2}\right) \times 2x \times \frac{1}{2} = -2x \sin(x^2 + 1)$$

34. Let $f(x) = x \cos x$

$\therefore$ We know by first principle,

$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$

$$\therefore \quad f'(x) = \lim_{h \to 0} \frac{(x+h)\cos(x+h) - x\cos x}{h} \quad [\because f(x) = x \cos x]$$

$$= \lim_{h \to 0} \frac{x\cos(x+h) + h\cos(x+h) - x\cos(x)}{h}$$

$$= \lim_{h \to 0} \left[\frac{x[\cos(x+h) - \cos x]}{h} + \frac{h\cos(x+h)}{h}\right]$$

$$= \lim_{h \to 0} \left[\frac{-x2 \sin \frac{x+h+x}{2} \sin \frac{x+h-x}{2}}{h} + \cos(x+h)\right]$$

$$= \lim_{h \to 0} \left[\frac{-2x \sin \frac{2x+h}{2} \sin \frac{h}{2}}{2 \cdot \frac{h}{2}} + \cos(x+h)\right]$$

$$= -x \sin x + \cos x$$

35. Given, $y = \sqrt{x} + \frac{1}{\sqrt{x}}$

On differentiating w.r.t. x, we get $\frac{dy}{dx} = \frac{1}{2\sqrt{x}} - \frac{1}{2x^{3/2}}$

At $x = 1$,

$$\frac{dy}{dx} = \frac{1}{2\sqrt{1}} - \frac{1}{2(1)^{3/2}} = \frac{1}{2} - \frac{1}{2} = 0$$

36. Given, $f(x) = \frac{x-4}{2\sqrt{x}}$

On differentiating w.r.t. x, we get

$$f'(x) = \frac{\sqrt{x}(1) - (x-4)\frac{1}{2\sqrt{x}}}{2(\sqrt{x})^2}$$

$$\therefore \quad f'(1) = \frac{\sqrt{1}(1) - (1-4)\frac{1}{2\sqrt{1}}}{2(\sqrt{1})^2} = \frac{1 + \frac{3}{2}}{2} = \frac{5}{4}$$

37. Given, $y = \frac{1 + \frac{1}{x^2}}{1 - \frac{1}{x^2}} \Rightarrow y = \frac{x^2 + 1}{x^2 - 1}$

On differentiating w.r.t. x, we get

$$\frac{dy}{dx} = \frac{(x^2 - 1)(2x) - (x^2 + 1)(2x)}{(x^2 - 1)^2} = \frac{2x^3 - 2x - 2x^3 - 2x}{(x^2 - 1)^2} = \frac{-4x}{(x^2 - 1)^2}$$

38. Given, $y = \frac{\sin x + \cos x}{\sin x - \cos x}$

On differentiating w.r.t. x, we get

$$\frac{dy}{dx} = \frac{(\sin x - \cos x)(\cos x - \sin x) - (\sin x + \cos x)(\cos x + \sin x)}{(\sin x - \cos x)^2}$$

$$= -\frac{(\sin x - \cos x)^2 - (\sin x + \cos x)^2}{(\sin x - \cos x)^2}$$

At $x = 0$

$$\frac{dy}{dx} = -\frac{-(\sin 0 - \cos 0)^2 - (\sin 0 + \cos 0)^2}{(\sin 0 - \cos 0)^2}$$

$$= \frac{-(0-1)^2 - (0+1)^2}{(0-1)^2} = \frac{-1-1}{1} = -2$$

39. Given, $y = \frac{\sin(x+9)}{\cos x}$

On differentiating w.r.t. x, we get

$$\frac{dy}{dx} = \frac{\cos x \cos(x+9) - \sin(x+9)\sin x}{(\cos x)^2}$$

$$= \frac{\cos(x+9+x)}{(\cos x)^2} = \frac{\cos(2x+9)}{(\cos x)^2}$$

At $x = 0$,

$$\frac{dy}{dx} = \frac{\cos 9}{(\cos 0)^2} = \cos 9$$

40. Given, $f(x) = 1 + x + \frac{x^2}{2} + \ldots + \frac{x^{100}}{100}$

On differentiating w.r.t. x, we get

$$f'(x) = 0 + 1 + \frac{2x}{2} + \ldots + \frac{100x^{99}}{100}$$

$$= 1 + x + x^2 + \ldots + x^{99}$$

$$\therefore \quad f'(x) = 1 + 1 + 1^2 + \ldots + 1^{99} = 100$$

- Open Statement
- Truth Table
- Logical Connectives or Sentencial Connectives
- Elementary Operations of Logic
- Converse, Inverse and Contrapositive of an Implication
- Tautology
- Contradiction

19.1 Sentence

A sentence is a relatively independent grammatical unit. It can stand alone or it can be combined with other sentences to form a text, a story etc.

There are following types of statements.

(i) Declarative/Assertive Sentence

A declarative sentence 'declares' or states a fact, arrangement or opinion. Declarative sentence can be either positive or negative.

e.g., Gopal Pandey is an intelligent student.

(ii) Imperative Sentence

The imperative commands (or sometimes requests). The imperative takes no subject as 'you' is the implied subject.

The imperative form ends with a period (.) or an exclamation point (!)

e.g., Please give me a cold drink.

(iii) Exclamatory Sentence

In this type of sentence, there is a sudden burst of feeling. The feelings may be full of joys, sorrows etc.

e.g., Hurrah ! We win hockey match.

(iv) Interrogative Sentence

A sentence that asks a question is an interrogative sentence. The interrogative form ends with a question mark (?).

e.g., Do you think that you win the prize today?

Reasoning is the foundation of mathematics. As science verifies through observation, mathematics relies on logic. Mathematical reasoning includes the kind of instinct exhibited by a good Engineer who finds solutions that work without worrying about the formal proof.

(v) Optative Sentence

A sentence that expresses a wish is an optative sentence.

e.g., Wish you best of luck !

19.2 Statement (Proposition)

We convey our daily views in the form of sentence which is a collection of words. This collection of words is called statements, if it has some sense. Therefore,

"A declarative sentence, whose truth or falsity can be decided is called a statement of logical sentence but the sentence should not be imperative, interrogative and exclamatory."

Statements are denoted by $p, q, r, ..$ etc.

e.g., "Delhi is the capital of India" is a statement, while "Do your work", is not a statement. There are following types of statements.

Note The working nature of statement in logic is same as nature of switch in circuit.

i.e., Switch — ON (1), OFF (0) and Statement — True (T), False (F)

(i) Simple Statement

A statement, if cannot be broken into two or more sentences, is a simple statement. The truth value of the simple statement does not explicitly depend on any other statement. Generally, small letters $p, q, r, \ldots$ denote simple statements.

(ii) Compound Statement

A statement formed by two or more simple statement by the words such as "and", "or", "not", "if then", "if and only if", then the resulting statement is called a compound statement. This is also called Logical connectives.

Note Two circuits can be connected either by series or parallel.

i.e., Two statements can be connected either by '$\wedge$' or '$\vee$'.

(iii) Substatements

Simple statements which when combined form a compound statement are called substatements, also called components.

Note

- A true statement is known as a valid statement.
- A false statement is known as an invalid statement.
- Imperative, exclamatory, interrogative, optative sentences are not statements.
- Mathematical identities are considered to be statements because they can either be true or false but not both.

***Sample* Problem 1** *Which of the following sentence is/are not statement?* **[NCERT]**

(a) *The sum of* 5 *and* 7 *is greater then* 10.
(b) *Answer this question*
(c) *The product of* (– 1) *and* 8 *is* 8.
(d) *All real numbers are complex numbers.*

Interpret (*b*)

(a) It is true that sum of 5 and 7 is greater than 10. Hence, it is a statement.
(b) It is an order. Hence, it is not a statement.
(c) It is true that sum of interior angles of a triangle is 180°. Hence, it is a statement.
(d) It is true that all real numbers are complex numbers. All real number can be expressed as $a + ib$. Hence, it is a statement.

19.3 Open Statement

A sentence which contains one or more variables such that when certain values are given to the variable it becomes a statement, is called an open statement.

eg, "He is a great man" is an open sentence because in this sentence "He" can be replaced by any person.

***Sample* Problem 2** *Which of the following statements is/are open statement(s)?*

(a) *Ram eats a mangoe.*
(b) *Krishna goes to school.*
(c) *He lives in India.*
(d) *Anil and Anuj they are good friend.*

Interpret (c) In a given options, only option (c) is an open statement, because in this sentence 'he' can be specify to any person.

19.4 Truth Table

A table that shows the relationship between the truth value of compound statement, $S(p, q, r, \ldots)$ and the truth values of its substatements $p, q, r, \ldots$ etc., is called the truth table of statement S.

(i) For a single statement p, number of rows = $2^1 = 2$

p
T
F

(ii) For two statements p and q, number of rows = $2^2 = 4$

p	q
T	T
T	F
F	T
F	F

(iii) For three statements p, q and r,

Number of Rows $= 2^3 = 8$

p	q	r
T	F	F
T	F	T
T	T	F
T	T	T
F	F	F
F	F	T
F	T	F
F	T	T

Note If a compound statement has simply n substatements, then there are 2^n rows representing logical possibilities.

***Sample* Problem 3** *If there are 6 simple statements, then for making a table, the number of rows are*

(a) 32 (b) 64 (c) 16 (d) 128

Interpret (b) We know that, if compound statements has n substatements, then there are 2^n rows in a table.

Here, $n = 6$

$\therefore$ Total number of rows $= 2^6 = 64$

19.5 Logical Connectives or Sentencial Connectives

Two or more statements are combined to form a compound statement by using symbols. These symbols are called logical connectives.

Logical connectives are given below.

Words	Symbols
and	$\wedge$
or	$\vee$
implies that (if ..., then)	$\Rightarrow$
If and only if (implies and is implied by)	$\Leftrightarrow$

19.6 Elementary Operations of Logic

Formation of compound sentences from simple sentence using logical connectives are termed as elementary operation of logic. There are five such operations discussed below

(i) Negation (Inversion) of Statement

A statement which is formed by changing the truth value of a given statement by using word like 'no' or 'not' is called negation of a given statement. It is representalley the symbol '~'

e.g., Let p : the number 2 is greater than 7.

Then, $\sim p$: the number 2 is not greater than 7.

If p is statement, then negation of p is denoted by '$\sim p$'. The truth table for NOT is given by

p	$\sim p$
T	F
F	T

(ii) Conjunction

A compound sentence formed by two simple sentences p and q using connective "and" is called the conjunction of p and q and is represented by $p \wedge q$.

e.g., Let p : Ramesh is a student

and q : Ramesh belongs to allahabad. Then,

e.g., $p \wedge q \equiv$ Ramesh is a student and he belongs to Allahabad.

The truth table for operation 'and' is given by

p	q	$p \wedge q$
T	T	T
T	F	F
F	T	F
F	F	F

Above conjunction can be explained through circuit.
Here, denote $1 \approx T, 0 \approx F$

$p \vee q$

A_1	A_2	Result (Bulb)
1	0	0
1	1	1
0	1	0
0	0	0

$\longrightarrow$

p	q	$p \wedge q$
T	F	F
T	T	T
F	T	F
F	F	F

Note

- The statement $p \wedge q$ is true, if both p and q are true.
- The statement $p \wedge q$ is false, if atleast one of p and q or both are false.

(iii) Disjunction (Alternation)

A compound sentence formed by two simple sentences p and q using connective "or" is called the disjunction of p and q and is represented by $p \vee q$.

e.g., Let p : Bus left early and q : My watch is going slow. Then, $p \vee q =$ Bus left early or my watch is going slow.

The truth table for 'operation' OR is given by

p	q	$p \vee q$
T	T	T
T	F	T
F	T	T
F	F	F

The above disjunction can be explained through circuit.

Here, denote $I \approx T, 0 \approx F$

A_1	A_2	Result (Bulb)
1	0	1
1	1	1
0	1	1
0	0	0

$\longrightarrow$

p	q	$p \vee q$
T	F	T
T	T	T
F	T	T
F	F	F

Note

- The statement $p \vee q$ is true, if atleast one of p and q or both are true.
- The statement $p \wedge q$ is false, if both p and q are false.

(iv) **Implication** (Conditional)

A compound sentence formed by two simple sentences p and q using connective "if ... then ..." is called the implication of p and q and represented by $p \Rightarrow q$ which is read as "p implies q". Here, p is called antecedent or hypothesis and q is called consequent or conclusion.

e.g., Let p : Train reaches in time.

and $q = I$ can attend the meeting. Then,

$p \Rightarrow q \equiv$ if train reaches in time, then I can attend the meeting.

The truth table for if ... then is given by

p	q	$p \Rightarrow q$	$\sim p$	$\sim p \vee q$
T	T	T	F	T
T	F	F	F	F
F	T	T	T	T
F	F	T	T	T

It is clear from the truth table that column III is equal to column V

i.e., Statement $p \Rightarrow q$ is equivalent to $\sim p \vee q$.

(v) **Biconditional Statement**

Two simple sentences connected by the phrase "if and only if," form a biconditional statement. It is represented by the symbol '$\Leftrightarrow$'.

e.g., Let $p : \Delta ABC$ is an isosceles triangle

and q : two sides of a triangle are equal.

Then, $p \Leftrightarrow q : \Delta ABC$ is an isosceles triangle if and only if two sides of a triangle are equal.

The truth table for if and only if is given by

p	q	$p \Leftrightarrow q$	$\sim p$	$\sim q$	$\sim p \vee q$	$p \vee \sim q$	$(\sim p \vee q) \wedge (p \vee \sim q)$
T	T	T	F	F	T	T	T
T	F	F	F	T	F	T	F
F	T	F	T	F	T	F	F
F	F	T	T	T	T	T	T

Note

- It is clear form the truth table that column III is equal to column VIII. *i.e.*, statement $p \Leftrightarrow q$ is equivalent to $(\sim p \sim \vee q) \wedge (p \vee \sim q)$
- The statement $p \Leftrightarrow q$ has true, if either both are true or both are false.
- The statement $p \Leftrightarrow q$ has false, if exactly one of them is false.

Table for Basic Logical Connections

p	q	$\sim p$	$p \wedge q$	$q \vee q$	$p \Rightarrow q$	$p \Leftrightarrow q$
T	T	F	T	T	T	T
T	F	F	F	T	F	F
F	T	T	F	T	T	F
F	F	T	F	F	T	T

Hot Spot

Negation of a Statement

These types of problem are directly or indirectly asked in different years in AIEEE (JEE Main) from 2008 *to* 2012.

To solve such types of problem following steps are given.

Step I If the given problem is not in standard form, then converts it in standard form (mathematical form).

Step II Apply the negation operation on that standard form.

Step III Use other logical operation to simplify it and get the result.

Now, we explain the above method by giving illustrative example.

***Sample* Problem 4** *Find the negation of the statement* $(p \vee \sim q) \Rightarrow r$.

(a) $\sim (p \wedge \sim q) \Rightarrow \sim r$ (b) $p \wedge q \Rightarrow r$

(c) $\sim p \wedge q \Rightarrow r$ (d) *None of these*

Interpret (a) **Step I** Convert in standard form.

It is already in standard form.

Step II Applying the negation operation

$\therefore \quad \sim (p \vee \sim q) \Rightarrow \sim r$

Step III Use other logical operation

$$(\sim p \wedge (\sim \sim q)) \Rightarrow \sim r \equiv \sim p \wedge q \Rightarrow \sim r$$

***Sample* Problem 5** *Which of the following pairs of statements is/are negation of each other?* **[NCERT]**

I. *The number x is not a rational number*
The number x is not an irrational number

II. *The number x is a rational number*
The number is an irrational number

(a) I (b) II
(c) I *and* II (d) *None of these*

Interpret (c)

I. **The negation of the statement.** The number x is not a rational number *i.e.*, the number x is a rational number. The second statement is the same as x is not irrational. Hence, both statements are negations of each other.

II. **The negation** of the statement. The number x is not a rational number *i.e.*, the number x is not a rational number or we can say x is an irrational number. The second statement is same. Therefore, both are negations of each other.

***Sample* Problem 6** *If p : the unit digit of an integer is zero and q : it is divisible by 5, then the biconditional statement $p \Leftrightarrow q$ is*

(a) *The unit digit of an integer is zero, if and only if it is divisible by 5*
(b) *If the unit digit of an integer is zero, then it is divisible by 5*
(c) *The unit digit of an integer is zero or it is divisible by 5*
(d) *None of the above*

Interpret (a) Given, p : the unit digit of an integer is zero and q : it is divisible by 5.

The biconditional statement $p \Leftrightarrow q$ is "the unit digit of an integer is zero, if and only if it is divisible by 5".

***Sample* Problem 7** *Let p and q stand for statements*
p : Ram is tall.
q : Bimla is beautiful,
then the statement "Ram is not tall or Bimla is beautiful" stands for

(a) $p \vee q$ (b) $\sim p \vee q$ (c) $\sim p \wedge q$ (d) $p \wedge q$

Interpret (b) Given, p : Ram is tall and q : Bimla is beautiful

$\therefore$ Given, statement can be represented as $\sim p \vee q$

19.7 Converse, Inverse and Contrapositive of an Implication

If p and q are two statements, then here is a quick definition of their converse, inverse and contrapositive

Implied Statement : if then, Converse : if then , Inverse : if not then not, Contrapositive : if not , then not

Note

- The converse of $p \Rightarrow q$ is $q \Rightarrow p$
- The contrapositive of $p \Rightarrow q$ is $\sim q \Rightarrow \sim p$
- The inverse of $p \Rightarrow q$ is $\sim p \Rightarrow \sim q$

e.g., If 2 + 2 = 4, then Jawahar Lal Nehru is the first prime minister of India.

Let $p \equiv 2 + 2 = 4$

and $q \equiv$ Jawahar Lal Nehru is the first prime minister of India. Bicondintial statement $p \Rightarrow q$

(i) The converse of $p \Rightarrow q$ is $q \Rightarrow p$
i.e., If Jawahar Lal Nehru is the first prime minister of India, then 2+2=4

(ii) The contrapositive of $p \Rightarrow q$ is $\sim q \Rightarrow \sim p$
i.e., If Jawahar Lal Nehru is not the first prime minister of India, then 2+2=4,

(iii) The inverse of $p \Rightarrow q$ is $\sim p \Rightarrow \sim q$ *i.e.*, if $2+2 \neq 4$,
then Jawahar Lal Nehru is not the first prime minister of India.

***Sample* Problem 8** *The contrapositive and converse of the statements "If the two lines are parallel, then they do not intersect in the same plane" is* **[NCERT]**

(a) *If the two straight lines intersect in a plane, then the lines are not parallel.*
If the two lines do not intersect in the same plane, then the two lines are parallel
(b) *If the two straight lines intersect in a plane, then the lines are parallel*
If the two lines do not intersect in the same plane, then the two lines are parallel
(c) *If the two straight lines intersect in a plane, then the lines are not parallel.*
If the two lines do not intersect in the same plane, then the two lines are not parallel
(d) *None of the above*

Interpret (a) **Contrapositive statement** If two straight lines intersect in a plane, then the lines are not parallel.

Converse Statement If two lines do not intersect in the same plane, then two lines are parallel.

19.8 Tautology

A **compound** statement is called a tautology, if it has truth value T whatever may be the truth value of its compounds.
e.g., Statement $(p \Rightarrow q) \wedge p \Rightarrow q$ is a tautology.
The truth table is prepared as follows

p	q	$p \Rightarrow q$	$p \Rightarrow q \wedge p$	$(p \Rightarrow q) \wedge p \Rightarrow q$
T	T	T	T	T
T	F	F	F	T
F	T	T	F	T
F	F	T	F	T

19.9 Contradiction (Fallacy)

A compound statement is called contradiction, if its truth value is F whatever may be the truth value of its components. *e.g.,* Statement $\sim p \wedge p$ is a contradiction. The truth table is prepared as follows

p	$\sim p$	$\sim p \wedge p$
T	F	F
F	T	F

Note A statement which is neither a tautology nor a contradiction is a contigency.

***Sample* Problem 9** *The statement $p \vee \sim (p \wedge q)$ is a*

(a) *tautology*
(b) *contradiction*
(c) *contigency*
(d) *None of the above*

Interpret (a)

p	q	$p \wedge q$	$\sim (p \wedge q)$	$p \vee \sim (p \wedge q)$
T	T	T	F	T
T	F	F	T	T
F	T	F	T	T
F	F	F	T	T

Hence, all values of a given statement is true, so it is a tautology.

***Sample* Problem 10** *The statement $(p \vee q) \wedge (\sim p \wedge \sim q)$ is a*

(a) *tautology* (b) *contradiction*
(c) *contigency* (d) *None of these*

Interpret (b)

p	q	$p \vee q$	$\sim p$	$\sim q$	$\sim p \wedge \sim q$	$(p \vee q) \wedge (\sim p \wedge \sim q)$
T	T	T	F	F	F	F
T	F	T	F	T	F	F
F	T	T	T	F	F	F
F	F	F	T	T	T	F

Hence, all values of a given statement is false, so it is a contradiction.

***Sample* Problem 11** *The statement $p \wedge (q \Leftrightarrow r)$ is a*

(a) *tautology* (b) *contradiction*
(c) *contigency* (d) *None of these*

Interpret (c)

p	q	r	$q \Leftrightarrow r$	$p \wedge (q \Leftrightarrow r)$
T	F	F	T	T
T	F	T	F	F
T	T	F	F	F
T	T	T	T	T
F	F	F	T	F
F	F	T	F	F
F	T	F	F	F
F	T	T	T	F

Algebra of Statement

(i) **Idempotent Laws**
For any statement p, we have
(a) $p \wedge p \equiv p$ (b) $p \vee p \equiv p$

(ii) **Commutative Laws**
For any two statements p and q, we have
(a) $p \wedge q \equiv q \wedge p$ (b) $p \vee q \equiv q \vee p$

(iii) **Associative Laws**
For any three statements p, q and r, we have
(a) $(p \wedge q) \wedge r \equiv p \wedge (q \wedge r)$ (b) $(p \vee q) \vee r \equiv p \vee (q \vee r)$

(iv) **Distributive Laws**
For any three statements p, q and r, we have
(a) $p \vee (q \wedge r) \equiv (p \vee q) \wedge (p \vee r)$
(b) $p \wedge (q \vee r) \equiv (p \wedge q) \vee (p \wedge r)$

(v) **Involution Laws**
For any statement p, we have $\sim (\sim p) \equiv p$

(vi) **De-morgan's Laws**
If p and q are any two statement, then
(a) $\sim (p \wedge q) = \sim p \vee \sim q$ (b) $\sim (p \vee q) = \sim p \wedge \sim q$

(vii) **Contrapositive Law**
For any two statements p and q, we have
$$p \Rightarrow q \equiv (\sim p) \Rightarrow (\sim q)$$

(viii) **Identity Law**
For any statement p, we have
$p \wedge T \equiv p$; where, T is a true statement.

***Sample* Problem 12** *The proposition $\sim (p \Leftrightarrow q)$ is equivalent to*

(a) $(p \vee \sim q) \wedge (q \wedge \sim p)$ (b) $(p \wedge \sim q) \vee (q \wedge \sim p)$
(c) $(p \wedge \sim q) \wedge (q \wedge \sim p)$ (d) *None of these*

Interpret (b) $\sim (p \Leftrightarrow q) \equiv \sim [(p \Rightarrow q) \wedge (q \Rightarrow p)]$

$\equiv \sim (p \Rightarrow q) \vee (\sim (q \Rightarrow p))$

($\because$ by De-Morgan's law)

$\equiv (p \wedge \sim q) \vee (q \wedge \sim p)$

WORKED OUT
Examples

Example 1 *The negation of the statement "101 is not a multiple of 3" is* [NCERT Exemplar]

(a) 101 *is a multiple of* 3 (b) 101 *is a multiple of* 2
(c) 101 *is an odd number* (d) 101 *is an even number*

Solution (a) The negation of given statement is

"101 is a multiple of 3".

Example 2 *The converse of the statement "If sun is not shining, then sky is filled with clouds" is* [NCERT Exemplar]

(a) *if sky is filled with clouds, then the sun is not shining*
(b) *if sun is shining, then sky is filled with clouds*
(c) *if sky is clear, then sun is shining*
(d) *if sun is not shining, then sky is not filled with clouds*

Solution (a) The converse of the given statement is "If sky is filled with clouds, then the sun is not shining".

Example 3 *Which of the following statement is not a conjunction?* [NCERT Exemplar]

(a) *Ram and Shyam are friends*
(b) *Both Ram and Shyam are tall*
(c) *Both Ram and Shyam are enemies*
(d) *None of the above*

Solution (d) Here, we see that option (a), (b) and (c) are all conjunction statement.

Example 4 *The contrapositive and converse of the statement "I go to beach whenever it is a sunny day" is* [NCERT]

(a) (i) *If it is not a sunny day, then I do not go to beach.*
(ii) *If it is a sunny day, then I go to beach*
(b) (i) *If it is a sunny day, then I do not go to beach*
(ii) *If it is a sunny day, then I go to beach*
(c) (i) *If it is not a sunny day, then I go to beach.*
(ii) *If it is not a sunny day, then I go to beach.*
(d) *None of the above*

Solution (a) **Contrapositive statement** If it is not a sunny day, then I do not go to beach.

Converse statement If it is a sunny day, then I go to beach.

Example 5 *Suppose p : A natural number n is odd and q : natural number n is not divisible by 2, then the biconditional statement $p \Leftrightarrow q$ is* [NCERT]

(a) *A natural number n is odd, if and only if it is divisible by* 2
(b) *A natural number n is odd, if and only if it is not divisible by* 2
(c) *If a natural number n is odd, then it is not divisible by* 2
(d) *None of the above*

Solution (b) Given, p : A natural number n is odd and q : natural number n is not divisible by 2

The biconditional statement $p \Leftrightarrow q$ *i.e.*, "A natural number n is odd if and only if it not divisible by 2".

Example 6 *The statement $p \wedge (\sim q \vee r) \wedge (\sim r \vee q)$ is*

(a) *tautology*
(b) *contradiction*
(c) *contigency*
(d) *None of the above*

Solution (c)

p	q	r	$\sim q$	$\sim r$	$\sim q \vee r$	$\sim r \vee q$	$p \wedge ((\sim q \vee r) \wedge (\sim r \vee q))$
T	F	F	T	T	T	T	T
T	F	T	T	F	T	F	F

Start Practice for JEE Main

Round I (Topically Divided Problems)

Sentence and Statements

1. Which of the following is a statement? [NCERT Exemplar]

(a) x is a real number
(b) Switch off the fan
(c) 6 is a natural number
(d) Let me go

2. Which of the following is not a statement? [NCERT Exemplar]

(a) Smoking is injurious to health
(b) 2 + 2 = 4
(c) 2 is the only even prime number
(d) Come here

3. The negation of the statement

"72 is divisible by 2 and 3" is [NCERT Exemplar]

(a) 72 is not divisible by 2 or 72 is not divisible by 3
(b) 72 is not divisible by 2 and 72 is not divisible by 3
(c) 72 is divisible by 2 and 72 is not divisible by 3
(d) 72 is not divisible by 2 and 72 is divisible by 3

4. The contrapositive of the statement

"If 7 is greater than 5, then 8 is greater than 6" is [NCERT Exemplar]

(a) If 8 is greater than 6, then 7 is greater than 5
(b) If 8 is not greater than 6, then 7 is greater than 5
(c) If 8 is not greater than 6, then 7 is not greater than 5
(d) If 8 is greater than 6,then 7 is not greater than 5

5. The conditional statement of
"You will get a sweet dish after the dinner" is [NCERT Exemplar]

(a) If you take the dinner, then you will get a sweet dish
(b) If you take the dinner, you will get a sweet dish
(c) You get a sweet dish if and only if you take the dinner
(d) None of the above

6. Let R be the set of real numbers and $x \in R$. Then, $x + 3 = 8$ is

(a) open statement (b) a true statement
(c) false statement (d) None of these

7. Which of the following is not logically equivalent to the following proposition?

"A real number is either rational or irrational"

(a) If a number is neither rational nor irrational, then it is not real
(b) If a number is not a rational or not an irrational, then it is not real
(c) If a number is not real, then it is neither rational or irrational
(d) If a number is real, then it is rational or irrational

8. Which of the following is not a proposition ?

(a) $\sqrt{3}$ is a prime
(b) $\sqrt{2}$ is irrational
(c) Mathematics is interesting
(d) 5 is an even integer

9. Which of the following is an open statement

(a) x is a natural number
(b) Give me a glass of water
(c) Wish you best of luck
(d) Good morning to all

Elementary Operations of Logic

10. The negation of the "statement, if a quadrilateral is a square, then it is a rhombus" is

(a) if a quadrilateral is not a square, then it is a rhombus
(b) if a quadrilateral is a square, then it is not a rhombus
(c) a quadrilateral is a square and it is not a rhombus
(d) a quadrilateral is not a square and it is a rhombus

11. In the truth table for the statement $(\sim p \Rightarrow \sim q) \wedge (\sim q \Rightarrow \sim p)$, the last column has the truth value in the following order
(a) TTTF (b) FTTF (c) TFFT (d) TTTT

12. If p, q and r are simple propositions with truth value true, false and true respectively, then the truth value of $((\sim p \vee q) \wedge \sim r) \Rightarrow p$
(a) true (b) false
(c) true, if r is false (d) true, if q is true

13. Let p and q be two statements. Then, $p \vee q$ is false, if
(a) p is false and q is true (b) both p and q are false
(c) both p and q are true (d) None of these

14. Let $p \wedge (q \vee r) = (p \wedge q) \vee (p \wedge r)$. Then, this law is known as
(a) Commutative law (b) Associative law
(c) De Morgan's law (d) Distributive law

15. Let p be the proposition Mathematics is interesting and let q be the proposition that Mathematics is difficult, then the symbol $p \wedge q$ means
(a) Mathematics is interesting implies that Mathematics is difficult.
(b) Mathematics is interesting implies and is implied by Mathematics is difficult.
(c) Mathematics is interesting and Mathematics is difficult.
(d) Mathematics is interesting or Mathematics is difficult.

16. If p : A man is happy.
q : A man is rich.
Then, the statement, "If a man is not happy, then he is not rich" is written as
(a) $\sim p \rightarrow \sim q$ (b) $\sim q \rightarrow p$
(c) $\sim q \rightarrow \sim p$ (d) $q \rightarrow \sim p$

17. Which of the following is the inverse of the proposition "If a number is a prime, then it is odd."
(a) If a number is not a prime, then it is odd
(b) If a number is not a prime, then it is not odd
(c) If a number is not odd then it is not a prime
(d) If a number is not odd, then it is a prime

18. The false statement in the following is
(a) $p \wedge (\sim p)$ is contradiction
(b) $(p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$ is a contradiction
(c) $\sim (\sim p) \Leftrightarrow p$ is a tautology
(d) $p \vee (\sim p) \Leftrightarrow$ is a tautology

19. $\sim (p \vee (\sim q))$ is equal to
(a) $\sim p \vee q$ (b) $(\sim p) \wedge q$
(c) $\sim p \vee \sim p$ (d) $\sim p \wedge \sim p$

20. If p and q are two statements such that
p : the questions paper is easy
q : we shall pass,
then the symbolic statement $\sim p \rightarrow \sim q$ means
(a) If the question paper is easy, then we shall pass
(b) If the question paper is not easy, then we shall not pass
(c) The question paper is easy and we shall pass
(d) The question paper is easy or we shall pass

21. For the following three statements
p : 2 is an even number
q : 2 is a prime number.
r : Sum of two prime numbers is always even, then the symbolic statement $(p \wedge q) \rightarrow \sim r$ means
(a) 2 is an even and prime number and the sum of two prime numbers is always even
(b) 2 is an even and prime number and the sum of two prime numbers is not always even
(c) 2 is an even and prime number, then the sum of two prime numbers is not always even
(d) 2 is an even and prime number, then the sum of two prime numbers is always even

22. For two statements p and q
p : A quadrilateral is a parallelogram,
q : The opposite sides are parallel.
Then, the compound proposition, "A quadrilateral is a parallelogram if and only if the opposite sides are parallel" is represented by
(a) $p \vee q$ (b) $p \rightarrow q$
(c) $p \wedge q$ (d) $p \leftrightarrow q$

23. If p, q, r and s are four simple statements, such as
p : The school bus will come
q : I go to school
r : I shall meet my friends
s : I shall go out for a movie,
then the compound statement, "If the school bus does not come or I will not go to school, then I shall meet my friend and go out for a movie." is represented by
(a) $\sim (p \wedge q) \Rightarrow (r \wedge s)$
(b) $\sim (p \wedge \sim q) \Rightarrow (r \wedge s)$
(c) $\sim (p \wedge q) \Rightarrow (r \vee s)$
(d) None of these

24. If p = He is intelligent.
q = He is strong.
Then, symbolic form of statement
"It is wrong that he is intelligent or strong," is
(a) $\sim p \vee \sim p$ (b) $\sim (p \wedge q)$
(c) $\sim (p \vee q)$ (d) $p \vee \sim q$

25. Which of the following is true for the statements p and q?
(a) $p \wedge q$ is true when atleast one of p and q is true
(b) $p \rightarrow q$ is true when p is true and q is false
(c) $p \leftrightarrow q$ is true only when both p and q are true
(d) $\sim (p \vee q)$ is false only when both p and q are false

26. If $p \Rightarrow (q \vee r)$ is false, then the truth values of p, q, r are respectively,
(a) T, F, F (b) F, F, F
(c) F, T, T (d) T, T, F

27. Negation of the statement $p \rightarrow (q \wedge r)$ is
(a) $\sim p \rightarrow \sim (q \vee r)$ (b) $\sim p \rightarrow \sim (q \wedge r)$
(c) $(q \wedge r) \rightarrow p$ (d) $p \wedge (\sim q \vee \sim r)$

28. $p \vee q$ is true when
(a) both p and q are true (b) p is true and q is false
(c) p is false and q is true (d) All of these

29. The statement $(\sim p \wedge q) \vee \sim q$ is
(a) $p \vee q$ (b) $p \wedge q$
(c) $\sim (p \vee q)$ (d) $\sim (p \wedge q)$

30. $\sim [\{\sim p) \wedge q]$ is equal to
(a) $p \vee (\sim q)$ (b) $p \vee q$
(c) $p \wedge (\sim q)$ (d) $\sim p \wedge \sim q$

31. $(\sim (\sim p)) \wedge q$ is equal to
(a) $\sim p \wedge q$ (b) $p \wedge q$
(c) $p \wedge \sim q$ (d) $\sim p \wedge \sim q$

32. Which of the following is true?
(a) $p \Rightarrow q \equiv \sim p \Rightarrow \sim q$
(b) $\sim (p \Rightarrow \sim q) \equiv \sim p \wedge q$
(b) $\sim (p \Rightarrow \sim q) \equiv \sim p \wedge q$
(c) $\sim (\sim p \Rightarrow \sim q) \equiv \sim p \wedge q$
(d) $\sim (\sim p \Leftrightarrow q) \equiv [\sim (p \Rightarrow q) \wedge \sim (q \Rightarrow p)]$

33. Let truth values of p be F and q be T. Then, truth value of $\sim (\sim p \vee q)$ is
(a) T (b) F
(c) either T or F (d) neither T nor F

34. If statements p and r are false and q is true, then truth value of $\sim p \Rightarrow (q \wedge r) \vee r$ is
(a) T (b) F
(c) either T or F (d) neither T nor F

35. Which of the following is always true?
(a) $(p \Rightarrow q) \equiv \sim q \Rightarrow \sim p$
(b) $\sim (p \vee q) \equiv \sim p \vee \sim q$
(c) $\sim (p \Rightarrow q) \equiv p \wedge \sim q$
(d) $\sim (p \vee q) \equiv \sim p \wedge \sim q$

36. If $p \Rightarrow (q \vee r)$ is false, then the truth values of p, q and r are respectively.
(a) TFF (b) FFF
(c) FTT (d) TTF

37. The logically equivalent proposition of $p \Leftrightarrow q$ is
(a) $(p \wedge q) \vee (p \wedge q)$ (b) $(p \Rightarrow q) \wedge (q \Rightarrow p)$
(c) $(p \wedge q) \vee (q \Rightarrow p)$ (d) $(p \wedge q) \Rightarrow (p \vee q)$

38. The statement $p \Rightarrow (q \Rightarrow p)$ is equivalent to
(a) $p \Rightarrow (p \Rightarrow q)$ (b) $p \Rightarrow (p \vee q)$
(c) $p \Rightarrow (p \wedge q)$ (d) $p \Rightarrow (p \Leftrightarrow q)$

39. If p and q are simple propositions, then $p \Rightarrow \sim q$ is true when
(a) both p and q are true (b) both p and q are false
(c) p is false and q is true (d) None of these

40. Which of the following is logically equivalent to $\sim (\sim p \Rightarrow q)$?
(a) $p \wedge q$ (b) $p \wedge \sim q$
(c) $\sim p \wedge q$ (d) $\sim p \wedge \sim q$

41. $\sim (p \vee q) \vee (\sim p \wedge q)$ is logically equivalent to
(a) $\sim p$ (b) p
(c) q (d) $\sim q$

42. Negation of the statement $(p \wedge r) \rightarrow (r \vee q)$ is
(a) $\sim (p \wedge r) \rightarrow \sim (r \vee q)$ (b) $(\sim p \vee \sim r) \vee (r \vee q)$
(c) $(p \wedge r) \wedge (r \wedge q)$ (d) $(p \wedge r) \wedge (\sim r \wedge \sim q)$

43. Which of the following is equivalent to $(p \wedge q)$?
(a) $p \rightarrow \sim q$ (b) $\sim (\sim p \wedge \sim q)$
(c) $\sim (p \rightarrow \sim q)$ (d) None of these

44. If p, q are true statements and r, s are false statements, then the truth value of $\sim ((p \wedge \sim r) \vee (\sim q \vee s))$ is
(a) true (b) false
(c) false for any p (d) None of these

45. If the compound statement $p \rightarrow (\sim p \vee q)$ is false, then the truth value of p and q are respectively
(a) T, T, (b) T, F
(c) F, T (d) F, F

46. Which of the following is always true?
(a) $(\sim p \vee \sim q) \equiv (p \wedge q)$
(b) $(p \rightarrow q) \equiv (\sim q \rightarrow \sim p)$
(c) $\sim (p \rightarrow \sim q) \equiv (p \wedge \sim q)$
(d) $\sim (p \leftrightarrow q) \equiv (p \rightarrow q) \rightarrow (q \rightarrow p)$

47. The negation of the compound statement $(p \vee q) \wedge r$ is
(a) $(\sim p \vee \sim q) \wedge \sim r$ (b) $(\sim p \wedge \sim q) \vee \sim r$
(c) $\sim (p \vee q) \Rightarrow r$ (d) $p \wedge q$

48. The negation of $(\sim p \wedge q) \vee (p \wedge \sim q)$ is
(a) $(p \vee \sim q) \vee (\sim p \vee q)$ (b) $(p \vee \sim q) \wedge (\sim p \vee q)$
(c) $(p \wedge \sim q) \wedge (\sim p \vee q)$ (d) $(p \vee \sim q) \wedge (p \vee \sim q)$

49. The negation of $(p \vee q) \wedge (p \vee \sim r)$ is
(a) $(\sim p \wedge \sim q) \vee (p \wedge \sim r)$ (b) $(\sim p \wedge \sim q) \wedge (\sim p \wedge r)$
(c) $(\sim p \wedge \sim q) \vee (\sim p \wedge r)$ (d) None of these

Tautology and Contradiction

50. A proposition is called a tautology, if it is
(a) always T
(b) always F
(c) sometimes T, sometimes F
(d) None of the above

51. If p and q are two statements, then statement $p \Rightarrow q \wedge \sim q$ is
(a) tautology
(b) contradiction
(c) neither tautology nor contradiction
(d) None of the above

52. Let p and q be two statements, then $(p \vee q) \vee \sim p$ is
(a) tautology (b) contradiction
(c) Both (a) and (b) (d) None of these

53. The statement $p \vee \sim p$ is
(a) tautology
(b) contradiction
(c) neither a tautology nor a contradiction
(d) None of the above

54. The statement $(p \Rightarrow q) \Leftrightarrow (\sim p \wedge q)$ is a
(a) tautology (b) contradiction
(c) neither (a) nor (b) (d) None of these

55. The proposition $\sim (p \Rightarrow q) \Rightarrow (\sim p \vee \sim q)$ is
(a) a Tautology (b) a Contradiction
(c) either (a) or (b) (d) neither (a) nor (b)

56. The negation of the compound proposition is $p \vee (\sim p \vee q)$
(a) $(p \wedge \sim q) \wedge \sim p$
(b) $(p \vee \sim q) \vee \sim p$
(c) $(p \wedge \sim q) \vee \sim p$
(d) None of the above

57. If p and q are two statements, then $\sim (p \wedge q) \vee \sim (q \Leftrightarrow p)$ is
(a) tautology
(b) contradiction
(c) neither tautology nor contradiction
(d) either tautology or contradiction

58. Let p and q be two statements. Then,
$$(\sim p \vee q) \wedge (\sim p \wedge \sim q) \text{ is a}$$
(a) tautology
(b) contradiction
(c) neither tautology nor contradiction
(d) both tautology and contradiction

59. The proposition $(p \Rightarrow \sim p) \wedge (\sim p \Rightarrow p)$ is
(a) contigency
(b) neither Tautology nor Contradiction
(c) contradiction
(d) tautology

60. If p and q are two statements, then
$$(p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p) \text{ is a}$$
(a) contradiction (b) tautology
(c) neither (a) nor (b) (d) None of these

61. The proposition $S : (p \Rightarrow q) \Leftrightarrow (\sim p \vee q)$ is
(a) a tautology (b) a contradiction
(c) either (a) or (b) (d) neither (a) nor (b)

62. The false statement in the following is
(a) $p \wedge (\sim p)$ is a contradiction
(b) $(p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$ is a contradiction
(c) $\sim (\sim p) \Leftrightarrow p$ is a tautology
(d) $p \vee (\sim p)$ is a tautology

63. $(p \wedge \sim q) \wedge (\sim p \wedge q)$ is
(a) a tautology
(b) a contradiction
(c) both a tautology and a contradiction
(d) neither a tautology nor a contradiction

64. The propositions $(p \Rightarrow \sim p) \wedge (\sim p \Rightarrow p)$ is
(a) Tautology and contradiction
(b) Neither tautology nor contradiction
(c) Contradiction
(d) Tautology

Round II (Mixed Bag)

Only One Option Correct

1. Statement $(p \wedge \sim q) \wedge (\sim p \vee q)$ is
(a) a tautology
(b) a contradiction
(c) both a tautology and a contradiction
(d) neither a tautology nor a contradiction

2. Which of the following is wrong statement?
(a) $p \rightarrow q$ is logically equivalent to $\sim p \vee q$
(b) If the truth values of p, q, r are T, F, T respectively, then the truth value of $(p \vee q) \wedge (q \vee r)$ is T
(c) $\sim (\vee q \vee q \vee r) \cong \sim p \wedge \sim q \wedge \sim r$
(d) The truth value of $p \wedge \sim (p \vee q)$ is always T

3. Which of the following statement is a contradiction?
(a) $(\sim p \vee \sim q) \vee (p \vee \sim q)$ (b) $(p \rightarrow q) \vee (p \wedge \sim q)$
(c) $(\sim p \wedge q) \wedge (\sim q)$ (d) $(\sim p \wedge q) \vee (\sim q)$

4. Which of the following is wrong?
(a) $p \vee \sim p$ is a tautology
(b) $\sim (\sim p) \leftrightarrow p$ is a tautology
(c) $p \wedge \sim p$ is a contradiction
(d) $((p \wedge q) \rightarrow q) \rightarrow p$ is a tautology

5. If p, q and r are simple propositions, then $(p \wedge q) \wedge (q \wedge r)$ is true, then
(a) p, q and r are true
(b) p, q are true and r is false
(c) p is true and q, r are false
(d) p, q and r are false

6. If $(q \wedge -r) \Rightarrow (q \vee r)$ is false, then p is
(a) True (b) False
(c) May be true and false (d) None of these

More Than One Correct Option

7. If p and q are simple proposition, then $(\sim p \wedge q) \vee (\sim q \wedge p)$ is false when p and q are respectively
(a) T, T (b) T, F
(c) F, F (d) F, T

8. If p, q and r are simple proposition, then $(\sim p \vee q) \Rightarrow r$ is true, when p, q and r are, respectively
(a) T, F, T (b) T, T, T
(c) T, F, F (d) F, F, F

9. Which of the following sentences is/are not statements? [NCERT]
(a) There are 35 days in a month.
(b) Mathematics is difficult.
(c) The square of a number is an even number.
(d) The side of a quadrilateral have equal lengths.

Comprehension Based Questions

Passage

Directions (Q. Nos. 10 and 11) *Let us define a truth table*

q	p	q	$\sim p$	$p \wedge q$	$\sim p \vee \sim q$	$\sim(\sim p \vee \sim q)$
F	T	T	T	F	F	T
T	T	F	F	F	T	F
F	F	T	T	F	T	F
T	F	F	T	F	T	F

On the basis of the above table, solve the following questions

10. The statement $\sim(\sim p \vee \sim q)$ is
(a) tautology (b) contradiction
(c) contigency (d) None of these

11. If $\sim(p \wedge q)$ is false, then corresponding values of p and q are, respectively
(a) T, T (b) T, F
(c) F, T (d) None of these

Assertion and Reason

Directions (Q. Nos. 12-21) *Each of these questions contans two statements : statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternatite choice, only one of which is the correct answer. You has to select one of the codes* (*a*), (*b*), (*c*), (*d*) *given below.*
(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.
(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.
(c) Statement I true, Statement II is false.
(d) Statement I is false, Statement II is true.

12. **Statement I** The statement $[p \wedge (p \to q)] \to q$ is a tautology.
Statement II If all truth values of a statement is true, then the statement is a tautology.

13. Let p : Ice is cold and q : blood is green be two statements, then
Statement I $p \vee q$: Ice is cold or blood is green.
Statement II $p \wedge q$: Ice is not cold or blood is green.

14. Let $S : \sim(p \Rightarrow q) \vee \sim(q \Rightarrow p)$
Statement I The statement S is logically equivalent to $(p \Leftrightarrow q)$
Statement II The logically equivalent proposition of $p \Leftrightarrow q$ is $(p \Rightarrow q) \wedge (q \Rightarrow p)$

15. If $p \to q$ be any conditional statement,
Statement I The converse of $p \to q$ is the statement $q \to p$.
Statement II The inverse of $p \to q$ is the statement $\sim q \to \sim p$.

16. Suppose p, q and r be any three statements.
Statement I The statement $p \to (q \to r)$ is a tautology.
Statement II $(p \wedge q) \to r$ and $p \to (q \to r)$ are identical.

17. Let p be the statement, "Mr A passed the examination", q be the statement, "Mr A is sad" and r be the statement "It is not true that Mr A passed therefore he is sad."
Statement I $r \equiv p \Rightarrow q$
Statement II The logical equivalent of $p \Rightarrow q$ is $\sim p \vee q$.

18. **Statement I** $\sim(p \leftrightarrow \sim q)$ is equivalent to $p \leftrightarrow q$
Statement II $\sim(p \leftrightarrow \sim q)$ is a tautology

19. **Statement I** $\sim(A \Leftrightarrow \sim \beta)$ is equivalent to $A \Leftrightarrow B$.
Statement II $A \vee (\sim(A \wedge \sim B))$ a tautology.

20. Consider
Statement I $(p \wedge \sim q) \wedge (\sim p \wedge q)$ is a fallacy.
Statement II $(p \to q) \leftrightarrow (\sim q \to \sim p)$ is a tautology.

21. Let p be the statement 'x is an irrational number', q be the statement 'y is a transcendental number' and r be the statement 'x is a rational number iff y is a transcendental number'.
Statement I r is equivalent to either q or p.
Statement II r is equivalent to $\sim(p \leftrightarrow \sim p)$.

Previous Years' Questions

22. The statement $p \to (q \to p)$ is equivalent to **[AIEEE 2008]**

(a) $p \to (p \leftrightarrow q)$ (b) $p \to (p \to q)$
(c) $p \to (p \vee q)$ (d) $p \to (p \wedge q)$

23. The negation of the statement

"If become a teacher, then I will open a school", is **[AIEEE 2012]**

(a) I will become a teacher and I will not open a school
(b) Either I will not become a teacher or I will not open a school
(c) Neither I will become a teacher nor I will open a school
(d) I will not become a teacher or I will open a school

24. The only statement among the following that is a tautology is **[AIEEE 2011]**

(a) $B \to [A \wedge (A \to B)]$
(b) $A \wedge (A \vee B)$
(c) $A \vee (A \wedge B)$
(d) $[A \wedge (A \to B)] \to B$

25. Consider the following statements
P : Suman is brilliant.
Q : Suman is rich.
R : Suman is honest.

The nagative of the statement. 'Suman is brilliant and dishonest, if and only if Suman is rich.' can be expressed as **[AIEEE 2011]**

(a) $\sim Q \leftrightarrow (P \sim R)$ (b) $\sim Q \leftrightarrow P \wedge R$
(c) $\sim (P \wedge \sim R) \leftrightarrow Q$ (d) $\sim P \wedge (Q \leftrightarrow \sim R)$

26. Let S be a non-empty subset of R. Consider the following statement

p : There is a rational number $x \in S$ such that $x > 0$.

Which of the following statements is the negation of the statement p? **[AIEEE 2010]**

(a) There is a rational number $x \in S$ such that $x \le 0$
(b) There is no rational number $x \in S$ such that $x \le 0$
(c) Every rational number $x \in S$ satisfies $x \le 0$
(d) $x \in S$ and $x \le 0 \Rightarrow x$ is not rational

the Guidance

Round I

1. (a) Here, without knowing the value of x, we do not know whether the given sentence is true or false. So, it is a sentence but not a statement.

(b) It is an imperative sentence and therefore it is not a statement

(c) It is a declarative sentence, which is clearly true. Therefore, it is a true statement

(d) It is an imperative sentence and therefore it is not a statement

2. In option (a), (b) and (c).

It is a declarative sentence, which is clearly true, therefore it is a true statement.

In option (d), it is an imperative sentence, therefore it is not a statement.

3. The negation of the given statement is "72 is not divisible by 2 or 72 is not divisible by 3".

4. The contrapositive of the given statement is "If 8 is not greater than 6, then 7 is not greater than 5.

5. The conditional statement of given statement is "If you take the dinner, then you will get a sweet dish".

6. Given, $x + 3 = 8$

It is an open statement.

7. Given proposition is not logically equivalent to "If a number is not a rational or not an irrational, then it is not real".

8. Mathematics is interesting is not a logical sentence. It may be interesting for some persons and may not be interesting for others.

$\therefore$ This is not a proposition.

9. "x is a natural number" is an open statement.

10. Let p and q be the propositions as given below

p : A quadrilateral is a square

q : A quadrilateral is a rhombus

The given proposition is $p \to q$

Now, $\sim (p \to q) \equiv p \wedge \sim q$

Therefore, the negation of the given proposition is

"A quadrilateral is a square and it is not a rhombus"

11. Let $S : (\sim p \Rightarrow \sim q) \wedge (\sim q \Rightarrow \sim p)$

$\sim p$	$\sim q$	$\sim p \Rightarrow \sim q$	$\sim q \Rightarrow \sim p$	S
T	T	T	T	T
T	F	F	T	F
F	T	T	F	F
F	F	T	T	T

12. Let $S : ((\sim p \vee q) \wedge \sim r) \Rightarrow p$

$\Rightarrow \quad S : ((\sim T \vee F) \wedge \sim T) \Rightarrow T$

13.

p	q	$p \vee q$
T	T	T
T	F	T
F	T	T
F	F	F

It is clear from the truth table that $p \vee q$ is false only when p and q are false.

14. By distributive law, $p \wedge (q \vee r) = (p \wedge q) \vee (p \wedge r)$

15. Given, p : Mathematics is interesting

q : Mathematics is difficult

$\therefore$ $p \wedge q$. Mathematics is interesting and Mathematics is difficult.

16. $\because p$: A man is happy

and q : A man is rich.

'If a man is not happy, then he is not rich' is written as $\sim p \to \sim q$.

17. p : A number is a prime

q : It is odd.

We have, $p \Rightarrow q$

The inverse of $p \Rightarrow q$ is $\sim p \Rightarrow \sim q$

i.e., if a number is not a prime, then it is not odd.

18. $p \Rightarrow q$ is logically equivalent to $\sim q \Rightarrow \sim p$

$\therefore$ $(p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$ is a tautology but not a contradiction.

19. $\sim (p \vee (\sim q)) \equiv \sim p \wedge \sim (\sim q) \equiv (\sim p) \wedge q$

20. Given, p : The question paper is easy and q : We shall pass given.

The symbolic representation of given option are

(a) : $p \to q$

(b) : $\sim p \to \sim q$

(c) : $p \wedge q$

(d) : $p \vee q$

21. Given, p : 2 is an even number

q : 2 is a prime number

r : sum of two prime numbers is always even.

The symbolic representation of given option (s) are

(a) : $p \wedge q \wedge r$

(b) : $p \wedge q \wedge \sim r$

(c) : $p \wedge q \Rightarrow \sim r$

(d) : $p \wedge q \Rightarrow r$

22. Given, p : A quadrilateral is a parallelogram.

q : The opposite sides are parallel.

"A quadrilateral is a parallelogram if and only if the opposite sides are parallel" is represented by $p \leftrightarrow q$.

23. (If the school bus does not come) $\vee$ (I will not go to school) $\rightarrow$ (I shall meet my friend) $\wedge$ (I shall go out for a movie)

$\Rightarrow \quad (\sim p) \vee (\sim q) \Rightarrow (r \wedge s)$

$\Rightarrow \quad \sim (p \wedge q) \Rightarrow (r \wedge s)$ (De-Morgan's Laws)

24. The symbolic form of given statement is $\sim (p \vee q)$.

25. (a) We know that, $p \wedge q$ is true when both p and q are true.

(b) We know that, $p \rightarrow q$ is false when p is true and q is false.

(c) We know that, $p \leftrightarrow q$ is true when either both p and q are true or both are false.

(d) If p and q both are false, then $p \vee q$ is false $\Rightarrow \sim (p \vee q)$ is true.

Hence, option (d) is true.

26.

p	q	r	$q \vee r$	$p \Rightarrow (q \vee r)$
T	F	F	F	F
T	F	T	T	T
T	T	F	T	T
T	T	T	T	T
F	F	F	F	T
F	F	T	T	T
F	T	F	T	T
F	T	T	T	T

Hence, truth values of p, q and r are respectively T, F, F.

27. We know that, $\sim (p \rightarrow q) \cong p \wedge \sim q$

$\therefore \quad \sim (p \rightarrow \sim (q \wedge r) \cong p \wedge (\sim (q \wedge r))$

$\cong p \wedge (\sim q \vee \sim r)$ [By De-Morgan's laws]

28.

p	q	$p \vee q$
T	T	T
T	F	T
F	T	T
F	F	F

29. $(\sim p \wedge q) \vee \sim q \equiv \sim q \vee (\sim p \wedge q)$ (by Commutative law)

$\equiv \sim q \vee (q \wedge q \sim p)$ (by Commutative law)

$\equiv \sim q \vee q\ (\sim q \vee \sim p)$ (by Distributive law)

$\equiv \sim (q \wedge p) \equiv \sim (p \wedge q)$

30. $\sim ((\sim p) \wedge q) \equiv \sim (\sim p) \vee \sim q \equiv p \vee (\sim q)$

31. $(\sim (\sim p)) \wedge q \equiv p \wedge q$

32. $\sim (p \Rightarrow q) \equiv p \wedge \sim q$

$\therefore \quad \sim (\sim p \Rightarrow \sim q) \equiv \sim p \wedge \sim (\sim q) \equiv \sim p \wedge q$

Thus, $\quad \sim (\sim p \Rightarrow \sim q) \equiv \sim p \wedge q$

33.

p	q	$\sim p$	$\sim p \vee q$	$\sim (\sim p \vee q)$
F	T	T	T	F

34.

p	q	r	$\sim p$	$q \wedge r$	$(q \wedge r) \vee r$	$\sim p \Rightarrow (q \wedge r) \vee r$
F	T	F	T	F	F	F

35. Since, $p \Rightarrow q \equiv \sim p \vee q$

$\therefore \quad \sim (p \Rightarrow q) \equiv p \wedge \sim q$

36.

p	q	r	$q \vee r$	$p \Rightarrow (q \vee r)$
T	F	F	F	F
T	F	T	T	T
T	T	F	T	T
T	T	T	T	T
F	F	F	F	T
F	F	T	T	T
F	T	F	T	T
F	T	T	T	T

37.

p	q	$p \Rightarrow q$	$q \Rightarrow p$	$p \Rightarrow q$	$(p \Rightarrow q) \wedge (q \Rightarrow p)$
T	T	T	T	T	T
T	F	F	T	F	F
F	T	T	F	F	F
F	F	T	T	T	T

38.

p	q	$q \Rightarrow p$	$p \Rightarrow (q \Rightarrow p)$	$p \vee q$	$p \Rightarrow (p \vee q)$
T	T	T	T	T	T
T	F	T	T	T	T
F	T	F	T	T	T
F	F	T	T	F	T

Hence, $\quad p \Rightarrow (p \Rightarrow q) \equiv p \Rightarrow (p \vee q)$

39.

p	q	$\sim q$	$p \Rightarrow \sim q$
T	T	F	F
T	F	T	T
F	T	F	T
F	F	T	F

40.

p	q	$\sim p$	$\sim q$	$\sim p \Rightarrow q$	$\sim (\sim p \Rightarrow q)$	$\sim p \wedge \sim q$
T	T	F	F	T	F	F
T	F	F	T	T	F	F
F	T	T	F	T	F	F
F	F	T	T	F	T	T

Hence, $\quad \sim (\sim p \Rightarrow q) \equiv \sim p \wedge \sim q$

41.

p	q	$\sim p$	$p \vee q$	$\sim(p \vee q)$	$\sim p \wedge q$	$\sim(p \vee q) \vee (\sim p \wedge q)$
T	T	F	T	F	F	F
T	F	F	T	F	F	F
F	T	T	T	F	T	T
F	F	T	F	T	F	T

$\therefore \quad \sim(p \vee q) \vee (\sim p \wedge q) \equiv \sim p$

42. We know that, $\sim(p \to q) \equiv p \wedge \sim q$

$\therefore \quad \sim((p \wedge r) \to (r \vee q)) \equiv (p \wedge r) \wedge [\sim(r \vee q)]$

$\equiv (p \wedge r) \wedge (\sim r \wedge \sim q)$

43.

p	q	$p \wedge q$	$\sim p$	$\sim q$	$p \to \sim q$	$\sim(p \to \sim q)$
T	T	T	F	F	F	T
T	F	F	F	T	T	F
F	T	F	T	F	T	F
F	F	F	T	T	T	F

44. $\sim((T \wedge \sim F) \vee (\sim T \vee F))$

$\Rightarrow \quad \equiv \sim((T \wedge T) \vee (F \vee F))$

$\Rightarrow \quad \equiv \sim((T) \vee (F)) \equiv \sim(T) \equiv F$

45. We know that, $p \to q$ is false only when p is true and q is false.

So, $p \to (\sim p \vee q)$ is false only when p is true and $(\sim p \vee q)$ is false.

But $(\sim p \vee q)$ is false if q is false because $\sim p$ is false.

Hence, $p \to (\sim p \vee q)$ is false when truth value of p and q are T and F respectively.

46. Since, $\sim(p \vee q) \equiv (\sim p \wedge \sim q)$ and $\sim(p \wedge q) \equiv (\sim p \vee q)$

So, option (b) and (d) are not true.

$(p \to q) \equiv p \wedge \sim q$, so option (c) is not true.

Now, $\quad p \to q \sim p \vee q$

$\sim q \to \sim p \equiv [\sim(\sim q) \vee \sim p] \equiv q \vee \sim p \equiv \sim p \vee q$

$p \to q \equiv \sim q \to \sim p$

47. Let $S : (p \vee q) \wedge r$

$\Rightarrow \quad \sim S : \sim(p \vee q) \wedge r)$

$\Rightarrow \quad \sim S : \sim(p \vee q) \vee \sim r$ (De-Morgan's Laws)

$\therefore \quad \sim S : (\sim p \wedge \sim q) \vee \sim r$

48. Let $S : (\sim p \wedge q) \vee (p \wedge \sim q)$

$\Rightarrow \quad \sim S : \sim((\sim p \wedge q) \vee (p \wedge \sim q))$

$\Rightarrow \quad \sim S : \sim(\sim p \wedge q) \wedge \sim(p \wedge \sim q)$ (De-Morgan's Law)

$\therefore \quad \sim S : (p \vee \sim q) \wedge (\sim p \vee q)$

49. Let $S : (p \vee q) \wedge (p \vee \sim r)$

$\Rightarrow \quad \sim S : \sim(p \vee q) \vee \sim(p \vee \sim r)$

$\therefore \quad \sim S : (\sim p \wedge \sim q) \vee (\sim p \wedge r)$

50. In tautology it always true values.

51. By truth table

p	q	$\sim q$	$q \wedge \sim q$	$p \Rightarrow q \wedge \sim q$
T	T	F	F	F
T	F	T	F	F
F	T	F	F	T
F	F	T	F	T

Hence, it is neither a tautology nor contradiction.

52. By truth table

p	q	$p \vee q$	$\sim p$	$(p \vee q) \vee \sim p$
T	T	T	F	T
T	F	T	F	T
F	T	T	T	T
F	F	F	T	T

It is clear that $(p \vee q) \vee \sim p$ is a tautology.

53.

p	$\sim p$	$q \vee \sim p$
T	F	T
T	F	T
F	T	T
F	T	T

54.

p	q	$\sim p$	$p \Rightarrow q$	$\sim p \wedge q$	$(p \Rightarrow q) \Leftrightarrow (\sim p \wedge q)$
T	T	F	T	F	F
T	F	F	F	F	T
F	T	T	T	T	T
F	F	T	T	F	F

55. By truth table

p	q	$\sim p$	$\sim q$	$p \Rightarrow q$	$\sim(p \Rightarrow q)$	$\sim p \vee \sim q$	$\sim(p \Rightarrow q) \Rightarrow (\sim p \vee \sim q)$
T	T	F	F	T	F	F	T
T	F	F	T	F	T	T	T
F	T	T	F	T	F	T	T
F	F	T	T	T	F	T	T

Hence, given proposition is a tautology.

56. Since, $\quad S : \sim(p \vee (\sim p \vee q))$

$\Rightarrow \quad S : \sim p \wedge \sim(\sim p \vee q)$ (De-Morgan's Law)

$\Rightarrow \quad S : \sim p \wedge (p \wedge \sim q)$ (De-Morgan's law)

57. By truth table

p	q	$(p \wedge q)$	$\sim(p \wedge q)$	$q \Leftrightarrow p$	$\sim(q \Leftrightarrow p)$	$\sim(p \wedge q) \vee \sim(q \Leftrightarrow p)$
T	T	T	F	T	F	F
T	F	F	T	F	T	T
F	T	F	T	F	T	T
F	F	F	T	T	F	T

It is clear that neither tautology nor contradiction.

58.

p	q	$\sim p$	$\sim q$	$(\sim p \vee q)$	$(\sim p \wedge \sim q)$	$(\sim p \vee q) \wedge (\sim p \wedge \sim q)$
T	T	F	F	T	F	F
T	F	F	T	F	F	F
F	T	T	F	T	F	F
F	F	T	T	T	T	T

Hence, it is neither tautology nor contradiction.

59.

p	$\sim p$	$p \Rightarrow \sim p$	$\sim p \Rightarrow p$	$(p \Rightarrow \sim p) \wedge (\sim p \Rightarrow p)$
F	T	T	F	F
T	F	F	T	F

$\therefore$ Statements is contradiction.

60.

p	q	$\sim q$	$\sim p$	$\sim q \Rightarrow \sim p$	$p \Leftrightarrow q$	$(p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$
T	T	F	F	T	T	T
T	F	T	F	F	F	T
F	T	F	T	T	T	T
F	F	T	T	T	T	T

Hence, it is tautology.

61.

p	q	$p \Rightarrow q$	$(\sim p \vee q)$	$(p \Rightarrow q) \Leftrightarrow (\sim p \vee q)$
T	T	T	T	T
T	F	F	F	T
F	T	T	T	T
F	F	T	T	T

Since, all values of given proposition is true, hence it is a tautology.

62. $p \Rightarrow q$ is logically equivalent to $\sim q \Rightarrow \sim p$.

$\therefore \quad (p \Rightarrow q) \Leftrightarrow (\sim q \Rightarrow \sim p)$

is a tautology but not a contradiction.

63. $(p \wedge \sim q) \wedge (\sim p \wedge q) = (p \wedge \sim q) \wedge (\sim q \wedge q) = f \wedge f = f$

(by using associative laws and commutative laws)

$\therefore \quad (p \wedge \sim q) \wedge (\sim p \wedge q)$ is a contradiction.

64.

p	$\sim p$	$p \Rightarrow \sim p$	$\sim p \Rightarrow p$	$(p \Rightarrow \sim p) \wedge (\sim p \Rightarrow p)$
T	F	F	T	F
F	T	T	F	F

Clearly, $(p \Rightarrow \sim p) \wedge (\sim p \Rightarrow p)$ is a contradiction.

Round II

1. The truth table of $(p \wedge \sim q) \wedge (\sim p \vee q)$ is as given below

p	q	$\sim p$	$\sim q$	$p \vee \sim q$	$\sim p \vee q$	$(p \wedge \sim q) \wedge (\sim p \vee q)$
T	T	F	F	F	T	F
T	F	F	T	T	F	F
F	T	T	F	F	T	F
F	F	T	T	F	T	F

The last column of the above truth table contains F only.

So, the given statement is a contradiction.

2. The truth tables of $p \to q$ and $\sim p \vee q$ are given below

p	q	$\sim p$	$p \to q$	$\sim (p \vee q)$
T	T	F	T	T
T	F	F	F	F
F	T	T	T	T
F	F	T	T	T

Clearly, truth tables of $p \to q$ and $\sim p \vee q$ are same.
So, $p \to q$ is logically equivalent to $\sim p \vee q$.
Hence, option (a) is correct.

If the truth value of p, q, r are T, F, T respectively, then the truth values of $p \vee q$ and $q \vee r$ are each equal to T. Therefore, the truth value of $(p \vee q) \wedge (q \vee r)$ is T.
Hence, option (b) is correct.

We know that, $\sim (p \vee q \vee r) \cong (\sim p \wedge \sim q \wedge \sim r)$
So, option (c) is correct.

If p is true and q is false, then $p \vee q$ is true. Consequently $\sim (p \vee q)$ is false and hence $p \wedge \sim (p \vee q)$ is false.
Hence, option (d) is wrong.

3. We consider following truth table.

p	q	$\sim p$	$\sim q$	$p \wedge q$	$p \vee q$	$(\sim (p \vee q))$	$(p \wedge q) \wedge \sim (p \vee q)$
T	T	F	F	T	T	F	F
T	F	F	T	F	T	F	F
F	T	T	F	F	T	F	F
F	F	T	T	F	F	T	F

Clearly, last column of the above truth table contains only F.
Hence, $(p \wedge q) \wedge \sim (p \vee q)$ is a contradiction

4. The truth value of $\sim (\sim p) \leftrightarrow p$ as follow

p	$\sim p$	$\sim (\sim p)$	$\sim (\sim p) \to p$	$p \to \sim (\sim p)$	$\sim (\sim p) \leftrightarrow p$
T	F	T	T	T	T
F	T	F	T	T	T

Since, last column of above truth table contains only T.

Hence, $\sim (\sim p) \to p$ is a tautology.

5.

p	q	r	$p \wedge q$	$p \wedge r$	$(p \wedge q) \wedge (q \wedge r)$
T	F	F	F	F	F
T	F	T	F	F	F
T	T	F	T	F	F
T	T	T	T	T	T
F	F	F	F	F	F
F	F	T	F	F	F
F	T	F	F	F	F
F	T	T	F	T	F

6.

p	q	r	$\sim r$	$p \wedge \sim r$	$p \vee r$	$(p \wedge \sim r) \Rightarrow (q \vee r)$
T	F	F	T	T	F	F
T	F	T	F	F	T	T
T	T	F	T	T	T	T
T	T	T	F	F	T	T
F	F	F	T	F	F	T
F	F	T	F	F	T	T
F	T	F	T	F	T	T
F	T	T	F	F	T	T

7.

p	q	$\sim p$	$\sim q$	$\sim p \wedge q$	$\sim q \wedge p$	$(\sim p \wedge q) \vee (\sim q \wedge p)$
T	T	F	F	F	F	F
T	F	F	T	F	F	F
F	T	T	F	T	F	T
F	F	T	T	F	F	F

8.

p	q	r	$\sim p$	$\sim p \vee q$	$(\sim p \vee q) \Rightarrow r$
T	F	F	F	F	F
T	F	T	F	F	T
T	T	F	F	T	F
T	T	T	F	T	T
F	F	F	T	T	F
F	F	T	T	T	T
F	T	F	T	T	F
F	T	T	T	T	T

9. (a) A month has 28 or 29 or 30 or 31 days. It is a false to say that a month has 35 days. So it is a statement.

(b) Mathematics may be difficult for one but may be easy for the other. Hence, it is not a statement.

(c) The square of a number may be even or it may be odd. Square of an odd number is always odd and square of an even number is always even.

e.g., $4^2 = 16$ (even) and $5^2 = 25$ (odd)

Hence, it not a statement.

(d) A quadrilateral may have equal lengths as it may be a rhombous or a square or the quadrilateral may have unequal sides (like parallelogram).

Hence, it is not a statement.

10. The values of $\sim(\sim p \vee \sim q)$ all are neither true nor false, so it is a contigency.

11. If $\sim(p \wedge q)$ is false, then corresponding values of p and q are respectively T and T.

12. Truth table for $[p \wedge (p \to q)] \to q$

p	q	$p \to q$	$p \wedge (p \to q)$	$[p \wedge (p \to q)] \to q$
T	T	T	T	T
T	F	F	F	T
F	T	T	F	T
F	F	T	F	T

All values of columns are true.

Therefore, $[p \wedge (p \to q)] \to q$

13.

p	q	$p \vee q$
T	T	T
T	F	T
F	T	T
F	F	F

p : Ice is cold q : Blood is green

$p \vee q$: Ice is cold or blood is green

$p \wedge q$: Ice is cold and blood is green

16. The truth table for $p \Leftrightarrow q$ is

p	q	$p \Leftrightarrow q$
T	F	F
T	T	T
F	F	T
F	T	F

Also, the truth table for $(p \Rightarrow q) \wedge (q \Rightarrow p)$ is

p	q	$p \Rightarrow q$	$q \Rightarrow p$	S
T	F	F	T	F
T	T	T	T	T
F	F	T	T	F
F	T	T	F	F

Hence, we can say that

$$p \Leftrightarrow q \equiv (p \Rightarrow q) \wedge (q \Rightarrow p)$$

15. If $p \to q$ be any conditional statement, then

(i) The converse of $p \to q$ is the statement $q \to p$.

(ii) The inverse of $p \to p$ is the statement $\sim p \to \sim q$

(iii) The contrapositive of $p \to q$ is the statement $\sim q \to \sim p$

16.

p	q	r	$p \to r$	$p \wedge q$	$p \to (q \to r)$	$(p \wedge q) \to r$
T	T	T	T	T	T	T
T	T	F	F	T	F	F
T	F	T	T	F	T	T
T	F	F	T	F	T	T
F	T	T	T	F	T	T
F	T	F	F	F	T	T
F	F	T	T	F	T	T
F	F	F	T	F	T	T

From table columns of $p \to (q \to r)$ is not a tautology and column of $p \to (q \to r)$ and $(p \wedge q) \to r$ are identical.

Hence, Statement I is false, Statement II is true.

17. p : Mr A passed the examination.

q : Mr A is sad.

r : It is not true that Mr A passed therefore he is sad.

$\therefore \quad r : \sim p \Rightarrow q$

Hence, Statement I is false for Statement II.

The truth table for $p \Rightarrow q$ is

p	q	$p \Rightarrow q$
T	F	F
T	T	T
F	F	T
F	T	T

Also, the truth table for $\sim p \vee q$ is

p	q	$\sim p$	$\sim p \vee q$
T	F	F	F
T	T	F	T
F	F	T	T
F	T	T	T

Hence, we can say that

$$p \Rightarrow q \equiv \sim p \vee q$$

Logically equivalents

$$p \Rightarrow q \equiv \sim p \vee q$$

$$p \Leftrightarrow q = (p \Rightarrow q) \wedge (q \Rightarrow p)$$

18.

p	q	$p \leftrightarrow q$	$\sim q$	$p \leftrightarrow \sim q$	$\sim(p \leftrightarrow \sim q)$
T	T	T	F	F	T
T	F	F	T	T	F
F	T	F	F	T	F
F	F	T	T	F	T

19. **Statement I**

A	B	$\sim B$	$A \Leftrightarrow \sim B$	$\sim(A \Leftrightarrow \sim B)$	$A \Leftrightarrow B$
T	T	F	F	T	T
T	F	T	T	F	F
F	T	F	T	F	F
F	F	T	F	T	T

$\therefore$ Statement I is true.

Statement II

A	B	$\sim B$	$(A \wedge \sim B)$	$\sim(A \wedge \sim B)$	$A \vee (\sim A \wedge \sim B)$
T	T	F	F	T	T
T	F	T	T	F	T
F	T	F	F	T	T
F	F	T	F	T	T

Statement II is true but it is not a correct explanation of Statement I.

20. **Statement II** $(p \to q) \leftrightarrow (\sim q \to \sim p) = (p \to q) \leftrightarrow (p \to q)$

which is always true, so statement II is true.

Statement I $(p \wedge \sim q) \wedge (\sim p \wedge q) \equiv p \wedge \sim q \wedge \sim p \wedge q)$

$$\equiv p \wedge \sim p \wedge \sim q \wedge q \equiv f \wedge f \equiv f$$

Hence, it is a fallacy statement. So, statement I is true.

Alternative Solution

Statement II $(p \to q) \leftrightarrow (\sim q \to \sim p)$

$\sim q \to \sim p$ ios contrapoaitive of $p \to q$ hence, $(p \to q) \leftrightarrow (p \to q)$ will be a tautology.

Statement II $(p \wedge \sim q)\ (\sim p \wedge q)$

p	q	$\sim p$	$\sim q$	$p \wedge \sim q$	$\sim p \wedge q$	$(p \wedge \sim q) \wedge (\sim p \wedge q)$
T	T	F	F	F	F	F
T	F	F	T	T	F	F
F	T	T	F	F	T	F
F	F	T	T	F	F	F

Hence, it is a fallacy.

21. Here, p : x is an irrational number

q : y is a transcendental number.

r : x is a rational number iff y is a transcendental number

$\Rightarrow \quad r : \sim p \leftrightarrow q$

$$S_1 : r \equiv q \vee p \text{ and } S_2 : r \equiv \sim(p \leftrightarrow \sim q)$$

p	q	$\sim p$	$\sim q$	$r : \sim p \leftrightarrow q$	$q \vee p$	$(p \leftrightarrow \sim q)$	$\sim(p \leftrightarrow \sim q)$
T	T	F	F	F	T	F	T
T	F	F	T	T	T	T	F
F	T	T	F	T	T	T	F
F	F	T	T	F	F	F	T

It is clear from the table that r is not equivalent to either of the statements.

Hence, none of the given options is correct.

22.

q	p	$q \to p$	$p \to (q \to p)$	$p \vee q$	$p \to (p \vee q)$
T	T	T	T	T	T
T	F	F	T	T	T
F	T	T	T	T	T
F	F	T	T	F	T

$\therefore$ Statement $p \to (q \to p)$ is equivalent to $p \to (p \vee q)$

23. Let us assume that p : 'I become a teacher' and q : I will open a school. Negation of $(p \to q)$ is $\sim(p \to q) \equiv p \wedge \sim q$ which means that 'I will become a teacher and I will not open a school'.

24.

A	B	$A \vee B$	$A \wedge B$	$A \vee (A \vee B)$	$A \vee (A \wedge B)$	$A \to B$	$A \wedge (A \to B)$	$A \wedge (A \to B) \to B$	$B \to (A \wedge (A \to B))$
T	T	T	T	T	T	T	T	T	T
T	F	T	F	T	T	F	F	T	T
F	T	T	F	F	F	T	F	T	F
F	F	F	F	F	F	T	F	T	T

$\because$ The truth value of all the elements of the column $A \wedge (A \to B) \to B$ $\therefore$ $A \wedge (A \to B) \to B$ is a tautology.

25. Suman is brilliant and dishonest, if and onlyif Suman is rich, is expressed as, $\quad Q \leftrightarrow (P \wedge \sim R)$

$\therefore$ Negation of it will be,

$$\sim Q \leftrightarrow (P \wedge \sim R)$$

26. P : There is rational number $x \in S$ such that $x > 0$

$\sim P$: Every rational number $x \in S$ satisfies $x \leq 0$

20.1 Representation of Data

The data once collected, must be arranged or organised in a way so that definite inferences can be made out from it. The most common organisational schemes are Tabular representation Graphical representation.

In tabular representation, the data can be organised as discrete frequency or continuous frequency distribution. Tabular representation provides both economy of representation and organisation. On the other hand in case of Graphical representation the most common types in which data can be represented are : Histogram, Pie diagram or an Ogive. The benefit of Graphical representation is that the data is often better understood and inferences/results can be made out of it easily and quickly.

Statistics is concerned with scientific method for collecting, organising, summarising, presenting and analysing data as well as with drawing valid conclusions and making reasonable decisions on the basis of such analysis.

20.2 Measures of Central Tendency

Generally, average of a distribution is a measure of the middle or expected value of distribution, such values are known as measures of central tendency. These are five types of central tendency
(i) Mean (ii) Geometric mean (iii) Harmonic mean (iv) Median (v) Mode.

20.3 Mean

The sum of all the observations is divided by the number of observations is called mean and it is denoted by $\bar{x}$.

(i) Mean of Ungrouped or Individual Data

If $x_1, x_2, x_3, \ldots, x_n$ are n observations, then mean by

(a) **Direct method**

$$\bar{x} = \frac{x_1 + x_2 + \ldots. + x_n}{n} = \frac{1}{n}\sum_{i=1}^{n} x_i$$

(b) **Shortcut method**

$$\bar{x} = A + \frac{1}{n}\sum_{i=1}^{n} d_i$$

where, A = Assumed mean and $d_i = x_i - A$

(ii) Mean of Grouped or Continuous Data

If $x_1, x_2, x_3, \ldots, x_n$ are n observations whose corresponding frequencies are $f_1, f_2, f_3, \ldots, f_n$, then mean by

(a) **Direct method**

$$\bar{x} = \frac{x_1 f_1 + x_2 f_2 + \ldots + x_n f_n}{f_1 + f_2 + \ldots + f_n} = \frac{\sum_{i=1}^{n} f_i x_i}{\sum_{i=1}^{n} f_i}$$

(b) **Shortcut method**

$$\bar{x} = A + \frac{\sum_{i=1}^{n} f_i d_i}{\sum_{i=1}^{n} f_i}$$

where A = Assumed mean and $d_i = x_i - A$

***Sample* Problem 1** *The arithmetic mean of the marks from the following table is*

Marks	0-10	10-20	20-30	30-40	40-50	50-60
Number of students	12	18	27	20	17	6

(a) 20 (b) 28
(c) 2800 (d) 100

Interpret (b)

Marks	Class mark x	f	fx
0-10	5	12	60
10-20	15	18	270
20-30	25	27	675
30-40	35	20	700
40-50	45	17	765
50-60	55	6	330
		$\Sigma f = 100$	$\Sigma fx = 2800$

$$\therefore \quad \bar{x} = \frac{\Sigma fx}{\Sigma f} = \frac{2800}{100} = 28$$

Note Class marks, since the grouped data represents the frequencies included between a specific class interval. So, we actually do not know how many times a particular observation lying in between that class limit is repeated. So, assume that the given frequency is the frequency of mid-point of that particular class interval. This mid-point is known as class mark.

Thus, class mark of an interval

$$= \frac{(\text{lower limit of interval} + \text{upper limit of interval})}{2}$$

Weighted Mean

If corresponding weight of $x_1, x_2, \ldots, x_n$ are $w_1, w_2, \ldots, w_n$ respectively, then

$$\text{Weighted mean} = \frac{w_1 x_1 + w_2 x_2 + \ldots.. + w_n x_n}{w_1 + w_2 + \ldots. + w_n}$$

$$= \frac{\sum_{i=1}^{n} w_i x_i}{\sum_{i=1}^{n} w_i}$$

***Sample* Problem 2** *The weighted mean of the first n natural numbers, the weights being the corresponding numbers, is*

(a) $\frac{n+1}{2}$ (b) $\frac{n+2}{2}$
(c) $\frac{2n+1}{3}$ (d) *None of these*

Interpret (c) First n natural numbers are $1, 2, 3, \ldots, n$; whose corresponding weights are $1, 2, 3, \ldots, n$ respectively.

$\therefore$ Weight mean

$$= \frac{1 \times 1 + 2 \times 2 + \ldots.. + n \times n}{1 + 2 + \ldots.. + n}$$

$$= \frac{1^2 + 2^2 + \ldots + n^2}{1 + 2 + \ldots + n}$$

$$= \frac{n(n+1)(2n+1)}{\frac{6n(n+1)}{2}} = \frac{2n+1}{3}$$

Combined Mean

If two sets of observations are given, then the combined mean of both the sets can be calculated by the following formula

$$\bar{x}_{12} = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}$$

where, $\bar{x}_1$ = mean of first set of observations
n_1 = number of observations in first set
$\bar{x}_2$ = mean of second set of observations
n_2 = number of observations in second set

Properties of Mean

(i) Algebraic sum of the deviations of a set of values from their mean is zero.

(ii) The sum of the squares of the deviations of a set of values is minimum when taken about mean.

(iii) Mean is affected by the change or shifting of origin and scale.

***Sample* Problem 3** *The average salary of male employees in a firm was ₹ 5200 and that of females was ₹ 4200. The mean salary of all the employees was ₹ 5000. The percentage of male and female employees are respectively*

(a) 80, 20 (b) 20, 80 (c) 60, 40 (d) 52, 48

Interpret (a) Let $x_1 = 5200$, $x_2 = 4200$, $\bar{x} = 5000$

Also, we know that $\bar{x} = \dfrac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$

$\Rightarrow \quad 5000\,(n_1 + n_2) = 5200\,n_1 + 4200\,n_2$

$\Rightarrow \quad \dfrac{n_1}{n_2} = \dfrac{4}{1}$

$\therefore$ The percentage of male employees in the firm

$$= \frac{4}{4+1} \times 100 = 80\%$$

and the percentage of female employees in the firm

$$= \frac{1}{4+1} \times 100 = 20\%$$

20.4 Geometric Mean (GM)

The nth root of the product of the values is called geometric mean.

(i) Geometric Mean for Ungrouped Data

If $x_1, x_2, x_3, \ldots, x_n$ be n observations, then geometric mean is given by $G = (x_1 \cdot x_2 \cdot x_3 \ldots x_n)^{1/n}$

$$\Rightarrow \quad \log G = \frac{1}{n}(\log x_1 + \log x_2 + \log x_3 + \ldots + \log x_n)$$

$$\Rightarrow \quad \log G = \frac{1}{n}\sum_{i=1}^{n} \log x_i$$

$$\Rightarrow \quad G = \text{antilog}\left[\frac{1}{n}\sum_{i=1}^{n} \log x_i\right]$$

(ii) Geometric Mean for Grouped Data

If $x_1, x_2, \ldots, x_n$ be n observations whose corresponding frequencies are $f_1, f_2, \ldots, f_n$, then geometric mean is given by

$$\text{GM} = (x_1^{f_1} \cdot x_2^{f_2} \ldots x_n^{f_n})^{1/N} = \text{antilog}\left[\frac{1}{N}\sum_{i=1}^{n} f_i \log x_i\right]$$

***Sample* Problem 4** *The geometric mean of the numbers $3, 3^2, 3^3, \ldots, 3^n$ is*

(a) $3^{2/n}$ (b) $3^{(n-1)/2}$ (c) $3^{n/2}$ (d) $3^{(n+1)/2}$

Interpret (d) $\therefore \text{GM} = (3 \cdot 3^2 \ldots 3^n)^{1/n}$

$$= 3^{\frac{1+2+\ldots+n}{n}}$$

$$= 3^{\frac{n(n+1)}{2n}} = 3^{\frac{n+1}{2}}$$

20.5 Harmonic Mean (HM)

The harmonic mean of any series is the reciprocal of the arithmatic mean of the reciprocals of the observations.

(i) Harmonic Mean for Ungrouped Data

If $x_1, x_2, \ldots x_n$ be n observations, then harmonic mean is given by

$$\text{HM} = \frac{n}{\dfrac{1}{x_1} + \dfrac{1}{x_2} + \ldots + \dfrac{1}{x_n}} = \frac{n}{\sum_{i=1}^{n} \dfrac{1}{x_i}}$$

(ii) Harmonic Mean for Grouped Data

If $x_1, x_2, \ldots x_n$ be n observations, whose corresponding frequencies are $f_1, f_2, \ldots, f_n$, then harmonic mean is given by

$$\text{HM} = \frac{\sum_{i=1}^{n} f_i}{\sum_{i=1}^{n} \dfrac{f_i}{x_i}}$$

***Sample* Problem 5** *Find the harmonic mean of $\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \ldots, \frac{n}{n+1}$, occurring with frequencies 1, 2, 3, …, n, respectively.*

(a) $\dfrac{n-1}{3-n}$ (b) $\dfrac{n+1}{3+n}$

(c) $\dfrac{n+1}{3-n}$ (d) *None of these*

Interpret (b) We know that,

$$\text{Harmonic mean} = \frac{\sum f}{\sum\left(\dfrac{f}{x}\right)}$$

$$\therefore \quad \sum f = 1 + 2 + 3 + \ldots + n = \frac{n(n+1)}{2}$$

and

$$\sum \frac{f}{x} = \frac{1}{1/2} + \frac{2}{2/3} + \frac{3}{3/4} + \ldots + \frac{n}{n/(n+1)}$$

$$= 2 + \frac{3 \times 2}{2} + \frac{4 \times 3}{3} + \ldots + \frac{n(n+1)}{n}$$

$$= 2 + 3 + 4 + \ldots + n + (n+1)$$

which is an arithmetic progression with $a = 2$ and $d = 1$.

By the formula of sum of n term of an AP, $\sum \frac{f}{x} = \left[\frac{n}{2}\{2a + (n-1)d\}\right]$,

we have

$$= \frac{n}{2}\{2 \times 2 + n - 1\}$$

$$\therefore \quad = \frac{n}{2}(3 + n)$$

$$\therefore \quad \text{Harmonic mean} = \frac{\frac{n(n+1)}{2}}{\frac{n(3+n)}{2}}$$

$$= \frac{n(n+1) \times 2}{n(3+n) \times 2} = \frac{n+1}{3+n}$$

20.6 Median

A set of observations whenever arranged in order of magnitude (ascending or descending), then the middlemost or central value gives the median. It divides the observation into two equal parts in such a way that the number of observations smaller than median is equal to the number greater than it.

(i) Median for Ungrouped or Individual Data

Suppose n observations are arranged in ascending or descending order.

(a) If n is an odd number, then

$$\text{Median} = \text{Value of}\left(\frac{n+1}{2}\right)\text{th term}$$

(b) If n is an even number, then

$$\text{Median} = \frac{\text{Value of}\left(\frac{n}{2}\right)\text{th term} + \text{Value of}\left(\frac{n}{2}+1\right)\text{th term}}{2}$$

(ii) Median for Discrete Frequency Data

First arrange the data in ascending or descending order and find cumulative frequency. Now find $\frac{N}{2}$, where $N = \Sigma f_i$. See the cumulative frequency just greater than $\frac{N}{2}$. The corresponding value of x is median.

(iii) Median for Continuous Data

In this case, the class corresponding to the cumulative frequency just greater than $\frac{N}{2}$ is called the median class and the value of median is obtained by the following formula.

$$\text{Median} = l + \left(\frac{\frac{N}{2} - c}{f}\right) \times h$$

where, l = lower limit of median class

f = frequency of median class

h = size of median class

c = cumulative frequency of class before median class

Note **Cumulative frequency** The cumulative frequency of a value is its frequency plus the frequencies of all smaller values *e.g.*,

x	f	cf
1	4	4
2	6	10 (4 + 6)
3	4	14 (4 + 6 + 4)

***Sample* Problem 6** *From the data given, the median of the average deposit balance of saving for the branch during March 1982 is*

Average deposit balance (₹)	Number of deposit
Less than 100	26
100-200	68
200-300	145
300-400	242
400-500	188
500-600	65
600-700	16

(a) 356 (b) 300

(c) 56.2 (d) 356.2

Interpret (d)

Average deposit balance (₹)	f	Cumulative frequency Cf
Less than 100	26	26
100- 200	68	94
200-300	145	239
300-400	242	481
400-500	188	669
500-600	65	734
600-700	16	750

$$\frac{N}{2} = \frac{750}{2} = 375$$

The frequency just greater than 375 is 481.

$\therefore$ Median class is 300–400.

$$\text{Median} = l + \frac{\left(\frac{N}{2} - c\right)}{f} \times h$$

$$= 300 + \frac{375 - 239}{242} \times 100$$

$$= 300 + 56.2 = 356.2$$

20.7 Mode

Mode is the value of the variate which occurs most frequency.

(i) Mode for Individual Data

The value which is repeated maximum number of times is called mode of the series.

(ii) Mode for Discrete Frequency Data

In this case, mode is the value of the variate corresponding to the maximum frequency.

(iii) Mode for Continuous Data

The class which has maximum frequency is called modal class or group. The mode is given by the formula

$$\text{Mode} = l + \frac{f_1 - f_0}{2f_1 - f_0 - f_2} \times h$$

where, l = lower limit of modal class

h = size of modal class

f_1 = frequency of modal class

f_0 = frequency of the class preceding the modal class

f_2 = frequency of the class succeeding the modal class

Note In the symmetrical distribution, the values of mean, median and mode coincide.

***Sample* Problem 7** *The mode of the following distribution is*

Class interval	Frequency
0-10	5
10-20	8
20-30	7
30-40	12
40-50	28
50-60	20
60-70	10
70-80	10

(a) 46 (b) 6.66
(c) 46.67 (d) *None of these*

Interpret (c) Here, maximum frequency is 28. Thus, the class 40 – 50 is the modal class.

$$\therefore \text{ Mode} = 40 + \frac{10(28-12)}{(2\times 28 - 12 - 20)} = 40 + 6.666 = 46.67 \text{ (approx.)}$$

20.8 Emperical Relationship between Mean, Median and Mode

A distribution in which the values of mean, median and mode coincide, is known symmetrical and if these values are not equal, then the distribution is said asymmetrical or skewed. In a moderately skewed distribution, there is a relation amongst mean, median and mode which is as follows

$$\text{Mean} - \text{Mode} = 3\,(\text{Mean} - \text{Median})$$

***Sample* Problem 8** *If in a frequency distribution, the mean and median are 20 and 21 respectively, then its mode is approximately*

(a) 24 (b) 23
(c) 25 (d) *None of these*

Interpret (b) $\because$ Mean – Mode = 3 (Mean – Median)

$\therefore$ 20 – Mode = 3(20 – 21)

$\Rightarrow$ 20 – Mode = –3 $\Rightarrow$ Mode = 23

Check Point 1

1. If a variable take values 0, 1, 2, ...,n with frequencies $q^n, \frac{n}{1}q^{n-1}p, \frac{n(n-1)}{1\cdot 2}q^{n-2}p^2, \ldots, p^n$, where p + q = 1, then the mean is
(a) np (b) nq
(c) n (p + q) (d) None of these

2. For a certain frequency table which has been partly reproduced here, the arithmetic mean was found to be ₹ 28.07

Income (in ₹)	15	20	25	30	35	40
Number of Workers	8	12	?	16	3	10

If the total number of workers is 75, then the missing frequencies are
(a) 14, 15 (b) 15, 14
(c) 13, 16 (d) 12, 17

3. The median wage of the following distribution is (in ₹)

Wages (in ₹)	2000-3000	3000-4000	4000-5000	5000-6000	6000-7000
Number of workers	3	5	20	10	5

(a) 4000 (b) 4575
(c) 4675 (d) None of these

4. If the mean of the numbers 27 + x, 31+ x, 89 + x, 107 + x, 156 + x is 82, then the mean of 130 + x, 126 + x, 68 + x, 50 + x, 1+ x is
(a) 75 (b) 157
(c) 82 (d) 80

5. The mode of the following distribution is

Class Interval	0-10	10-20	20-30	30-40	40-50	50-60	60-70
Frequency	5	8	7	12	28	20	10

(a) 46.67 (b) 40 (c) 44.67 (d) 45

6. Mean of 100 items is 49. It was discovered that three items which should have been 60, 70, 80 were wrongly read as 40, 20 and 50, respectively. The correct mean is
(a) 48 (b) 82.5
(c) 50 (d) 80

7. The weighted mean of first n natural numbers whose weights are equal to the squares of corresponding numbers is
(a) $\frac{n+1}{2}$ (b) $\frac{3n(n+1)}{2(2n+1)}$
(c) $\frac{(n+1)(2n+1)}{6}$ (d) $\frac{n(n+1)}{2}$

8. The mean deviation from the median is
(a) greater than the measured from any other value
(b) less than that measured from any other value
(c) equal to that measured from any other value
(d) maximum if all observations are positive

20.9 Positional Measures

These are the values of the variable which divide the total frequency into number of equal parts *e.g.,* Median divides the total frequency into two equal parts.

Some of these are as follows

(i) Quartiles

Those values of the variable which divides total distribution into four equal parts are known as quartiles. Thus, there will be three quartiles dividing the total distribution in four equal parts.

Three quartiles are Q_1 (lower quartile), Q_2 (median), Q_3 (upper quartile).

	Individual or Discrete Series	Continuous Series	Formula
Q_r	$\frac{r(n+1)}{2}$th term	$\frac{rn}{4}$th term	$Q_r = l + \frac{h}{f}\left(\frac{rn}{4} - c\right)$

(ii) Deciles

Those values of variables which divides the total distribution into ten equal parts, are known as deciles.

(iii) Percentiles

Those values of variables which divides the total distribution into hundred parts, are known as percentiles.

20.10 Measures of Dispersion

A measure of dispersion is designed to state the extent to which the individual observations vary from their average. These are following types of dispersion are

(i) Range (ii) Quartile deviation (iii) Mean deviation (iv) Standard deviation (v) Variance

20.11 Range

Range is the difference between two extreme observations of distribution. If L and S are largest and smallest observations respectively, then

$$\text{Range} = L - S \quad \text{and} \quad \text{coefficient of range} = \frac{L-S}{L+S}$$

Note In a grouped frequency distribution, the range is calculated by subtracting the lower limit of lower class intervals from the upper limit of the highest class.

20.12 Quartile Deviation

Quartile deviation or semi-interquartile range QD is given by

$$\text{QD} = \frac{1}{2}(Q_3 - Q_1)$$

and coefficient of $\text{QD} = \frac{Q_3 - Q_1}{Q_3 + Q_1}$

where, Q_1 and Q_3 are the first and third quartiles of the distribution respectively.

***Sample* Problem 9** *The quartile deviation of daily wages of in (₹) of 11 persons given below*

140, 145, 130, 165, 160, 125, 150, 170, 175, 120, 180

(a) 22.5 (b) 25
(c) 20 (d) 21.2

Interpret (c) The given data in ascending order of magnitude is 120, 125, 130, 140, 145, 150, 160, 165, 170, 175, 180

Here, $Q_1 = \left(\frac{n+1}{4}\right)$ th term $= \frac{11+1}{4} = \frac{12}{4} = 3$rd

$= 130$

$Q_3 = \frac{3(n+1)}{4}$th $= \frac{3 \times (11+1)}{4} = 9$th

$= 170$

$\therefore \quad \text{QD} = \frac{Q_3 - Q_1}{2} = \frac{170 - 130}{2} = \frac{40}{2}$

$= 20$

20.13 Mean Deviation

Mean deviation of a distribution is the arithmetic mean of the absolute deviation of the terms of the distribution from its statistical mean (AM, median or mode).

(i) For Ungrouped or Individual Series

If $x_1, x_2, \ldots, x_n$ are n observations, then mean deviation from average, A (usually mean, median, mode) is

$$\text{MD} = \frac{\sum_{i=1}^{n} |x_i - A|}{n} = \frac{\sum_{i=1}^{n} |d_i|}{n}$$

where, $d_i = x_i - A$

(ii) For Grouped Distribution

If $x_1, x_2, \ldots, x_n$ are n observations whose corresponding frequencies are $f_1, f_2, \ldots, f_n$, then mean deviation from average A (usually mean, median or mode) is

$$\text{MD} = \frac{\sum_{i=1}^{n} f_i |x_i - A|}{\sum_{i=1}^{n} f_i} = \frac{\sum_{i=1}^{n} f_i |d_i|}{\sum_{i=1}^{n} f_i}$$

$$\text{Coefficient of MD} = \frac{\text{Mean deviation}}{\text{Corresponding average}}$$

Note

- Algebraic sum of the deviations of a set of values from their arithmetic mean is zero.
- Mean deviation is least when taken from median.

***Sample* Problem 10** *Find the mean deviation about median for the following data.*

Marks	0-10	10-20	20-30	30-40	40-50	50-60
Number of girls	6	8	14	16	4	2

[NCERT]

(a) 10.34 (b) 10.50 (c) 10.40 (d) 10.37

Interpret (a)

Class	f_i	cf	Mid value x_i	$\lvert x_i - M \rvert$	$f_i \lvert x_i - M \rvert$
0-10	6	6	5	$\lvert 5 - 27.86 \rvert = 22.86$	137.16
10-20	8	(14)C	15	$\lvert 15 - 27.86 \rvert = 12.86$	102.88
(20-30)	(14)	28	25	$\lvert 25 - 27.86 \rvert = 2.86$	40.04
30-40	16	44	35	$\lvert 35 - 27.86 \rvert = 7.14$	114.24
40-50	4	48	45	$\lvert 45 - 27.86 \rvert = 17.14$	68.56
50-60	2	50	55	$\lvert 55 - 27.86 \rvert = 27.14$	54.28
Total	$\Sigma f_i = 50$				517.16

$$\frac{N}{2} = \frac{50}{2} = 25$$

$$\Rightarrow \quad C = 14, f = 14, l = 20, h = 10$$

$$\text{Median } M = l + \frac{\frac{N}{2} - C}{f} \times h$$

$$= 20 + \frac{25 - 14}{14} \times 10$$

$$= 20 + \frac{11 \times 10}{14}$$

$$= 20 + 7.86 = 27.86$$

$$\therefore \text{ Mean deviation about median} = \frac{\Sigma f_i |x_i - M|}{\Sigma f_i}$$

$$= \frac{517.16}{50} = 10.34$$

20.14 Standard Deviation

The standard deviation of a variate is the square root of the arithmetic mean of the squares of all deviations of the values of the variate x from the arithmatic mean of the observations and is denoted by σ.

(i) Standard Deviation for Individual Series

If $x_1, x_2, x_3, \ldots, x_n$ are n observations, then

$$\text{SD } (\sigma) = \sqrt{\frac{\sum_{i=1}^{n} (x_i - \bar{x})^2}{n}} \quad \text{or} \quad (\sigma) = \sqrt{\frac{\sum_{i=1}^{n} x_i^2}{n} - (\bar{x})^2}$$

or $$\sigma = \sqrt{\frac{1}{n} \sum_{i=1}^{n} d_i^2 - \left(\frac{1}{n} \sum_{i=1}^{n} d_i\right)^2}$$

where, $d_i = x_i - \bar{x}$

(ii) Standard Deviation for Frequency Distribution

If $x_1, x_2, x_3, \ldots, x_n$ are n observations and corresponding frequencies are $f_1, f_2, \ldots, f_n$ respectively, then

$$\sigma = \sqrt{\frac{\sum_{i=1}^{n} f_i (x_i - \bar{x})^2}{N}} \quad \text{or} \quad (\sigma) = \frac{\sum_{i=1}^{n} f_i x_i^2}{N} - (\bar{x})^2$$

or $$\sigma = \sqrt{\frac{1}{N}\left(\sum_{i=1}^{n} f_i d_i^2\right) - \frac{1}{N}\left(\sum_{i=1}^{n} f_i d_i\right)^2}$$

where, $d_i = x_i - \bar{x}$ and $N = \Sigma f_i$

Properties of Standard Deviation

(i) It is independent of origin.

(ii) It is dependent of change of scale.

(iii) It is not less than mean deviation from mean.

(iv) Let n_1 and n_2 be the sizes of two series. Their means and standard deviations are $\bar{x}_1, \bar{x}_2$ and σ_1, σ_2 respectively. Let $\bar{x}$ denote the combined mean of two series, that is

$$\bar{x} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$$

$\therefore$ The combined standard deviation of two series is given by

$$\sigma = \sqrt{\frac{n_1(\sigma_1^2 + d_1^2) + n_2(\sigma_2^2 + d_2^2)}{n_1 + n_2}}$$

or $$\sigma = \sqrt{\frac{n_1\sigma_1^2 + n_2\sigma_2^2}{n_1 + n_2} + \frac{n_1 n_2(\bar{x}_1 - \bar{x}_2)^2}{(n_1 + n_2)^2}}$$

where, $d_1 = \bar{x}_1 - \bar{x}$ and $d_2 = \bar{x}_2 - \bar{x}$

(v) $\sigma = \frac{3(\text{Quartile deviation})}{2}$

(vi) $\sigma = \frac{5(\text{Mean deviation})}{4}$

***Sample* Problem 11** *The mean and standard deviation of 20 observations are found to be 10 and 2. On rechecking, it was found that an observation 8 was incorrect. Find the correct standard deviation if wrong item is omitted.* **[NCERT]**

(a) 1.88 (b) 1.99

(c) 1.95 (d) *None of these*

Interpret (*b*) Given, $\bar{x} = 10$ and $\sigma = 2, n = 20$

$\Rightarrow \quad \frac{\Sigma x_i}{20} = 10$

$\Rightarrow \quad \Sigma x_i = 20 \times 10$

$\Rightarrow \quad \Sigma x_i = 200$

If observation 8 is omitted, then $\Sigma x_i = 200 - 8 = 192$

Now, remaining number of observation = 19

$\Rightarrow$ Correct mean $= \frac{\Sigma x_i}{n} = \frac{192}{19} = 10.10$

Again, $\sigma = 2 \Rightarrow \sigma^2 = 4$

$\Rightarrow \quad \frac{\Sigma x_i^2}{n} - (\bar{x})^2 = 4 \Rightarrow \frac{\Sigma x_i^2}{20} - (10)^2 = 4$

$\Rightarrow \quad \Sigma x_i^2 = (4 + 100) \times 20 = 104 \times 20 = 2080$

If observation 8 is omitted, then $\Sigma x_i^2 = 2080 - 64 = 2016$

Now, correct standard deviation $\sigma = \sqrt{\frac{2016}{19} - \left(\frac{192}{19}\right)^2}$

$$= \sqrt{\frac{2016 \times 19 - (192)^2}{19 \times 19}}$$

$$= \frac{1}{19}\sqrt{38304 - 36864}$$

$$= \frac{1}{19}\sqrt{1440} = \frac{37.95}{19} = 1.99$$

Hot Spot

Variance

The variance of a variate is the square of standard deviation and it is denoted by σ^2 or Var (x).

$$\text{Var}(x) = \sigma^2 = (\text{standard deviation})^2$$

Coefficient of dispersion $= \frac{\sigma}{\bar{x}}$

These types of problem are directly asked in two consecutive years of AIEEE (JEE Main) 2013, 2012 and 2006. To solve such types of problems following steps are given below.

Step I Firstly write the given data, if it is given.

Step II If either change of origin or change of scale is given, then apply it.

Step III If other condition is given, then apply it.

Step IV Simplify it. Use the formula of variance.

***Sample* Problem 12** *Find the variance for the following frequency distribution*

Class	0-30	30-60	60-90	90-120	120-150	150-180	180-210
Frequency	2	3	5	10	3	5	2

(a) 2280 (b) 2276

(c) 2275 (d) *None of the above*

Interpret (*b*) **Step I** Write the given data.

Class	Frequency (f_i)	Mid-value x_i	Deviation from mean $d_i = \frac{x_i - A}{h}$, $A = 105$	d_i^2	$f_i d_i$	$f_i d_i^2$
0-30	2	15	– 3	9	– 6	18
30-60	3	45	– 2	4	– 6	12
60-90	5	75	– 1	1	– 5	5
90-120	10	105	0	0	0	0
120-150	3	135	1	1	3	3
150-180	5	165	2	4	10	20
180-210	2	195	3	9	6	18
Total	30				2	76

Step II Use the formula and simplify it.

$$\text{Variance} = \left[\frac{\Sigma f_i d_i^2}{\Sigma f_i} - \left(\frac{\Sigma f_i d_i}{\Sigma f_i}\right)^2\right] \times h^2 = \left[\frac{76}{30} - \left(\frac{2}{30}\right)^2\right] \times (30)^2$$

$$= \left[\frac{76}{30} - \frac{4}{30 \times 30}\right] \times 900$$

$$= \left(\frac{2280 - 4}{900}\right) \times 900$$

$$= \frac{2276}{900} \times 900 = 2276$$

Effect of Average and Dispersion on Change of Origin and Scale

	Change of origin	Change of scale
Mean	Dependent	Dependent
Median	Not dependent	Dependent
Mode	Not dependent	Dependent
Standard deviation	Not dependent	Dependent
Variance	Not dependent	Dependent

***Sample* Problem 13** *The mean and standard deviation of marks obtained by 50 students of a class in three subjects, Mathematics, Physics and Chemistry are given below*

Subject	Mathematics	Physics	Chemistry
Mean	42	32	40.9
Standard deviation	12	15	20

Which of these three subjects shows the highest variability in marks and which shows the lowest? [**NCERT**]

(a) *Chemistry, Mathematics* (b) *Mathematics, Physics*
(c) *Chemistry, Physics* (d) *None of these*

Interpret (a) Here, $n = 50$

For Mathematics,

Coefficient of variation (CV) $= \frac{\sigma}{\bar{x}} \times 100$

$$= \frac{12}{42} \times 100 = \frac{2}{7} \times 100 = \frac{200}{7}$$

$$= 28.57 \quad \text{...(i)}$$

For Physics, $\text{CV} = \frac{\sigma}{\bar{x}} \times 100 = \frac{15}{32} \times 100$

$$= \frac{1500}{32} = 46.87 \quad \text{...(ii)}$$

For Chemistry, $\text{CV} = \frac{\sigma}{\bar{x}} \times 100$

$$= \frac{20}{40.9} \times 100 = \frac{2000}{40.9} = 48.89 \quad \text{...(iii)}$$

From Eqs. (i), (ii) and (iii), we have

CV of Chemistry > CV of Physics > CV of Mathematics

$\therefore$ Chemistry shows the highest variability and Mathematics shows the least variability.

Check Point **2**

1. Let s be the standard deviation of n observations. Each of the n observations is multiplied by a constant c. Then, the standard deviation of the resulting number is
(a) s (b) cs
(c) $s\sqrt{c}$ (d) None of these

2. The mean deviation from the mean of the AP a, a + d, a + 2d, ..., a + 2nd is
(a) $n(n+1)d$ (b) $\frac{n(n+1)d}{2n+1}$
(c) $\frac{n(n+1)d}{2n}$ (d) $\frac{n(n-1)d}{2n+1}$

3. The variance of 6, 8, 10, 12, 14 is
(a) 7 (b) 8
(c) 12 (d) 16

4. If MD is 12, the value of SD will be
(a) 75 (b) 12
(c) 24 (d) None of these

5. The mean of 5 observations is 4 and their variance is 5.2. If three If there observations are 1, 2 and 6, then the other two are
(a) 2 and 9 (b) 3 and 8
(c) 4 and 7 (d) 5 and 6

6. Let r be the range and $S^2 = \frac{1}{n-1}\sum_{i=1}^{n}(x_i - \bar{x})^2$ be the standard deviation of a set of observations $x_1, x_2, \ldots, x_n$, then
(a) $S \le r\sqrt{\frac{n}{n-1}}$ (b) $S = r\sqrt{\frac{n}{n-1}}$
(c) $S \ge r\sqrt{\frac{n}{n-1}}$ (d) None of these

7. The mean and standard deviation of six observations are 8 and 4, respectively. If each observation is multiplied by 3, then find the mean and new standard deviation of the resulting observations.
(a) 24, 12 (b) 24,144 (c) 24, 150 (d) 12, 12

8. The sum and sum of squares corresponding to length x (in cm) and weight (y) (in g) of 50 plant products are given below

$$\sum_{i=1}^{50} x_i = 212, \sum_{i=1}^{50} x_i^2 = 902.8$$

and $$\sum_{i=1}^{50} y_i = 261, \sum_{i=1}^{50} y_i^2 + 1457.6$$

Which is more varying, the length or weight?
(a) weight (b) length
(c) cannot be determined (d) None of these

WORKED OUT Examples

Example 1 *Mean of 9 observations is 100 and mean of 6 observations is 80, then the mean of 15 observations is*

(*a*) 92 (*b*) 29
(*c*) 1380 (*d*) 15

Solution (*a*) $n_1 = 9, \quad \bar{x}_1 = 100$ and $n_2 = 6, \quad \bar{x}_2 = 80$

$$\therefore \quad \bar{x} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$$

$$= \frac{9 \times 100 + 6 \times 80}{9 + 6}$$

$$= \frac{1380}{15} = 92$$

Example 2 *Mean and mode of the following data are respectively*

Class	f_i
0-10	22
10-20	38
20-30	46
30-40	35
40-50	20

(*a*) 24.56, 24.26 (*b*) 24.26, 24.56
(*c*) 39.55, 16.1 (*d*) *None of these*

Solution (a)

Class	x_i	f_i	$x_i f_i$
0-10	5	22	110
10-20	15	38	570
20-30	25	46	1150
30-40	35	35	1225
40-50	45	20	900
		161	3955

$$\text{Mean} = \frac{\Sigma f_i x_i}{\Sigma f_i} = \frac{3955}{161} = 24.56 \text{ (approx.)}$$

Median = 24.26 (as solved in example 1)

$$\therefore \quad \text{Mode} = 3\,(24.46) - 2\,(24.56)$$

$$= 24.26$$

Example 3 *Median, for the following distribution is*

Wages (₹)	Number of labour
0-10	22
10-20	38
20-30	46
30-40	35
40-50	20

(*a*) 24.46 (*b*) 14.80
(*c*) 34.21 (*d*) *None of these*

Solution (*a*)

Class	f	cf
0-10	22	22
10-20	38	60
20-30	46	106
30-40	35	141
40-50	20	161

Here, $\frac{N}{2} = \frac{161}{2} = 80.5$

Median class is 20 – 30.

$$\therefore \quad \text{Median} = l + \left(\frac{\frac{N}{2} - c}{f}\right) h$$

$$= 20 + \left(\frac{80.5 - 60}{46} \times 10\right) = 24.46$$

Example 4 *The median of distribution* 83, 54, 78, 64, 90, 59, 67, 72, 70, 73 *is*

(*a*) 71 (*b*) 70
(*c*) 72 (*d*) *None of these*

Solution (*a*) On arranging in ascending order, we get

54, 59, 64, 67, 70, 72, 73, 78, 83, 90

$n = 10$ (even number)

$$\therefore \text{Median} = \frac{\text{Value of } \frac{10}{2} \text{ th term} + \text{Value of } \left(\frac{10}{2} + 1\right) \text{th term}}{2}$$

$$= \frac{\text{Value of 5th term} + \text{Value of 6th term}}{2} = \frac{70 + 72}{2} = 71$$

Example 5 *The mean and standard deviation of a group of 100 observations were found to be 20 and 3, respectively. Later on it was found that three observations were incorrect, which are recorded by 21, 21 and 18. Find the mean and standard deviation, if the incorrect observation are omitted.* **[NCERT]**

(*a*) 3.05 (*b*) 3.03
(*c*) 3.09 (*d*) *None of these*

Solution (*b*) Given, $n = 100, \bar{x} = 20, \sigma = 3$

$\because \quad \bar{x} = 20$

$\Rightarrow \quad \dfrac{\Sigma x}{100} = 20$

$\Rightarrow \quad \Sigma x_i = 100 \times 20$

$\Rightarrow \quad \Sigma x_i = 2000$

Now, incorrect observations 21, 21 and 18 are omitted, then correct sum is

$$\Sigma x_i = 2000 - 21 - 21 - 18 = 2000 - 60 = 1940$$

Now, correct mean of remaining 97 observations is

$$\bar{x} = \frac{1940}{97} = 20$$

Again, $\quad \sigma = 3 \Rightarrow \sqrt{\dfrac{\Sigma x_i^2}{n} - (\bar{x})^2} = 3$

$\Rightarrow \quad \dfrac{\Sigma x_i^2}{100} - (20)^2 = 9$

$\Rightarrow \quad \dfrac{\Sigma x^2}{100} = 9 + 400$

$\Rightarrow \quad \Sigma x^2 = 409 \times 100 = 40900$

Now, correct Σx^2 is

$$\Sigma x^2 = 40900 - (21)^2 - (21)^2 - (18)^2$$
$$= 40900 - 441 - 441 - 324$$
$$= 40900 - 1206 = 39694$$

Now, correct SD for remaining 97 observations is

$$\sigma = \sqrt{\frac{39694}{97} - \left(\frac{1940}{97}\right)^2}$$
$$= \sqrt{409.2 - (20)^2} = \sqrt{409.2 - 400}$$
$$= \sqrt{9.2} = 3.03$$

Example 6 *Find the mean deviation about mean for the data in following tables*

Income per day	Number of persons
0-100	4
100-200	8
200-300	9
300-400	10
400-500	7
500-600	5
600-700	4
700-800	3

[NCERT]

(*a*) 358, 157.92 (*b*) 359, 158.92
(*c*) 358, 158.20 (*d*) *None of these*

Solution (*a*)

Class	(f_i)	Mid value x_i	$d_i = \dfrac{x_i - A}{B}$, $A = 350$, $h = 100$	$f_i d_i$	$\lvert x_i - \bar{x} \rvert$	$f_i \lvert x_i - \bar{x} \rvert$
0-100	4	50	– 3	–12	308	1232
100-200	8	150	– 2	–16	208	1664
200-300	9	250	– 1	–9	108	972
300-400	10	350	0	0	8	80
400-500	7	450	1	7	92	644
500-600	5	550	2	10	192	960
600-700	4	650	3	12	292	1168
700-800	3	750	4	12	392	1176
Total	$\Sigma f_i = 50$			4		7896

$$\text{Mean } \bar{x} = A + \frac{\Sigma f_i d_i}{\Sigma f_i} \times h = 350 + \frac{4}{50} \times 100 = 350 + 8$$

$$\bar{x} = 358$$

$$\text{Mean deviation about the mean} = \frac{\Sigma f_i \mid x_i - \bar{x} \mid}{\Sigma f_i} = \frac{7896}{50} = 157.92$$

Example 7 *The mean life of a sample of 60 bulbs was 650 h and the standard deviation was 8 h. A second sample of 80 bulbs has a mean life of 660 h and standard deviation 7 h. Find the over all standard deviation.* **[NCERT Exemplar]**

(*a*) 8.97 (*b*) 8.98
(*c*) 8.94 (*d*) *None of these*

Solution (*c*) Given, $n_1 = 60, \bar{x}_1 = 650, \sigma_1 = 8,$

$n_2 = 80, \bar{x}_2 = 660, \sigma_2 = 7$

$$\therefore \text{ Combined SD} = \sqrt{\frac{n_1\sigma_1^2 + n_2\sigma_2^2}{n_1 + n_2} + \frac{n_1 n_2 (\bar{x}_1 - \bar{x}_2)^2}{(n_1 + n_2)^2}}$$

$$= \sqrt{\frac{60 \times 64 + 80 \times 49}{60 + 80} + \frac{60 \times 80\,(650 - 660)^2}{(60 + 80)^2}}$$

$$= \sqrt{\frac{3840 + 3920}{140} + \frac{(4800 \times 100)}{(140)^2}}$$

$$= \sqrt{\frac{7760}{140} + \frac{480000}{19600}}$$

$$= \sqrt{\frac{776}{14} + \frac{4800}{196}}$$

$$= \sqrt{55.42 + 24.49}$$

$$= \sqrt{79.91} = 8.94$$

Start Practice for JEE Main

Round I (Topically Divided Problems)

Mean, Geometric and Harmonic Mean

1. A statistical measure which cannot be determined graphically is
(a) median (b) mode
(c) harmonic mean (d) mean

2. The arithmetic mean of an AP and the mean of first and last term of an AP are
(a) equal
(b) unequal
(c) square of each other
(d) None of the above

3. The mean height of 25 male workers in a factory is 61 cm and the mean height of 35 female workers in the same factory is 58 cm. The combined mean height of 60 workers in the factory is
(a) 59.25 (b) 59.5
(c) 59.75 (d) 58.75

4. The average of the squares of the numbers 0, 1, 2, 3, 4,..., n is
(a) $\frac{1}{2}n(n+1)$ (b) $\frac{1}{6}n(2n+1)$
(c) $\frac{1}{6}(n+1)(2n+1)$ (d) $\frac{1}{6}n(n+1)$

5. Mean of 100 items is 49. It was discovered that three items which should have been 60, 70 and 80 were wrongly read as 40, 20 and 50, respectively. The correct mean is
(a) 48 (b) $82\frac{1}{2}$
(c) 50 (d) 80

6. The AM of n numbers of a series is $\bar{x}$. If the sum of first $(n-1)$ terms is k, then the nth number is
(a) $\bar{x} - k$ (b) $n\bar{x} - k$
(c) $\bar{x} - nk$ (d) $n\bar{x} - nk$

7. The mean of the series $x_1, x_2, \ldots, x_n$ is $\bar{x}$. If x_2 is replaced by λ, then the new mean is
(a) $\bar{x} - x_2 + \lambda$ (b) $\frac{\bar{x} - x_2 - \lambda}{n}$
(c) $\frac{(n-1)\bar{x} + \lambda}{n}$ (d) $\frac{n\bar{x} - x_2 + \lambda}{n}$

8. For a certain frequency table which has been partly reproduced here, the arithmetic mean was found to be ₹ 28.07.

Income (in ₹)	Number of workers
15	8
20	12
25	?
30	16
35	?
40	10

If the total number of workers is 75, then missing frequencies are respectively
(a) 14, 15 (b) 15, 14 (c) 13, 16 (d) 12, 17

9. If the average of the numbers 148, 146, 144, 142, ... in AP, be 125, then the total numbers in the series will be
(a) 18 (b) 24 (c) 30 (d) 48

10. The mean of the values of 1, 2, 3, ..., n with respectively frequencies $x, 2x, 3x, \ldots, nx$ is
(a) $\frac{n}{2}$ (b) $\frac{1}{3}(2n+1)$
(c) $\frac{1}{6}(2n+1)$ (d) $\frac{n}{2}$

11. The mean of n items is $\bar{x}$. If the first term is increased by 1, second by 2 and so on, then the new mean is
(a) $\bar{x} + n$ (b) $\bar{x} + \frac{n}{2}$
(c) $\bar{x} + \frac{n+1}{2}$ (d) None of these

12. If the mean of n observations $1^2, 2^2, 3^2, \ldots, n^2$ is $\frac{46n}{11}$, then n is equal to
(a) 11 (b) 12
(c) 23 (d) 22

13. The weighted AM of first n natural numbers whose weights are equal to the corresponding numbers is equal to
(a) $2n + 1$ (b) $\frac{1}{2}(2n + 1)$
(c) $\frac{1}{3}(2n + 1)$ (d) $\frac{2n + 1}{6}$

14. The AM of the series 1, 2, 4, 8, 16, …, 2^n is
(a) $\frac{2^n - 1}{n}$ (b) $\frac{2^{n+1} - 1}{n + 1}$
(c) $\frac{2^n + 1}{n}$ (d) $\frac{2^n - 1}{n + 1}$

15. In a class of 50 students, 10 have failed and their average marks are 28. The total marks obtained by the entire class are 2800. The average marks of those who have passed, are
(a) 43 (b) 53
(c) 63 (d) 70

16. If $\bar{x}_1$ and $\bar{x}_2$ are the means of two distributions such that $\bar{x}_1 < \bar{x}_2$ and $\bar{x}$ is the mean of the combined distribution, then
(a) $\bar{x} < \bar{x}_1$ (b) $\bar{x} > \bar{x}_2$
(c) $\bar{x} = \frac{\bar{x}_1 + \bar{x}_2}{2}$ (d) $\bar{x}_1 < \bar{x} < \bar{x}_2$

17. If the mean of the set of numbers $x_1, x_2, \ldots, x_n$ is $\bar{x}$, then the mean of the numbers $x_i + 2i, 1 \le i \le n$ is
(a) $\bar{x} + 2n$ (b) $\bar{x} + n + 1$
(c) $\bar{x} + 2$ (d) $\bar{x} + n$

18. The mean of 30 given numbers, when it is given that the mean of 10 of them is 12 and the mean of the remaining 20 is 9, is equal to
(a) 11 (b) 10 (c) 9 (d) 5

19. Mean of 100 observations is 45. If it was later found that two observations 19 and 31 were incorrectly recorded as 91 and 13. The correct mean is
(a) 44 (b) 45
(c) 44.46 (d) 45.54

20. The mean of a set of observations is $\bar{x}$. If each observation is divided by, $\alpha \neq 0$ and then is increased by 10, then the mean of the new set is
(a) $\frac{\bar{x}}{\alpha}$ (b) $\frac{\bar{x} + 10}{\alpha}$
(c) $\frac{\bar{x} + 10\alpha}{\alpha}$ (d) $\alpha\bar{x} + 10$

21. The mean of n observations is $\bar{x}$. If one observation x_{n+1} is added, then the mean remains same. The value of x_{n+1} is
(a) 0 (b) 1
(c) n (d) $\bar{x}$

22. In a class of 100 students, the average amount of pocket money is ₹ 35 per student. If the average is ₹ 25 for girls and ₹ 50 for boys, then the number of girls in the class is
(a) 20 (b) 40 (c) 60 (d) 80

23. If the sum of deviations of a number of observations about 4 is 30 and that about 3 is 40. Then, mean of the observations is
(a) 7 (b) 10
(c) 11 (d) None of these

24. If a variate x is expressed as a linear function of two variates u and v in the form $x = au + bv$, then mean $\bar{x}$ of x is
(a) $a\bar{u} + b\bar{v}$ (b) $\bar{u} + \bar{v}$
(c) $\bar{b}u + \bar{a}v$ (d) None of these

25. The average salary of male employees in a firm was ₹ 520 and that of females was ₹ 420. The mean salary of all the employees was ₹ 500. The percentage of male employees is
(a) 80% (b) 60% (c) 40% (d) 20%

26. The AM of n observations is M. If the sum of $(n - 4)$ observations is a, then the mean of remaining four observations is
(a) $\frac{nM - a}{4}$ (b) $\frac{nM + a}{2}$
(c) $\frac{nM - a}{2}$ (d) $nM + a$

27. The mean of the n observations $x_1, x_2, x_3, \ldots, x_n$ be $\bar{x}$. Then, the mean of n observations $2x_1 + 3, 2x_2 + 3, 2x_3 + 3, \ldots, 2x_n + 3$ is
(a) $3\bar{x} + 2$ (b) $2\bar{x} + 3$
(c) $\bar{x} + 3$ (d) $2\bar{x}$

28. The mean age of a combined group of men and women is 25 yr. If the mean age of the group of men is 26 yr and that of the group of women is 21 yr, then the percentage of men and women in the group are respectively
(a) 60, 40 (b) 80, 20
(c) 20, 80 (d) 40, 60

29. The AM of ${}^{2n+1}C_0, {}^{2n+1}C_1, {}^{2n+1}C_2, \ldots, {}^{2n+1}C_n$ is
(a) $\frac{2^n}{n}$ (b) $\frac{2^n}{n + 1}$
(c) $\frac{2^{2n}}{n}$ (d) $\frac{2^{2n}}{(n + 1)}$

30. The mean of the values $0, 1, 2, 3, \ldots, n$ with the corresponding weights ${}^nC_0, {}^nC_1, \ldots, {}^nC_n$ respectively is

(a) $\frac{2^n}{(n+1)}$ (b) $\frac{2^{n+1}}{n(n+1)}$

(c) $\frac{n+1}{2}$ (d) $\frac{n}{2}$

31. If a variable takes values 0, 1, 2, ..., n with frequencies $q^n, \frac{n}{1}q^{n-1}p, \frac{n(n-1)}{1\cdot 2}q^{n-2}p^2, \ldots p^n$, where $p + q = 1$, then the mean is

(a) np (b) nq

(c) $n(p + q)$ (d) None of these

32. The GM of the numbers $2, 2^2, 2^3, \ldots 2^n$ is

(a) $2^{2/n}$ (b) $2^{n/2}$

(c) $2^{n-1/2}$ (d) $2^{n+1/2}$

33. Let G_1 and G_2 be the ... geometric means of two ... series $x_1, x_2, \ldots, x_n; y_1, y_2, \ldots, y_n$. If G is the geometric mean of $\frac{x_i}{y_i}$, $i = 1, 2, \ldots, n$. Then, G is equal to

(a) $G_1 - G_2$ (b) $\frac{\log G_1}{\log G_2}$

(c) $\frac{G_1}{G_2}$ (d) $\log\left(\frac{G_1}{G_2}\right)$

34. Geometric mean of first group of 4 observations is 8 and that of second group of 3 observations is 1024. Then, geometric mean of all the 7 observations is

(a) 64 (b) 32

(c) 128 (d) None of these

35. If the observations 2, 4, 8 and 16 occur 8, 6, 4 and 2 times respectively, then the geometric mean of the observations is

(a) 8 (b) $4\sqrt{2}$

(c) 4 (d) None of these

36. The harmonic mean of the numbers $1, \frac{1}{2}, \frac{1}{3}, \ldots, \frac{1}{n}$ is

(a) $\frac{1}{n+1}$ (b) $\frac{2}{n+1}$

(c) $\frac{3}{n+1}$ (d) None of these

37. If harmonic mean of first 5 observations is $\frac{5}{2}$ and harmonic mean of another 5 observations is $\frac{9}{2}$, then harmonic mean of all 10 observations is

(a) 7 (b) $\frac{45}{14}$

(c) $\frac{101}{36}$ (d) None of these

38. Geometric mean of 10 observations is 8. If geometric mean of first six observations is 4, then geometric mean of last four observations is

(a) $16\sqrt{2}$ (b) $8\sqrt{2}$

(c) 16 (d) None of these

39. Two possible observations have arithmetic mean 3 and geometric mean $2\sqrt{2}$. If each observation is multiplied by 2, then harmonic mean will be

(a) $\frac{16}{3}$ (b) $\frac{8}{3}$

(c) 12 (d) None of these

40. Geometric mean of first group of 5 observations is 8 and that of second group of 4 observations is $128\sqrt{2}$. Then, grouped geometric mean is

(a) 64 (b) $32\sqrt{2}$

(c) 32 (d) None of these

Median and Mode

41. Which of the following is not a measure of central tendency?

(a) Mean (b) Median

(c) Mean-deviation (d) Mode

42. For dealing with qualitative data the best average is

(a) AM (b) GM (c) median (d) mode

43. The mean weight of 9 items is 15. If one more item is added to the series, the mean becomes 16. The value of 10th item is

(a) 35 (b) 30 (c) 25 (d) 20

44. If a variable takes the discrete values $\alpha + 4$, $\alpha - \frac{7}{2}$, $\alpha - \frac{5}{2}, \alpha - 3, \alpha - 2, \alpha + \frac{1}{2}, \alpha - \frac{1}{2}, \alpha + 5\ (\alpha > 0)$, then the median is

(a) $\alpha - \frac{5}{4}$ (b) $\alpha - \frac{1}{2}$ (c) $\alpha - 2$ (d) $\alpha + \frac{5}{4}$

45. Coefficient of skewness for the values

Median = 18.8, $Q_1 = 14.6$, $Q_3 = 25.2$ is

(a) 0.2 (b) 0.5

(c) 0.7 (d) None of these

46. Median of ${}^{2n}C_0, {}^{2n}C_1, {}^{2n}C_2, {}^{2n}C_3, \ldots, {}^{2n}C_n$ (where, n is even) is

(a) ${}^{2n}C_{\frac{n}{2}}$ (b) ${}^{2n}C_{\frac{n+1}{2}}$

(c) ${}^{2n}C_{\frac{n-1}{2}}$ (d) None of these

47. If the sum of 11 consecutive natural numbers is 2761, then the middle number is

(a) 249 (b) 250

(c) 251 (d) 252

48. If the mode of the data is 18 and the mean is 24, then median is
(a) 18 (b) 24 (c) 22 (d) 21

49. If in a moderately asymmetrical distribution mode and mean of the data are 6λ and 9λ respectively, then median is
(a) 8λ (b) 7λ (c) 6λ (d) 5λ

50. If the median of 21 observations is 40 and if the observations greater than the median are increased by 5, then the median of the new data will be
(a) 40 (b) 45
(c) $4 + \frac{50}{21}$ (d) $45 - \frac{50}{21}$

51. In a moderately skewed distribution the values of mean and median are 5 and 6, respectively. The value of mode in such a situation is approximately equal to
(a) 8 (b) 11
(c) 16 (d) None of these

Quartile Deviation and Mean Deviation

52. Consider the following statements
I. The values of median and mode can be determined graphically.
II. Mean, median and mode have the same unit.
III. Range is the best measure of dispersion.
Which of these is/are correct?
(a) Only I (b) Only II
(c) Both II and III (d) None of these

53. The quartile deviation of daily wages (in ₹) of 7 persons given below 12, 7, 15, 10, 17, 19 and 25 is
(a) 14.5 (b) 5
(c) 9 (d) 4.5

54. The quartile deviation for the following data is

x	2	3	4	5	6
f	3	4	8	4	1

(a) 0 (b) $\frac{1}{4}$ (c) $\frac{1}{2}$ (d) 1

55. If two variables x and y are such that $2y + 5 = 3x$ and Quartile Deviation (QD) of x is 8, then (QD) of y is
(a) 2 (b) 8
(c) 4 (d) None of these

56. Find the quartile deviation of the following distribution.

Marks	0-10	10-20	20-30	30-40	40-50
Number of students	10	20	35	25	10

(a) 8.20 (b) 8.25
(c) 8.30 (d) None of these

57. For a series the value of mean deviation is 15, the most likely value of its quartile deviation is
(a) 12.5 (b) 11.6
(c) 13 (d) 9.7

58. The mean deviation of the data 3, 10, 10, 4, 7, 10, 5 from the mean is [NCERT Exemplar]
(a) 2 (b) 2.57 (c) 3 (d) 3.75

59. When tested, the lives (in hours) of 5 bulbs were noted as follows
1357, 1090, 1666, 1494, 1623
The mean deviations (in hours) from their mean is [NCERT Exemplar]
(a) 178 (b) 179
(c) 220 (d) 356

60. Following are the marks obtained by 9 students in a Mathematics test
50, 69, 20, 33, 53, 39, 40, 65, 59
The mean deviation from the median is [NCERT Exemplar]
(a) 9 (b) 10.5
(c) 12.67 (d) 14.76

61. Find the mean deviation about the mean of the set of first n natural numbers when n is an odd number. [NCERT Exemplar]
(a) $\frac{n^2 + 1}{4n}$ (b) $\frac{n^2 - 1}{4n}$
(c) $\frac{n^2 - 3}{5n}$ (d) None of these

62. Find the mean deviation from the median of the following data [NCERT Exemplar]

Class interval	0-6	6-12	12-18	18-24	24-30
Frequency	4	5	3	6	2

(a) 7.08 (b) 7
(c) 7.1 (d) 7.05

Standard Deviation

63. The standard deviation of the data 6, 5, 9, 13, 12, 8, 10 is [NCERT Exemplar]
(a) $\sqrt{\frac{52}{7}}$ (b) $\frac{52}{7}$
(c) $\sqrt{6}$ (d) 6

64. The mean of 100 observations is 50 and their standard deviation is 5. The sum of all squares of all the observations is [NCERT Exemplar]
(a) 50000 (b) 250000
(c) 252500 (d) 255000

65. Let a, b, c, d and e be the observations with mean m and standard deviation S. The standard deviation of the observations $a + k, b + k, c + k, d + k, e + k$ is [NCERT Exemplar]

(a) S (b) kS
(c) $S + k$ (d) $\frac{S}{k}$

66. The SD of 15 items is 6 and if each item is decreases by 1, then standard deviation will be

(a) 5 (b) 7 (c) $\frac{91}{15}$ (d) 6

67. If SD of X is S, then SD of the variable $\mu = \frac{aX + b}{c}$, where a, b and c are constants, is

(a) $\left|\frac{c}{a}\right|\sigma$ (b) $\left|\frac{a}{c}\right|\sigma$
(c) $\left|\frac{b}{c}\right|\sigma$ (d) $\frac{c^2}{a^2}\sigma$

68. If $\bar{x}$ is the arithmetic mean of n independent variates $x_1, x_2, x_3, \ldots, x_n$ each of the standard deviation σ, then variance $(\bar{x})$ is

(a) $\frac{\sigma^2}{n}$ (b) $\frac{n\sigma^2}{2}$
(c) $\frac{(n+1)\sigma^2}{3}$ (d) None of these

69. Let x_1, x_2, x_3, x_4 and x_5 be the observations with mean m and standard deviation S. The standard deviation of the observations

kx_1, kx_2, kx_3, kx_4 and kx_5 is [NCERT Exemplar]

(a) $k + S$ (b) $\frac{S}{k}$
(c) kS (d) S

70. Let $x_1, x_2, \ldots, x_n$ be n observations. Let $w_i = lx_i + k$ for $i = 1, 2, \ldots, n$, where l and k are constants. If the mean of x_i's is 48 and their standard deviation is 12, the mean of w_i's is 55 and standard deviation of w_i's is 15, the values of l and k should be [NCERT Exemplar]

(a) $l = 1.25, k = -5$ (b) $l = -1.25, k = 5$
(c) $l = 2.5, k = -5$ (d) $l = 2.5, k = 5$

71. The variance of the first n natural numbers is

(a) $\left(\frac{n^2 - 1}{12}\right)$ (b) $\frac{n(n^2 - 1)}{12}$
(c) $\left(\frac{n^2 + 1}{12}\right)$ (d) $\frac{n(n^2 + 1)}{12}$

72. Standard deviations for first 10 natural numbers is [NCERT Exemplar]

(a) 5.5 (b) 3.87
(c) 2.97 (d) 2.87

73. Consider the numbers 1, 2, 3, 4, 5, 6, 7, 8, 9, 10. If 1 is added to each number, then variance of the numbers so obtained is [NCERT Exemplar]

(a) 6.5 (b) 2.87
(c) 3.87 (d) 8.25

74. The following information relates to a sample of size 60 : $\Sigma x^2 = 18000$, $\Sigma x = 960$.

The variance is [NCERT Exemplar]

(a) 6.63 (b) 16
(c) 22 (d) 44

75. Coefficient of variation of two distributions are 50 and 60 and their arithmetic means are 30 and 25 respectively. Difference of their standard deviation is [NCERT Exemplar]

(a) 0 (b) 1 (c) 1.5 (d) 2.5

76. If the variance of $1, 2, 3, 4, 5, \ldots, 10$ is $\frac{99}{12}$, then the standard deviation of $3, 6, 9, 12, \ldots, 30$ is

(a) $\frac{297}{4}$ (b) $\frac{3}{2}\sqrt{33}$
(c) $\frac{3}{2}\sqrt{99}$ (d) $\sqrt{\frac{99}{12}}$

77. The mean and standard deviation of some data for the time taken to complete a test are calculated with the following results

Number of observations = 25, mean = 18.2 s, standard deviation = 3.25 s.

Further, another set of 15 observations $x_1, x_2, \ldots, x_{15}$, also in seconds, is now available and we have $\sum_{i=1}^{15} x_i = 279$ and $\sum_{i=1}^{15} x_i^2 = 5524$. Find the standard deviation based on all 40 observations. [NCERT Exemplar]

(a) 3.80 (b) 3.87
(c) 3.70 (d) None of these

78. If for a distribution $\Sigma(x - 5) = 3$, $\Sigma(x - 5)^2 = 43$ and the total number of items is 18, find the mean and standard deviation. [NCERT Exemplar]

(a) 94, 1.53
(b) 93, 1.53
(c) 93, 1.55
(d) None of the above

79. The mean and variance of n values of a variable x are 0 and σ^2, respectively. If the variable $y = x^2$, then mean of y is

(a) σ (b) σ^2
(c) 1 (d) None of these

80. The variance of the numbers 2, 3, 11 and x is $\frac{49}{4}$. Find the value of x.

(a) 6, $\frac{14}{3}$ (b) 6, $\frac{14}{5}$
(c) 6, $\frac{16}{3}$ (d) None of these

81. If runs of two players A and B in 10 cricket matches are such that player A has mean 50 and variance 36 and player B has mean 60 and variance 81 of runs, then the player more consistent in runs is

(a) A
(b) B
(c) Both are equally consistent
(d) None of the above

82. Mean and standard deviation of 100 observations were found to be 40 and 10, respectively. If at the time of calculation two observations were wrongly taken as 30 and 70 in place of 3 and 27, respectively, find the correct standard deviation. [NCERT Exemplar]

(a) 10.20 (b) 10.24
(c) 10.29 (d) 10.27

83. Two samples of sizes 100 and 150 have means 45 and 55 and standard deviations 7 and 12, respectively. Find the mean and standard deviation of the combined sample.

(a) 11.30 (b) 11.45
(c) 11.40 (d) 11.50

Round II (Mixed Bag)

Only One Correct Option

1. The marks of some students were listed out of 75. The SD of marks was found to be 9. Subsequently the marks were raised to a maximum of 100 and variance of new marks was calculated. The new variance is

(a) 81 (b) 122
(c) 144 (d) None of these

2. A batsman scores sums in 10 innings 38, 70, 48, 34, 42, 55, 46, 63, 54 and 44, then the deviation from median is

(a) 8.6 (b) 6.4
(c) 9.6 (d) 10.6

3. Consider any set of 201 observations $x_1, x_2, \ldots, x_{200}, x_{201}$. It is given that $x_1 < x_2 < \ldots < x_{200} < x_{201}$. Then, the mean deviation of this set of observations about a point k is minimum when k is equal to

(a) $(x_1 + x_2 + \ldots + x_{200} + x_{201}) / 201$
(b) x_1
(c) x_{101}
(d) x_{201}

4. In a college of 300 students every student reads 5 newspapers and every newspaper is read by 60 students. The number of newspapers are

(a) atleast 30 (b) atmost 20
(c) exactly 25 (d) None of these

5. If the mean of a set of observations $x_1, x_2, \ldots, x_{10}$ is 20, then the mean of $x_1 + 4, x_2 + 8, \ldots, x_{10} + 40$ is

(a) 34 (b) 38 (c) 40 (d) 42

6. If $\sum_{i=1}^{18} (x_i - 8) = 9$ and $\sum_{i=1}^{18} (x_i - 8)^2 = 45$, then the standard deviation of $x_1, x_2, \ldots, x_{18}$ is

(a) $\frac{4}{9}$ (b) $\frac{9}{4}$
(c) $\frac{3}{2}$ (d) None of these

7. If the standard deviation of $x_1, x_2, \ldots, x_n$ is 3.5, then the standard deviation of $-2x_1 - 3, -2x_2 - 3, \ldots, -2x_n - 3$ is

(a) -7 (b) -4
(c) 7 (d) 1.75

8. The mean deviation from mean of the observation $a, a + d, a + 2d, \ldots, a + 2nd$ is

(a) $\frac{n(n+1)d^2}{3}$ (b) $\frac{n(n+1)}{2} d^2$
(c) $a + \frac{n(n+1)d^2}{2}$ (d) None of these

9. The first of two samples has 100 items with mean 15 and SD = 3. If the whole group has 250 items with mean 15.6 and SD = $\sqrt{13.44}$, the SD of the second group is

(a) 4 (b) 5
(c) 6 (d) 3.52

10. If the mean of five observations $x, x+2, x+4, x+6$ and $x+8$ is 11, then the mean of last three observations is

(a) 13 (b) 15
(c) 17 (d) None of these

11. The median of 19 observations of a group is 30. If two observations with values 8 and 32 are further included, then the median of the new group of 21 observations will be

(a) 28 (b) 30
(c) 32 (d) 34

12. If a variable x takes values x_i such that $a \le x_i \le b$, for $i = 1, 2, \ldots n$, then

(a) $a^2 \le \text{var}(x) \le b^2$ (b) $a \le \text{var}(x) \le b$

(c) $\frac{a^2}{4} \le \text{var}(x)$ (d) $(b - a)^2 \ge \text{var}(x)$

13. If the arithmetic mean of two unequal positive real numbers a and b $(a > b)$ be twice as their geometric mean, then $a : b$ is equal to

(a) $(2 + \sqrt{3}) : (\sqrt{2} + 3)$ (b) $(2 - \sqrt{3}) : (2 + \sqrt{3})$

(c) $(2 + \sqrt{3}) : (2 - \sqrt{3})$ (d) None of these

14. Following is the statement of marks obtained by two students A and B in 10 examination papers.

Paper	1	2	3	4	5	6	7	8	9	10
Marks scored by *A*	44	80	76	48	52	72	68	56	60	54
Marks scored by *B*	48	75	54	60	63	69	72	51	57	66

If the consistency of performance is the criterion for awarding a prize, find the prize winner among A and B.

(a) student A

(b) student B

(c) either students or A and B

(d) None of the above

15. There are 60 students in a class. The following is the frequency distribution of the marks obtained by the students in a test

Marks	0	1	2	3	4	5
Frequency	$x-2$	x	x^2	$(x+1)^2$	$2x$	$x+1$

where, x is a positive integer. Find the mean and standard deviation of the marks.

(a) 2.9, 1.14 (b) 2.8, 1.12

(c) 2.8, 1.18 (d) None of these

More Than One Correct Option

16. The variable x takes two values x_1 and x_2 with frequencies f_1 and f_2, respectively. If σ denotes the standard deviation of x, then

(a) $\sigma^2 = \frac{f_1x_1^2 + f_2x_2^2}{f_1 + f_2} - \left(\frac{f_1x_1 + f_2x_2}{f_1 + f_2}\right)^2$

(b) $\sigma^2 = \frac{f_1f_2}{(f_1 + f_2)^2}(x_1 - x_2)^2$

(c) $\sigma^2 = \frac{(x_1 - x_2)^2}{f_1 + f_2}$

(d) None of the above

17. Which of the following is a correct statement?

(a) The sum of the deviations from arithmetic mean is zero

(b) Computation of arithmetic mean is based on all observations

(c) It gives no importance to extreme values

(d) None of the above

Comprehension Based Questions

Passage

Directions (Q. Nos. 18 and 19) *Let us consider the series $x_1, x_2, \ldots, x_n$ whose mean is $\bar{x}$ and variance is σ^2.*
On the basis of above information, answer the following questions.

18. If x_i is replaced by x_i', then new mean is

(a) $\bar{x} - x_i + x_i'$ (b) $\frac{(n-1)\bar{x} + x_i'}{n}$

(c) $\frac{n\bar{x} - x_i + x_i'}{n}$ (d) None of these

19. If 5 is added in each observation, then the new variance is

(a) σ^2 (b) $\sigma^2 + 5$

(c) $\sigma^2 - 5$ (d) None of these

Assertion and Reason

Directions (Q. Nos. 20-25) *Each of these questions contains two statements : Statement* I (*Assertion*) *and Statement* II (*Reason*). *Each of these questions also has four alternative choices, only one of which is the correct answer. You have to select one of the codes* (*a*), (*b*), (*c*) *and* (*d*) *given below.*

(a) Statement I is true, Statement II is true; Statement II is a correct explanation for Statement I.

(b) Statement I is true, Statement II is true; Statement II is not a correct explanation for Statement I.

(c) Statement I is true; Statement II is false.

(d) Statement I is false; Statement II is true.

20. Suppose two groups of scores A and B are such that $A = (x, x+2, x+4)$ and $B = (x-2, x+2, x+6)$

Statement I Group B has more variability than group A.

Statement II The value of mean for group B is more than that of group A.

21. The algebraic sum of deviation from their mean is defined as $\sum_{i=1}^{n} (x_i - \bar{x})$

Statement I The algebraic sum of the deviations of 20 observations measured from 30 is 2. The mean value of the observations is 30.

Statement II The sum of deviation from their mean is zero.

22. If n is a natural number, then

Statement I The mean of the squares of first n natural number is $\frac{(n+1)(2n+1)}{6}$.

Statement II $\Sigma n = \frac{n(n+1)}{2}$

23. Standard deviation is not depend on change of origin.

Statement I The standard deviation of variable $\frac{ax+b}{c}$ is $\left|\frac{a}{c}\right|\sigma$.

Statement II The standard deviation of a linear equation is $\sigma \times |\text{coefficient of } x|$.

24. **Statement I** If μ is the mean of a distribution, then $\Sigma f_i(y_i - \mu)$ is equal to 0.

Statement II The mean of the square of first n natural numbers is $\frac{1}{6}n(2n+1)$.

25. **Statement I** The variance of first n natural numbers is $\frac{n^2-1}{12}$.

Statement II The sum of first n natural numbers is $\frac{n(n+1)}{2}$ and the sum of squares of first n natural numbers is $\frac{n(n+1)(2n+1)}{6}$.

Previous Years' Questions

26. If the mean deviations about the median of the numbers $a, 2a, \ldots, 5a$ is 50, then $|a|$ is equal to **[AIEEE 2011]**

(a) 3 (b) 4 (c) 5 (d) 2

27. For two data sets, each of size 5, the variance are given to be 4 and 5 and the corresponding means are given to be 2 and 4, respectively. The variance of the combined data set is **[AIEEE 2010]**

(a) $\frac{5}{2}$ (b) $\frac{11}{2}$ (c) 6 (d) $\frac{13}{2}$

28. If the mean deviation of number $1, 1+d, 1+2d, \ldots, 1+100d$ from their mean is 255, then the d is equal to **[AIEEE 2009]**

(a) 10.0 (b) 20.0
(c) 10.1 (d) 20.2

29. The mean of the numbers a, b, 8, 5 and 10 is 6 and the variance is 6.80. Then, which one of the following gives possible values of a and b? **[AIEEE 2008]**

(a) $a = 3, b = 4$ (b) $a = 0, b = 7$
(c) $a = 5, b = 2$ (d) $a = 1, b = 6$

30. The average marks of boys in a class is 52 and that of girls is 42. The average marks of boys and girls combined is 50. The percentage of boys in the class is **[AIEEE 2007]**

(a) 40% (b) 20%
(c) 80% (d) 60%

the Guidance

Round I

1. A statistical measure which cannot be determined graphically is harmonic mean.

2. Let $a, a+d, a+2d, \ldots, a(n-1)d$ be the n terms in AP.

$$\therefore \quad \text{Mean} = \frac{a + (a+d) + \ldots + \{a + (n-1)d\}}{n}$$

$$\Rightarrow \quad \text{Mean} = \frac{n}{2}\left\{\frac{2a + (n-1)d}{n}\right\}$$

$$\Rightarrow \quad \text{Mean} = \frac{a + \{a + (n-1)d\}}{2}$$

$$\therefore \quad \text{Mean} = \begin{pmatrix}\text{Mean of first and last term} \\ \text{of the given AP}\end{pmatrix}$$

3. Since, $n_1 = 25, n_2 = 35, \bar{x}_1 = 61, \bar{x}_2 = 58$

$$\because \quad \bar{x} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$$

$$\therefore \quad \bar{x} = \frac{(25)(61) + (35)(58)}{25 + 35} = \frac{1525 + 20230}{60} = \frac{3555}{60} = 59.25$$

4. $$\text{Mean} = \frac{0^2 + 1^2 + 2^2 + 3^2 + \ldots + n^2}{(n+1)}$$

$$= \frac{n(n+1)(2n+1)}{6(n+1)}$$

$$= \frac{1}{6}n(2n+1)$$

5. Sum of 100 items $= 49 \times 100 = 4900$

Sum of items added $= 60 + 70 + 80 = 210$

Sum of items replaced $= 40 + 20 + 50 = 110$

New sum $= 4900 - 110 + 210 = 5000$

$$\therefore \quad \text{New mean} = \frac{5000}{100} = 50$$

6. Let the n numbers be $x_1, x_2, \ldots, x_n$. Then,

$$\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i$$

$$\Rightarrow \quad \bar{x} = \frac{x_1 + x_2 + \ldots + x_{n-1} + x_n}{n}$$

$$\Rightarrow \quad \bar{x} = \frac{k + x_n}{n} \qquad (\because x_1 + x_2 + \ldots + x_{n-1} = k)$$

$$\therefore \quad x_n = n\bar{x} - k$$

7. We have, $\bar{x} = \dfrac{x_1 + x_2 + \ldots + x_{n-1} + x_n}{n}$

$$\Rightarrow \quad n\bar{x} = x_1 + x_2 \ldots + x_{n-1} + x_n$$

Let $\bar{y}$ be the new mean when x_2 is replaced by λ. Then,

$$\bar{y} = \frac{x_1 + \lambda + x_3 + \ldots + x_{n-1} + x_n}{n}$$

$$\Rightarrow \quad \bar{y} = \frac{(x_1 + x_2 + \ldots + x_n) - x_2 + \lambda}{n}$$

$$\therefore \quad \bar{y} = \frac{n\bar{x} - x_2 + \lambda}{n}$$

8. $\because 8 + 12 + f_1 + 16 + f_2 + 10 = 75$

$$\Rightarrow \quad f_1 + f_2 = 29 \qquad \ldots\text{(i)}$$

and $120 + 240 + 25f_1 + 480 + 35f_2 + 400 = 28.07 \times 75$

$$\Rightarrow \quad 1240 + 25f_1 + 35f_2 = 2105.25$$

$$\Rightarrow \quad 5f_1 + 7f_2 = 173.25 \qquad \ldots\text{(ii)}$$

On solving Eqs. (i) and (ii), we get

$$f_1 = 15 \quad \text{and} \quad f_2 = 14$$

9. Given series is 148, 146, 144, 142, ... whose first term and common difference is

$$a = 148, d = (146 - 148) = -2$$

$$S_n = \frac{n}{2}[2a + (n-1)d] = 125 \qquad \text{(given)}$$

$$\Rightarrow \quad 125n = \frac{n}{2}[2 \times 148 + (n-1) \times (-2)]$$

$$\Rightarrow \quad n^2 - 24n = 0 \quad \Rightarrow \quad n(n-24) = 0$$

$$\Rightarrow \quad n = 24 \qquad (n \neq 0)$$

10. $$\therefore \text{Mean} = \frac{1 \times x + 2 \times 2x + 3 \times 3x + \ldots n \times nx}{x + 2x + 3x + \ldots + nx}$$

$$= \frac{x(1^2 + 2^2 + 3^2 \ldots + n^2)}{x(1 + 2 + 3 + \ldots + n)} = \frac{\dfrac{n(n+1)(2n+1)}{6}}{\dfrac{n(n+1)}{2}} = \frac{2n+1}{3}$$

11. Let $x_1, x_2, \ldots x_n$ be the n items.

Given, $$\bar{x} = \frac{x_1 + x_2 + \ldots + x_n}{n} \qquad \ldots\text{(i)}$$

$$\therefore \quad \text{New mean} = \frac{(x_1 + 1) + (x_2 + 2) + \ldots + (x_n + n)}{n}$$

$$= \frac{(x_1 + x_2 + \ldots + x_n) + (1 + 2 + \ldots + n)}{n}$$

$$= \bar{x} + \frac{n(n+1)}{2n} \qquad [\because \text{from Eq. (i)}]$$

$$= \bar{x} + \frac{(n+1)}{2}$$

12. According to the given condition,

$$\frac{1^2 + 2^2 + 3^2 + \ldots + n^2}{n} = \frac{46n}{11}$$

$$\Rightarrow \quad \frac{n(n+1)(2n+1)}{6n} = \frac{46n}{11}$$

$\Rightarrow \quad 11(2n^2 + 3n + 1) = 276n$

$\Rightarrow \quad 22n^2 - 243n + 11 = 0$

$\Rightarrow \quad (n - 11)(22n - 1) = 0 \Rightarrow n = 11$

13. The required mean is

$$\bar{X} = \frac{1\cdot 1 + 2\cdot 2 + 3\cdot 3 + \ldots + n\cdot n}{1 + 2 + 3 + \ldots + n}$$

$$= \frac{\Sigma n^2}{\Sigma n} = \frac{n(n+1)\dfrac{(2n+1)}{6}}{\dfrac{n(n+1)}{2}} = \frac{2n+1}{3}$$

14. The required AM is

$$\bar{X} = \frac{1 + 2 + 2^2 + 2^3 + \ldots + 2^n}{n+1}$$

$$= \frac{1(2^{n+1} - 1)}{(2-1)} \cdot \frac{1}{(n+1)} = \frac{2^{n+1} - 1}{n+1}$$

15. $\because$ Total marks of 10 failed students $= 28 \times 10 = 280$

and total marks of 50 students $= 2800$

$\therefore$ Total marks of 40 passed students $= 2800 - 280 = 2520$

$\therefore$ Average marks of 40 passed students $= \dfrac{2520}{40} = 63$

16. Let n_1 and n_2 be the number of observations in two groups having means $\bar{x}_1$ and $\bar{x}_2$, respectively. Then,

$$\bar{x} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$$

Now, $\quad \bar{x} - \bar{x}_1 = \dfrac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2} - \bar{x}_1$

$\Rightarrow \quad \bar{x} - \bar{x}_1 = \dfrac{n_2(\bar{x}_2 - \bar{x}_1)}{n_1 + n_2} > 0 \quad [\because \bar{x}_2 > \bar{x}_1 (\text{given})]$

$\Rightarrow \quad \bar{x} > \bar{x}_1 \quad \ldots(\text{i})$

Also, $\quad \bar{x} - \bar{x}_2 = \dfrac{n_1(\bar{x}_1 - \bar{x}_2)}{n_1 + n_2} < 0 \quad [\because \bar{x}_2 > \bar{x}_1 (\text{given})]$

$\Rightarrow \quad \bar{x} < \bar{x}_2 \quad \ldots(\text{ii})$

From Eqs. (i) and (ii), we have $\bar{x}_1 < \bar{x} < \bar{x}_2$

17. $\bar{x} = \dfrac{1}{n}\displaystyle\sum_{i=1}^{n} x_i$

$\Rightarrow \quad \displaystyle\sum_{i=1}^{n} x_i = n\bar{x}$

Let $M = \dfrac{1}{n}\displaystyle\sum_{i=1}^{n} (x_i + 2i) = \dfrac{1}{n}\sum_{i=1}^{n} x_i + 2(1 + 2 + \ldots + n)$

$\Rightarrow \quad M = \dfrac{1}{n} n\bar{x} + 2\dfrac{n(n+1)}{2}$

$\therefore \quad M = \bar{x} + (n+1)$

18. Given that, $n_1 = 10, \bar{x}_1 = 12, n_2 = 20, \bar{x}_2 = 9$

$\therefore \quad \bar{x} = \dfrac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2} = \dfrac{10 \times 12 + 20 \times 9}{10 + 20}$

$= \dfrac{120 + 180}{30} = \dfrac{300}{30} = 10$

19. Total of corrected observations

$= 4500 - (91 + 13) + (19 + 31) = 4446$

$\therefore \quad \text{Mean} = \dfrac{4446}{100} = 44.46$

20. Let $x_1, x_2, x_3, \ldots x_n$ be n observations. Then,

$$\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i$$

$\therefore$ New mean, $\bar{X} = \dfrac{1}{n}\displaystyle\sum_{i=1}^{n}\left(\frac{x_i}{\alpha} + 10\right)$

$$= \frac{1}{\alpha}\left(\frac{1}{n}\sum_{i=1}^{n} x_i\right) + \frac{1}{n}\cdot(10n)$$

$$= \frac{1}{\alpha}\bar{x} + 10 = \frac{\bar{x} + 10\alpha}{\alpha}$$

21. Let $x_1, x_2, x_3, \ldots, x_n$ be n observations.

$\therefore \quad \bar{x} = \dfrac{\Sigma x_i}{n} \quad \ldots(\text{i})$

New mean $= \dfrac{\Sigma x_i + x_{n+1}}{n+1}$

According to the question, $\bar{x} = \dfrac{\Sigma x_i + x_{n+1}}{n+1}$

$\Rightarrow \quad (n+1)\bar{x} = n\bar{x} + x_{n+1}$

$\Rightarrow \quad x_{n+1} = \bar{x}$

22. Let the number of girls in the class $= y$

$\therefore$ Number of boys in the class $= 100 - y$

Now, $\bar{x}_1 = 25, \; n_1 = y, \; \bar{x}_2 = 50, \; n_2 = 100 - y$

and $\quad \bar{x} = 35, \; n_1 + n_2 = 100$

$\therefore \quad 35 = \dfrac{25 \times y + 50 \times (100 - y)}{100}$

$\Rightarrow \quad 3500 = 25y + 5000 - 50y$

$\Rightarrow \quad 25y = 1500 \Rightarrow y = 60$

$\therefore$ Number of girls in the class $= 60$

23. Given that, $\quad \displaystyle\sum_{i=1}^{n} (x_i - 4) = 30$

and $\quad \displaystyle\sum_{i=1}^{n} (x_i - 3) = 40$

i.e., $\quad \Sigma x_i - 4n = 30 \quad \ldots(\text{i})$

and $\quad \Sigma x_i - 3n = 40 \quad \ldots(\text{ii})$

On solving Eqs. (i) and (ii), we get

$n = 10$ and $\Sigma x_i = 70$

$\therefore \quad \text{Mean} = \dfrac{\sum_{i=1}^{n} x_i}{n} = \dfrac{1}{10}(70) = 7$

24. Since, $x = au + bv$

$\therefore \quad \Sigma x = a\Sigma u + b\Sigma v$

$\Rightarrow \quad n\bar{x} = a(n\bar{u}) + b(n\bar{v})$

$\Rightarrow \quad \bar{x} = a\bar{u} + b\bar{v}$

25. Since, $\bar{x}_1 = 520$, $\bar{x}_2 = 420$ and $\bar{x} = 500$

Also, we know $\bar{x} = \dfrac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$

$\Rightarrow \quad 500(n_1 + n_2) = 520n_1 + 420n_2$

$\Rightarrow \quad 20n_1 = 80n_2$

$\Rightarrow \quad n_1 : n_2 = 4 : 1$

Hence, the percentage of male employees in the firm

$$= \left(\frac{4}{4+1}\right) \times 100 = 80\%$$

26. Let $x_1, x_2, \ldots, x_n$ be n observations.

$$\therefore \quad M = \frac{x_1 + x_2 + x_3 + \ldots + x_n}{n}$$

$$= \frac{x_1 + x_2 + \ldots + x_{n-4} + x_{n-3} + x_{n-2} + x_{n-1} + x_n}{n}$$

$\Rightarrow nM = a + x_{n-3} + x_{n-2} + x_{n-1} + x_n$

$$\Rightarrow \quad \frac{nM - a}{4} = \frac{x_{n-3} + x_{n-2} + x_{n-1} + x_n}{4}$$

27. Given that, $\bar{x} = \dfrac{x_1 + x_2 + \ldots + x_n}{n}$

$\Rightarrow \quad n\bar{x} = x_1 + x_2 + \ldots\ldots + x_n$

Now, required mean $= \dfrac{2x_1 + 3 + \ldots + 2x_n + 3}{n}$

$$= \frac{2(x_1 + x_2 + \ldots + x_n) + 3n}{n}$$

$$= \frac{2n\bar{x} + 3n}{n} = 2\bar{x} + 3$$

28. The formula for combined mean is

$$\bar{X} = \frac{n_1\bar{X}_1 + n_2\bar{X}_2}{n_1 + n_2}$$

We are given $\bar{X} = 25$, $\bar{X}_1 = 26$, $\bar{X}_2 = 21$. Let $n_1 + n_2 = 100$ and n_1 denotes men and n_2 denotes women.

$$n_2 = 100 - n_1$$

$$\therefore \quad 25 = \frac{26n_1 + 21(100 - n_1)}{100} \Rightarrow n_1 = 80$$

So, $n_2 = 20$

Hence, the percentage of men and women is 80 and 20, respectively.

29. ${}^{2n+1}C_0 + {}^{2n+1}C_1 + {}^{2n+1}C_2 + \ldots + {}^{2n+1}C_{2n} + {}^{2n+1}C_{2n+1}$

$$= 2^{2n+1}$$

Now, ${}^{2n+1}C_0 = {}^{2n+1}C_{2n+1}$,

${}^{2n+1}C_1 = {}^{2n+1}C_{2n} \ldots {}^{2n+1}C_r = {}^{2n+1}C_{2n-r+1}$

So, sum of first $(n + 1)$ terms = sum of last $(n + 1)$ terms

$\Rightarrow \quad {}^{2n+1}C_0 + {}^{2n+1}C_1 + {}^{2n+1}C_2 + \ldots + {}^{2n+1}C_n = 2^{2n}$

$$\Rightarrow \quad \frac{{}^{2n+1}C_0 + {}^{2n+1}C_1 + {}^{2n+1}C_2 + \ldots + {}^{2n+1}C_n}{n+1} = \frac{2^{2n}}{(n+1)}$$

30. Required mean $= \dfrac{0 \cdot {}^nC_0 + 1 \cdot {}^nC_1 + 2 \cdot {}^nC_2 + \ldots + n \cdot {}^nC_n}{{}^nC_0 + {}^nC_1 + {}^nC_2 + \ldots + {}^nC_n}$

$$= \frac{n \cdot 2^{n-1}}{2^n} = \frac{n}{2}$$

31. Required mean,

$$\Rightarrow \quad \bar{x} = \frac{0 \cdot q^n + 1 \cdot \frac{n}{1} q^{n-1}p + 2 \cdot \frac{n(n-1)}{2!} q^{n-2}p^2 + \ldots + n \cdot p^n}{q^n + \frac{n}{1} q^{n-1}p + \frac{n(n-1)}{2!} q^{n-2}p^2 + \ldots + p^n}$$

$$\Rightarrow \quad \bar{x} = \frac{0 \cdot {}^nC_0 q^n p^0 + 1 \cdot {}^nC_1 q^{n-1}p + \ldots + n \cdot {}^nC_n q^0 p^n}{{}^nC_0 q^n p^0 + {}^nC_1 q^{n-1}p^1 + \ldots + {}^nC_n q^{n-n}p^n}$$

$$\Rightarrow \quad \bar{x} = \frac{\sum_{r=0}^{n} r \cdot {}^nC_r q^{n-r}p^r}{\sum_{r=0}^{n} {}^nC_r q^{n-r}p^r} = \frac{\sum_{r=0}^{n} r \cdot \frac{n}{r}\, {}^{n-1}C_{r-1} q^{n-r} p \cdot p^{r-1}}{\sum_{r=0}^{n} {}^nC_r q^{n-r}p^r}$$

$$\Rightarrow \quad \bar{x} = \frac{np\left[\sum_{r=1}^{n} {}^{n-1}C_{r-1} p^{r-1} q^{(n-1)-(r-1)}\right]}{\sum_{r=0}^{n} {}^nC_r q^{n-r}p^r}$$

$$\Rightarrow \quad \bar{x} = \frac{np(q+p)^{n-1}}{(q+p)^n}$$

$$\therefore \quad \bar{x} = np \qquad (\because q + p = 1)$$

32. $\text{GM} = (2^1 \cdot 2^2 \cdot 2^3 \ldots 2^2)^{1/n}$

$\Rightarrow \quad \text{GM} = (2^{1+2+3\ldots+n})^{1/n}$

$$\Rightarrow \quad \text{GM} = \left\{2^{\frac{n(n+1)}{2}}\right\}^{1/n}$$

$$\text{GM} = \{2\}^{\frac{n+1}{2}}$$

33. Given, $G_1 = (x_1 \cdot x_2 \ldots x_n)^{1/n}$

and $G_2 = (y_1 \cdot y_2 \ldots y_n)^{1/n}$

$$\therefore \quad G = \left(\frac{x_1}{y_1} \cdot \frac{x_2}{y_2} \ldots \frac{x_n}{y_n}\right)^{1/n} = \frac{(x_1 \cdot x_2 \ldots x_n)^{1/n}}{(y_1 \cdot y_2 \ldots y_n)^{1/n}} = \frac{G_1}{G_2}$$

34. By using combined geometric mean formula, we get

$$\text{GM} = \sqrt[(n_1+n_2)]{x_1^{n_1} \times x_2^{n_2}}$$

$$= \sqrt[7]{8^4 \times 1024^3} = \sqrt[7]{2^{12} \times 2^{30}} = 2^{42/7} = 2^6$$

$\Rightarrow \quad \text{GM} = 64$

35. $\because$ We know that,

Geometric mean $= \sqrt[n]{x_1 \times x_2 \times \ldots \times x_n}$

$$= \sqrt[20]{2^8 \times 4^6 \times 8^4 \times 16^2}$$

$$= \sqrt[20]{2^8 \times 2^{12} \times 2^{12} \times 2^8}$$

$$= \sqrt[20]{2^{40}} = 2^{\frac{40}{20}} = 2^2 = 4$$

36. We know that,

$$\text{Harmonic mean} = \frac{n}{\Sigma 1/x} = \frac{n}{1+2+3+\ldots+n}$$

$$= \frac{n}{\frac{n(n+1)}{2}} = \frac{2}{n+1}$$

37. Let H_1 and n_1 are the harmonic mean and number of observations of first group and H_2 and n_2 are the harmonic mean and number of observations of another group.

$\therefore$ By using combined harmonic mean formula, we get

$$\text{Combined harmonic mean} = \frac{n_1+n_2}{\frac{n_1}{H_1}+\frac{n_2}{H_2}} = \frac{5+5}{\frac{5}{\frac{5}{2}}+\frac{5}{\frac{9}{2}}}$$

$$= \frac{10}{\frac{28}{9}} = \frac{90}{28} = \frac{45}{14}$$

38. We are given, here geometric mean of 10 observations is 8 and geometric mean of first six observations is 4, then we have to find the geometric mean of last four observations. Let G be the GM of last four observations.

$\therefore$ By using grouped geometric mean,

i.e., $8^{10} = 4^6 \times G^4$

$\Rightarrow$ $G^4 = \frac{8^{10}}{4^6} = \frac{2^{30}}{2^{12}} = 2^{18}$

$\Rightarrow$ $G = 2^{18/4} = 2^4\sqrt{2} = 16\sqrt{2}$

39. Since, we know that

$$(\text{GM})^2 = \text{AM} \times \text{HM}$$

$$(2\sqrt{2})^2 = 3 \times \text{HM}$$

$$\Rightarrow \quad \text{HM} = \frac{8}{3}$$

Also, given here that, if each observation is multiplied by 2, then

$$\text{HM} = \frac{8}{3} \times 2 = \frac{16}{3}$$

40. Suppose that, G_1 is the GM of first 5 observations $= 8$ and G_2 is the GM of last 4 observations $= 128\sqrt{2}$

Also, let G be the grouped mean

$$= 9\sqrt{(G_1^{n_1} \times G_2^{n_2})} = (G_1^5 \times G_2^4)^{1/9}$$

$$= [8^5 \times (128\sqrt{2})^4]^{1/9} = \left[(2^3)^5 \times \left(2^{7+\frac{1}{2}}\right)^4\right]^{1/9}$$

$$= (2^{15} \times 2^{30})^{1/9} = 2^{\frac{45}{9}} = 2^5 = 32$$

41. Mean deviation is not a measure of central tendency.

42. For dealing with qualitative data, the best average is median.

43. Total weight of 9 items $= 15 \times 9 = 135$

and total weight of 10 items $= 16 \times 10 = 160$

$\therefore$ Weight of 10th item $= 160 - 135 = 25$

44. Since, $\alpha > 0$ (given), arrange the data in ascending order.

$$\alpha - \frac{7}{2}, \alpha - 3, \alpha - \frac{5}{2}, \alpha - 2, \alpha - \frac{1}{2}, \alpha + \frac{1}{2}, \alpha + 4, \alpha + 5$$

$$\text{Median} = \frac{\alpha - 2 + \alpha - \frac{1}{2}}{2} = \frac{2\alpha - \frac{5}{2}}{2} = \alpha - \frac{5}{4}$$

45. $\text{Coefficient of skewness} = \frac{Q_3 + Q_1 - 2\,(\text{median})}{Q_3 - Q_1}$

$$= \frac{25.2 + 14.6 - 2\,(18.8)}{25.2 - 14.6} = \frac{2.2}{10.6} = 0.20$$

46. ${}^{2n}C_0, {}^{2n}C_1, {}^{2n}C_2, \ldots, {}^{2n}C_n$ is odd number of binomial coefficients (when n is even) and middle binomial coefficient is ${}^{2n}C_{n/2}$ which is required median.

47. Let the first natural number be x

According to the question,

$$(x) + (x+1) + (x+2) + (x+3) + (x+4) + (x+5) + (x+6) + (x+7) + (x+8) + (x+9) + (x+10) = 2761$$

$\Rightarrow$ $11x + 55 = 2761$

$\Rightarrow$ $x = \frac{2761 - 55}{11} = \frac{2706}{11} = 246$

$\therefore$ Middle number $= x + 5 = 246 + 5 = 251$

48. Since, Mode $= 3$ (Median) $- 2$ (Mean)

$\therefore$ $18 = 3$ (Median) $- 2(24) \Rightarrow$ Median $= 22$

49. $\because$ Mode $= 3$ (Median) $- 2$ (Mean)

$\therefore$ $6\lambda = 3$ (Median) $- 18\lambda$

$\Rightarrow$ Median $= 8\lambda$

50. If the observations greater than the median are increased by 5, then C_n median will not be affected.

51. Given that, mean $= 5$, median $= 6$

For a moderately skewed distribution, we have

Mode $= 3$ median $- 2$ mean

$\Rightarrow$ Mode $= 3\,(6) - 2\,(5) = 8$

52. The values of median and mode can be determined graphically is the correct statement.

53. Firstly, arrange the data in ascending order

i.e., 7, 10, 12, 15, 17, 19, 25

$\therefore$ $Q_1 = \text{Size of}\left(\frac{n+1}{4}\right)\text{th item}$

$= \text{Size of 2nd item} = 10$

$Q_3 = \text{Size of}\left[\frac{3(n+1)}{4}\text{ th}\right]\text{item}$

$= \text{Size of 6th item} = 19$

$\therefore$ Quartile deviation $= \frac{Q_3 - Q_1}{2} = \frac{19 - 10}{2} = 4.5$

54. Here, $N = 20$

$$Q_1 = \frac{N+1}{4} = \left(\frac{21}{4}\right)\text{th} = 3$$

Similarly, $Q_3 = 3\left(\frac{N+1}{4}\right)$ th observation

$$= 3\left(\frac{21}{4}\right) = \frac{63}{4} \text{ th} = 5$$

$$\therefore \quad QD = \frac{1}{2}(Q_3 - Q_1) = \frac{1}{2}(5-3) = 1$$

55. Given that,

$$2y + 5 = 3x$$

$$\Rightarrow \quad y = \frac{3x}{2} - \frac{5}{2}$$

Therefore, QD of $y = \left|\frac{3}{2}\right| \times$ QD of $x = \frac{3}{2} \times 8 = 12$

$[\because y = bx + c \Rightarrow QD(y) = |b|\, QD(x)]$

56. From given data, we make the following table

Class Interval (CI)	Frequency (f)	Cumulative frequency (cf)
0-10	10	10
10-20	20	30
20-30	35	65
30-40	25	90
40-50	10	100

Here, $\frac{N}{4} = \frac{100}{4} = 25$ and $\frac{3N}{4} = \frac{3 \times 100}{4} = 74$

$$\therefore \quad Q_1 = L_1 + \frac{\frac{N}{4} - cf}{f} \times i = 10 + \frac{25-10}{20} \times 10$$

$$= 10 + 7.5 = 17.5$$

and $$Q_3 = L_1 + \frac{\frac{3N}{4} - cf}{f} \times i = 30 + \frac{75-65}{25} \times 10$$

$$= 30 + 4 = 34$$

Hence, quartile deviation $= \frac{Q_3 - Q_1}{2} = \frac{34 - 17.5}{2} = 8.25$

57. Since, $MD = \frac{4}{5}\sigma$, $QD = \frac{2}{3}\sigma$

$$\therefore \quad \frac{MD}{QD} = \frac{6}{5}$$

$$\Rightarrow \quad QD = \frac{5}{6}(MD) = \frac{5}{6}(15) = 12.5$$

58. Mean, $$\bar{x} = \frac{3 + 10 + 10 + 4 + 7 + 10 + 5}{7} = \frac{49}{7}$$

$$= 7$$

$\therefore$ Mean deviation, $MD = \sum_{i=1}^{7} \frac{|x_i - \bar{x}|}{n}$

$$= \frac{\left[\begin{array}{l} |3-7| + |10-7| + |10-7| + |4-7| + |7 \\ \quad -7| + |10-7| + |5-7| \end{array}\right]}{7}$$

$$= \frac{4+3+3+3+0+3+2}{7} = \frac{18}{7} = 2.57$$

59. $\therefore$ Mean, $$\bar{x} = \frac{1357 + 1090 + 1666 + 1494 + 1623}{5}$$

$$= \frac{7230}{5} = 1446$$

$\therefore$ Mean deviation, $MD = \sum_{i=1}^{5} |x_i - \bar{x}|$

$$= \frac{\begin{array}{l} |1357 - 1446| + |1090 - 1446| + |1666 \\ \quad -1446| + |1494 - 1446| + |1623 - 1446| \end{array}}{5}$$

$$= \frac{89 + 356 + 220 + 48 + 177}{5} = \frac{890}{5} = 178$$

60. Firstly, given marks are arranged in ascending order 20, 33, 39, 40, 50, 53, 59, 65, 69

$\therefore$ Median, $M_d = \left(\frac{9+1}{2}\right)$ th term = 5th term = 50

$\therefore$ Mean deviation, $MD = \frac{\sum_{i=1}^{9} |x_i - M_d|}{n}$

$$= \frac{\begin{array}{l} |20-50| + |33-50| + |39-50| + |40-50| + |50 \\ \quad -50| + |53-50| + |59-50| + |65-50| + |69-50| \end{array}}{9}$$

$$= \frac{30 + 17 + 11 + 10 + 0 + 3 + 9 + 15 + 19}{9}$$

$$= \frac{114}{9} = 12.67$$

61. Now, mean of first n natural numbers,

$$\bar{x} = \frac{1 + 2 + \ldots + n}{n}$$

$$= \frac{n(n+1)}{2n} = \frac{n+1}{2}$$

$$\therefore \quad \text{Mean deviation} = \frac{\Sigma |x_i - \bar{x}|}{n}$$

$$= \frac{\left[\begin{array}{l} \left|\frac{n+1}{2} - 1\right| + \left|\frac{n+1}{2} - 2\right| \ldots + \left|\frac{n+1}{2} - \frac{n+1}{2}\right| \\ \quad + \left|\frac{n+1}{2} - \left(\frac{n+1}{2} + 1\right)\right| + \left|\left(\frac{n+1}{2}\right) - \left(\frac{n+1}{2} + 2\right)\right| \\ \quad + \ldots + \left|\frac{n+1}{2} - \left(\frac{n+1}{2} + \frac{n-1}{2}\right)\right| \end{array}\right]}{n}$$

$$= \frac{\frac{n-1}{2} + \frac{n-3}{2} + \ldots + 0 + 1 + 2 + \ldots + \frac{n-1}{2}}{n}$$

$$= \frac{\left\{\frac{n}{2} + \frac{n}{2} + \ldots + (n-1) \text{ term}\right\} + \frac{1}{2} + \frac{1}{2} + \ldots + \frac{n-1}{2} \text{ term}}{n}$$

$$= \frac{\frac{n(n-1)}{2 \times 2} + \frac{(n-1)}{2 \times 2}}{n} = \frac{n^2 - n + n - 1}{4n}$$

$$= \frac{n^2 - 1}{4n}$$

62.

Class interval	Mid value x_i	f	cf	$\lvert x - M_d \rvert$	$f \lvert x - M_d \rvert$
0-6	3	4	4	11	44
6-12	9	5	9	5	25
12-18	15	3	12	1	3
18-24	21	6	18	7	42
24-30	27	2	20	13	26
Total		20			140

Now, $\frac{N}{2} = \frac{20}{2} = 10$, which lies in the interval 12-18.

$$l = 12, cf = 9, f = 3$$

$$\therefore \quad M_d = 12 + \frac{10-9}{3} \times 6 \quad \left(\because M_d = l + \frac{\frac{N}{2} - cf}{f} \times h \right)$$

$$= 12 + 2 = 14$$

$$\therefore \quad \text{Mean deviation} = \frac{\Sigma f_i \mid x_i - M_d \mid}{N} = \frac{140}{20} = 7$$

63. **Hint** Now, Mean $\bar{x} = \frac{6+5+9+13+12+8+10}{7} = \frac{63}{7} = 9$

$\therefore$ Standard deviation, $\sigma = \sqrt{\frac{(x_i - \bar{x})^2}{n}}$

64. **Hint** $\sigma = \sqrt{\frac{\Sigma x_i^2}{n} - (\bar{x})^2}$

65. We know that, if any constant is added in each observation, then standard deviation remain same.

$\therefore$ The standard deviation of the observations $a + k, b + k, c + k, d + k, e + k$ is S.

66. We know that, standard deviation is independent of change of origin.

Hence, if each item is decreased by 1, then standard deviation will be same *i.e.*, 6.

67. We know that,

$$\text{var}(aX + b) = a^2 \text{var}(X)$$

$$\therefore \quad \text{var}\left(\frac{aX+b}{c}\right) = \left(\frac{a}{c}\right)^2 \text{var}(X) = \frac{a^2}{c^2}\sigma^2$$

$$\therefore \quad \text{SD} = \sqrt{\text{var}\left(\frac{aX+b}{c}\right)} = \left|\frac{a}{c}\right|\sigma$$

68. We have, $\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i$

$$\therefore \quad \text{var}(\bar{x}) = \frac{1}{n^2}\left[\sum_{i=1}^{n} \text{var}(x_i) + 2\sum_{i \neq j}^{n} \text{cov}(x_i, x_j)\right]$$

$$= \frac{1}{n^2}[n\sigma^2] = \frac{\sigma^2}{n}$$

[$\because$ x_i and x_j are independent variable, therefore $\text{cov}(x_i, x_j) = 0$]

69. Standard deviation is dependent on charge of scale. Therefore, the standard deviation of $kx_1, kx_2, kx_3, kx_4, kx_5$ is kS.

70. Given, $w_i = lx_i + k$

$$M(x_i) = \bar{x} = 48, \sigma(x_i) = 12$$

$$M(\bar{w}) = 55 \text{ and } \sigma(w) = 15$$

$$M(w_i) = lM(x_i) + M(k)$$

$$55 = l \times 48 + k \quad \ldots\text{(i)}$$

and $\quad \sigma(w_i) = l\sigma(x_i) + \sigma(k)$

$$\Rightarrow \quad 15 = l(12) + 0$$

$$\Rightarrow \quad l = \frac{15}{12} = 1.25$$

$\therefore$ From Eq. (i),

$$55 = 1.25 \times 48 + k$$

$$\Rightarrow \quad k = 55 - 60$$

$$\therefore \quad k = -5$$

71. $$\bar{x} = \frac{1+2+3+\ldots+n}{n} = \frac{(n+1)}{2}$$

Variance, $\sigma^2 = \frac{\Sigma(x_i)^2}{n} - (\bar{x})^2 = \frac{\Sigma n^2}{n} - \left(\frac{n+1}{2}\right)^2$

$$= \frac{n(n+1)(2n+1)}{6n} - \left(\frac{n+1}{2}\right)^2 = \frac{n^2-1}{12}$$

72. **Hint** Now mean, $\bar{x} = \frac{1+2+\ldots+10}{10}$

$$= \frac{\frac{10(10+1)}{2}}{10} = \frac{11}{2} \quad \left[\because \Sigma n = \frac{n(n+1)}{2}\right]$$

$$\therefore \quad \sigma = \sqrt{\frac{\Sigma x_i^2}{n} - (\bar{x})^2}$$

73. We know SD of first 10 natural number is 2.87.

i.e., $\quad \sigma = 2.87$

Variance, $\sigma^2 = 8.24$

We know that, variance is independent of change of origin.

Hence, after adding 1 on each observation new variance will same *i.e.*, 8.25

74. Given, $\Sigma x^2 = 18000$, $\Sigma x = 960$ and $n = 60$

$$\because \quad \sigma^2 = \frac{\Sigma x^2}{n} - \left(\frac{\Sigma x}{n}\right)^2 = \frac{18000}{60} - \left(\frac{960}{60}\right)^2$$

$$= 300 - (16)^2 = 300 - 256 = 44$$

75. Given, coefficient of variation, $C_1 = 50$

and coefficient of variation, $C_2 = 60$

$$\bar{x}_1 = 30 \text{ and } \bar{x}_2 = 25$$

$$\because \quad C = \frac{\sigma}{\bar{x}} \times 100$$

$$\therefore \quad 50 = \frac{\sigma_1}{30} \times 100$$

$\Rightarrow \quad \sigma_1 = 15$ and $60 = \frac{\sigma_2}{25} \times 100$

$\Rightarrow \quad \sigma_2 = 15$

$\therefore$ Required difference, $\sigma_1 - \sigma_2 = 15 - 15 = 0$

76. Given, $\sigma_{10}^2 = \frac{99}{12} = \frac{33}{4}$

$\Rightarrow \quad \sigma_{10} = \frac{\sqrt{33}}{2}$

SD of required series $= 3\sigma_{10} = \frac{3\sqrt{33}}{2}$

77. $n_1 = 25, \bar{x}_1 = 18.2, \sigma_1 = 3.25, n_2 = 15$

$$\sum_{i=1}^{15} x_i = 279 \text{ and } \Sigma x_i^2 = 5524$$

Now, $\bar{x}_2 = \frac{\sum_{i=1}^{15} x_i}{n_2} = \frac{279}{15} = 18.6$

$$\sigma_2 = \sqrt{\frac{\Sigma x_i^2}{n_2} - (\bar{x}_2)^2} = \sqrt{\frac{5524}{15} - (18.6)^2}$$

$$= \sqrt{368.27 - 345.96} = \sqrt{22.31} = 4.72$$

Now, $\bar{x}_{12} = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2}$

$$= \frac{25 \times 18.2 + 15 \times 18.6}{25 + 15}$$

$$= \frac{455 + 279}{40} = \frac{734}{40} = 18.35$$

$\therefore \quad d_1 = \bar{x}_1 - \bar{x}_{12}$

$= 18.2 - 18.35 = -0.15$

$d_2 = \bar{x}_2 - \bar{x}_{12} = 18.6 - 18.35 = 0.25$

$\therefore$ Combined standard deviation

$$\sigma_{12} = \sqrt{\frac{n_1\sigma_1^2 + n_2\sigma_2^2 + n_1d_1^2 + n_2d_2^2}{n_1 + n_2}}$$

$$= \sqrt{\frac{25 \times (3.25)^2 + 15 \times (4.72)^2 + 25 \times (-0.15)^2 + 15 \times (0.25)^2}{25 + 15}}$$

$$= \sqrt{\frac{264.06 + 334.176 + 0.5625 + 0.9375}{40}}$$

$$= \sqrt{\frac{599.736}{40}} = \sqrt{14.9934} = 3.87$$

78. Given, $\Sigma(x - 5) = 3$ and $\Sigma(x - 5)^2 = 43, n = 18$

$\therefore \quad$ Mean $= 5 + \frac{\Sigma(x-5)}{18} = 5 + \frac{3}{18} = 5 + \frac{1}{6}$

$$= \frac{31}{6} = 5.17$$

Now, $\Sigma(x - 5)^2 = 43$

$\Rightarrow \quad \Sigma x^2 - \Sigma 10x + \Sigma 25 = 43$

$\Rightarrow \quad \Sigma x^2 - 10\{\Sigma(x - 5 + 5)\} + 18 \times 25 = 43$

$\Rightarrow \quad \Sigma x^2 - 10\Sigma(x - 5) - 10\ \Sigma 5 + 450 = 43$

$\Rightarrow \quad \Sigma x^2 - 10(3) - 10 \times 18 \times 5 + 450 = 43$

$\Rightarrow \quad \Sigma x^2 - 30 - 900 + 450 = 43$

$\Rightarrow \quad \Sigma x^2 = 523$

and $\quad \Sigma(x - 5) = 3$

$\Rightarrow \quad \Sigma x - 5\Sigma 1 = 3$

$\Rightarrow \quad \Sigma x = 3 + 5 \times 18 = 93$

$\because \quad \sigma = \sqrt{\frac{\Sigma x^2}{n} - \left(\frac{\Sigma x}{n}\right)^2} = \sqrt{\frac{523}{18} - \left(\frac{93}{18}\right)^2}$

$$= \sqrt{29.06 - (5.17)^2} = \sqrt{29.06 - 26.73}$$

$$= \sqrt{2.33} = 1.53$$

79. Given that,

mean $= 0$ and variance $= \sigma^2$ (for x)

Therefore, variance $= \sigma^2 = \frac{\Sigma x^2}{n} - \left(\frac{\Sigma x}{n}\right)^2$

$\Rightarrow \quad \sigma^2 = \frac{\Sigma x^2}{n} - 0 \quad \Rightarrow \sigma^2 = \frac{\Sigma x^2}{n}$

Now, $\quad y = x^2$

$\Rightarrow \quad \Sigma y = \Sigma x^2$

$\therefore \quad \bar{y} = \frac{\Sigma x^2}{n} = \sigma^2$

80. From given data, we make the following table

x	x^2
2	4
3	9
11	121
x	x^2
$\Sigma x = 16 + x$	$\Sigma x^2 = 134 + x^2$

But we know that, variance $= \frac{\Sigma x^2}{n} - \left(\frac{\Sigma x}{n}\right)^2$

$\Rightarrow \quad \frac{134 + x^2}{4} - \left(\frac{16 + x}{4}\right)^2 = \frac{49}{4}$ (given)

$\Rightarrow \quad \frac{134 + x^2}{4} - \frac{(256 + x^2 + 32x)}{16} = \frac{49}{4}$

$\Rightarrow \quad \frac{3x^2 - 32x + 280}{16} = \frac{49}{4}$

$\Rightarrow \quad 280 + 3x^2 - 32x = \frac{49}{4} \times 16$

$\Rightarrow \quad 280 + 3x^2 - 32x = 196$

$\Rightarrow \quad 3x^2 - 32x + 84 = 0$

$\Rightarrow \quad (x - 6)(3x - 14) = 0$

$\Rightarrow \quad x = 6, x = \frac{14}{3}$

Therefore, the values of x are 6 and $\frac{14}{3}$.

81. Given that,

mean and variance of players A and B is

$$\bar{x}_1 = 50, \sigma_1^2 = 36 \text{ or } \sigma_1 = 6$$

$$\bar{x}_2 = 60, \sigma_2^2 = 81 \text{ or } \sigma_2 = 9$$

From the following formula, we can check consistency

coefficient of variation $= \dfrac{\text{SD}}{\text{Mean}} \times 100$

Therefore, coefficient of variation of player,

$$A = \frac{\sigma_1}{\bar{x}_1} \times 100 = \frac{6}{50} \times 100 = 12\%$$

and coefficient of variation of player,

$$B = \frac{\sigma_2}{\bar{x}_2} \times 100 = \frac{9}{60} \times 100 = 15\%$$

Since, coefficient of variation of player A is less, hence it is more consistent in comparision to player B.

82. $\therefore$ New mean, $\bar{x} = \dfrac{100 \times 40 + 3 + 27 - 30 - 70}{100}$

$$= \frac{4000 - 70}{100} = \frac{3930}{100}$$

$$= 39.3$$

$\because$ $\Sigma x^2 = N(\sigma^2 + \bar{x}^2)$

$\therefore$ $\text{SD} = 100(100 + 1600)$

$$= 170000$$

New, $\Sigma x^2 = 170000 - (30)^2 - (70)^2 + (3)^2 + (27)^2$

$$= 170000 - 900 - 4900 + 9 + 729$$

$$= 164938$$

$\therefore$ New, $\text{SD} = \sqrt{\dfrac{\text{New } \Sigma x^2}{N} - (\text{New } \bar{x})^2}$

$$= \sqrt{\frac{164938}{100} - (39.3)^2}$$

$$= \sqrt{1649.38 - 1544.49} = \sqrt{104.89}$$

$$= 10.24$$

83. **Hint** combined mean

$$(\bar{x}) = \frac{n_1\bar{x}_1 + n_2\bar{x}_2}{n_1 + n_2} = \frac{100 \times 45 + 150 \times 55}{100 + 150}$$

$$= \frac{4500 + 8250}{250} = 51$$

$\therefore$ $d_1^2 = (\bar{x} - \bar{x}_1)^2 = (51 - 45)^2 = 36$

and $d_2^2 = (\bar{x} - \bar{x}_2)^2 = (51 - 55)^2 = 16$

Therefore, combined SD $(\sigma) = \sqrt{\dfrac{n_1\sigma_1^2 + n_2\sigma_2^2 + n_1 d_1^2 + n_2 d_2^2}{n_1 + n_2}}$

Round II

1. Given, $\sigma = 9$

Let a student obtains x marks out of 75. Then, his marks out of 100 are $\dfrac{4x}{3}$. Each observation is multiply by $\dfrac{4}{3}$.

$\therefore$ New SD, $\sigma = \dfrac{4}{3} \times 9 = 12$

Hence, variance is $\sigma^2 = 144$

2. The ascending order of the given data are

$$34, 38, 42, 44, 46, 48, 54, 55, 63, 70$$

Hence, Median, $M = \dfrac{46 + 48}{2} = 47$

$\therefore$ Median deviation

$$= \frac{\Sigma|x_i - M|}{n} = \frac{\Sigma|x_i - 47|}{n}$$

$$= \frac{13 + 9 + 5 + 3 + 1 + 1 + 7 + 8 + 16 + 23}{10} = 8.6$$

3. Given that, $x_1 < x_2 < x_3 < \ldots < x_{201}$

$\therefore$ Median of the given observation $= \left(\dfrac{201 + 1}{2}\right)$ th item

$$= x_{101}$$

Now, deviation will be minimum of taken from the median.
